A History of the United States

37 chapters, each told across the same ten eras

Contents

Introduction: How We Know What Happened

Part 1: The Land and Its First Peoples

1. Exploration and Discovery
2. Native Nations
3. Land and Environment

Part 2: Coming, Moving, Settling

4. Immigration to America
5. Migration Across America
6. City Building
7. Home and Family Life

Part 3: Making and Building

8. Technology
9. Science
10. Energy
11. Transportation
12. Landmarks
13. The Elements

Part 4: Work, Food, and Money

14. Work and Workers
15. Food and Farming
16. Economy

17. Money
18. Marketplace and Consumer Life
19. Big Business and Its Power

Part 5: Power, Law, and War

20. Government, Law, and Politics
21. Crime, Police, and Justice
22. War and the Military
23. America and the World

Part 6: Freedom and Fairness

24. Slavery and Freedom
25. Rights and Movements

Part 7: Health and Safety

26. Health, Disease, and Medicine
27. Disasters and Rescue
28. Drugs and Alcohol

Part 8: Faith, Learning, and News

29. Religion
30. School and Education
31. News and Communication

Part 9: Culture and Play

32. Art
33. Music
34. Storytelling Evolution
35. Styles
36. Sports and Play
37. Holidays

How We Know What Happened

Nobody alive today saw the Pueblo Revolt, the founding of Jamestown or the first Thanksgiving. Nobody alive saw Cahokia when it was the largest city north of Mexico. Everything known about those times comes from what people left behind: papers, objects, bones, buildings, photographs, and the stories that families and nations told their children.

Historians are people who study the past and write about it. They gather that evidence and check it. Each kind of evidence keeps some facts and loses others. A historian gathers as many kinds as possible and checks them against each other. Then the historian states what is known, what is not known, and where the evidence disagrees. Those three things, the known, the unknown and the disputed, show up all through American history.

Papers written at the time

A record made when something happened, by someone who was there, is called a primary source. Letters, diaries, court papers and newspaper reports are primary sources. A book written later by someone who studied those papers is called a secondary source. Historians trust a primary source most, but they still check it, because the person who wrote it saw only part of what happened.

Letters contain people's own words. John and Abigail Adams wrote each other more than 1,100 letters while John was away for years on government work. On 31 March 1776, Abigail asked John to "Remember the Ladies, and be more generous and favourable to them than your ancestors." She added, "Do not put such unlimited power into the hands of the Husbands." The letter is online at the Massachusetts Historical Society's website, in her own spelling and handwriting.

A diary is a book in which a person writes down each day as it happens. Amelia Stewart Knight kept one in 1853, when she traveled by wagon from Iowa to Oregon with her husband and seven children. She wrote about rain, mud, dust, sick children and hard river crossings. She was pregnant the whole way. She did not mention it in the diary until her son Adam was born, on 18 September 1853. The family had reached Oregon the day before.

Court records contain the judges' own words about how they punished people. On 9 July 1640, a court in Virginia judged three servants of a man named Hugh Gwyn who had run away together and been caught. The court gave the two European men four more years of work as punishment. It sentenced the third man, John Punch, an African, to serve "for the time of his

natural Life." That record is the first known sentence in Virginia that made a person a slave for life. It is also the first record in which Virginia judges punished one man more harshly than the others because of his race.

Newspapers printed news within days, which makes them useful and also risky, because reporters wrote before all the facts were in. The journalist Ida B. Wells used newspapers as evidence. A lynching is a murder by a mob that kills a person without any trial. Wells collected the yearly lists of lynchings printed in the *Chicago Tribune* and checked the reasons the mobs gave. In her 1892 pamphlet *Southern Horrors*, she counted 728 Black Americans lynched in the past eight years. She found that only one third of them had even been accused of rape.

Bones, ruins and things in the ground

Archaeology is the study of the past through the things people left in the ground: tools, pots, buildings, trash and graves. Archaeologists dig slowly and record exactly where each object lay, because where something was found is part of what it shows. For most of the thousands of years that people lived in North America, nobody wrote anything on paper. Most of what is known about those years comes from archaeology.

Cahokia was a city of Native people in what is now Illinois, across the Mississippi River from St. Louis. It was largest from about 1050 to 1150. No writing by Cahokia's people has been found. In 2012, chemists published tests on residue, the dried leftover film, inside beaker cups from Cahokia and nearby sites. They found caffeine and other chemicals that come from holly leaves. The cups had held Black Drink, a tea brewed from yaupon or dahoon holly. Those plants grow far south of Cahokia, so people carried the leaves north. Cahokia's people also controlled the making and trade of hoe blades of Mill Creek chert, a hard stone quarried in southern Illinois. Archaeologists have found those blades more than 400 miles away.

Bones show signs of some diseases and of a poor diet. In Illinois, researchers studied the skeletons of Mississippian people buried at Dickson Mounds in the 1100s. Some skulls had patches of pitted, spongy bone. That damage forms when a person has anemia, which here means too little iron in the blood. The researchers found the damage grew much more common after people changed from hunting and gathering to farming. Corn, the main crop, has little iron the body can use.

At Jamestown in Virginia, the English colonists ran out of food in the winter of 1609 to 1610. Powhatan, the leader of the Native nations around them, had cut off trade and surrounded their fort. The colonists ate their horses, their dogs, rats and leather. Written accounts from the time say starving colonists also ate the bodies of the dead. In 2013, researchers at the

Smithsonian announced a find from that winter. The bones of a girl showed that starving colonists had eaten from her body. Researchers call her Jane. No record states her real name. For that winter, the written accounts and the bones agree.

Stories passed down

Oral tradition is history that people keep by telling it, from parents to children, across many lifetimes. Native nations kept their laws, treaties and histories this way for thousands of years before Europeans arrived, and many still do. Records written by colonists describe Native nations from the outside. A nation's own tradition records what its people remember and how they understood events.

The Haudenosaunee, a league of five nations in what is now New York, kept their founding law, the Great Law of Peace, in spoken words and on wampum belts. Wampum is beads cut from purple and white shells. The designs woven into a belt stood for the terms of an agreement, and speakers read the belts aloud in council. The Two Row Wampum belt shows two purple rows on white beads. They stand for two boats traveling side by side on one river, with neither steering the other. The Haudenosaunee tradition says it records their first agreement with the Dutch, in 1613. A paper treaty with that date also survives, and scholars dispute whether it is genuine. The belt is the Haudenosaunee record of the agreement.

Sometimes new evidence shows an oral tradition was right and the written histories were wrong. The usual account said the nations of the Plains got horses mostly after 1680. That year the Pueblo nations rose together and drove the Spanish out of New Mexico, and horses the Spanish left behind spread north. Native oral histories said the horses came earlier. In 2023, the scientist William Taylor and a team that included Lakota, Comanche, Pawnee and other Native partners published tests on old horse bones in the journal *Science*. They used radiocarbon dating, which measures a kind of carbon that breaks down at a steady rate in anything that was once alive. Many Plains and Rocky Mountain nations had horses by the early 1600s, decades before 1680. The bones also showed the horses had worn bridles and eaten corn, so people kept and fed them. That matched the Native histories.

Recorded interviews are a newer kind of spoken history. From 1936 to 1938, writers hired by the Federal Writers' Project, a government jobs program, interviewed people who had been born into slavery. They wrote down more than 2,300 accounts in 17 states. The accounts are held at the Library of Congress in a collection called "Born in Slavery." On 11 June 1949 in Baltimore, a Library of Congress worker named Hermond Norwood recorded Fountain Hughes on tape. "My name is Fountain Hughes. I was born in Charlottesville, Virginia," he said. He

described slave auctions: "They'd sell us like they sell horses and cows and hogs and all like that." The tape is part of a Library of Congress collection named "Voices Remembering Slavery."

Photographs

A photograph shows what was in front of the camera at one moment. It does not show who arranged the scene, what happened just outside the frame, or whether the caption is true. Historians check photographs the way they check papers.

On 6 July 1863, at Gettysburg, photographers working for Alexander Gardner took a picture of a dead soldier. He lay behind a stone wall at a place called Devil's Den. In 1866 Gardner published it with a caption that identified the man as a Confederate sharpshooter killed by a shell. In 1975 the historian William Frassanito compared it with other photographs from the same days. He showed it was one of six pictures of the same body, and that the photographers had moved the body from another spot to the wall. The rifle next to him was most likely a prop. Writers still argue about which way the body was moved. Both sides agree the photographers moved it. Nobody knows the dead man's name.

Captions can be wrong about the people in a picture too. In 1910 Lewis Hine photographed a girl working as a spinner in a cotton mill in North Pownal, Vermont. His caption names her "Addie Laird" and states her age as 12. Other girls at the mill said she was ten. In 2005 and 2006, a researcher named Joe Manning traced her life and found her real name, Addie Card. She died in 1993.

Counting

Numbers look exact, but every count depends on who did the counting, what they counted, and why. When two counts of the same thing differ, historians look for the reason.

The men who wrote the Constitution in 1787 decided how to count people for seats in the House of Representatives. They counted each enslaved person as three fifths of a free person. The enslaved people being counted could not vote and had no rights under the law. Counting them added House seats for the states where they were enslaved.

A count changes when the area changes. The Handbook of Texas states that the hurricane of 8 September 1900 killed between 6,000 and 8,000 people in the city of Galveston. For the whole island, the estimates run from 10,000 to 12,000. Both numbers can be correct, because each counts a different place.

A count also changes when someone decides what to leave out. At Hoover Dam, built in the 1930s, the federal Bureau of Reclamation's official count is 96 workers killed on the job. That count leaves out 42 deaths recorded as pneumonia. Many historians think those men were poisoned by carbon monoxide, a gas from engine exhaust, in the tunnels. The official count is lower than the true one, and the exact number is unknown.

Some counts stay uncertain because the bodies were hidden. On 31 May and 1 June 1921, a white mob in Tulsa, Oklahoma, burned the Black neighborhood of Greenwood. Some of the mob were men the Tulsa police had sworn in as deputies, and National Guard troops rounded up Black residents. Bodies were dumped in the Arkansas River, carried off on railroad cars, and buried in unmarked graves. The accounts do not name who moved them. The historian Scott Ellsworth writes that believable estimates of the dead run from 50 to 300. No white person was ever sent to prison for the killings.

The words "at least" in a count mean the real number may be higher. Federal officials ran or paid for boarding schools that took Native children from their families from 1819 to 1969. In 2024 officials at the US Department of the Interior, led by Secretary Deb Haaland, finished a report on those schools. The first part of the report, in 2022, listed 408 schools. The final part, in 2024, listed 417. It counted at least 973 children who died at the schools and at least 74 burial sites. The report itself states that the true number of deaths is higher.

Counts of lynchings differ for a similar reason. Researchers at the Equal Justice Initiative counted more than 4,400 racial terror lynchings between 1877 and 1950. They use that name for lynchings meant to frighten Black Americans. Other groups chose different years and different rules for what counted, so their totals differ. A careful writer gives the number together with the name of whoever counted it.

Who wrote the records, and who is missing

For most of American history, the people who wrote things down and kept the papers were the people with power: officials, officers, owners and ministers. Their records describe other people from the outside, and many people appear in them without names.

In late August 1619, an English ship called the *White Lion* landed captive Africans at Point Comfort, Virginia. The colonist John Rolfe wrote that it brought "20. and odd Negroes." His record lists none of their names. The first record of Africans in English Virginia records them only as a number.

Enslavers wrote their own record of the people who escaped them. Southern newspapers printed thousands of advertisements offering rewards for people who had run away. A project at Cornell University called Freedom on the Move is putting thousands of them online. The ads were written to catch people, but they also show those people's skills. Many ads warned that the person "can read" or "can write and may forge a pass," meaning the person could write a fake travel permit.

Some enslaved people left their own words in other places. An enslaved potter in Edgefield, South Carolina, known as Dave, cut short poems and dates into the clay of the large jars he made. One jar from 1834 reads, "put every bit all between / surely this jar will hold 14." After slavery ended, the 1870 census, the government's count of every person in the country, listed him as "David Drake, turner," a worker who shapes clay on a turning wheel. According to the Equal Justice Initiative, the 1870 census was the first time formerly enslaved people could formally record a last name.

When sources disagree

When two records tell a story differently, historians check who wrote each one and whether that person was there. They check how long after the event it was written, whether the writer checked it with the people involved, and what the writer gained from telling it one way. A record made soon after, by a witness who checked it, is the better source. When neither is clearly better, a careful historian reports both.

Sojourner Truth spoke to a women's rights meeting in Akron, Ohio, in May 1851. Two versions of her speech exist. The first was printed by Marius Robinson, a secretary of the meeting, in the newspaper the *Anti-Slavery Bugle* on 21 June 1851, about three weeks after she spoke. Truth stayed with Robinson and his wife, Emily, in Ohio that year. In his version she says, "I have as much muscle as any man, and can do as much work as any man." She also says, "I can't read, but I can hear."

The second version was written by Frances Dana Gage, who had led the meeting. She published it in 1863, twelve years later, and she did not check it with Truth. Gage's version is the famous one, with the question "Ain't I a woman?" repeated through it. Robinson's report does not contain that question. Gage wrote Truth's words in the way people talked in the South. Truth grew up in Ulster County, New York, and spoke only Dutch until she was nine. She was never enslaved in the South. In Gage's version, Truth also says she had thirteen children. According

to the National Women's History Museum, she had five. Gage herself called her account "but a faint sketch of her speech." Robinson's report, printed within weeks by a man who knew her, is the closer record of what Truth said.

Sometimes a modern summary and a person's own account disagree. A National Park Service web page states that a mob stormed Ida B. Wells's newspaper office in Memphis in 1892 and destroyed her equipment. Wells told it differently that same year. White Memphians met at the Cotton Exchange Building and sent a committee to find the paper's editors. Wells wrote that the editors escaped being lynched only because the committee could not find them. Her business partner fled and was ordered not to return. Wells was in New York and was warned that she would be hurt if she came back. Then, she wrote, the people the paper owed money to "took possession of the office and sold the outfit." Her own account does not describe a fire or a wrecked press.

Even a careful writer's own words need checking. Wells dated that meeting "Wednesday evening May 24, 1892." But 24 May 1892 was a Tuesday. The day and the date in her pamphlet do not match, so one of them is wrong.

A legend can grow far bigger than the record. In an old story, Harriet Tubman made 19 trips back into Maryland and led 300 people to freedom. National Park Service historians, using her own statements and the records, give about 13 trips and about 70 people, most of them her family and friends.

People can disagree about their own lives too. Fountain Hughes told the interviewer in 1949 that he was 101 years old, which would put his birth in 1848. Some reference books give 1854. A careful account states both years.

Old words in old records

People in the past used words that people today find hurtful, and some words meant something different then. When John Rolfe wrote "20. and odd Negroes" in 1619, he used the common word of his time for Black people. Laws, newspapers, signs and songs from the past are full of such words. A quotation keeps the words the person actually used, because changing them would change the record. Some words were made to insult a whole people. Those are not repeated. Instead, the account says plainly what the word called people.

Names change too. The same nation can appear under more than one name. The Haudenosaunee, for example, appear in many English records as the Iroquois. Places also change names over time.

Stories that grew up later

Some of the best-known stories about American history took shape long after the events. Historians find where a story first appeared by searching for the oldest record that tells it.

Only two eyewitness accounts of the 1621 harvest meal at Plymouth survive. One is a letter Edward Winslow wrote in December 1621 and printed in London in 1622 in a book called *Mourt's Relation*. The other is William Bradford's history of the colony. Winslow wrote that the governor sent four men out to hunt birds, and that the Wampanoag leader Massasoit, also called Ousamequin, came "with some ninetie men." For three days the English fed them, and the Wampanoag men went out, killed five deer and gave them to the governor and other leaders. The English did not call it a thanksgiving. Historians at Plimoth Patuxet Museums write that Ousamequin's visit was probably a show of strength. The Wampanoag sealed alliances through spoken agreements and an exchange of gifts.

The phrase "the first Thanksgiving" came much later. In 1841 a Boston minister named Alexander Young printed Winslow's letter in a book and added a note: "This was the first Thanksgiving, the harvest festival of New England." Writers in older newspapers already credited the Pilgrims with the holiday in general. The *Salem Gazette* of 28 November 1816 praised "our Pilgrim forefathers, who instituted this religious festival," but it did not mention the 1621 meal.

Another story grew up after the Civil War. A catechism is a set of questions with answers to learn by heart. In 1904 a Texas chapter of the United Daughters of the Confederacy wrote one. It asked, "What was the feeling of the slaves towards their masters?" Its printed answer was, "They were faithful and devoted and were always ready and willing to serve them." Another answer stated that Southerners "believed that each State should regulate her own affairs." The claim that the South fought for states' rights and not for slavery is called the Lost Cause. A record written in 1861 states the reason directly. On 9 January 1861, Mississippi's leaders adopted a statement of their reasons for leaving the Union. It reads, "Our position is thoroughly identified with the institution of slavery."

Questions with no answer

Some questions cannot be answered, because no record of the answer was ever made or none survived. When that happens, a careful historian states that the record is missing and leaves the gap empty instead of guessing.

No surviving record identifies any of the "20. and odd" Africans John Rolfe saw land in 1619. The records also do not settle whether the Virginia colonists treated them as servants, who could earn their freedom after some years, or as slaves for life. Virginia's laws did not yet use the word "slave."

In 1973, Oglala Lakota people and members of the American Indian Movement held the village of Wounded Knee, South Dakota, for 71 days. US marshals and FBI agents surrounded it. Frank Clearwater, a Cherokee man, was shot in the head on 17 April 1973 while he rested in a church inside the village, during a gunfight with federal forces. He died on 25 April. The published accounts do not say who fired the shot.

The past keeps changing

The past itself does not change. What is known about it does. New tests find new facts in old bones, as the horse study did in 2023. Lost letters turn up in attics and archives. People who were left out of the old records, like the potter Dave or the 20 Africans who landed in 1619, are found again when someone looks for them. Each new piece of evidence can confirm an old account, correct it, or show that it was wrong.

The history of the United States is long, and much of it is hard. It includes freedom won and freedom stolen, cities built and nations pushed off their land, inventions, wars, songs and games. All of it happened to real people with real names, when the records kept them. The best way to know it is the way historians do: look at the evidence, ask who made it, and say plainly what it shows.

PART 1

The Land and Its First Peoples

Chapter 1: Exploration and Discovery

Before 1500

The first people to explore this land came from Asia during the last ice age. At that time a strip of dry land joined Siberia to Alaska. Human footprints at White Sands, in New Mexico, show that people were here at least 21,000 years ago, and probably about 23,000 years ago. Over thousands of years their descendants spread across the whole continent, into its deserts, mountains, forests, coasts and plains.

By 1500 hundreds of Native nations lived here, speaking many different languages. Nobody knows how many people lived north of Mexico at that time. Estimates run from about 1 million to about 18 million.

The footprints at White Sands

White Sands National Park in New Mexico holds fossil human footprints. Scientists dated seeds of a water plant found in the layers just above and just below the prints. Tests on the seeds gave ages of about 21,000 and about 23,000 years.

For a long time scientists had thought people first arrived only about 13,500 to 16,000 years ago. When the seed dates came out in 2021, some scientists questioned them. A water plant can take in old carbon from the rock around it, and that can make its seeds test older than they are. So in 2023 a team of scientists tested two other things from the same layers. One of the two lead scientists on the study was Jeff Pigati, a geologist at the US Geological Survey. The team dated pollen from pine trees and other trees that grow cones. They also measured how long grains of quartz sand had been buried out of the sunlight. Tests on the pollen gave about 21,000 to 23,000 years, and tests on the quartz gave at least 21,500 years. Every method put the footprints at about 21,000 to 23,000 years old. The park's own web page on the footprints states that people have lived in North America "for at least 23,000 years."

Trade routes and Pacific voyaging

Native people knew routes across the continent long before any European arrived. Traders carried copper from Lake Superior, shells from the Gulf of Mexico, turquoise from the Southwest and obsidian from the West. Obsidian is a natural glass formed by volcanoes. Archaeologists have found each of these goods hundreds of miles from where it came from. Archaeologists are scientists who dig up and study the things people left behind. Chert is a hard stone that can be shaped into tools. The people of Cahokia, a city on the Mississippi River near present-day St. Louis, controlled a kind called Mill Creek chert. Hoe blades made of it turn up more than 400 miles away.

Polynesian sailors crossed thousands of miles of open Pacific Ocean to reach the Hawaiian Islands. Polynesians are the peoples of the many islands of the central and southern Pacific. The archaeologist Patrick Kirch reviewed 150 years of study and put their first arrival and settlement between about the years 1000 and 1200. Older studies had put it between about the years 300 and 750. Scientists still argue about the exact century.

Leif Erikson

Who: A Norse sailor from Greenland, son of Erik the Red, who led one of the first European voyages to North America.

When and where: About the year 1000, and a Norse camp dated to 1021. L'Anse aux Meadows, Newfoundland, Canada.

Norse sailors from Greenland reached North America about 500 years before Columbus. The Norse are the people often called Vikings. Two Icelandic sagas, the *Saga of the Greenlanders* and the *Saga of Erik the Red*, tell the story. A saga is an old Icelandic story. The sagas say that Leif Erikson, son of Erik the Red, reached a land he called Vinland.

The sagas also describe the people the Norse met there, whom the Norse called Skraelings. According to the sagas, the two groups traded and also fought, and the fights led the Norse to leave. The sagas give the people no other name, and no record shows which Native nation they belonged to.

In 1960 a local man, George Decker, led the Norwegian explorer Helge Ingstad to some old mounds near the village of L'Anse aux Meadows. People there called the place the "old Indian camp." Helge Ingstad and the archaeologist Anne Stine Ingstad dug there for seven seasons, from 1961 to 1968. They found a Norse camp.

In 2021 scientists worked out the exact year when some of the wood at the camp was cut. A storm on the sun in the year 993 left a mark in the rings of trees growing on Earth. The scientists found that mark in pieces of wood cut with metal blades, and counted the rings out to the bark. The scientists concluded that the Norse cut those trees down in 1021. That is 471 years before Columbus reached the Bahamas.

Estimates of how long the Norse stayed run from a few years to about twenty. Another account says the camp was only a place to repair boats. Native people had lived on the same spot long before the Norse came. Five earlier groups had lived there. The oldest of them lived there about 6,000 years ago. A Native people that archaeologists call the Dorset lived there about 300 years before the Norse.

The camp shows that Norse people reached Newfoundland. Which place in the sagas it was is still argued. One answer is Leif's own camp. Another is a second place in the sagas called Hop. Nothing dug up at the site has settled the question.

The 1500s

In the 1500s European sailors mapped the Atlantic and Gulf coasts, and Spanish armies marched far inland. Every place they reached was already the home of a Native nation. Native guides showed several of them the way, including the way to the Grand Canyon. The explorers also took people captive, seized stored food and attacked towns whose people refused to let them in.

In 1565 Spanish colonists built St. Augustine in Florida, inside a Timucua town.

Christopher Columbus

Who: A sea captain from Genoa, in Italy, who sailed west for Spain looking for a sea route to Asia.

When and where: Four voyages from 1492 to 1504, to the Bahamas, the Caribbean islands and the coasts of Central and South America.

Christopher Columbus crossed the Atlantic four times, and he never set foot in what is now the United States. Columbus was born in Genoa in 1451 and sailed for the king and queen of Spain. He believed that by sailing west he could reach Asia.

At about 2 in the morning on October 12, 1492, a lookout named Rodrigo de Triana saw land from the ship *Pinta*. It was an island in the Bahamas. Its people, the Lucayan Taino, called it Guanahani. Columbus named it San Salvador. On that first voyage he took Taino people captive and carried them to Spain to show the king and queen.

In 1494 and 1495 Columbus's soldiers made war on the Taino of Hispaniola, an island in the Caribbean. They fought until the Taino surrendered and agreed to pay a tribute. A tribute is a payment that a conquered people are forced to hand over. Columbus set the rule. In the Cibao, the part of the island with the gold mines, every Taino aged 14 or older had to bring in a hawk's bell full of gold dust every six months. A hawk's bell is a small round bell. A priest named Bartolome de las Casas wrote that the Spaniards cut off the hands of people who failed to pay. How often Spaniards did this is still argued over.

In February 1495 Columbus's men rounded up about 1,500 Taino. Some accounts say 1,600. They shipped about 500 of the strongest to Spain to be sold as slaves, or 550 in some accounts. About 200 of them died on the voyage. Within a few decades most of the Taino on Hispaniola were dead. Spanish soldiers made war on them, Spanish colonists forced them to work, and many died of disease. Counts of how many Taino lived there when Columbus arrived do not agree.

In 1500 the Spanish rulers sent an investigator, Francisco de Bobadilla, to Hispaniola. Bobadilla arrested Columbus and sent him back to Spain in chains. Bobadilla took statements from 23 witnesses and wrote them into a report. It records that Columbus punished a man who stole corn by having his ears and nose cut off. Then Columbus sold the man as a slave. The report was found again in 2005 in an archive, a building that stores old papers, in the Spanish city of Valladolid.

Columbus died in Valladolid on May 20, 1506. He never said in public that he had reached a new continent. What he believed in private is not settled. The name "America" came from another Italian sailor, Amerigo Vespucci. Vespucci wrote in 1503 that the lands across the Atlantic were a new continent. In 1507 a German mapmaker, Martin Waldseemuller, printed a world map that named the new land America.

Sailing the coasts, 1497 to 1542

John Cabot was an Italian, born Giovanni Caboto, who sailed for King Henry VII of England. On June 24, 1497, his small ship, the *Matthew*, reached the coast of North America with a crew of 18 to 20 men. Where he landed is disputed. Some accounts say Newfoundland and others

say Cape Breton Island. Cabot went ashore only once, and he went no farther inland than a crossbow could shoot. King Henry gave him 10 pounds in English money, which was about two years' pay for a laborer.

Juan Ponce de Leon sailed from Puerto Rico in March 1513 with three ships and 65 people. Among them were two free Africans, one of them a man named Juan Garrido, and two enslaved Native people. Ponce de Leon named the land La Florida. His was the first European expedition to Florida that anyone wrote down. A map made in 1502, called the Cantino map, already shows a shape like Florida, so Spanish slave raiders may have reached it first without leaving a record. On the Gulf coast the Calusa people of southwest Florida refused to trade. Calusa warriors in canoes drove his ships away. In the fights that followed, his men captured eight Calusa, four men and four women.

Ponce de Leon came back in 1521 to build a colony on Calusa land. Calusa warriors fought the newcomers, and they wounded him. He died of the wound in Cuba that July. A popular story says that he was searching for a Fountain of Youth. No writing from his own time supports that story, and his contract with the Spanish king says nothing about a fountain.

In 1524 Giovanni da Verrazzano, an Italian sailing for the king of France, followed the Atlantic coast from Florida to what is now New Brunswick, in Canada. In New York Bay he met about 30 canoes of Lenape people. In Narragansett Bay, Wampanoag and Narragansett people visited him. Verrazzano wrote to the French king about the voyage himself. In his letter he described what about twenty of his men did on the peninsula now called Delmarva, south of New York Bay. They found an old woman, a young woman and some children hiding in the grass. He wrote: "We took the boy from the old woman to carry back to France, and we wanted to take the young woman, who was very beautiful and tall, but it was impossible to take her to the sea because of the loud cries she uttered." So his men kidnapped the boy, and they left the young woman behind only because she screamed. The boy was about eight years old. The letter does not give his name or his people, and no known record tells what happened to him in France.

From 1534 to 1542 the Frenchman Jacques Cartier explored the St. Lawrence River in present-day Canada. In the winter of 1535 to 1536, Native people at the town of Stadacona gave his men a medicine made from evergreen trees, which saved them from scurvy. These people are now called the St. Lawrence Iroquoians. Scurvy is a disease caused by a severe lack of vitamin C, which comes from fresh food. It makes people weak, damages their gums and makes them bleed under the skin. In 1536 Cartier kidnapped Donnacona, an Iroquoian chief, along with Donnacona's two sons and seven other people. The French never brought any of them home.

Cabeza de Vaca and Estevanico

Who: Two of the four survivors of a Spanish expedition who crossed the Southwest on foot. Alvar Nunez Cabeza de Vaca was a Spanish member of the expedition. Estevanico was an enslaved African man.

When and where: 1528 to 1539. Florida, Texas, the Southwest and northern Mexico.

Four men out of an army of hundreds walked from the coast of Texas to Mexico City between 1534 and 1536. Two of them were Alvar Nunez Cabeza de Vaca and a man the Spanish called Estevanico, or Esteban.

The army belonged to Panfilo de Narvaez. It left Spain in June 1527 with about 600 men. In April 1528 Narvaez landed near Tampa Bay, in Florida, with 300 men. They took over a town of the Apalachee people. Apalachee warriors attacked them there, at first 200 at once, shooting burning arrows into the houses the Spaniards had taken. Many of the men also fell sick, and many were starving. By September only 242 of them were still alive. By then the survivors had built rafts to try to reach Mexico by sea. In November 1528 a storm washed about 80 of them onto Galveston Island, off the coast of Texas.

Estevanico was born about the year 1500 in Azemmour, in Morocco, in North Africa. Cabeza de Vaca described him as a Black man who spoke Arabic. In 1522 a Spanish nobleman, Andres Dorantes, bought him as a slave. Dorantes and Estevanico were both on the Narvaez expedition, and both lived through it.

On the Texas coast, Native people held the survivors as slaves for years. These people are now called Coahuiltecan. In 1534 the last four escaped: Cabeza de Vaca, Dorantes, Alonso del Castillo Maldonado and Estevanico. They walked west. Along the way they worked as healers among the nations they met. In July 1536 they reached Mexico City. Cabeza de Vaca published an account of the journey in 1542.

After the journey the Spanish viceroy in Mexico, Antonio de Mendoza, bought Estevanico from Dorantes or received him as a gift. A viceroy is the king's governor of a colony. Some evidence suggests that Mendoza freed him.

In 1539 Mendoza sent a friar named Marcos de Niza north to look for seven rich cities that people called Cibola, with Estevanico as his guide. A friar is a member of a Catholic religious order. They left Culiacan, in northern Mexico, on March 7, 1539. Estevanico went ahead of the friar with Native guides from Sonora, in northern Mexico. People of Hawikuh, a Zuni town, killed him there. One Spanish account says he was "shot through with arrows." The Spanish accounts disagree about why he was killed. Coronado reported

> that the people of the town said Estevanico had killed and attacked their women. Pedro de Castaneda, who marched with Coronado and wrote an account of the march in the 1560s, wrote that they killed him because he demanded turquoise and women.
>
> Estevanico is the first person with both African and Arab family roots known to have explored what is now the United States. The first person with African family roots known to explore North America came before him. He was Juan Garrido, who sailed with Ponce de Leon to Florida in 1513.

Armies inland: de Soto and Coronado, 1539 to 1542

Two Spanish armies marched deep into the continent between 1539 and 1542.

Hernando de Soto landed in Florida in May 1539 with 620 men and 220 horses. For three years he marched through the Southeast, and his soldiers took the stored food of the towns they passed through. From October 1539 to March 1540 his army lived in Anhaica, the capital of the Apalachee people, where Tallahassee stands today. There his men ate the Apalachee's stored food. De Soto seized dozens of men, women and children to carry his army's supplies. To get his army through, he took local leaders hostage. One was the leader of the Coosa people, whom de Soto held until the army had passed the Coosa towns. At a town called Hymahi, de Soto's men took all the food. A National Park Service history states that de Soto burned at least one person from the town to death. He did it while questioning people about a town farther on, called Cofitachequi.

On October 18, 1540, de Soto's army reached Mabila, a town most likely in the southern part of present-day Alabama. It was surrounded by a palisade, a wall of tall upright logs. Its leader was a man the Spanish called Tascalusa. A Spanish officer, Baltasar de Gallegos, decided that a leading man of Mabila had not shown him respect. Rodrigo Ranjel, de Soto's secretary, wrote that Gallegos cut off the man's arm "with a slash." Then a battle began. De Soto's men fought for about nine hours and set the town on fire with people still inside. One of the expedition's own record keepers wrote: "We killed them all either with fire or the sword." A National Park Service history gives about 2,000 people of Mabila killed and over 200 Spanish. Reports from the University of Alabama give about 20 Spanish killed and 250 wounded, with thousands of people of Mabila killed. The site of Mabila has never been found.

De Soto died of fever beside the Mississippi River on May 21, 1542. His men sank his body in the river. They did not want the nations they had fought to learn that he could die. The survivors reached Mexico in September 1543.

Francisco Vazquez de Coronado left Compostela, in Mexico, in February 1540. He led about 400 European soldiers, 1,300 to 2,000 Native allies from Mexico and four friars. They were looking for cities of gold. In July 1540, close to starving, they reached the Zuni town of Hawikuh and demanded to be let in. The Zuni had drawn lines of sacred cornmeal on the ground and warned the Spaniards not to cross them. When the Spaniards crossed, the Zuni shot arrows. Coronado's men attacked the town, and the Zuni left it after a short fight.

Coronado sent out scouting parties from there. Pedro de Tovar's men forced their way into a Hopi town whose people had refused to let them in. Hopi guides then led Garcia Lopez de Cardenas and his men to the South Rim of the Grand Canyon. They were the first Europeans to see it.

In the winter of 1540 to 1541 the army camped along the Rio Grande among the Tiguex pueblos. A pueblo is a town of connected houses built of stone or dried mud. Coronado's men took over the pueblo of Coofor, near present-day Bernalillo, New Mexico, and forced its people out. A National Park Service history states that the fighting began after "a Spanish soldier assaulted a Pueblo woman, wife to a Tiguex man." Pedro de Castaneda, who was on the march, wrote down what happened about twenty years later. A Spaniard told the woman's husband to hold his horse, went up into the house, and raped her or tried to rape her. Rape means forcing a person to have sex. Castaneda would not name the man. A later witness, Juan de Contreras, named him in testimony as Juan de Villegas, a soldier on horseback. The husband and the town's leaders came to complain and pointed out the horse. The soldier denied it, and nobody punished him.

In the war that followed, Coronado's soldiers killed hundreds of Tiguex people and burned their villages. At a pueblo called Arenal, the defenders made the sign of peace. Two Spaniards, Pablo de Melgosa and Diego Lopez, answered with the same sign. The defenders put down their weapons, and the Spaniards promised not to punish them. Spanish soldiers then took them to Cardenas's tent. Coronado had ordered Cardenas not to take any of them alive. Cardenas had 200 stakes set up to burn the captives alive. When the soldiers began tying them to the stakes and burning them, about a hundred men in the tent fought back. Spanish soldiers on foot attacked the tent, and horsemen chased down the men who ran. Castaneda wrote that not one of them was left alive, except a few who hid. Those few spread the news that the Spaniards did not keep their promises of peace. Coronado's men also made Tiguex women and children slaves.

In the spring of 1541 a Native guide the Spanish called "the Turk," probably a Wichita or Pawnee man, led the army out onto the Great Plains. He told them of a rich land called Quivira. At Quivira, in present-day central Kansas, Coronado found the grass houses of Wichita towns and no gold. Before he left, Coronado ordered the Turk garroted. That means he was strangled to death with a cord or an iron collar that was tightened around his neck. The army went back to Mexico in 1542.

Spanish officials later charged Coronado and Cardenas with crimes against Native people on the march. Coronado's friends sat on the court in Mexico that heard his case, and they cleared him. Members of the Council of the Indies, the king's council in Spain for the American colonies, found Cardenas guilty.

St. Augustine, 1565

In September 1565 Pedro Menendez de Aviles and about 800 colonists landed on the coast of Florida. The colonists included 26 women and an unknown number of enslaved Africans. They settled at the town of a Timucua chief named Seloy. They used Seloy's council house, the building where the town's leaders met, as their first fort. That same month Menendez's men destroyed Fort Caroline, a French settlement nearby in Timucua country. At Matanzas Inlet they killed more than a hundred Frenchmen who had surrendered.

The Timucua soon wanted the Spaniards gone from their town. In 1566 Timucua warriors shot flaming arrows at the fort. Nine months after they arrived, the Spaniards moved their settlement across the bay to Anastasia Island.

The 1600s

European colonists of the 1600s built small settlements at the edges of the continent. English colonists built James Fort, at Jamestown in Virginia, in 1607, and the Spanish governor Pedro de Peralta founded Santa Fe, in New Mexico, in about 1610. French colonists settled on the St. Lawrence River, in present-day Canada. On Manhattan Island, the homeland of the Lenape people, Dutch colonists built New Amsterdam. The land between these settlements was the home of Native nations.

The explorers of this century traveled by water, in ships and in canoes. Native guides and hosts told several of them where the rivers went.

Champlain and the lake, 1609

Samuel de Champlain, a Frenchman, explored the coast of New England as far south as Cape Cod in 1605 and 1606. In 1608 he founded Quebec, on the St. Lawrence River in present-day Canada. That first winter, 16 of his 25 men died of scurvy.

In June 1609 Champlain went south with two other Frenchmen and a party of Wendat, Algonquin and Montagnais warriors. The Wendat are also called the Huron. They took him to the lake now named for him, between present-day New York and Vermont. In late July, at Ticonderoga, they met a party of Haudenosaunee men. The Haudenosaunee are also called the Iroquois. In the fight that followed, according to the historian Marcel Trudel, Champlain killed two of the Haudenosaunee men.

Henry Hudson

Who: An English sea captain hired by the Dutch East India Company to look for a sea route to Asia.

When and where: 1609 to 1611. The Hudson River in New York, then Hudson Bay in Canada.

In September 1609 Henry Hudson sailed the Dutch ship *Half Moon* up a river in what is now New York. The Lenape called it Muhheakantuck, and the Mohicans called it Mahicannittuk. Today it is called the Hudson River. Hudson was not the first European in its harbor. Verrazzano had been there in 1524. The Lenape and Munsee people lived along the lower river, and the Mohicans lived along the upper river.

Hudson's mate, Robert Juet, kept a journal of the voyage. A mate is a ship's officer just below the captain. Juet's journal records what happened on the river. On September 6 two canoes carrying 26 men attacked the ship's small boat. An arrow hit a sailor named John Colman in the throat and killed him. Two other sailors were hurt. On September 9 the crew seized two Native men who had come aboard. They dressed them in red coats to keep them on the ship. On the morning of September 15 the two men climbed out through a port, a small opening in the ship's side, and swam away. Once the ship was under sail, Juet wrote, "they called to us in scorn."

On the way back down the river, Hudson's crew killed about 10 to 12 Native men. Juet's journal records each of these killings, on October 1 and 2. On October 1 a man in a canoe climbed in through the cabin window. He took a pillow, two shirts and two belts for carrying bullets. The ship's mate shot him in the chest and killed him. Another man swam up and grabbed the side of the ship's small boat. The ship's cook cut off one of the man's hands with a sword, and the man drowned.

On October 2 men in two canoes shot arrows at the ship. The crew fired their guns and killed two or three of them. About a hundred men on a point of land shot at the ship too. Juet fired a small cannon at them and killed two. He fired again at a canoe with nine or ten men in it and killed one, and the crew shot three or four more. Then the ship anchored off the shore that Juet called "Manna-hata." Juet did not write down which nation the dead men belonged to.

On his next voyage Hudson sailed for England in a ship called the *Discovery*. He searched for a northern sea passage in the great bay in Canada now named for him. The crew spent the winter in James Bay. In June 1611 most of the crew mutinied, which means they rose up against their captain. They put Hudson, his teenage son John and seven sick or loyal men into a small open boat and sailed away. No European saw any of them again. A survivor, Abacuk Pricket, named Henry Greene and Robert Juet as the leaders. The men Pricket blamed were already dead and could not answer him, so his story cannot be checked. Only eight of the thirteen mutineers lived to reach England. English courts put some of them on trial, and none was punished.

Marquette and Jolliet

Who: Jacques Marquette, a French Jesuit priest, and Louis Jolliet, a fur trader born near Quebec. The Jesuits are a group of priests within the Catholic Church.
When and where: May to August 1673. From St. Ignace, Michigan, down the Mississippi River to the mouth of the Arkansas River.

In 1673 Jacques Marquette and Louis Jolliet paddled down the Mississippi River far enough to learn that it flows to the Gulf of Mexico and not to the Pacific Ocean. Native people had told them about the river first. Illinois people had described it to Marquette and invited him to visit.

The two men left St. Ignace, in present-day Michigan, on May 17, 1673. They had two canoes and five paddlers of French and Native ancestry. On the river, Michigamea warriors almost attacked them. The town's elders stopped the attack and fed the travelers. Farther south the Quapaw people hosted them for two nights near the mouth of the Arkansas River.

On July 17 they turned back, about 435 miles from the Gulf. They feared the Spanish. They had also been told that the nations farther south were well armed and would attack anyone who got in the way of their trade. On the way home they took a shorter route up

the Illinois River, which their Native hosts told them about. In August they reached the mission of St. Francis Xavier, a church post where priests worked to turn Native people to the Catholic faith, at Green Bay in present-day Wisconsin.

Near Montreal, Jolliet's canoe tipped over in the Lachine Rapids, and his notes were lost. Marquette's account became the main record of the journey. Marquette died of dysentery on May 18, 1675, in present-day Michigan. Dysentery is an infection of the gut that causes severe, bloody diarrhea.

Robert de La Salle

Who: A French fur trader and explorer who claimed the whole Mississippi River valley for the king of France.

When and where: 1682 to 1687. The lower Mississippi River and the coast of Texas.

Robert de La Salle was the first European known to follow the Mississippi River all the way down to the sea. In February 1682 his party came down the Illinois River to the Mississippi, built canoes there, and paddled down to the Gulf of Mexico. On the way, his men built a small fort near present-day Memphis, Tennessee.

On April 9, 1682, at the mouth of the river, La Salle claimed the whole Mississippi River basin for France. A river basin is all the land whose rain drains into one river. He named it Louisiana, after King Louis XIV. Many Native nations lived in that basin. La Salle left every one of them out of his claim. In 1803 French officials sold the claim that began that day to the United States.

In July 1684 La Salle sailed from France with four ships and 300 colonists to build a colony at the river's mouth. The ships sailed past the river's mouth and landed at Matagorda Bay, in Texas, on the land of the Karankawa people. Before they got there, Spanish sea raiders in the Caribbean had seized one ship, the *St. Francois*, with its load of supplies and tools. In Matagorda Bay the *Aimable* ran onto a sandbar and stuck there. The commander of the escort ship, the *Joly*, sailed it back to France. That left only *La Belle*, and it later ran aground in the bay. The colonists built their settlement on Garcitas Creek, near present-day Victoria, Texas.

On March 19, 1687, near present-day Navasota, Texas, one of La Salle's own men, Pierre Duhaut, killed him from an ambush. Jean L'Archeveque had drawn La Salle into talking with him so that Duhaut could strike. Later a third member of the party shot Duhaut. In

1688 Karankawa-speaking people killed the 20 adults still at the colony and took five children captive. The wreck of *La Belle* was found in Matagorda Bay in 1995.

1700 to 1750

English colonists did little exploring beyond the Appalachian Mountains between 1700 and 1750. The journeys into country that no European had mapped came from outside the English colonies. Men of the Russian navy reached the coast of Alaska in 1741. Four Frenchmen, two of them sons of a fur trader, crossed the northern Great Plains in 1742 and 1743 with Mandan guides. They may have been the first Europeans to do so.

Vitus Bering

Who: A Danish-born officer in the Russian navy who led the Russian voyage that reached Alaska in 1741.

When and where: 1728 and 1741. The Bering Strait and the coast of Alaska.

Vitus Bering led the Russian voyage that reached Alaska in 1741. He was born in Horsens, in Denmark, in 1681, and he served as an officer in the navy of Russia. In August 1728 he sailed north through the narrow strip of sea between Asia and North America. It is now called the Bering Strait.

Before the second voyage, Native people in Kamchatka, in eastern Siberia, killed several Russians under Bering's command. Bering sent a group of armed men north to find the killers, with orders not to use force if they could avoid it. The armed men killed several Koryak people in the settlement of Utkolotsk and made the rest slaves. The Russians tortured Koryak people, hurting them on purpose to make them give up the killers. The naturalist on the voyage, Georg Steller, was horrified to see it. A naturalist is a scientist who studies plants and animals. The report of what Steller saw does not say how the Russians tortured them.

In 1741 Bering commanded the ship *St. Peter*. On July 16 his crew sighted Mount Saint Elias on the Alaska coast, and they landed briefly at or near Kayak Island. That coast was Native land. Steller described animals that European scientists had not recorded before, among them a bird now called Steller's jay and a sea animal now called Steller's sea cow.

> Bering's second ship, the *St. Paul*, was under the command of Aleksei Chirikov. On July 15, 1741, Chirikov's crew sighted land in southeast Alaska, the homeland of the Tlingit people. On July 17 he sent an officer, Abram Dementiev, and 10 armed men ashore in a boat to look for a safe place to anchor. After a week they had not come back. Chirikov sent another officer, Saveliev, and a few men in his second, smaller boat. They did not come back either. About 15 men were gone. With no boats left, Chirikov could not search for them or land, and on July 27 he sailed west without them. Nobody knows what happened to them. People living on that shore may have killed them, or they may have drowned in the strong tides along that coast. One study argues that they went to live among the Tlingit.
>
> On the way home, scurvy spread through the crew of the *St. Peter*. The ship was wrecked on an island near Kamchatka, now called Bering Island. Bering died there on December 19, 1741. About 28 of his men also died. At the time, people blamed scurvy for all of these deaths. In 1991 a team of Russian and Danish scientists dug up Bering's remains and studied his teeth and bones. They concluded that his own death was more likely caused by heart failure.

The La Verendrye brothers on the northern Plains, 1742 to 1743

Pierre La Verendrye was a French fur trader in what is now Canada. On April 29, 1742, two of his sons and two other Frenchmen left Fort La Reine, at present-day Portage la Prairie, Manitoba. The son who kept the journal was known by the French title the Chevalier, which means knight. He was most likely Louis-Joseph La Verendrye. They reached the Mandan towns on the upper Missouri River on May 19 and waited there two months. On July 23 they set out west with two Mandan guides.

For months they traveled with Plains nations that the French called the Horse People, the Bow People and the Little Cherry People. Which modern nations these were is not agreed. The Bow People may have been Pawnee, and the Little Cherry People were probably Arikara. The Horse People told them that two years before, a nation the French called the Snake People had destroyed seventeen of their villages. The Snake People had killed the men and the old women and taken the young women to sell. Which nation the Snake People were is not certain.

The brothers may have been the first Europeans to see the Rocky Mountains, probably in what is now Wyoming. Their journal is hard to follow, so nobody knows their route for certain. It lay in French archives until it was found in 1851.

On March 30, 1743, the brothers buried a lead plate at the Little Cherry People's fort beside the Missouri River. The plate is six by eight inches. One side has words in Latin stamped into it that name King Louis XV, their father and the year 1741. On the other side someone scratched the date and the names of the men who placed it. The plate was found at Pierre, South Dakota, in 1913. It is kept in the South Dakota Cultural Heritage Center.

1750 to 1800

American and British diplomats signed a peace treaty in Paris on September 3, 1783. Diplomats are officials who speak for their countries, and a treaty is a written agreement between them. In the treaty the diplomats agreed that the western border of the new United States would be the Mississippi River. Native nations lived on the land between the Appalachian Mountains and that river. The diplomats did not invite them to the talks.

Before and after that treaty, colonists from Virginia and North Carolina pushed through the Appalachians into Kentucky, which the Shawnee used as a hunting ground. In the Pacific, three voyages reached places no European was known to have reached before. Spanish scouts saw San Francisco Bay in 1769. The British navy captain James Cook reached the Hawaiian Islands in 1778. In 1792 an American fur trader, Robert Gray, sailed into the mouth of the Columbia River.

Daniel Boone

Who: A hunter who marked Boone's Trace, later called the Wilderness Road, through the Cumberland Gap into Kentucky.

When and where: 1767 to 1778. The Appalachian Mountains and Kentucky.

Daniel Boone marked the road that colonists used to cross the Appalachian Mountains into Kentucky. The Cumberland Gap is a low pass through the Appalachians, and Native nations had used it long before any colonist. In 1750 a Virginia doctor named Thomas Walker told colonists about it, and he named the Cumberland River. In 1769 Joseph Martin built a fort near the gap for people who claimed land there, and Native men chased Martin and his men out.

Kentucky was the hunting ground of the Shawnee. The Cherokee and the Haudenosaunee also claimed it. In a treaty signed at Fort Stanwix in 1768, Haudenosaunee leaders gave up their claim to Kentucky to the British. The Shawnee did not sign that treaty.

Boone and his brother Squire first crossed into Kentucky in 1767. In May 1769 Boone set out with five other men on a hunting and trapping trip that lasted two years. One of them, John Findley, had told him about the Cumberland Gap. On December 22, 1769, a Shawnee party caught Boone and his brother-in-law, John Stewart. The Shawnee took all their skins and told them to leave and never come back.

In 1773 Boone led his family and about 50 other people toward Kentucky to settle there. On October 9 a small group left the main party to get supplies. It included Boone's oldest son, James, several white men and two enslaved Black men named Charles and Adam. A band of Delaware, Shawnee and Cherokee men attacked them. The historian John Mack Faragher writes that the band had decided "to send a message of their opposition to settlement." The attackers shot James Boone, who was 16 or 17, and Henry Russell through the hips so they could not run. The historians Michael Lofaro and Nancy O'Malley describe what the attackers did next. They tortured the two young men, slashing them with knives and tearing out their fingernails and toenails. Then they killed them. They captured Charles. Adam hid in a pile of driftwood and saw what happened. The families turned back.

In 1774 Virginians fought the Shawnee in a war called Dunmore's War. After the Virginians won a battle at Point Pleasant, Shawnee leaders gave up their claims to Kentucky. Then Richard Henderson, a judge from North Carolina, hired Boone to help start a colony in Kentucky, which Henderson called Transylvania.

In March 1775 Boone invited leaders of Cherokee towns to a meeting at Sycamore Shoals, where Henderson bought the Cherokee claim to Kentucky. Three Cherokee leaders, Attakullakulla, Oconostota and Sewanooko, signed the deed, the paper that handed over the land. It is dated March 17. It covered about 20 million acres. Henderson paid in trade goods, which one estimate values at about 10,000 British pounds. The sale broke the law. A British royal order of 1763 and the laws of Virginia and North Carolina all forbade private buyers to buy Native land. A Cherokee leader named Dragging Canoe refused to agree to the sale. He warned that Kentucky "is bloody ground, and will be dark and difficult to settle."

Boone then led a work party that cut a trail through the Cumberland Gap into central Kentucky. It was later called the Wilderness Road. The work party included Sam, an enslaved Black man, and other enslaved workers. Near present-day Richmond, Kentucky, Native men attacked the camp and killed Sam and his owner. Boone built a settlement called Boonesborough on the Kentucky River.

> On July 14, 1776, three teenage girls were floating in a canoe on the Kentucky River outside Boonesborough. Two Cherokee and three Shawnee warriors, led by the Cherokee Hanging Maw, captured them. The girls were Boone's daughter Jemima and Elizabeth and Frances Callaway. Boone's men caught up two days later, as the warriors were building a fire for breakfast, and freed the girls. In 1778 Shawnee warriors captured Boone himself. He lived among the Shawnee for months before he escaped.

The Pacific: California, Hawaii and the Columbia, 1769 to 1792

In 1769 a Spanish official, Jose de Galvez, sent an expedition north from San Diego to survey California and to claim it for Spain. Native nations already lived there. The commander was Gaspar de Portola. His party of 74 men included soldiers, an engineer, two friars and Christian Native men from Baja California. They walked past Monterey Bay without recognizing it. In early November 1769 Sergeant Jose Francisco Ortega led a group of scouts over Montara Mountain, south of present-day San Francisco. A huge bay blocked their way north. Ortega's scouts were the first Europeans known to see San Francisco Bay. Portola, their commander, was not with the scouting party.

Portola and his officers agreed to turn back on November 11. Members of the expedition reported that most of their meetings with Native people along the way were peaceful, and that people gave the Spaniards directions and food. On November 30 about a dozen Rumsen people brought the starving soldiers pinole, which is flour made from ground seeds.

The British navy captain James Cook reached the Hawaiian Islands on January 18, 1778. He and his crews were the first Europeans known to see them. They landed at Waimea, on the island of Kauai, and on Niihau. While Cook's men were ashore collecting supplies, one of them, John Williamson, shot and killed a Hawaiian man. Cook's crews were also the first Europeans to bring some diseases to the islands.

Cook came back in late November 1778. At Kealakekua Bay, on the island of Hawaii, about 10,000 people and 1,000 canoes met the ships, and the high chief Kalaniopuu welcomed him. On February 13, 1779, Hawaiians took one of the ships' boats. The next day Cook went ashore to kidnap Kalaniopuu and hold him until the boat was returned. Crowds gathered. Cook fired a warning shot, then shot one Hawaiian man dead. In the fight that followed, Hawaiians killed Cook and four marines, the soldiers who served on his ships. The marines were Corporal James Thomas and Privates Theophilus Hinks, Thomas Fatchett and John Allen. Cook's men killed seventeen Hawaiians. The accounts of Cook's last moments contradict each other.

Robert Gray was a sea captain from Rhode Island. In 1787 a group of Boston merchants sent him and another captain, John Kendrick, to the Pacific Northwest. The two were to buy sea otter furs and sell them in China. In 1790 Gray finished the first voyage by an American ship around the world. On his first trip, in August 1788, his men fought the Tillamook people at Tillamook Bay, in Oregon. On August 16 Marcus Lopez, Gray's Black cabin boy and cook from the Cape Verde Islands, saw that a Tillamook man had taken his cutlass, a short curved sword. Lopez chased the man. Armed Tillamook men surrounded Lopez and killed him. Gray named the bay Murderer's Harbor.

In 1792 Gray attacked Native villages along the coast, both before and after he found the Columbia. In April 1792 he ordered his men to destroy Opitsaht, a Nuu-chah-nulth village of about 200 houses on Vancouver Island, in present-day Canada. The village was empty at the time. One of his officers, John Boit, called it "a fine village, the Work of Ages," and wrote that Gray "had let his passions go too far." In May he ordered an attack on another Nuu-chah-nulth village, and his men killed seven people and took their sea otter furs.

On the evening of May 11, 1792, Gray's crew found a safe channel over the sandbars at the mouth of a large river, where Chinook and Clatsop people lived. His ship, the *Columbia Rediviva*, sailed in. Gray named the river the Columbia, after his ship. He was the first navigator known to enter it who was not Native.

Later in 1792, at Grays Harbor in present-day Washington State, Gray fired on a group of Chinook people and killed 20. Back in Clayoquot Sound, near Opitsaht, a war canoe came toward his ship at night, and Gray killed or wounded at least 25 of the men in it. In 2005 Gray's descendants formally apologized for the destruction of Opitsaht.

1800 to 1850

On April 30, 1803, American diplomats in Paris agreed to pay France $15 million for the right to take Louisiana from the Native nations who lived on most of it. Diplomats are officials who speak for their countries. American officials could now take that land by treaty or by war, and no European government could claim it ahead of them. A treaty is a written agreement between nations. French officials controlled only a small part of Louisiana. It covered about 828,000 square miles, most of the land west of the Mississippi River whose rain drains into that river. With it, the land the United States claimed nearly doubled.

Over the next fifty years Army officers, fur trappers and a Navy squadron, a group of warships, crossed and mapped lands where Native nations already lived. Native guides showed several of them the way. Crow people drew a map that showed trappers the way over South Pass. Two men who had run away from Spanish missions, church settlements run by Catholic priests, led a party across the Mojave Desert. An Ojibwe guide led an American to the source of the Mississippi. Some of these explorers killed the people whose land they crossed.

Meriwether Lewis and William Clark

Who: Two Army officers sent by President Thomas Jefferson to cross the Louisiana Purchase to the Pacific Ocean.

When and where: May 1804 to September 1806. From near St. Louis up the Missouri River, over the Rocky Mountains and down the Columbia River to the Pacific coast of Oregon.

Movie: *The Far Horizons* (1955), a film about the expedition.

Meriwether Lewis and William Clark led an Army expedition from near St. Louis, through the new Louisiana Purchase and beyond it, to the Pacific Ocean and back. President Thomas Jefferson gave them written orders. They were to find "the most direct & practicable water communication across this continent for the purpose of commerce." Jefferson wanted a river route that traders could use to cross the continent. Members of Congress voted $2,324 for supplies.

Jefferson also ordered them to tell the Native nations they met that their land now belonged to the United States. They were to say that the president in Washington, whom they called "their great father," now ruled over them. Lewis and Clark carried silver peace medals with Jefferson's face on them. They carried an air rifle to show off American weapons. American officials used the expedition's maps, medals and flags as legal steps to claim each nation's land. They relied on an idea in American law called the doctrine of discovery. Under it, the government whose explorers found a land first held the right to it against every other European government. When American diplomats bought Louisiana, they bought that right from France.

On May 14, 1804, Clark and about 30 men left Camp Dubois, in Illinois, near St. Louis. Lewis joined them at St. Charles, Missouri. In all the party had as many as 45 members, among them York, a man Clark held as a slave. Sergeant Charles Floyd died on August 20, 1804, probably of appendicitis, an infection of a small part of the gut. He was the only member of the party to die on the journey.

On September 25, 1804, near present-day Fort Pierre, South Dakota, Lakota chiefs, among them Black Buffalo, demanded gifts before they would let the boats pass. Lakota warriors took hold of a boat and an oar. Lewis ordered his men to show their guns, and Clark drew his sword. Black Buffalo ordered his warriors back, and nobody was killed. In his journal Clark called the Lakota the "vilest miscreants," meaning the worst villains, and in the same line he used an insulting word for Native people.

The party spent the winter of 1804 to 1805 at Fort Mandan, beside the Mandan and Hidatsa towns in present-day North Dakota. There Lewis and Clark, the expedition's two captains, hired a French-Canadian trader, Toussaint Charbonneau. They also met Sacagawea, a young Shoshone woman he held as his wife. In the spring they went on up the Missouri to the streams where it begins. They crossed the Continental Divide at Lemhi Pass. The Continental Divide is the line of high ground that separates rivers flowing east from rivers flowing west. They crossed the Bitterroot Mountains at Lolo Pass and then went down the Clearwater, Snake and Columbia rivers by canoe. They found no water route across the continent. What they found instead was a trail that Native people used.

They first saw the Pacific on November 7, 1805. On November 24 Clark wrote down every member's choice for a place to spend the winter, including the choices of York and of Sacagawea. Accounts differ about whether this counts as a vote. The party built Fort Clatsop near present-day Astoria, Oregon. Food ran short that winter, and they had too little money to buy enough food from the Native nations nearby.

On the way home the party split up. Lewis took three men: George Drouillard and the brothers Joseph and Reubin Field. On the night of July 26, 1806, the four camped with some Blackfeet men on the Two Medicine River in present-day Montana. At dawn the Blackfeet men took the Americans' guns and tried to drive off their horses. Reubin Field stabbed one of the Blackfeet men to death. Lewis shot another man in the belly. The National Park Service says two or three Blackfeet were killed. Lewis wrote down no names for them. He left a peace medal around the neck of a dead man "that they might be informed who we were." It was the only fight on the expedition in which anyone was killed.

The expedition reached St. Louis on September 23, 1806. The captains had met more than 70 Native nations and drawn about 140 maps. Every man in the party except York received double pay and 320 acres of land.

Sacagawea

Who: A Lemhi Shoshone woman who interpreted for Lewis and Clark while carrying her baby son.

When and where: 1805 to 1806. From Fort Mandan in North Dakota to the Pacific and back.

Sacagawea was the interpreter who spoke for the expedition with her own Shoshone people. An interpreter is a person who puts one language into another. She was born about 1788 near present-day Salmon, Idaho, among the Lemhi Shoshone. Most accounts say she was Shoshone. A Hidatsa account written in 2021, *Our Story of Eagle Woman*, states that she was Hidatsa by birth.

In 1800, when she was about 12, Hidatsa raiders captured her and several other children. The raiders killed four Shoshone men, four women and several boys. She was held at a Hidatsa village in present-day North Dakota. When she was about 13, Toussaint Charbonneau, a French-Canadian trader, took her as his wife. She did not agree to it. Accounts say he either bought her and another Shoshone girl, Otter Woman, from the Hidatsa, or won Sacagawea gambling. Records of the expedition describe Charbonneau as her husband and her owner.

Her son, Jean Baptiste, was born at Fort Mandan on February 11, 1805. Lewis gave her crushed rattlesnake rattle to speed the birth. She carried her son on the whole journey.

In August 1805 the party met a band of Shoshone. Its leader, Cameahwait, turned out to be her brother. Sacagawea interpreted, and the Shoshone traded horses to the party for the crossing of the mountains. She also met a woman who had been taken prisoner at the same time as she was.

She was mainly the expedition's interpreter, not its guide. On the way home she did show the way in country she knew. On July 13, 1806, she told Clark to cross into the valley of the Yellowstone River through the pass now called Bozeman Pass, in Montana. Clark wrote that she "has been of great service to me as a pilot through this Country." In the journals the men called her "the wife of our interpreter" and "the Snake woman." Snake was their name for the Shoshone. They also called her by an insulting word for a Native woman.

A clerk at a fur post on the Missouri River, John Luttig, wrote that "the wife of Charbonneau" died of a fever on December 20, 1812, at about age 25. The post was in present-day South Dakota. Most accounts accept that record. In Shoshone tradition, she lived until 1884 and died on the Wind River Reservation in Wyoming. A reservation is

land the US government set aside for a Native nation. The Hidatsa account also disputes the 1812 record. In 1813 William Clark became the legal guardian of her son and her daughter, Lizette. That meant the law made him responsible for the children.

York

Who: A Black man held as a slave by William Clark, who took him on the Lewis and Clark expedition.

When and where: 1804 to about 1815. The journey to the Pacific, then Kentucky.

York crossed the continent with Lewis and Clark as a slave, and he came home still a slave. He was born into slavery in Caroline County, Virginia. His parents, Old York and Rose, were enslaved by John Clark III. In 1799 William Clark inherited York under his father's will. Before the expedition York married a woman who was enslaved by a different owner, near Louisville, Kentucky.

On the journey York hunted with a gun. Enslaved men were usually not allowed to carry one. On November 24, 1805, Clark wrote down York's choice for the winter camp alongside everyone else's.

After the expedition every other man received double pay and 320 acres of land. York received nothing. He asked Clark for his freedom because of his services on the journey. He also asked to be hired out near his wife in Louisville, or to be sold to someone there. Clark refused, and he wanted York hired out to "a Severe Master." In 1808 Clark wrote that York had "Such a notion about freedom and his emence Services." He meant that York believed his great services on the journey had earned him his freedom. Clark did not agree. In July 1809 Clark whipped York, giving him what Clark called "a Severe trouncing," and had him put in jail.

Clark rented York out to work for other people as a wagon driver in Louisville. The last record of him in that work is from 1815. In 1811 his wife's owner planned to move to Natchez, Mississippi, far to the south, and York probably never saw her again. The National Park Service states that York was freed sometime after 1815. No paper freeing him has been found. Nobody knows for certain when or how he died.

In 2001 President Bill Clinton made York an honorary sergeant in the US Army.

Zebulon Pike

Who: A US Army lieutenant sent to explore the northern and southern edges of the Louisiana Purchase.

When and where: 1805 to 1807. Minnesota, then Colorado, New Mexico and northern Mexico.

Zebulon Pike led two Army expeditions to the edges of the Louisiana Purchase. His commander, General James Wilkinson, sent him out. Pike left St. Louis on August 9, 1805, to find where the Mississippi River begins. On September 21, 1805, at the mouth of the Minnesota River, he bought land from the Dakota people for a future Army fort. He named Cass Lake, in present-day Minnesota, as the river's source, but the true source is a lake farther up. An Ojibwe guide showed it to an American in 1832.

In 1806 Wilkinson sent him west to find where the Arkansas and Red rivers begin, near the Spanish lands of New Mexico and Texas. In November 1806 Pike's men tried to climb the tall peak in present-day Colorado that later took his name. They turned back in snow up to their waists. They had gone almost two days without food.

Pike's party crossed into Spanish land. No one knows whether he got lost or went there on purpose. On February 26, 1807, Spanish soldiers arrested Pike and some of his men. The soldiers took them to Santa Fe and then to Chihuahua, in Mexico. There the Spanish commander, Nemesio Salcedo, questioned Pike and took his papers. Spanish officials released Pike at the Louisiana border on July 1, 1807. Accounts still differ about whether Pike was an explorer or a spy for Wilkinson.

Pike was killed on April 27, 1813, in the War of 1812, during an American attack on the town of York, now Toronto, in Canada. By then he was a general. As British soldiers pulled back, they blew up their store of gunpowder, and the blast killed Pike and 37 other American soldiers.

John Colter

Who: A soldier of the Lewis and Clark expedition who stayed in the mountains to trap.

When and where: 1806 to 1809. Montana and Wyoming.

In the winter of 1807 to 1808 John Colter walked alone through the country that is now Yellowstone National Park. He was the first person of European descent known to see it. He had been a member of the Lewis and Clark expedition. On August 13, 1806, at the

Mandan towns, the captains let him leave early to guide two trappers back up the Missouri River.

In 1807 Colter joined a fur party led by the trader Manuel Lisa. In October 1807 Lisa sent him out alone to find the Crow people and ask them to trade. That winter Colter walked more than 500 miles through the country that is now Yellowstone and Grand Teton national parks. He came back in March or April 1808. Few people believed his reports of hot springs, and they called the place "Colter's Hell."

In 1808 Colter fought beside Flathead and Crow men against the Blackfeet, and he was wounded in the leg. Many retellings blame Lewis's fight of 1806 for the Blackfeet's anger at Americans, and that link is disputed. In 1808 or 1809 he and another trapper, John Potts, were paddling a canoe on the Jefferson River in present-day Montana. Several hundred Blackfeet men ordered them ashore. Colter came ashore, and the Blackfeet took his weapons and stripped him naked. Potts refused to come ashore. Blackfeet men shot and wounded him. He shot one of them, and then they killed him with arrows.

The Blackfeet told Colter to run, and they chased him. He ran about five miles to the Madison River. He killed the one man who caught up with him, using the man's own spear. Then he hid in a beaver lodge and walked for eleven days to a trading fort. All of this comes from Colter's own telling, as other people retold it later.

Colter died of jaundice, an illness that turns the skin and eyes yellow. One record gives the date as May 7, 1812, and another gives November 22, 1813.

The first recorded climb of Pikes Peak, 1820

On July 14, 1820, three men from an Army expedition led by Major Stephen Long reached the top of the mountain now called Pikes Peak. One of them was Edwin James, a 22-year-old naturalist, a scientist who studies plants and animals. It is the first recorded climb to the top. The Ute people call the mountain Tava-kaavi. Their tradition says that Ute ancestors were the first to climb it. Long called the high plains a "Great American Desert."

Trappers and the fur trade, 1822 to 1840

In 1822 two fur traders, William Ashley and Andrew Henry, put an advertisement in a St. Louis newspaper. They wanted one hundred "enterprising young men," meaning bold young men ready for hard work, to go up the Missouri River to its source and work there for one, two or

three years. They paid $200 a year. The men who answered became known as Ashley's Hundred. Jedediah Smith, Jim Bridger and Hugh Glass were among the men who joined Ashley's company.

In late May 1823 Ashley's boats reached the towns of the Arikara people on the Missouri River, in present-day South Dakota, to buy horses. The Arikara were angry after a fight with men of another fur company, and they wanted a trading post of their own. On June 2, 1823, Arikara men attacked Ashley's party. Records give two counts of Ashley's men killed, 12 and 13. In August an Army officer, Henry Leavenworth, led about 230 soldiers against the Arikara towns. About 750 Lakota and Yankton warriors and about 50 trappers went with him. His men fired cannon at the towns. Leavenworth and the Arikara then agreed to a peace, and the Arikara left their towns at night. Men of the Missouri Fur Company then burned one of the towns. No reliable count of the Arikara killed has survived.

From 1825 to 1840 the trappers met every summer at a gathering they called the rendezvous, in the mountains of present-day Wyoming, Utah or Idaho. The word is French for a meeting. There the trappers sold their furs and bought supplies for the next year. Native people came too, and so did the Native wives and children of many trappers.

In 1832 an Ojibwe guide named Ozaawindib led Henry Rowe Schoolcraft to the true source of the Mississippi River. Schoolcraft was an Indian agent, a US official who dealt with Native nations, at Sault Ste. Marie, in Michigan. The source was a lake that the Ojibwe called Elk Lake. Schoolcraft renamed it Lake Itasca. He made up the name from pieces of the Latin words for "truth" and "head."

Hugh Glass

Who: A fur trapper who survived a grizzly bear attack after the men left to watch over him abandoned him.

When and where: 1823. Northwestern South Dakota.

Movie: *The Revenant* (2015), a film based on his story. An earlier film, *Man in the Wilderness* (1971), is based on it too.

Hugh Glass crawled and walked about 200 miles to safety after a grizzly bear tore the flesh from his body. The two men left to care for him had taken his gun and gone. He was born about 1783. In 1823 he joined Ashley's fur company, and he was shot in the leg in the Arikara attack of June 2. A letter he wrote to the parents of John Gardner, a trapper killed that day, still survives.

Late that summer, near the forks of the Grand River in present-day South Dakota, Glass surprised a mother grizzly with two cubs. The bear bit him and slashed him with her claws. Another trapper later said she had "torn the flesh from the lower part of the body, and from the lower limbs," and torn his neck badly. His leg was broken. The cuts on his back were so deep that his ribs showed through.

Andrew Henry, the leader of the party, asked for two men to stay with Glass until he died and then bury him. John Fitzgerald and a man written down as "Bridges" stayed. They dug a grave. Then they left, taking Glass's rifle and knife, and told the others he was dead. Whether "Bridges" was Jim Bridger is still argued. Bridger later denied it.

Glass set his own broken leg and wrapped himself in the bear's hide. He crawled and walked about 200 miles to Fort Kiowa on the Missouri River, and part of the way he floated on a raft down the Cheyenne River. The journey took six weeks. He let maggots eat the dead flesh in his wounds, to keep the wounds from turning to gangrene. Gangrene is the rotting of dead flesh in a living body. Glass later found "Bridges" and forgave him. Fitzgerald had joined the Army, and Glass got his rifle back.

The story was first printed in 1825, in a Philadelphia magazine called *The Port Folio*. A writer named James Hall wrote it, and other accounts dispute parts of it. No diary by Glass tells the story. It comes from other people's later retellings. In early 1833 Arikara warriors killed Glass and two other trappers, Edward Rose and Hilain Menard, on the Yellowstone River.

Jedediah Smith

Who: A fur trapper from New York who led the first party of US citizens known to reach California over land.

When and where: 1823 to 1831. The Rocky Mountains, California and Oregon.

Jedediah Smith led the first party of US citizens known to reach California over land. He was born in New York in 1799 and answered Ashley's advertisement in 1822. In the autumn of 1823, in the Black Hills region, a grizzly bear broke his ribs and took his head in its mouth. It tore off his scalp and one ear. Smith told another trapper, Jim Clyman, how to sew them back on, and Clyman did. Afterward Smith wore his hair long to hide the scar.

In 1824, in the Wind River valley of present-day Wyoming, Crow people drew a map in sand and on a buffalo hide to show Smith's men the way west. With the map, Smith's men crossed South Pass, a crossing of the Rocky Mountains in present-day Wyoming. The Crow already used the pass. A trader named Robert Stuart had crossed it in 1812, but few Americans learned of his crossing. Smith's party made the pass known to Americans.

In August 1826 Smith led 15 men southwest toward California. Mojave people near present-day Needles, California, sheltered them. Two men who had run away from the Spanish missions guided them west across the Mojave Desert. On November 27, 1826, they reached Mission San Gabriel. California then belonged to Mexico. The Mexican governor, Jose Maria Echeandia, arrested Smith as a suspected spy and held him for about two weeks. In 1827 Smith's party became the first US citizens known to cross the Sierra Nevada mountains and the Great Basin desert, going east.

In August 1827 Smith came back with 18 men and two French-Canadian women. As they crossed the Colorado River, Mojave men attacked them. Trappers from Taos, in New Mexico, had fought the Mojave, and the Mojave were set on revenge. They killed ten of Smith's men, among them Silas Gobel, and took the two women captive. Smith's men shot and killed two Mojave men.

On July 11, 1828, on the Umpqua River in present-day Oregon, an Umpqua man took an axe from Smith's camp. Smith and another man tied a cord around the Umpqua man's neck while the rest of the party held their guns ready. On July 14 Umpqua men attacked the camp while Smith and two others were away. They killed 15 of Smith's men. One man, Arthur Black, escaped.

On May 27, 1831, Smith left a wagon train on the Santa Fe Trail to look for water near the Cimarron River, in present-day Kansas. He did not come back. Weeks later his partners learned that Comanche men had killed him. His body was never found.

Jim Bridger

Who: A trapper and guide from Virginia who never learned to read or write.

When and where: 1823 to 1881. Wyoming, Utah and Montana.

Jim Bridger was one of the first two men who were not Native known to reach the Great Salt Lake. He was born in Richmond, Virginia, in 1804. His parents died when he was 13, and he never learned to read or write. In 1823, at 19, he joined Ashley's trappers.

In the fall of 1824 Bridger floated down the Bear River in a bull boat, a boat made of buffalo hide, and reached the Great Salt Lake. A French-Canadian trader, Etienne Provost, reached the lake at about the same time. In October 1824 Shoshone men attacked Provost's party at the Jordan River and killed eight of his men. The Shoshone, the Ute and other nations already lived around the lake.

In 1843 Bridger and his partner Louis Vasquez built Fort Bridger, a trading post on the Oregon Trail in present-day Wyoming. In 1850 Bridger found a crossing of the mountains now called Bridger Pass. He later worked as a scout for the Army. By 1875 he was blind, and he died on July 17, 1881. Whether he was the "Bridges" who left Hugh Glass in 1823 is still argued. Bridger denied it.

Charles Wilkes

Who: A US Navy lieutenant who led a large exploring voyage of six ships paid for by the US government.

When and where: August 1838 to June 1842. The Pacific islands, Antarctica and the Pacific Northwest.

Charles Wilkes commanded the United States Exploring Expedition, a Navy exploring voyage paid for by the US government. W. John Kress, a plant scientist at the Smithsonian Institution, calls it the first American exploring expedition to other parts of the world. Members of Congress approved it in May 1836. Wilkes was only a lieutenant, and he got the command in April 1838 after more senior officers turned it down. On August 18, 1838, he left Virginia with six ships and nearly 350 men. They included naturalists, a mineralogist, who studies rocks, and a scholar of languages. One ship, the *Sea Gull*, went missing off South America in 1839.

On January 16, 1840, two officers on the ship *Peacock* sighted mountain peaks in the far south. The ships followed the coast. In February Wilkes wrote that they had "discovered the Antarctic Continent." His crews charted about 1,500 miles of that coast, which is now called Wilkes Land. French and British ships were exploring the same waters that year.

In the Fiji Islands in 1840, Wilkes's men burned villages and killed Fijians. On July 12 Wilkes had his men burn the villages of Solevu and Tye after people from Solevu took one of his boats. An officer, William Hudson, took a Fijian chief named Vendovi prisoner by first taking his brothers prisoner. Americans blamed Vendovi for killing American sailors in 1834. Vendovi died in the Navy hospital in New York soon after the ships came home in

June 1842. The expedition's surgeons cut off his head, and his skull became part of the first collections of the Smithsonian Institution. In December 2025 his remains were returned to his home district of Rewa, in Fiji, and buried in the chiefs' burial ground at Lomanikoro.

Later in July 1840, off Malolo Island, Lieutenant Joseph Underwood held the son of a village chief hostage while he bargained for food. The young man jumped from the boat, and the Americans fired over his head. Fighting began. Fijians killed Underwood and Wilkes's nephew, Midshipman Wilkes Henry. The Americans killed about ten Fijians that day. Accounts disagree over whether the escape or the shot started the fight.

The next day Wilkes landed about 70 men on Malolo. He ordered them to kill the men, to burn the villages and to "spare only the women and the children." His men burned the villages of Sualib and Arro and killed between 74 and 104 Fijians. In 1841 men from the *Peacock* fought about 700 islanders on Drummond's Island, in the Gilbert Islands, killed twelve and burned two villages.

In 1841 Wilkes's ships mapped Puget Sound, in present-day Washington State, and his men mapped more than 800 miles of Oregon. The *Peacock* was wrecked on the sandbar at the mouth of the Columbia. The expedition came home to New York on June 10, 1842. It had sailed about 87,000 miles and lost two ships and 28 men. It brought back more than 60,000 plant and bird specimens, which helped start the collections of the Smithsonian Institution in Washington. It also brought 254 live plants, which started what became the US Botanic Garden.

Back home, Navy officers tried Wilkes in a court-martial, a trial held by the military. They cleared him of losing the *Peacock* and of mistreating his officers. They found him guilty of illegally punishing sailors in his squadron. His punishments had included flogging, which means beating a man's bare back with a whip. Navies of that time used a whip of nine knotted cords, called a cat-o'-nine-tails, which was made to tear the skin and cause great pain. One charge named flogging round the fleet, a sentence under which a sailor was whipped aboard each ship of the squadron in turn.

John C. Frémont

Who: An Army mapmaker, later known as "the Pathfinder," whose reports and maps guided thousands of travelers west.

When and where: 1842 to 1849. The Oregon Trail, the Great Basin, the Sierra Nevada, California and Oregon.

John C. Frémont led four expeditions to map the West, and on the third one his men killed at least 120 Wintu people in California. He was born in 1813. In 1841 he married Jessie Benton, the daughter of Senator Thomas Hart Benton of Missouri. Benton got the government to pay for Frémont's expeditions. A mountain man, a trapper who lived in the western mountains, named Kit Carson guided him. Frémont and Jessie wrote the report of the first expedition together.

In 1842 Frémont led 25 men up the Platte River to South Pass. In 1843 and 1844 he went on to the Columbia River with almost 40 men and a cannon. Then he turned south and, in winter, crossed the Sierra Nevada into California. He was one of the first Americans to see Lake Tahoe. He showed that no river drains the Great Basin to the sea. The Great Basin is a huge dry region between the Rocky Mountains and the Sierra Nevada. Members of the Senate and of the House each ordered 10,000 copies of his report on this trip. In 1846 members of the Senate had seven maps from his work printed. Thousands of American travelers heading west used them as a guide.

In 1845 Frémont set out again, with an armed party of about 60 men. Officials of the War Department secretly told him to act as a soldier if war with Mexico began. On April 5, 1846, some settlers claimed that Native people were about to attack them. Frémont's party attacked a camp of Wintu people on the Sacramento River, near present-day Redding, California. Most of the people in the camp were women and children, and they were trapped against the river. One of Frémont's men, Thomas Breckenridge, wrote that "the order was given to ask no quarter and to give none." That meant no one would be spared, even people who tried to surrender.

Frémont's men fired their rifles in volleys, then charged with swords and pistols. Men on horseback chased and killed people who ran. Riflemen shot people who were swimming in the river. Breckenridge counted 120 to 150 dead, and another of Frémont's men, Thomas Martin, counted over 175. An eyewitness, William Isaac Tustin, said at least 600 to 700 were killed on land and 200 or more in the water. Kit Carson, who took part, later called it "a perfect butchery." None of Frémont's men was killed or wounded. Nobody was ever charged.

After that, Frémont's men shot Native people on sight. Breckenridge said the men "had orders while in camp or on the move to shoot Indians on sight." On the night of May 9, 1846, Klamath men attacked Frémont's camp and killed two or three of his party. On May

12 Kit Carson led an attack on Dokdokwas, a Klamath village at the mouth of the Williamson River, in present-day Oregon, and killed at least 14 people. The people of Dokdokwas may have had nothing to do with the first attack. Nobody was charged for these killings either. In June 1846 Frémont joined a revolt by American settlers against Mexican rule in California, the start of his part in the war with Mexico.

In the winter of 1848 to 1849 Frémont tried to find a route for a railroad through the San Juan Mountains of Colorado. By December 12, 1848, the party needed ninety minutes to move 300 yards, and the mules had begun to die. In the end ten of the men died. Some of the starving survivors partly ate at least one of the bodies. Ute warriors later killed two of the men, Benjamin Kern and "Old Bill" Williams, when they went back for the party's gear. In 1856 members of the new Republican Party made Frémont their first candidate for president. He died in 1890.

1850 to 1900

Between 1850 and 1900 government teams mapped the West in detail, and other Americans pushed into Alaska and the Arctic. After the Civil War members of Congress paid for four survey teams, groups sent to measure and map the western lands. Native nations lived on the land the surveyors mapped. One survey leader, an Army officer, had written orders to count them and to choose places for Army forts. In 1867 Secretary of State William Seward agreed to buy Alaska from Russia, and in 1885 an Army officer crossed part of its interior.

By 1890 the official in charge of the census wrote that there could "hardly be said to be a frontier line" left between settled and unsettled land. American explorers had already turned toward the North Pole. Two of their voyages ended with most of the men dead.

Jim Beckwourth

Who: A Black fur trapper, born into slavery, who lived with the Crow and found a low pass through the Sierra Nevada.

When and where: 1824 to 1866. The Rocky Mountains, California and Colorado.

Jim Beckwourth found the lowest pass through the Sierra Nevada mountains in California, and it now carries his name. He turned an old Native path over it into a trail and was never paid for the work. He was born into slavery in Frederick County, Virginia,

in 1798 or 1800. His father, Jennings Beckwith, was a white planter who held Beckwourth's mother, a Black woman, as a slave. By law he owned her, and she could not refuse him. His father freed him in papers filed in court in 1824, 1825 and 1826.

In 1824 Beckwourth joined Ashley's fur company. For eight or nine years he lived with a band of Crow people, who named him "Bull's Robe." He married the daughter of a chief and rose from warrior to chief. His own book says he became the Crow's highest war chief. Other accounts suggest his fur company planned his stay so that it could win the Crow people's trade.

Beckwourth found the pass in 1850. At 5,221 feet above sea level, it is the lowest crossing of the Sierra Nevada in California. In 1851 he improved an old Native path over it into a trail that ran down to the town of Marysville. It saved gold seekers and settlers about 150 miles and kept them off steep passes such as Donner Pass.

By Beckwourth's own account, the merchants of Marysville had promised to pay him for the trail. When he came to collect in 1851, two large fires had burned the town, and its leaders were unable to pay him. In 1996 Marysville named its largest park Beckwourth Riverfront Park, to recognize the debt the town still owed him.

In the winter of 1854 to 1855 Beckwourth told the story of his life to a writer, Thomas Bonner. The book came out in 1856. Bonner never paid Beckwourth his half of the money. How much of the book is true is disputed.

In 1864 Colonel John Chivington hired Beckwourth as a scout. On November 29, 1864, Chivington's soldiers attacked a camp of Cheyenne people at Sand Creek, in Colorado. The commander of a nearby Army fort had told the Cheyenne they would be safe there, and the camp was flying an American flag. Chivington's soldiers killed an estimated 70 to 163 Cheyenne. National Park Service counts give about 230 killed, most of them women, children and old people, among the Cheyenne and Arapaho in the camp. Soldiers cut scalps and other parts from the bodies of the dead. After that the Cheyenne refused to trade with Beckwourth.

He died in a Crow village in Montana in 1866. Jim Bridger and a newspaper editor, William Byers, said the Crow poisoned him. Modern accounts name severe high blood pressure as the more likely cause.

The Great Surveys of the West, 1867 to 1879

In 1867 Clarence King, a geologist, a scientist who studies rocks and the earth, began a survey along the 40th parallel, from eastern California to Wyoming. A parallel is an east-west line on a map. In 1872 King's team found a field in Colorado where diamonds had supposedly been found, and showed that the diamond field was a fake.

In 1871 members of Congress gave Ferdinand Hayden $40,000 to survey the Yellowstone country. His party of 32 included the photographer William Henry Jackson and the painter Thomas Moran. The railroad banker Jay Cooke arranged for Moran to go. Cooke wanted to make Yellowstone known to help the Northern Pacific Railroad. Jackson took the first known photographs of Yellowstone's waterfalls. Jackson's photographs, Moran's paintings and the survey's work helped persuade members of Congress to make Yellowstone a public park. President Ulysses S. Grant signed the law on March 1, 1872.

A band of Mountain Shoshone called the Tukudika had lived in the Yellowstone country for thousands of years. In the fall of 1879 the park's superintendent, Philetus Norris, found a camp the Tukudika had recently left. He asked the US Indian agent at Fort Washakie for help. The agent sent a party of Shoshone men, who moved the Tukudika out of their homeland to the Wind River Reservation, in Wyoming. A National Park Service history states that the Tukudika "were forcibly removed to reservations," which means they were made to go whether they wanted to or not.

From 1872 to 1879 Army Lieutenant George Wheeler mapped the land west of the 100th meridian. A meridian is a north-south line on a map, and the 100th meridian runs through the Great Plains. Under his orders, each inch of his maps was to stand for eight miles of land. He was also to "discover the numbers, habits, and disposition of Indians in the section" and to "select sites for future military installations." That meant counting the Native people, learning how they lived and whether they were friendly, and picking places for Army forts.

In 1879 members of Congress ended the Wheeler, King and Powell surveys and moved their work into a new agency, the US Geological Survey. Clarence King was its first director.

Alaska, 1867 to 1885

At 4 in the morning on March 30, 1867, Secretary of State William Seward and a Russian diplomat, Eduard de Stoeckl, signed a treaty. Under it, Seward agreed to pay $7.2 million for Alaska, about 2 cents an acre, for 586,412 square miles, and de Stoeckl agreed for Russia to sell it. Most reactions in the United States were positive. Some opponents called it "Seward's Folly"

or "Seward's Icebox." Seward's own figures counted about 8,000 Native people under Russian rule and about 50,000 more living beyond it. Neither Seward nor the Russian officials asked any of them.

In the spring of 1885 Army Lieutenant Henry Allen set out to cross Alaska with two soldiers, Sergeant Cady Robertson and Private Fred Fickett, and $2,000. They went up the Copper River. At the Native village of Taral a prospector, John Bremner, joined them. A prospector is a person who searches for gold or other minerals. Local Native people showed them how to build and use boats made of animal skins. The men ate rotten meat full of worms. They crossed the Alaska Range by a pass that Allen named Miles Pass and went down the Tanana River and up the Koyukuk, about 1,500 miles in all. Two of the men got scurvy, a disease caused by a severe lack of vitamin C, which comes from fresh food.

John Wesley Powell

Who: A Civil War officer who had lost an arm and who led the first recorded boat journey by white men through the whole Grand Canyon.

When and where: May to August 1869. The Green and Colorado rivers in Wyoming, Utah and Arizona.

Movie: *Ten Who Dared* (1960), a Disney film about the expedition.

John Wesley Powell had only one arm when he led the first recorded boat trip by white men through the whole Grand Canyon. He was born in 1834. At the Battle of Shiloh, in April 1862, he was giving the order to fire when a rifle bullet hit his right arm. He lost the arm below the elbow. The raw nerve endings hurt him for the rest of his life. He went back to the Army and fought at Vicksburg.

On May 24, 1869, Powell and nine other men set out from Green River, in Wyoming Territory, in four wooden boats. At a rapid they named Disaster Falls they wrecked and lost one boat, the *No Name*. They named other places along the way, among them Flaming Gorge and Glen Canyon. One man, Frank Goodman, left the trip in July.

On August 28 three men, Oramel Howland, his brother Seneca Howland and William Dunn, left the river. They were afraid of the rapids ahead, and they climbed out of the canyon. They were never seen again. Shivwits Paiute men later told Powell's interpreter that they had killed the three by mistake. The Shivwits said they had taken them for prospectors who had raped and killed a Shivwits woman. Rape means forcing a person to

have sex. Other accounts say Mormon settlers from Toquerville, Utah, killed them instead. Mormons are members of the Church of Jesus Christ of Latter-day Saints. No one knows for certain.

Powell and five men reached the Mormon settlement of St. Thomas, Nevada, on August 30, 1869. They had traveled almost 930 miles in 98 days. They were the first white men recorded passing through the whole canyon. Paiute people and other Native nations had lived along it long before them.

Powell went down the river a second time in 1871 and 1872. From 1881 to 1894 he led the US Geological Survey.

Toward the North Pole, 1879 to 1898

Twenty of the 33 men on the *Jeannette* died on the voyage, among them its captain, Navy Lieutenant George De Long. In 1879 De Long sailed the ship north through the Bering Strait. James Gordon Bennett Jr., the owner of the *New York Herald* newspaper, paid for the voyage. De Long hoped to find an open sea around the North Pole. Ice trapped the ship for nearly two years and crushed it on June 13, 1881. The men dragged their boats across the ice and then sailed for the Lena River in Siberia. One boat, under Lieutenant Charles Chipp, was lost with all eight men in it. De Long and the men in his boat landed in the river's delta, the low, wet land where a river splits into many channels near the sea. They starved there. His last journal entry, on October 30, 1881, lists the dead and ends "Mr Collins dying." Thirteen men came home. The voyage proved that there is no open sea at the pole.

Only six of the 25 men Army Lieutenant Adolphus Greely took to the far north came home, and Greely ordered one of the others shot. In 1881 Greely took his men to Ellesmere Island, in Canada's far north. They were to record the weather as part of the First International Polar Year, when scientists from several countries studied the far north and far south at the same time. Two of his men, Lieutenant James Lockwood and Sergeant David Brainard, set a new record for the farthest north anyone had reached. Two Greenland Inuit dog drivers, Jens Edward and Thorlip Frederik Christiansen, went with them.

Supply ships failed to reach the party in 1882 and again in 1883. The men spent their last winter at Cape Sabine with about 40 days of food. Private Charles B. Henry stole food again and again. On June 6, 1884, Greely wrote an order: "Private Henry will be shot to-day." The

order warned that Henry was stronger than any two of the other men. Three men, David Brainard, Francis Long and Julius Fredericks, shot him at 2 in the afternoon. On Greely's order, two of their guns held bullets and one held a blank, a cartridge with no bullet in it.

When rescue ships arrived on June 22, 1884, seven men were still alive. One died soon after, so six of the 25 lived to go home. Apart from Henry, the dead died of hunger, cold and drowning. In August 1884 doctors examined the body of one dead officer, Lieutenant Frederick Kislingbury, and found flesh cut from the bones. The survivors said they knew nothing about anyone eating the dead.

Robert Peary was a Navy officer who later led expeditions toward the pole. In 1894 he reached the Cape York meteorite in northern Greenland. A meteorite is a rock that falls to Earth from space. Inuit people had relied on it to make tools. Peary took it. In 1896 Franz Boas, a scientist at the American Museum of Natural History in New York, asked Peary to bring an Inuk, one of the Inuit, to the museum. In 1897 Peary deceived six Inuit into sailing with him to New York. He promised they could go home within a year with tools, weapons and gifts, and he did not keep that promise. The six arrived in September 1897. Staff at the museum kept them in its basement, and 20,000 people paid to look at them.

By November 1 all six had tuberculosis, a lung disease that spreads through the air. Four died in a New York hospital in 1898: Qisuk on February 17, Atangana and Nuktaq that spring, and a girl, Aviaq, on May 24. Qisuk's son, Minik, born about 1890, survived. The museum's scientific staff wanted to keep Qisuk's body for study. Boas had the staff hold a fake burial. They filled a coffin with stones, laid a stuffed shape covered with a cloth on top, and buried it so that Minik would believe his father had been buried. Boas later said the ceremony was meant to comfort the boy. Museum staff sent Qisuk's body to the estate of the museum's building manager, William Wallace, where Wallace had a workshop for cleaning skeletons. There the flesh was stripped from Qisuk's bones. The records do not name who did that work. Museum staff later put the skeleton on display in the museum. Wallace adopted Minik.

Of the two who lived, a young man named Uisaakassak demanded to go home to Greenland. He sailed home on the ship *Windward* in July 1898. Minik stayed in the United States. About 1906 New York newspapers reported that his father's skeleton was on display, and Minik learned it from his classmates. He died in the flu epidemic of 1918. In 1993 a Canadian writer, Kenn Harper, got the remains of Qisuk and the three others returned to Greenland, where they were buried at Qaanaaq.

1898: islands in two oceans

In 1898 President William McKinley, members of Congress and American diplomats took control of islands in the Pacific Ocean and the Caribbean Sea. Members of Congress voted to annex the Republic of Hawaii, which means to take it over as part of the United States. McKinley signed their resolution on July 7, 1898. Hawaii's former ruler, Queen Liliuokalani, protested to Congress. On December 10, 1898, after a war between Spain and the United States, diplomats from the two countries signed a treaty in Paris. Under the treaty, Spanish officials gave up Cuba and handed Puerto Rico, Guam and the Philippines to the United States. American officials agreed to pay Spain $20 million for the Philippines.

1900 to 1950

Many American explorers of the years 1900 to 1950 worked far from home. Some traveled by dog sled toward the North Pole. Pilots flew toward both poles and across the Atlantic Ocean. Teams from Yale University and from a New York museum dug in the mountains of Peru and the Gobi Desert of Mongolia. Two of the explorers' claims are still argued over. One is whether Robert Peary's party reached the North Pole in 1909, and the other is whether Richard Byrd flew over it in 1926. In some of the places these explorers went, local people led the way. Inuit men, women and children joined Peary's last expedition to the North Pole. The Inuit are the Native people of the far north, from Alaska to Greenland. Four Inuit men were in the small party that Peary said reached the pole, and a local man led Hiram Bingham up to Machu Picchu.

> ### Matthew Henson (with Robert Peary)
>
> **Who:** A Black sailor and explorer from Maryland who was Robert Peary's navigator and dog-sled driver on seven Arctic voyages.
>
> **When and where:** 1887 to 1909. Northern Greenland and the Arctic Ocean.
>
> Matthew Henson went with Robert Peary on the 1909 journey that Peary claimed reached the North Pole. Members of Congress thanked Peary in 1911. Most of Henson's honors came after 1937, more than 25 years later. Henson was born on August 8, 1866, in Charles County, Maryland. His parents were sharecroppers, farmers who worked someone else's land for a share of the crop. They had been free before the Civil War. In 1867 the family left southern Maryland to escape attacks by the Ku Klux Klan, a group of white men who used violence to terrorize Black people.

At 12 Henson went to sea as a cabin boy. The ship's captain, a man named Childs, taught him to read and write. In November 1887 Henson was working in a clothing store in Washington, D.C., when he met Robert Peary, a Navy officer. Peary hired him as his helper on a trip to measure and map land in Nicaragua, where people were planning a canal. Their first Arctic trip together was in 1891 and 1892, and they made seven Arctic voyages over nearly 23 years.

Henson traded with the Inuit and learned their language. They called him Mahri-Pahluk. He is remembered as the only member of the expedition who was not Inuit and became skilled at driving and training dog teams the Inuit way. He was also Peary's navigator, the person who worked out where they were and which way to go.

In July 1908 Peary's ship, the *Roosevelt*, left New York. Inuit men, women and children from Cape York, in Greenland, joined the expedition. In February 1909 the sled parties set out across the frozen Arctic Ocean. There were 7 expedition members, 19 Inuit, 140 dogs and 28 sleds. They carried supplies forward in relays. One party hauled loads part of the way and left them, and the next party carried them on. By the end Peary could no longer walk, and he rode on a sled. He sent Henson ahead as a scout.

On April 6, 1909, Peary said that his party had reached the North Pole. The last group was six men: Peary, Henson and four Inuit men named Ootah, Egingwah, Seegloo and Ooqueah. Henson later said that he was the first of the party to reach the spot they believed was the pole.

The claim is disputed. Frederick Cook, who had been the doctor on Peary's trip of 1891 to 1892, said he had reached the pole in 1908, a year before Peary. Members of a National Geographic Society committee backed Peary. In 1989 the British explorer Wally Herbert studied Peary's records for the National Geographic Society. He concluded that the records were unreliable. They showed the party moving faster than seemed possible. Herbert found that the party may have stopped 30 to 60 miles short of the pole.

In 1911 members of Congress voted Peary their formal thanks, and he was promoted to rear admiral, one of the highest ranks in the Navy. Henson published a book in 1912 called *A Negro Explorer at the North Pole*. "Negro" was the common word for a Black person at that time. He became the first African American life member of the Explorers Club, a society of explorers, in 1937, and he received a medal for the Peary expedition in 1944. Presidents Harry Truman and Dwight Eisenhower welcomed him to the White House. He died on March 9, 1955. In 1988 he and his wife were buried again at Arlington National

Cemetery. The National Geographic Society gave him its Hubbard Medal in 2000. In 2021 the International Astronomical Union, the scientists' group that names places in space, named a crater on the Moon after him.

Hiram Bingham

Who: A Yale history teacher, not a trained archaeologist, who made the Inca site of Machu Picchu famous.

When and where: 1911 to 1915. The Andes Mountains of Peru.

In 1911 Hiram Bingham reached Machu Picchu and later made it famous around the world, though people had known the place long before he arrived. He was born in Honolulu in 1875 and taught South American history at Yale University. He later served one day as governor of Connecticut, in 1925, and then as a US senator until 1933. He was not trained as an archaeologist, a scientist who studies the past by digging up what people left behind. In 1911 he led an expedition from Yale to Peru to look for the last capital of the Inca. The Inca ruled an empire in the Andes Mountains before the Spanish arrived.

On July 24, 1911, a local man named Melchor Arteaga led Bingham up to Machu Picchu. The people living in the valley next to it already knew the ruins. Explorers from the Peruvian city of Cusco are said to have reached it in 1901. One of them, Agustin Lizarraga, wrote "A. Lizarraga 1902" in charcoal on a wall there, and Bingham found the writing. A map from 1874 already shows the site. Bingham later wrote about the ruins as if he had found them himself.

Bingham guessed that Machu Picchu was the Incas' last capital, and he called it the "Lost City." The last capital was really Vilcabamba, which Bingham also visited without recognizing it.

Bingham's team dug up about 40,000 objects at Machu Picchu, among them mummies, bones and pottery. They shipped them to Yale under an order from Peru's government. Peruvian officials said the objects had only been lent. Yale and Peruvian officials agreed in 2007 on what to do with them, and Yale officials began sending the objects back in 2012.

Roy Chapman Andrews

Who: A naturalist from Wisconsin who started as a janitor at the American Museum of Natural History and later ran it.

When and where: 1922 to 1928. The Gobi Desert of Mongolia.

In the Gobi Desert in 1923, Roy Chapman Andrews's team found the first nests of dinosaur eggs known to science. Andrews was born in Beloit, Wisconsin, in 1884. He started work at the American Museum of Natural History in New York as a janitor. From 1922 to 1928 he led the museum's expeditions into the Gobi Desert of Mongolia. His teams went by car from Peking, in China, the city now called Beijing. He was looking for the remains of the earliest humans. His teams found none.

They found other fossils instead. Fossils are the remains of living things from long ago, turned to stone or pressed into rock. In 1922 they found the bones of a giant relative of the rhinoceros that had no horn. On July 13, 1923, they found nests full of fossil dinosaur eggs. Scientists first thought the eggs came from a dinosaur called *Protoceratops*. In 1995 scientists showed that they belonged to a meat-eating dinosaur called *Oviraptor*.

In 1928 Chinese officials seized what the expedition had found. They later gave the finds back. In 1934 Andrews became director of the museum.

Richard Byrd

Who: A US Navy pilot who led flights and expeditions to both poles.

When and where: 1926 to 1935. The Arctic and Antarctica.

Movie: *With Byrd at the South Pole* (1930), a documentary film of the trip.

Richard Byrd led the first flight to the South Pole, in 1929. His claim to have flown over the North Pole three years earlier is disputed. Byrd was born in Virginia in 1888 and became a Navy pilot in 1918.

On May 9, 1926, Byrd and the pilot Floyd Bennett flew a three-engine plane, the *Josephine Ford*, toward the North Pole. Members of Congress voted both men the Medal of Honor for the flight. Most researchers who have studied the flight believe the plane could not carry enough fuel to fly as far as Byrd said. In 1958 another pilot, Bernt Balchen, said that Bennett had told him they never reached the pole. Byrd's diary was made public in 1996. It contains navigation readings that were erased. Those readings differ from his official report. The historian Dennis Rawlins concluded that Byrd flew about 80 percent of the way and turned back because of an oil leak. Other researchers defend Byrd's claim.

In Antarctica, Byrd built a base camp called Little America on the Ross Ice Shelf, a huge sheet of ice floating on the sea. On November 28, 1929, Byrd, the pilot Bernt Balchen, the radio operator Harold June and the photographer Ashley McKinley took off for the South Pole. They flew there and back in 18 hours and 41 minutes. To make the plane light enough to climb onto the high ice of the Antarctic Plateau, they threw supplies out.

On his second expedition, in 1934, Byrd spent five months alone in a weather hut called Advance Base. Fumes from a badly vented stove, one that did not let its smoke out properly, gave him carbon monoxide poisoning. Carbon monoxide is a gas with no smell that stops the blood from carrying oxygen. He nearly died. Men from the base camp reached him on their third try. Byrd died in 1957.

Charles Lindbergh

Who: An airmail pilot who made the first solo nonstop flight across the Atlantic Ocean.

When and where: May 20 to 21, 1927. From Garden City, New York, to Paris, France.

In May 1927 Charles Lindbergh, an airmail pilot, became the first person to fly alone and without stopping across the Atlantic Ocean. Workers at Ryan Airlines, a company in San Diego, built his single-engine plane, the *Spirit of St. Louis*.

On May 20, 1927, Lindbergh took off from Roosevelt Field, in Garden City, New York. He landed at Le Bourget airfield outside Paris 33 hours and 30 minutes later, after about 3,600 miles. He won the $25,000 Orteig Prize, which had been offered for the first nonstop flight between New York and Paris.

Two British fliers, John Alcock and Arthur Brown, had made the first nonstop flight across the Atlantic eight years earlier. They flew from St. John's, Newfoundland, to Clifden, Ireland, on June 14 and 15, 1919, in under sixteen hours. Lindbergh was the first to make the crossing alone.

Amelia Earhart

Who: The first woman to fly alone and nonstop across the Atlantic Ocean.

When and where: 1932, Newfoundland to Northern Ireland, and 1937, the central Pacific Ocean.

> Five years after Lindbergh, Amelia Earhart made the same kind of crossing, alone and without stopping, the first woman to do it. She was born on July 24, 1897. In 1928 she crossed the Atlantic by air as a passenger, the first woman to do so. On May 20, 1932, when she was 34, she took off alone from Harbour Grace, in Newfoundland. She flew through strong winds and ice, and her engine had problems. After 14 hours and 56 minutes she landed in a pasture near the city of Derry, in Northern Ireland. Members of Congress voted her the Distinguished Flying Cross, a medal for bravery or great skill in flying.
>
> In 1937 Earhart set out to be the first woman to fly around the world. Her route ran about 29,000 miles, near the equator. The navigator Fred Noonan flew with her. On June 29 they reached Lae, in New Guinea, with about 7,000 miles to go.
>
> On July 2, 1937, they took off for Howland Island, a tiny island in the Pacific. A Coast Guard ship, the *Itasca*, waited there to guide them in by radio. The crew of the *Itasca* heard her clearly, but she could not hear the ship. The ship's radio direction finder could not lock onto her signal to show which way it came from. At 7:58 in the morning she radioed that she could not hear the *Itasca*. Earhart and Noonan were never found. She was declared legally dead on January 5, 1939.

1950 to 2000

After 1950 the places no person had ever seen were the deepest parts of the ocean and space beyond the Earth. On October 4, 1957, Soviet engineers launched Sputnik, the first satellite to circle the Earth. A satellite is an object that travels in a path around a planet. The next year members of Congress passed a law that set up NASA, the US space agency. Soviet and American crews then flew into space, one flight after another. Between 1969 and 1972 twelve American astronauts walked on the Moon.

Three American astronauts died in a fire on the launch pad in 1967. Seven died when the space shuttle *Challenger* broke apart in 1986. A space shuttle was a spacecraft that rode rockets up into space and landed on a runway when it came back. In the ocean, two men reached the deepest point on Earth in 1960, and scientists found living things around hot springs on the sea floor in 1977.

Don Walsh

Who: A US Navy lieutenant who, with the Swiss scientist Jacques Piccard, made the first dive to the deepest point in the ocean.

When and where: January 23, 1960. The Challenger Deep in the Mariana Trench, near Guam in the Pacific Ocean.

On January 23, 1960, Navy Lieutenant Don Walsh and the Swiss ocean scientist Jacques Piccard reached the bottom of the deepest known place in the ocean. It is called the Challenger Deep, and it lies in the Mariana Trench, near the island of Guam in the Pacific. No craft of any kind, with people or without, had been there before.

They went down in the *Trieste*, a deep-diving craft called a bathyscaphe. Piccard's father, Auguste Piccard, had designed it, and it was built in Italy in 1953. The US Navy bought it. The trip down took 4 hours and 47 minutes. Below 30,000 feet, one of the outer window panes cracked, and the craft shook.

At the time they measured the depth as 37,799 feet. The figure was later corrected to 35,814 feet, which is almost seven miles. Newer measurements give between 35,797 and 36,070 feet. The two men stayed on the bottom for twenty minutes, in a cabin that was 45 degrees Fahrenheit.

Walsh and Piccard reported seeing flatfish on the bottom. Scientists now doubt it, because fish are not known to live deeper than about 26,000 to 28,000 feet. Walsh later said they could have been mistaken.

Into space, 1957 to 1972

NASA was set up on July 29, 1958, under a law called the National Aeronautics and Space Act. NASA's staff began work on October 1, 1958. Its full name is the National Aeronautics and Space Administration. On April 12, 1961, a Soviet cosmonaut, Yuri Gagarin, circled the Earth once, the first person to travel into space. Cosmonaut is the Russian word for an astronaut. Three weeks later, on May 5, 1961, Alan Shepard became the first American in space. His flight lasted 15 minutes. It went up into space and came straight back down without circling the Earth.

On May 25, 1961, President John F. Kennedy asked Congress to set the goal, "before this decade is out, of landing a man on the Moon and returning him safely to the Earth." The Moon program was called Apollo. At its peak 400,000 people worked on it, and it cost $25.4 billion.

On February 20, 1962, John Glenn circled the Earth three times in 4 hours and 55 minutes in a capsule called *Friendship 7*. He was the first American to orbit the Earth, which means to travel all the way around it. Two Soviet cosmonauts had orbited before him.

On January 27, 1967, three astronauts died in a fire during a practice countdown on the launch pad in Florida. They were Gus Grissom, Ed White and Roger Chaffee, the crew of Apollo 1. An electric spark set nylon material on fire inside a cabin filled with pure oxygen. The hatch opened inward, and the pressure inside the cabin held it shut. It took workers on the launch pad five minutes to open all three layers of the hatch. The fire melted the men's suits and air hoses. Doctors who examined their bodies found that the main cause of death was carbon monoxide gas from the fire, which had stopped their hearts. All three also had third-degree burns, burns that destroy the skin all the way through. Most of the burns happened after the men had died.

In December 1968 the crew of Apollo 8 became the first people to orbit the Moon. Between December 1968 and December 1972, 24 astronauts flew around the Moon. Six Apollo crews landed on it, and twelve men walked on it. The last landing was Apollo 17, in December 1972. No one has walked on the Moon since.

Katherine Johnson

Who: A Black mathematician from West Virginia who calculated the flight paths of the first American spaceflights.

When and where: From 1953. The Langley laboratory in Hampton, Virginia.

Movie: *Hidden Figures* (2016). The actor Taraji P. Henson plays Johnson.

Katherine Johnson worked out the flight path of the first American spaceflight, in 1961, and checked the numbers for the first American flight around the Earth, in 1962. She was born on August 26, 1918, in White Sulphur Springs, West Virginia. Her county had no public high school for Black students. Her family sent her to one on the campus of West Virginia State College, and she started there at the age of ten. Later she was one of three Black students chosen to be the first to attend the graduate school of West Virginia University.

In June 1953 she was hired at the Langley laboratory, in Hampton, Virginia. The laboratory belonged to NACA, the government agency that came before NASA. Her job title was "computer." At that time a computer was a person who did long calculations by hand. Segregation means keeping people apart by race. Virginia's lawmakers had passed segregation laws, and federal workplaces had segregation rules of their own. Under them,

Johnson and the other Black women computers had to work, eat and use restrooms apart from white workers. The sign on their office read "Colored Computers." "Colored" was a word for Black people used at that time.

Johnson calculated the path and the launch time for Alan Shepard's flight in 1961. For John Glenn's flight in 1962, NASA officials used electronic computers for the first time to plan the orbit. Glenn asked for Johnson by name to check the machines' numbers. He refused to fly until she had checked them. She later worked on the paths that let Apollo spacecraft meet each other in space.

In 2015 President Barack Obama gave her the Presidential Medal of Freedom. Members of Congress awarded her the Congressional Gold Medal in 2019. She died on February 24, 2020, at the age of 101.

Apollo 11 crew

Who: Neil Armstrong, Buzz Aldrin and Michael Collins, the crew of the first spacecraft to land people on the Moon.

When and where: July 16 to 24, 1969. From Florida to the Moon's Sea of Tranquility and back to the Pacific Ocean.

On July 20, 1969, Neil Armstrong and Buzz Aldrin became the first people to land on the Moon. A Saturn V rocket had launched them and Michael Collins from Kennedy Space Center, in Florida, on July 16.

Armstrong and Aldrin flew the lunar module, a small landing craft named *Eagle*, down to a flat plain called the Sea of Tranquility. Collins stayed in orbit around the Moon in the command module, *Columbia*, the part of the spacecraft that would carry all three men home. About six hours after landing, Armstrong stepped out onto the Moon. Aldrin followed him 19 minutes later. An estimated 600 million people, about one in five people on Earth, watched Armstrong's first steps live on television. Another count gives 650 million.

The two men collected 47.5 pounds of rock and soil and spent more than 21 hours on the Moon's surface. The three astronauts splashed down safely in the Pacific Ocean on July 24, 1969.

Apollo 13 crew

Who: Jim Lovell, Jack Swigert and Fred Haise, a Moon-landing crew whose spacecraft was badly damaged by an explosion.

When and where: April 11 to 17, 1970. Between the Earth and the Moon.

Movie: *Apollo 13* (1995), based on Lovell's book about the flight, *Lost Moon*.

The crew of Apollo 13 survived an explosion on the way to the Moon by living in their small landing craft. They were Jim Lovell, the commander, Jack Swigert and Fred Haise. Swigert had taken the place of Ken Mattingly, who had been exposed to German measles, an illness that spreads from person to person.

The spacecraft launched on April 11, 1970. Two days later the crew stirred one of the oxygen tanks, a routine job. Damaged insulation on the wires inside the tank caught fire, and the tank exploded. The oxygen in both of the main spacecraft's tanks escaped into space.

After the explosion, mission controllers cancelled the Moon landing and worked to bring the crew home alive. The three men shut down the main spacecraft to save it for the trip back down through the atmosphere, the layer of air around the Earth. They moved into the small lunar module, *Aquarius*, and lived in it on the way home. It was cold and wet inside, and they ran short of drinking water. The air had to be cleared of carbon dioxide, the gas people breathe out. The crew and the engineers on the ground worked out a way to make the main spacecraft's carbon dioxide filters fit the lunar module.

The crew swung around the Moon and headed home. They splashed down safely in the South Pacific on April 17, 1970. Members of the review board later blamed the way the tank had been tested before the flight, and the Teflon plastic inside it.

Sylvia Earle

Who: A marine biologist from New Jersey who set a deep-diving record and led the first all-woman team to live underwater.

When and where: 1970 to 1992. The Virgin Islands and the waters off Hawaii.

Sylvia Earle holds the women's record for the deepest dive to the sea floor, 1,250 feet down. She was born in New Jersey in 1935 and became a marine biologist, a scientist who studies life in the sea. In 1969 the people running the Tektite project, which let scientists

live in a laboratory under the sea, turned her down. By then she had spent more than 1,000 hours underwater doing research.

In 1970 Earle led the first all-woman team of aquanauts, people who live and work underwater. They lived in a laboratory 50 feet below the surface off the Virgin Islands. In 1979 she put on a hard diving suit that kept the water pressure away from her body. With no line connecting her to the surface, she dived to the sea floor off Oahu, Hawaii, 1,250 feet down. That women's depth record still stands. From 1990 to 1992 she was the first woman to be chief scientist of NOAA, the US government's ocean and weather agency.

Robert Ballard

Who: A Navy oceanographer and sea-floor geologist from Kansas.

When and where: 1977 to 1989. The Pacific floor near the Galapagos Islands and the North Atlantic.

Robert Ballard helped find living things where scientists had expected none, and later he found the wreck of the *Titanic*. He was born in Wichita, Kansas, in 1942. He became an oceanographer, a scientist who studies the ocean, and he worked at the Woods Hole Oceanographic Institution.

In 1977 Ballard was a diver on an expedition that used the submarine *Alvin* on the sea floor near the Galapagos Islands, in the Pacific. Its members found hot springs on the sea floor. Groups of living things surrounded them. They got their energy from chemicals in the water from the springs, not from sunlight. All the scientists on board were geologists, scientists who study rocks and the Earth, because they had been certain there would be no life to study.

In 1982 Ballard asked the Navy to pay for a search for the *Titanic*. He planned to use a new camera robot called *Argo*, which a ship could tow along the sea floor. The Navy's leaders agreed, on one condition. First he had to use *Argo* to look in secret at the wrecks of two Navy nuclear submarines, the *Thresher* and the *Scorpion*. Both had sunk in the 1960s. After that work, in 1985, Ballard and a French team found the wreck of the *Titanic*. In June 1989 he found the wreck of the *Bismarck*, a battleship of Nazi Germany that sank in the North Atlantic in May 1941.

Sally Ride and Mae Jemison

Who: The first American woman in space and the first African American woman in space.
When and where: 1983 and 1992, aboard the space shuttles *Challenger* and *Endeavour*.

In 1983 Sally Ride became the first American woman in space, and in 1992 Mae Jemison became the first African American woman in space. Ride was a physicist from California, a scientist who studies matter and energy. She joined NASA in 1978. On June 18, 1983, she flew on the space shuttle *Challenger*. She was the third woman in space. The first had been Valentina Tereshkova of the Soviet Union, in 1963. At 32 Ride was the youngest American astronaut to fly.

On the flight Ride worked the shuttle's robot arm. Reporters sent more than 500 requests to interview her. Two months later, on August 30, 1983, Guion Bluford became the first African American in space.

Ride later served on the Rogers Commission, which investigated the *Challenger* explosion in 1986, and on the Columbia Accident Investigation Board, which investigated the loss of the shuttle *Columbia* in 2003. She was the only person to serve on both. She died in 2012. Her obituary, the published notice of her death, named Tam O'Shaughnessy as her partner of 27 years. Ride had kept the relationship private while she was alive. She is the first astronaut known to have been LGBTQ, which stands for lesbian, gay, bisexual, transgender or queer.

Mae Jemison was born in Decatur, Alabama, in 1956 and grew up in Chicago. She studied chemical engineering at Stanford University and then became a doctor. From 1983 to 1985 she worked as a doctor in Liberia and Sierra Leone, in West Africa. She went there with the Peace Corps, a US government program that sends volunteers to work in other countries. She joined NASA in 1987. From September 12 to 20, 1992, she flew aboard the space shuttle *Endeavour*.

The Challenger explosion, 1986

On January 28, 1986, the space shuttle *Challenger* broke apart 73 seconds after it lifted off. All seven people on board died. They were the commander, Dick Scobee, the pilot, Michael Smith, and Ellison Onizuka, Judith Resnik, Ronald McNair, Gregory Jarvis and Christa McAuliffe, a schoolteacher. Many schools watched the launch live because a teacher was on board.

The shuttle broke apart because rubber rings, called O-rings, failed in a joint of one of its booster rockets. The rings sealed the joint so that hot gas could not escape. The record cold that morning had made them stiff. Test results going back to 1977 had shown that these seals were flawed. Two engineers at the Morton Thiokol company, Allan McDonald and Roger Boisjoly, had warned against launching in the cold. NASA managers ignored their warnings. Several of the crew are thought to have survived the breakup itself. Someone switched on the emergency air supply of the pilot, Michael Smith. The crew cabin then fell and struck the ocean.

2000 to Today

Since 2000, robot spacecraft steered from Earth have explored Mars and the outer solar system. Rovers, robot vehicles, drive across Mars, and probes, robot spacecraft sent to study faraway places, have flown past Pluto and out beyond the planets. People have lived on the International Space Station, a laboratory that circles the Earth, without a break since November 2, 2000. On Earth, most of the ocean floor has still not been mapped. In April 2026 an international mapping project reported that 28.7 percent had been mapped. That same month four astronauts flew around the Moon, the first people to travel there since 1972.

The loss of Columbia, 2003

On February 1, 2003, the space shuttle *Columbia* broke apart over Texas and Louisiana. It was coming back down through the atmosphere. All seven astronauts on board died. They were the commander, Rick Husband, the pilot, William McCool, and Michael Anderson, Kalpana Chawla, David Brown, Laurel Clark and Ilan Ramon, the first astronaut from Israel.

During the launch, a piece of foam from the shuttle's big fuel tank had broken off and hit the left wing. It damaged the panels that protected the wing from the heat of coming back through the atmosphere. Foam had struck shuttles before, on 65 of the 79 earlier launches that had been photographed. While *Columbia* was in orbit, a team of engineers asked several times for pictures of the wing, taken by military satellites or telescopes. The mission's management team said it had no need for the pictures, and Linda Ham, the mission manager, cancelled the request.

Robots to Mars and beyond

NASA's rover *Curiosity* landed in Gale crater on Mars on August 6, 2012. *Curiosity* was still working in September 2026. The rover *Perseverance* landed on February 18, 2021, in Jezero Crater. The mission's planners chose the crater because an ancient river once flowed into it and left a delta, a fan of mud and sand. *Perseverance* drills rock samples and stores them so that a later mission could bring them to Earth. In July 2024 it found a rock that shows a possible chemical sign of ancient life.

Perseverance carried a helicopter named *Ingenuity*, the first aircraft to fly on another planet. It was built for five flights. It made 72 flights over nearly three years, until its rotor blades broke when it landed on January 18, 2024.

The probe *New Horizons* left Earth on January 19, 2006. On July 14, 2015, it passed 7,800 miles above Pluto, the first spacecraft to visit it. On January 1, 2019, it flew past an object called Arrokoth, about 4 billion miles from the Sun.

Two older probes, *Voyager 1* and *Voyager 2*, were launched in 1977. On August 25, 2012, *Voyager 1* became the first spacecraft to reach interstellar space, the space between the stars. Interstellar space begins beyond the stream of particles that blows out from the Sun. *Voyager 2* followed on November 5, 2018. *Voyager 1* is the most distant object people have ever made. Both Voyagers get their power from plutonium, a radioactive metal that gives off heat. According to a NASA report of April 17, 2026, each loses about 4 watts of power a year. A watt is the unit used to measure electric power. That day NASA engineers switched off one of *Voyager 1*'s instruments, the Low-energy Charged Particles instrument, to save power. Two of its science instruments still work.

The James Webb Space Telescope was launched on December 25, 2021, from French Guiana, in South America. It cost just under $10 billion. It was built to see light from about 180 million years after the universe began, light that left the first galaxies. A galaxy is a huge group of billions of stars.

> ### James Cameron
>
> **Who:** A Canadian film director who dove alone to the deepest point in the ocean.
>
> **When and where:** March 26, 2012. The Challenger Deep in the Mariana Trench, in the western Pacific Ocean.

On March 26, 2012, James Cameron, a film director from Canada, became the first person to dive alone to the Challenger Deep, the deepest point in the ocean. He piloted a small deep-diving craft, the *Deepsea Challenger*, to the bottom alone. The craft was built in Sydney, Australia, with the National Geographic Society.

The trip down took 2 hours and 37 minutes, about twice as fast as the *Trieste* in 1960. The deepest reading on the dive was 35,787 feet. Cameron spent about three hours exploring the bottom, the first person to spend that long there. A problem with the craft's hydraulic system made it hard to use the equipment for collecting samples. The hydraulic system used fluid under pressure to move the equipment.

Cameron's was the second dive with people on board to reach the Challenger Deep, 52 years after Don Walsh and Jacques Piccard. He was the third person to go there, after Walsh and Piccard. The *Deepsea Challenger* was later given to the Woods Hole Oceanographic Institution, where Robert Ballard had worked.

Mapping the sea floor

In an international project called Seabed 2030, people from many countries are working to map the whole floor of the ocean. On April 28, 2026, staff of the International Hydrographic Organization, a group of countries that work together on sea charts, published the project's latest total. The project's leaders reported that 28.7 percent of the ocean floor had been mapped. Almost five million square kilometers, about 1.9 million square miles, had been added in the year before. In June 2025 the project had reported 27.3 percent.

Artemis II crew

Who: Reid Wiseman, Victor Glover and Christina Koch of NASA and Jeremy Hansen of Canada, the first people to travel to the Moon since 1972.

When and where: April 1 to 10, 2026. From Florida around the Moon and back to the Pacific Ocean off San Diego.

In April 2026 four astronauts flew around the Moon, the first people to go there in more than 50 years. They were the commander, Reid Wiseman, the pilot, Victor Glover, and Christina Koch of NASA, and Jeremy Hansen of the Canadian Space Agency. They launched on April 1, 2026. It was the first flight with a crew for NASA's Orion spacecraft and its SLS rocket. SLS stands for Space Launch System. The crew circled around the Moon but did not land.

According to NASA's announcement of April 10, 2026, the crew traveled 252,756 miles from Earth at their farthest point. That broke the record of 248,655 miles set by the crew of Apollo 13 in 1970. A web page of the Smithsonian's National Air and Space Museum states that Koch became the first woman to travel that far from Earth. Glover became the first Black man and Hansen the first Canadian to do so. Koch had already spent 328 days in orbit on the International Space Station, ending in February 2020. It was the longest single spaceflight by a woman up to that time.

Some experts outside NASA objected to flying this mission without a redesigned heat shield. After Orion's test flight without a crew in November 2022, NASA engineers found that its heat shield had worn away in ways they had not expected. The heat shield protects the spacecraft from the heat of coming back through the atmosphere. NASA's leaders kept the same shield for Artemis II and changed the path the spacecraft would take on the way down.

The crew splashed down safely in the Pacific Ocean off San Diego at 5:07 p.m. Pacific time on April 10, 2026, after a trip of nearly ten days.

Chapter 2: Native Nations

Before 1500

Before 1500 many nations lived in the land that is now the United States. A nation is a group of people who govern themselves. Lyle Campbell, a scholar who studies languages, counts in Britannica more than 300 languages spoken in what are now the United States and Canada when Europeans first arrived. He sorts them into 57 families of related languages, and 20 of those families were found only in California. The nations built towns and carried goods hundreds of miles to trade. They made agreements with other nations and fought wars against them.

Nobody knows how many people lived here before 1500. Scholars have used different methods and reached different answers. In 1976 Douglas Ubelaker put the number for the lower 48 states at about 1.85 million. In 1983 Henry Dobyns put it at about 18 million for all of North America north of Mexico. Textbooks published between 1988 and 1990 stated numbers from 1 million to 12 million. No number is settled.

People had lived on this land for thousands of years before any ship came from Europe. At Celilo Falls, on the Columbia River, scientists who dig up and study old camps and tools date the first signs of people to at least 10,000 years ago, and some accounts say 15,000. In those thousands of years, some peoples built cities and later left them.

Cities and kingdoms

Near where St. Louis, Missouri, stands today, people built Cahokia, the largest city north of Mexico. People lived there from about 700 to about 1400. The city was biggest around 1100. Roughly 10,000 to 20,000 people lived in the city then. Some estimates put as many as 50,000 in the country around it. London had about as many people at the same date. Cahokia's people had scattered by about 1350, and by about 1400 nobody lived there. Why they left is still argued. The causes put forward are drought, floods, and running short of the wood and food its people needed. No single cause is settled.

In what is now New Mexico, Ancestral Puebloan people built large stone buildings called great houses in Chaco Canyon. Ancestral Puebloans are the ancestors of today's Pueblo peoples. *Pueblo* is the Spanish word for town. After long droughts, people began leaving Chaco around 1140, and by 1200 most of them had gone. They moved into the Pueblo communities of the Southwest.

The Calusa of southwest Florida built a kingdom without farming. Fish and shellfish fed about 20,000 people. Their capital, Calos, stood on mounds of shell at Mound Key. The Calusa built pens with walls of shell, called watercourts. They kept live fish in the pens. Scientists have dated the watercourts to between 1300 and 1400. The Calusa collected tribute, which means regular payments in goods, from other groups. Those groups lived along the coast from south of Tampa Bay down to the Florida Keys.

Traders carried turquoise, seashells, copper and obsidian hundreds of miles from nation to nation. Obsidian is a black glass formed by volcanoes, and it can be chipped to a sharp edge. Native trails crossed the continent, and later newcomers traveled along them.

The ancestors of the Navajo (Diné) and the Apache moved south toward the Southwest. They came from what is now western Canada and eastern Alaska. Accounts differ about when they arrived. Some date the arrival to the 1200s, and others put it in the 1400s or as late as about 1525.

The Great Law of Peace

Five nations had been fighting one another: the Mohawk, the Oneida, the Onondaga, the Cayuga and the Seneca. Their people accepted an agreement called the Great Law of Peace, or Gayanesshagowa, and formed one confederacy, the Haudenosaunee. A confederacy is a group of nations that keep their own governments but agree to act together on matters they share. The five nations came together under one Grand Council.

According to Haudenosaunee tradition, two men brought the five warring nations together under the Great Law. They were the Peacemaker and Hiawatha. The Haudenosaunee kept the law in memory and recited it aloud. They recorded it on wampum belts instead of on paper. A wampum belt is made of shell beads woven into patterns, and each pattern stands for the terms of an agreement.

Scholars disagree about when the Confederacy began. Barbara Mann and Jerry Fields date the founding to 1142. They base that date on an eclipse of the sun described in the founding tradition. Most other estimates place the founding between the middle 1100s and the late 1400s. Many favor the middle or late 1400s.

Writers for the Library of Congress describe the Haudenosaunee Confederacy as one of the oldest democracies in the world that still exist. In a democracy, the people have a say in how they are governed.

Few records of single persons survive from these centuries.

The 1500s

In the 1500s ships from Europe began to reach these coasts. Spanish expeditions, which were large armed groups traveling into country new to them, marched inland. The Europeans carried diseases, and the diseases spread among the Native nations.

The diseases spread ahead of the Spanish expeditions and behind them. A town could lose many of its people before any European arrived there. The diseases killed large shares of whole communities. Some writers call these deaths the Great Dying.

No one can give a single death toll, because no one knows how many people lived here at the start. Estimates for North America north of Mexico run from about 1 million to about 18 million. A death toll worked out from the low estimate and one worked out from the high estimate differ by millions of people. In 1900, United States census takers, the officials who count the people of the country, counted about 250,000 Native people in the United States. Even the lowest estimate for 1500, about 1 million, is four times that count. Disease killed many of the missing people. Over the four centuries after 1500, wars, killings, and armed men forcing whole nations off their land killed many others.

The entradas

Spanish leaders called their armed expeditions into the north entradas. Hernando de Soto led one across the Southeast from 1539 to 1543. Francisco Vázquez de Coronado led another across the Southwest and the southern Plains from 1540 to 1542. Coronado's force had more than 300 armed Europeans and at least 1,200 Native allies.

De Soto sailed from Havana in May 1539 and landed in Florida with more than 620 men and 220 horses. For four years his men marched through the Southeast. They crossed the lands of the Mississippian chiefdoms. Mississippian is the name now given to the town-building peoples of the Mississippi Valley and the Southeast in these centuries. A chiefdom is a group of towns under a single ruler. De Soto's men attacked the people of the towns on their route and forced people to work for the expedition. At the town of Hymahi, de Soto took all of the town's

food. Later he burned at least one of its people to death while he questioned them about another town, Cofitachequi. His men also carried disease with them. De Soto died of a fever in the spring of 1542. The survivors of his expedition reached Mexico on September 10, 1543.

De Soto's men were the first Europeans to see those chiefdoms, and almost the last. In the decades after de Soto's men attacked their towns, forced their people to work and spread disease among them, the chiefdoms broke apart. Over the century that followed, the survivors regrouped and took in refugees, people who had fled their own towns. They formed the new nations and confederacies of the Southeast.

The Spanish also brought horses back to North America. Horses had lived here long before, but they had died out thousands of years earlier. Christopher Columbus carried horses on his second voyage, in 1493. Spanish colonists brought more to the mainland through the 1500s. Coronado's expedition brought horses in 1540, and Juan de Oñate's colonists brought them to New Mexico in 1598.

Paquiquineo (Don Luís)

Who: A young man from the Chesapeake Bay country who left on a Spanish ship, met the king of Spain, and spent nine years getting home. The records do not say whether he went willingly.

When and where: Left the Chesapeake in 1561. Landed back on the James River in September 1570.

In 1561 a young man named Paquiquineo left the Chesapeake Bay country on a Spanish ship. The Spanish records do not settle whether he went willingly or was taken.

He appeared before King Philip II in Spain. In Mexico City he was baptized, which means he went through the Christian ceremony that makes a person a member of the church. He was given the name of the viceroy there, Don Luís de Velasco. A viceroy governed a Spanish colony for the king.

Paquiquineo spent nine years trying to get back to the Chesapeake. He came back inside a Spanish expedition. In September 1570 he landed on the James River as guide and translator for a small Jesuit mission. A mission was a group of Catholic priests and helpers sent to turn people to Christianity. Jesuits belong to one order, or society, of Catholic priests. Father Juan Bautista de Segura led this one.

In February 1571 Paquiquineo led an attack on the mission, and the attackers killed the missionaries. They spared the altar boy, Alonso de Olmos, a boy who helped the priests at church services.

> In August 1572 Pedro Menéndez de Avilés, the Spanish governor of Florida, sent soldiers to the James River. They captured some of Paquiquineo's people in a fight. The Spanish found several of the captives guilty of killing the missionaries and hanged them from the yardarms of their ship. A yardarm is a crossbeam on a ship's mast. The Spanish records do not give the names of the men they hanged. The Powhatan people returned Alonso de Olmos to the Spanish. The soldiers did not find Paquiquineo. European records after 1572 do not include him, and no story passed down by word of mouth that can be checked describes him.
>
> Spanish officials sent no more missions to the Chesapeake. English colonists landed at Jamestown, in the same country, 36 years after the mission, in 1607.

Acoma, 1598 and 1599

In 1598 Juan de Oñate led Spanish colonists north from Mexico and founded a colony in New Mexico, the country of the Pueblo nations. Acoma Pueblo, the town of the Acoma people, stands on a mesa, a hill with a flat top and steep sides. Before any fighting, Oñate had gathered the Acoma elders for a ceremony in which they promised to obey the king of Spain. The Spanish wrote it down as the "Act of Obedience and Vassalage by the Indians of Acoma." A vassal is a person bound to obey a ruler. From then on the Spanish treated the Acoma as subjects of the king of Spain, bound by Spanish law. Spanish officials later used that paper to argue that their war on Acoma was legal.

In December 1598 Oñate's nephew Juan de Zaldívar came to Acoma with about thirty soldiers. He took some of them up the mesa to demand food. In the Acoma people's own account, as reporters for the Rio Grande Sun newspaper told it in 2019, the soldiers raped an Acoma woman. Rape means forcing a person into sex. The All Pueblo Council of Governors is a council of the leaders of the Pueblo nations. In October 2023 its leaders said in a public statement that the soldiers "had demanded food and supplies, assaulted an Acoma woman, and forced allegiance to the Spanish crown." Forcing allegiance to the Spanish crown means the soldiers made the Acoma promise loyalty to the king of Spain. Then the Acoma killed Zaldívar and eleven to fourteen of his men. Accounts differ on the number.

On December 28 Oñate opened a formal inquiry, an official hearing to find out what had happened. He questioned the survivors of Zaldívar's party. He asked the Franciscan friars with him whether a war against Acoma would be just. Friars are Catholic religious brothers, and the Franciscans are one order of them. The friars answered that he "possessed both the authority and sufficient cause," which meant he had the right to make war and a good enough reason. In

January 1599 Juan de Zaldívar's brother Vicente led about seventy soldiers up the mesa. Over two or three days of fighting, his soldiers killed Acoma men, women and children. They took the town and burned much of it.

Nobody counted the dead. The only detailed written story of the fighting by someone who was there is a long poem published in 1610 by Gaspar Pérez de Villagrá, a captain who rode with the expedition. He wrote it to praise the expedition. Estimates run from about 300 to about 1,500. They include about 300, about 600, 600 to 800, and about 800. Leaders of the All Pueblo Council of Governors use the figure of about 800 Acoma men, women and children today. The National Park Service's figure is about 1,500.

Vicente de Zaldívar's soldiers captured about 500 Acoma men, women and children. One record gives the number put on trial as 507. Oñate tried them at Santo Domingo Pueblo, though some accounts place the trial at San Juan Pueblo. He passed sentence on February 12, 1599. He sentenced men over twenty-five to have one foot cut off and to be forced to work for the Spanish without pay for twenty years. Males from twelve to twenty-five, and females over twelve, got the same twenty years of forced work. He sentenced the old people to be handed over as slaves to the Plains Apache. Oñate's sentence for two Hopi men captured in the fighting was to have their right hands cut off. Then he had them released to carry word of the punishment to their own people.

Oñate declared the Acoma children under twelve innocent. He still ordered them taken from their parents and handed to the friars. On Oñate's order, about seventy girls under twelve were sent south along the road to Mexico, to convents there. Neither the National Park Service's account nor the Pueblo council's statement names the men who took them. A convent is a house where nuns live, women who have promised their lives to the Catholic church. The National Park Service's account states that almost certainly none of the girls ever came home. The Pueblo council's 2023 statement gives sixty children taken to Mexico, and it also states that none returned. According to PBS, some scholars believe the children were later sold as slaves.

Oñate's sentence is in the written record. Whether anyone carried out the cutting of feet is disputed. Acoma people have passed down their own account since 1599: Oñate had the right feet of 24 captive men cut off. The New York Times reported that account in 1998. Two historians who worked for years in these records doubt that the feet were cut off. Marc Simmons first wrote that they were, and he later came to doubt it. John Kessell notes that no record describes a one-footed Acoma man.

Spanish officials charged Oñate with thirty crimes. Accounts date the charges to 1612 or 1613 and the judges' decision to 1614. The judges found him guilty of twelve, among them using too much force against Acoma. They banished him from New Mexico for life, which means they ordered him never to return. They also barred him from Mexico City for four years and fined him 6,000 ducats, a Spanish gold coin. PBS gives the Mexico City term as five years. Oñate had rebuilt a fortune in his family's mines at Zacatecas. Rebecca Carlson, who wrote about his trial in a 2008 university paper, calls the fine unimportant to him. He spent years working to have that decision undone. Accounts differ on whether he was ever pardoned, which means officially forgiven by the king. Carlson writes that he was pardoned in 1623. Other accounts say the proof of a pardon is unclear.

The 1600s

Native nations still held nearly the whole continent through the 1600s. Along the eastern coast, the European settlements were a thin strip. Those settlers needed food and trade from the nations around them, and they stayed only as long as those nations let them. In New Mexico, Spanish colonists had ruled the Pueblo nations by force since 1598. Native leaders chose which newcomers to deal with: the Dutch, the French, the English or the Spanish. They played those newcomers against one another, which means they used each group's rivalry with the others to bargain.

Haudenosaunee leaders made alliances with the newcomers and recorded them on wampum belts. In New England, English colonists fought two wars against coastal nations, the Pequot War of 1636 to 1638 and Metacom's war of 1675 and 1676. In the Southwest in 1680, the people of the Pueblo nations rose together and drove the Spanish off their land. They kept the Spanish out for twelve years.

Tsenacommacah

In eastern Virginia, Wahunsenacawh inherited rule over six tribes. He built them into a group of more than thirty tribes that paid him tribute. His country was called Tsenacommacah. The English called him "the Powhatan." His own title was mamanatowick, or paramount chief. A paramount chief is a chief whom other chiefs answer to. About 15,000 people lived in his country, spread across some 10,000 square miles between the James River and the Potomac. A tribe here means a people with its own leader. Each tribe's leader was called a weroance, and each weroance paid tribute to Wahunsenacawh.

English colonists founded Jamestown inside Tsenacommacah in 1607, on land that Wahunsenacawh ruled.

Wampum diplomacy and the Covenant Chain

Haudenosaunee diplomats, the people who spoke for their nations with other nations, recorded agreements on wampum belts. Speakers kept the words of each agreement in memory, and the pattern of the belt recorded its terms.

The Two Row Wampum, Guswenta, records the Haudenosaunee account of their first agreement with the Dutch. It has two purple rows of beads on a white background. The rows stand for two boats traveling the same river side by side, with neither one steering the other. Haudenosaunee tradition dates the agreement to 1613. A paper document with the same date also exists, and accounts differ about whether it is genuine.

The Haudenosaunee alliance with the English colonies was called the Covenant Chain. A covenant is a serious promise. The oldest surviving record of the Silver Covenant Chain dates from 1677. That year Haudenosaunee leaders and the New York governor, Edmund Andros, made the alliance official at Albany. Silver tarnishes, which means it turns dark over time, so a silver chain has to be polished to stay bright. Haudenosaunee and English leaders "polished" the Covenant Chain again and again. That meant they renewed the alliance at councils, with speeches and wampum.

The coastal wars

In Connecticut, English colonists and their Mohegan and Narragansett allies fought the Pequot from 1636 to 1638. Before dawn on May 26, 1637, an English-led force set fire to the Pequot town at Mystic, which was protected by walls. In under an hour they killed hundreds of people, most of them elders, women and children.

A treaty is a formal written agreement between nations. In the Treaty of Hartford of 1638, the English colonists and their Mohegan and Narragansett allies declared that the Pequot nation no longer existed. They made it illegal to use the name Pequot. Under the treaty, the winners took Pequot survivors for themselves or sold them into slavery. Colonists had already begun selling captives during the war. In July 1637 Captain William Peirce sailed the ship *Desire* out of Boston with seventeen Pequot captives, fifteen of them children. Governor John Winthrop of Massachusetts wrote, "We sent fifteen of the boys and two of the women to Bermuda, by Mr. Pierce." Peirce sold them in the Caribbean. The Mashantucket Pequot Tribal Nation is in Connecticut today.

In 1675, nearly forty years after the Pequot War, Metacom led a coalition of nations against the New England colonies. A coalition is a group that agrees to act together. Metacom was the Wampanoag sachem, and a sachem is the leader of a nation. His coalition fought the colonists from 1675 to 1676. Colonial soldiers and their Native allies killed Native people, and the coalition's fighters killed colonists. About 9,000 people died in all, and estimates put Native deaths at roughly half of all the Native people in New England. For the size of the population, writers for Britannica and other histories call it the bloodiest war in American history.

On October 13, 1675, the men who governed the Massachusetts colony ordered that Native people from the praying towns be taken to Deer Island in Boston Harbor and kept there. The praying towns were villages of Native people who had become Christians. The colonists feared these people would turn against the English and join Metacom. Colonists took the people of Natick to the island first. The National Park Service puts the number held there at about 500 to 1,100, most of them women and children. They had too little food and shelter through a freezing winter. The two accounts of the deaths differ. The National Park Service says that very few of them survived. The Partnership of Historic Bostons, a Boston history group, says that more than half of them died over the winter. Colonists released the survivors in May 1676. An unknown number had been smuggled off the island and sold as slaves in the West Indies or in Tangier, in North Africa. No surviving record names the men who voted for the island prison, and the National Park Service's account does not name the men who sold the captives. Every year, descendants of the nations in the war hold a gathering on Deer Island to remember them.

Inland, from the middle to the late 1600s, Haudenosaunee warriors fought the Beaver Wars against nations to the west and north. They fought for control of the fur trade, the trade in animal furs with Europeans. In 1649 more than 1,000 Seneca and Mohawk warriors attacked the two main towns of the Wendat, also called the Huron. The warriors destroyed the Wendat nation as a single people. Some Wendat survivors fled to Quebec, and others went to the Neutral nation. Haudenosaunee warriors defeated the Neutral in 1651. They absorbed the Erie in 1657, which means the Erie survivors became part of the Haudenosaunee nations. By 1675 they had absorbed the Susquehannock to the south and moved west into the Ohio Valley, the writers of the Canadian Encyclopedia say.

Metacom (King Philip)

Who: Wampanoag sachem, son of Massasoit, who led the coalition war of 1675 and 1676 against the New England colonies. The English called him King Philip.

When and where: Southern New England. Killed at Mount Hope, August 12, 1676.

> Metacom was the son of Massasoit, the Wampanoag leader who had made an arrangement with the Plymouth colonists in 1621. In 1675 Metacom led a coalition of nations to war against the New England colonies.
>
> In early August 1676 the company of the Plymouth captain Benjamin Church captured Metacom's wife and his nine-year-old son.
>
> On August 12, 1676, at Mount Hope, a Native man named Alderman, who was serving with Church's company, shot Metacom dead. Church wrote his own account of what came next. He ordered that "not one of his bones should be buried," because Metacom had left English dead unburied. Church told a Native man he called his "old Indian Executioner" to cut off Metacom's head and to quarter his body, which means to cut it into four pieces. Church gave the head and one of Metacom's hands to Alderman. Alderman showed the hand to colonists who paid him to see it. Plymouth's leaders paid Church's men thirty shillings, a sum in English money, for each enemy they had killed or captured, and they paid the same for Metacom's head. At Plymouth the head was set on a pole. Church's book does not say who put it there. By the account of a later editor of Church's book, it stayed there for more than 24 years.
>
> The leaders of Plymouth Colony asked ministers what to do with Metacom's son. On September 7, 1676, two ministers, Samuel Arnold and John Cotton, wrote that the children of such enemies could be put to death. In March 1677 Cotton wrote in a letter, "Philip's boy goes now to be sold." The boy and his mother were sold into slavery. Cotton's letter does not say who sold them. Most accounts say the two were sent to Bermuda. Others say they were sent to the West Indies.
>
> Colonial leaders sold hundreds of other captives into slavery to pay what the war had cost the colonies. On August 4, 1675, Plymouth's council of war ruled that 112 Native men, women and children held at Plymouth were "to be sold." The council named the colony's treasurer to sell them. Church wrote that these people had surrendered because of promises made to them, and that about 160 of them were "sold, and transported out of the Country."

The Pueblo Revolt

The Pueblo nations along the Rio Grande had lived under Spanish rule since Juan de Oñate founded the New Mexico colony in 1598. In 1675 the Spanish governor, Juan Francisco Treviño, ordered 47 Pueblo religious leaders arrested. The Spanish called their religious

practice sorcery, which means using magic to do harm. Spanish officials sentenced four of the leaders to be hanged. Three were hanged, and the fourth killed himself. Spanish officials whipped the others in public and put them in prison. Pueblo people went to Santa Fe and demanded that the prisoners be freed, and the Spanish let them go. One of the freed leaders was Po'pay.

On August 10, 1680, the people of many separate towns rose against the Spanish on the same day. They spoke Tewa, Tiwa, Towa, Tano, Keres and other languages, and the Zuni and the Hopi also promised to help. Pueblo fighters besieged Santa Fe, which means they surrounded the town and cut it off. They took the town and drove the Spanish out of New Mexico. In the rising they killed 401 settlers and 21 Franciscan friars. The Pueblo fighters let most of the Spanish leave, and the Spanish went south.

The Pueblos governed themselves for the next twelve years. In those years they lived through drought, raids and famine, which is a long shortage of food. Diego de Vargas led Spanish forces back into New Mexico in 1692 to retake it, and Pueblo fighters kept up armed resistance for years after that. Writers of the EBSCO Research Starters history guide call the Pueblo Revolt the most successful uprising by Native people against European rule in North America.

Po'pay (Popé)

Who: A Tewa religious leader from Ohkay Owingeh who organized the 1680 rising across dozens of towns and several languages.

When and where: New Mexico, August 1680.

Po'pay had to get the people of dozens of towns to rise on a single day. The people of those towns did not all speak the same language.

Pueblo accounts say that runners carried knotted cords from town to town. The knots on each cord marked the days left until the rising. Po'pay set the rising for August 11, by one account, or August 13, by another.

On August 9 the Spanish captured two of the runners, Pedro Omtua and Nicolás Catua of Tesuque Pueblo. Spanish officials tortured them to make them explain the knotted cords. Torture means hurting a person on purpose to force them to talk. The Smithsonian's account of the runners does not say how they were hurt. Later the Spanish hanged them. No surviving record names the men who did it. When Po'pay learned that the runners had been caught, he ordered the rising to begin early. It began on August 10, 1680.

> A statue of Po'pay stands in the United States Capitol. It is one of New Mexico's two statues in the Capitol's Statuary Hall collection, which holds statues of two people from each state's history.

When the Spanish left New Mexico in 1680, they left their horses behind. An estimated 1,500 or more horses passed into Native hands at once. Writers for the Smithsonian's National Museum of the American Indian call it the largest single transfer of horses. According to the traditional account, Native people then traded horses west and north along Native trade routes. The horses reached the Ute, the Navajo, the Apache, the Comanche, the Kiowa, the Shoshone and the nations of the northern Plains.

In 2023 a team led by William Taylor published a study in the journal *Science*. Its findings do not fit this account. Lakota, Comanche and Pawnee people were among the study's writers, and other Native partners worked on it too. The team used radiocarbon dating on the remains of horses from Wyoming, Kansas and New Mexico. Radiocarbon dating measures a form of carbon that breaks down at a steady rate. The amount left shows how old a bone is. The horses had been ridden and had eaten corn that people fed them. They had also worn bridles, which are straps around a horse's head used to steer it. They were there by the early 1600s, decades before the revolt. Native oral histories, which are accounts passed down by telling, had said the same thing. The timing is not settled.

By either account, Plains nations had horses by the 1700s.

1700 to 1750

French and British officials both wanted Native allies in the first half of the 1700s. Haudenosaunee leaders bargained with both sides. Native nations also went on making their own agreements with one another.

In these years the Haudenosaunee accepted the Tuscarora as a member nation. South Carolina forces had defeated the Tuscarora, and colonists had taken their land in North Carolina. On the southern Plains, the Comanche built the strongest power in the region on horses and trade.

The printed speeches of the Onondaga speaker Canasatego, from these years, are among the best records of Native diplomacy from that century. Diplomacy means dealing with other nations through talks and agreements.

Neutrality as strategy

On August 4, 1701, about 1,300 delegates from more than thirty nations met at Montreal. Delegates are people sent to speak for a group. There they made peace with the leaders of New France, the French colony in what is now Canada. As part of the same peace, the Haudenosaunee promised to stay neutral. That meant they would fight for neither France nor Britain.

For half a century, Haudenosaunee leaders used their neutrality to bargain with both sides.

The Tuscarora move north

In 1710 more than 400 Swiss and German settlers, led by Baron Christoph von Graffenried, founded the town of New Bern, North Carolina, on Tuscarora land. They pushed the people of the Native town of Chattoka off the spot where the Neuse and Trent rivers meet. Slave raiders were also capturing Tuscarora people to sell them as slaves. The State Library of North Carolina's history of the war does not name the raiders. On September 22, 1711, Tuscarora fighters struck back in attacks they had planned together. The war lasted until 1713. South Carolina colonial forces, with Native allies of their own, defeated the Tuscarora. By that library's count, 1,400 Tuscarora were dead and 1,000 had been captured and enslaved.

About 1,500 Tuscarora survivors then moved north, roughly 500 miles. They asked the Five Nations of the Haudenosaunee to sponsor them, which meant to speak for them and accept them. The Oneida took them in. In 1722 the whole Tuscarora nation became the sixth nation of the Haudenosaunee Confederacy. Since then the Confederacy has had six member nations, and it is also known as the Six Nations.

Comanche power

The Comanche moved onto the southern Plains in the early 1700s and became the most powerful nation there. Comanchería, the country they controlled, later covered about 240,000 square miles.

The Comanche built their power on horses. They bred, trained and traded horses, and they controlled the horse trade from the southern Plains to the northern Plains. In the 1740s they traded bison robes and horses to French traders for guns. The French guns were better than the weapons the Comanche could get from the Spanish. Comanche fighters also raided other peoples. A raid is a quick attack to seize goods, horses or people. Comanche leaders made agreements with other nations as well as fighting them.

Treaty councils

A treaty council was a meeting where Native leaders and colonial officials bargained and made agreements. At these councils, speakers on both sides made speeches and exchanged wampum.

At Lancaster, Pennsylvania, in June and July of 1744, colonial officials paid the Haudenosaunee to give up their claims to the Shenandoah Valley.

> #### Canasatego
>
> **Who:** Onondaga leader and the Haudenosaunee's speaker at treaty councils, whose 1744 speech on union Benjamin Franklin printed.
>
> **When and where:** Lancaster, Pennsylvania, June and July 1744. He gave the union speech on July 4, 1744.
>
> Canasatego spoke for the Haudenosaunee Confederacy at treaty councils with colonial officials.
>
> On July 4, 1744, he closed the council at Lancaster by advising the colonies to unite, as his own nations had done centuries earlier: "We heartily recommend Union and a good Agreement between you our Brethren... you, as well as we, will become the stronger."
>
> Benjamin Franklin printed the minutes of the council, the written record of what was said there, including the speech.

1750 to 1800

After 1750, French and British forces fought their wars on Native land. Then the leaders, soldiers and settlers of a new country, the United States, moved onto that land and fought the nations for it.

British forces beat the French in 1763. An empire is a country that rules other lands and peoples. After 1763, Native nations had no second empire to bargain with against Britain. Then the colonists went to war with Britain in the American Revolution. The Haudenosaunee nations took different sides in that war, and their Confederacy split for the first time in centuries. During the war, in 1778, United States officials signed their first treaty with a Native nation. In 1791 fighters from a confederacy of nations in the Ohio Country destroyed a United States army.

Pontiac and the Line

French and British commanders both needed Native allies in the French and Indian War, which lasted from 1754 to 1763.

In 1763 a loose confederacy of nations from the Great Lakes, the Illinois Country and the Ohio Country rose against the British. Under the Odawa leader Pontiac, their fighters took or besieged British forts across the west. Pontiac lifted his siege of Detroit in October 1763, but the fighting went on until 1766.

At Fort Pitt in 1763, British officers tried to give smallpox to the Native fighters around them. Smallpox is a disease that spreads from person to person and can kill. Delaware, Shawnee and Mingo fighters had besieged the fort, where Pittsburgh stands today, and smallpox had broken out among the British soldiers inside. On June 24, 1763, the fort's commander, Captain Simeon Ecuyer, and the trader William Trent gave two Delaware men, Turtle's Heart and Mamaltee, two blankets and a handkerchief from the fort's smallpox hospital. Trent wrote in his journal, "I hope it will have the desired effect." In July the British commander in North America, General Jeffery Amherst, asked Colonel Henry Bouquet in a letter whether smallpox could be sent among the nations at war. Bouquet answered that he would try to spread it with blankets. A month after the June meeting, Trent saw the two Delaware men again, and they showed no sign of smallpox. A man named Gershom Hicks later said that about 100 Native people died of smallpox between the spring of 1763 and April 1764. The historian Elizabeth Fenn writes that no one can know whether the attempt to spread smallpox worked.

British officials answered the war by drawing a line. They issued the Royal Proclamation on October 7, 1763. A proclamation is an official public announcement of an order. In it they forbade colonists to settle west of the Appalachian Mountains, and they set aside the land beyond for the Native nations. Colonists were angry about the line and crossed it anyway. Writers for Encyclopedia Virginia call the Proclamation a foundation of later treaty law, the set of rules for agreements between governments.

In December 1763 armed settlers from Paxton Township, Pennsylvania, killed the twenty Conestoga people who lived in a small town near Lancaster. The Conestoga were unarmed. On December 14, fifty-seven men came at daybreak and found three men, two women and a boy at home. They shot them, stabbed them and killed them with hatchets. One of the dead was Shehaes, a very old man who had helped make a treaty with William Penn in 1701. They killed him in his bed. The attackers scalped all six, which means they cut away the skin and hair from the top of each head, and burned the huts. Lancaster's officials put the other fourteen Conestoga in the town workhouse to keep them safe. A workhouse was a building where poor

people were made to work, and Franklin called this one "a strong Building." On December 27 about fifty men broke down the workhouse door and killed all fourteen with guns and hatchets, children a year old among them. The Paxton men claimed the Conestoga had hidden enemy spies. The historian Michael Goode writes that the charge was made up. British soldiers stationed nearby did nothing to stop the killings, and no one was ever put on trial for them. Benjamin Franklin wrote down the names of the dead in 1764.

The Revolution splits the Haudenosaunee

Under the Great Law, the Five Nations, and then the Six, had stayed united for centuries. In the American Revolution they split. The Oneida and the Tuscarora sided with the Americans. The Mohawk, the Seneca, the Cayuga and the Onondaga fought with the British. Many of them fought under the Mohawk leader Joseph Brant, whose own name was Thayendanegea. At the Battle of Oriskany, on August 6, 1777, Haudenosaunee men fought on both sides.

In 1779 George Washington ordered an expedition into Seneca and Cayuga country. In his written orders, Washington directed "the total destruction and devastation of their settlements." From July 31 to October 15, General John Sullivan's soldiers burned more than forty Seneca and Cayuga towns and the crops in their fields. Thousands of people fled to the British at Fort Niagara. That winter many of them starved or froze to death there.

In 1790 Seneca chiefs spoke to Washington directly. "When your army entered the country of the Six Nations, we called you the Town-destroyer," they said, "and to this day, when that name is heard, our women look behind them and turn pale." The name was older than the burning of their towns. Washington had been given the name Conotocaurius, Town Destroyer, in 1753, and his great-grandfather had been given it before him.

The treaty system begins

On September 17, 1778, at Fort Pitt, United States officials signed their country's first treaty with a Native nation. The Lenape leaders White Eyes, John Kill Buck Jr. and Pipe signed for their nation. The treaty identifies the Lenape as the Delaware. In the treaty, the American officials recognized Lenape sovereignty, which means the right of a nation to govern itself. They also asked the Lenape to let American troops cross their land safely. The negotiators raised the idea of a Native fourteenth state, which would join the thirteen and send its own representatives to Congress. No one in Congress ever acted on that idea.

In all, United States officials and Native leaders made 374 treaties that were formally approved, or ratified. The last of them date from the 1860s. The National Archives holds all 374, and its archivists, the people who keep its records, have put every one online. Each of the 374 is an agreement between the United States and a Native nation.

The Northwest Confederacy

North of the Ohio River, the nations built a confederacy to defend their country. Its leaders included Little Turtle of the Miami, Blue Jacket of the Shawnee and Buckongahelas of the Lenape.

On November 4, 1791, about a thousand confederacy fighters fought the army of General Arthur St. Clair. About 930 of his soldiers began the fight. The confederacy's fighters destroyed his army. Counts of the soldiers they killed run from more than 630 to more than 650. Counts of the wounded run from 264 to more than 270. The casualty rate, which counts the killed and the wounded together, was about 97 percent of the soldiers who fought. No battle in the history of the U.S. Army has had a higher rate. Native casualties were roughly 100. St. Clair's defeat is still the largest defeat Native forces have ever given a United States army, larger than the Battle of the Little Bighorn, fought 85 years later. After the defeat, members of Congress held the first investigation by Congress in the country's history.

In 1794 Anthony Wayne led a legion, an army unit of 3,300 men, against the confederacy. On August 20, 1794, at Fallen Timbers, near where Toledo, Ohio, stands today, Wayne's legion defeated the confederacy. At Greenville, on August 3, 1795, after that defeat, the confederacy's leaders signed a treaty with Wayne, who signed for the United States. They had lost the war, and in the treaty they signed away most of Ohio and part of Indiana to the United States.

> #### Little Turtle (Mishikinaakwa)
>
> **Who:** Miami war leader who co-led the confederacy that destroyed St. Clair's army in 1791, then decided the war could not be won and argued for peace.
>
> **When and where:** The Wabash and Maumee country, in present-day Indiana and Ohio, in the 1780s and 1790s.
>
> Little Turtle was one of the leaders of the confederacy that beat St. Clair on November 4, 1791.
>
> Three years later the same confederacy lost at Fallen Timbers. Little Turtle decided that the war could not be won. On August 3, 1795, he signed the Treaty of Greenville, in which the defeated confederacy's leaders signed away most of Ohio to the United States. He

> spent his last years arguing against more war with the United States.

1800 to 1850

In the first half of the 1800s, Native leaders east of the Mississippi River tried several ways to keep their nations' land. North of the Ohio River, people from many nations joined a confederacy, a union of nations that agree to act together, and fought American armies. In the Southeast, Cherokee leaders wrote a constitution, a written plan for their government and its basic laws, and took their fight to court. In Florida, Seminole fighters went to war against removal.

Two Shawnee brothers, Tecumseh and Tenskwatawa, built the northern confederacy around one idea. Tecumseh said that the land belonged to all the nations together, so no single nation could sell any part of it. In 1811 soldiers under the American commander William Henry Harrison burned the confederacy's center. American soldiers killed Tecumseh in battle in 1813.

The Cherokee changed their nation fast in the eleven years from 1821 to 1832. In 1821 Sequoyah showed a way to write the Cherokee language. In 1827 Cherokee leaders approved their constitution, with three branches of government, and in 1828 they began printing a newspaper. In 1832 Chief Justice John Marshall, the head of the Supreme Court of the United States, wrote the court's ruling in the Cherokee Nation's favor.

In 1830 members of Congress passed the Indian Removal Act. Under it, United States soldiers forced the nations of the Southeast out of their homes and moved them west. In the Cherokee removal alone, soldiers held about 16,000 people in stockades, pens fenced with upright logs, and more than 4,000 of them died of cold, hunger and disease. In the West, the people of those nations built their governments again.

Tecumseh and Tenskwatawa

Around 1805 a Shawnee man named Tenskwatawa began preaching that Native people should return to Native ways of living. His brother Tecumseh took the movement to other nations and asked them to join it. In 1808 the brothers built a town on the Wabash River as the center of a confederacy of many nations. The town was called Prophetstown. Tenskwatawa was known as the Prophet.

William Henry Harrison, an American governor, was buying Native land through treaties. A treaty is a written agreement between nations. In 1809 Native leaders signed the Treaty of Fort Wayne with him and sold him land. Tecumseh said those leaders had no right to sell land that all the nations held together. In August 1810 Tecumseh met Harrison at Vincennes and told him that the land belonged to all the nations in common, meaning together. "No part has a right to sell, even to each other, much less to strangers," Tecumseh said. He called the latest sale "bad," because "it was made by a part only." By that argument, every sale made by one nation alone counted for nothing.

On November 7, 1811, while Tecumseh was away asking more nations to join the confederacy, Harrison marched about a thousand men to Prophetstown and fought the people there. The fight became known as the Battle of Tippecanoe. On the next day, November 8, Harrison burned the town.

Fighters from the confederacy fought on beside the British in the War of 1812. On October 5, 1813, they fought the Battle of the Thames at Moraviantown, in the British colony of Upper Canada. Their British ally, Major General Henry Procter, left the battlefield in the middle of the fight. British army officers later put Procter on trial for his failures in that campaign. American soldiers killed Tecumseh in the battle. After his death the confederacy broke apart.

Tecumseh

Who: Shawnee leader who went from nation to nation arguing that Native land belonged to all the nations together, so no single nation could sell it.

When and where: the Wabash River country and the South, 1805 to 1813. Killed in battle at the Thames, October 5, 1813.

Movie: *We Shall Remain: Tecumseh's Vision* (PBS, 2009), a documentary about him and his brother.

Tecumseh traveled to other nations to ask them to join the confederacy. In October 1811 he arrived at the yearly great council of the Creek Nation at Tuckabatchee, where more than 5,000 Creek people had gathered. The Creek leader Big Warrior refused to join him, because he was afraid of losing the support of the United States.

Tecumseh's argument was that no single nation could sell land that belonged to all of them. In 1810 he told William Henry Harrison that the land "never was divided, but belongs to all for the use of each." He added, "Any sale not made by all is not valid." Not valid means it does not count.

Enough nations joined him to make Prophetstown the center of a confederacy. In 1811 Harrison burned the town while Tecumseh was away. Two years later American soldiers killed Tecumseh in Upper Canada, where he was fighting beside the British, and his confederacy broke apart.

The Cherokee renaissance

In 1821 a Cherokee man named Sequoyah showed a syllabary he had made. A syllabary is a set of written characters in which each character stands for a whole syllable, not a single sound. Sequoyah's had 86 characters. Within a few years most Cherokee people could read and write it. Writers at the website History.com state that by the 1830s a larger share of Cherokee people could read than of the white settlers around them.

Cherokee leaders set up a capital at New Echota in 1825. In 1827 they approved a written constitution. They modeled it on the United States Constitution, with three branches of government. Officials of the state of Georgia answered by declaring the Cherokee government abolished, which means ended by law.

In 1828 the Cherokee began printing the *Cherokee Phoenix*, the first Native American newspaper. They printed it in Cherokee and in English.

Sequoyah

Who: Cherokee silversmith who could not read or write any language, and made a way to write his own. He is the only person in recorded history known to have created a writing system alone, without first being able to read and write another language.

When and where: born in Taskigi, Tennessee, about 1770. First showed his syllabary in 1821. Died 1843 in Mexico.

Sequoyah could not read or write English or any other language. He worked on the problem for about twelve years.

By 1821 he had made 86 characters, one for each syllable in spoken Cherokee. Within a few years most of the Cherokee Nation was reading and writing them.

Sequoyah's birth year is not certain. The years given for it run from 1770 to 1778. The Library of Congress lists it as 1770 with a question mark, which means the year is not certain. He died in 1843, in Mexico.

Removal

President Andrew Jackson signed the Indian Removal Act into law on May 28, 1830. Under it, the president could give Native nations land west of the Mississippi River in exchange for their land in the East.

Cherokee leaders took their fight with Georgia to the courts. Georgia's lawmakers had made it a crime for a white person to live in the Cherokee Nation after March 1, 1831, without a license from the state. Samuel Worcester was a minister from Vermont who translated parts of the Bible into Cherokee. He and another missionary, Elizur Butler, decided to challenge the law, and they would not leave. Missionaries are people sent to spread their religion. On July 7, 1831, Georgia guards arrested Worcester, Butler and nine other missionaries. In September 1831 they were tried in Georgia and found guilty. Each was sentenced to four years in prison at hard labor, which means forced hard work. The New Georgia Encyclopedia's account of the case does not name the judge.

In *Worcester v. Georgia*, decided in 1832, Chief Justice John Marshall, the head of the Supreme Court, ruled that the laws of Georgia had no force inside the Cherokee Nation. He held that the Nation was under the protection of the United States. That ruling is still one of the foundations of tribal sovereignty law, the law about a Native nation's right to govern itself. Georgia's officials ignored the ruling, and United States officials went ahead with removal anyway.

Worcester stayed in the Georgia prison at Milledgeville until January 1833. He came out after he accepted a pardon, an order forgiving the crime, from Georgia's governor, Wilson Lumpkin.

In May 1838 President Martin Van Buren sent General Winfield Scott with about 7,000 soldiers to round up the Cherokee people who had not moved west. Georgia's militia, its citizen soldiers, joined them. In 1838 and 1839, soldiers came to Cherokee houses in the Southeast and took families out at gunpoint, often with no time to pack. They held about 16,000 Cherokee people in stockades in Tennessee and Alabama. Then the soldiers forced them to go to Indian Territory, in what is now Oklahoma. More than 4,000 of them died of cold, hunger and disease. That figure is the traditional estimate. The National Park Service counts more than a thousand deaths on the trip itself, and perhaps several thousand more from what the removal did to people afterward. In 1984 Russell Thornton, a scholar at the University of Minnesota, wrote that the number of deaths "may have been twice" that figure. The Cherokee named the removal *Nunna daul Tsuny*, the Trail Where We Cried. In English it is called the Trail of Tears.

United States officials and soldiers forced all five of the large southeastern nations to move to Indian Territory: the Cherokee, the Muscogee (Creek), the Choctaw, the Chickasaw and the Seminole. From 1831 to 1833 they removed more than 14,000 Choctaw people, and hundreds died. In 1836 and 1837 they removed more than 14,500 Creek people. Several hundred died on the way, and about 3,200 died after they arrived, of disease, hunger and cold. In Indian Territory, the people of those nations rebuilt their governments, their courts, their newspapers and their schools.

Rebecca Neugin

Who: a Cherokee woman who was about three years old when soldiers took her family out of their home in Georgia in 1838.

When and where: Georgia to Indian Territory, 1838 and 1839. Interviewed in 1932.

In 1838 soldiers took Rebecca Neugin's family out of their home in Georgia. Rebecca was about three years old. The soldiers held the family in a camp in Tennessee, and in September 1838 the family set out west. Rebecca and the smaller children rode in a wagon, while her mother, her father and her older brother Dick walked the whole way.

In 1932 the historian Grant Foreman interviewed her, and she told him what she remembered of the journey. She was about 97 years old. The interview came 94 years after the removal, and she was one of the last people still alive who had been on it. She died on July 15, 1932.

The Seminole resistance

In Florida many Seminole people refused to leave, and United States soldiers fought them in the Second Seminole War, from 1835 to 1842. It was the longest war between United States forces and a Native nation east of the Mississippi, and the one that cost the most. National Park Service writers give its cost in a count. For every four Seminole people the army forced out of Florida, soldiers killed one Seminole. Three soldiers died for each four forced out, and the army spent $32,000.

On October 21, 1837, General Thomas Jesup lured the Seminole war leader Osceola to a talk under a white flag of truce. Under a flag of truce, both sides promise not to attack or seize anyone while they talk. Osceola came in under the flag, and Jesup had him seized. Many people in the United States protested the trick in public at the time. Osceola died a prisoner at Fort Moultrie, South Carolina, on January 30, 1838.

Most of the fighting stopped in 1842. A few hundred Seminole people never surrendered and stayed in the Everglades. Their descendants belong to two tribes today. Federal officials, meaning officials of the national government, recognized the Seminole Tribe of Florida in 1957 and the Miccosukee Tribe in 1962. That means they accepted each tribe as a nation with its own government. Leaders of both tribes point out that the Seminole were never conquered.

Osceola

Who: Seminole war leader in the fight against removal from Florida.

When and where: Florida. Seized by General Thomas Jesup under a flag of truce, October 21, 1837. Died a prisoner at Fort Moultrie, South Carolina, January 30, 1838.

Osceola was born in 1804 in the Creek town of Talisi, in what is now Alabama, and he was named Billy Powell at birth. He grew up to be a Seminole war leader in the fight against removal from Florida. On October 21, 1837, General Thomas Jesup lured him to a talk under a white flag of truce. When Osceola arrived, Jesup had him seized.

Many people in the United States said in public at the time that the trick was wrong.

Osceola died three months later, on January 30, 1838, a prisoner at Fort Moultrie. After he died, the army doctor Frederick Weedon cut off his head before the burial and put it on display in his drug store. The Seminole kept fighting until 1842.

1850 to 1900

United States officials and soldiers forced Native nations onto reservations in the second half of the 1800s. A reservation is an area of land that United States officials set aside for a nation, in a treaty or by an order. Soldiers and officials forced the nation's people onto it and held them there. Officials and settlers then took the rest of the nation's country.

In these years United States soldiers killed hundreds of Native people at a time. In 1862 army officers hanged 38 Dakota men at one time at Mankato, Minnesota. At Bear River in 1863 soldiers killed an estimated 250 to 500 Shoshone people, and at Sand Creek in 1864 about 230 Cheyenne and Arapaho people, most of them women, children and elders. Cavalry, soldiers on horseback, killed about 177 Piikani people on the Marias River in 1870, by the best estimate. Soldiers at Wounded Knee in 1890 killed between 250 and 300 Lakota people.

In 1868 Navajo leaders signed a treaty in which United States officials agreed to let their people go home. Hunters killed off the bison herds that fed the Plains nations, and army officers encouraged the killing. In 1871 members of Congress stopped making treaties with Native nations. Lakota, Cheyenne and Arapaho fighters beat George Custer's soldiers at the Little Bighorn in 1876. The next year the Nez Perce fled toward Canada with the army behind them.

In 1879 an Army officer named Richard Henry Pratt opened the first federal boarding school for Native children built far from the reservations. Federal means run by the national government of the United States. Federal officials used Pratt's school as the model for many more. Pratt stated his aim in his own words: "Kill the Indian in him, and save the man." Federal investigators later counted at least 973 children who died at the federal boarding schools.

In 1887 members of Congress passed a law under which federal officials cut nations' shared land into private pieces. The officials opened what was left over to white settlers.

The wars, from the nations' side

In Minnesota in 1862, United States officials failed to deliver the food and the payments that they had promised the Dakota in treaties. Dakota fighters went to war, and the war lasted six weeks. Afterward, army officers sitting as military commissions tried 392 Dakota men. A military commission is a court run by the army. Some of the trials took less than five minutes. The men had no defense lawyers and no interpreters, the people who translate between two languages. The army officers on the commissions sentenced 303 of the men to death by hanging.

President Abraham Lincoln and his lawyers read the trial records. Lincoln looked first for men found guilty of rape, which means forcing a person into sex, and found two. Then he added men found to have taken part in killing people who were not soldiers. He cut the list of men to be executed down to 39. One of the 39 was reprieved, which means his execution was called off. On December 26, 1862, at Mankato, army officers hanged 38 Dakota men together while about 4,000 people watched. The hanging at Mankato is the largest mass execution, the most people put to death at one time, in United States history. Captain William Duley cut the rope. Several members of his family had been killed in a Dakota attack on the Lake Shetek settlement. The bodies were put in a shallow grave on a sandbar. The Minnesota Historical Society's account does not say who buried them. Before morning, doctors had dug up most of the bodies to use for medical study.

Two of the men had been hanged by mistake. By the Minnesota Historical Society's account, Wicaŋhˇpi Wastedaŋpi, who went by the name Caske, stepped forward when the name "Caske" was called. The name called was another man's, and he was hanged in that man's place. The other, Wasicuŋ, was a young white man whom the Dakota had adopted as a child, and the commission had found him not guilty at his trial.

On January 29, 1863, Colonel Patrick Edward Connor led soldiers against a winter camp of Northwestern Shoshone people on the Bear River, near what is now Preston, Idaho. Connor had announced that he would take no prisoners. His soldiers killed an estimated 250 to 500 Shoshone people. Afterward army leaders promoted Connor to brigadier general, a higher rank.

In 1863 and 1864, United States soldiers marched about 8,500 Navajo people more than 300 miles to Bosque Redondo and held them there. This forced march is known as the Long Walk. Thousands of the Navajo died while soldiers held them at Bosque Redondo. In 1868 Navajo leaders negotiated a treaty in which United States officials agreed to let the survivors go home. The Navajo were one of the very few removed nations who got their homeland back.

Colonel John Chivington led about 675 volunteer soldiers against Black Kettle's Cheyenne and Arapaho camp at Sand Creek in Colorado on November 29, 1864. The camp was flying a United States flag and a white flag. Earlier that month Major Scott Anthony, the commander at nearby Fort Lyon, had told Black Kettle's people to camp at Sand Creek. In his report of November 16 he wrote that he told them "no war would be waged against them." That promise was to hold until his own commander decided what to do. When Chivington arrived, Anthony agreed to the attack. The attack lasted eight hours. The soldiers killed about 230 people, most of them women, children and elders. A massacre is the killing of many people who cannot defend themselves.

Captain Silas Soule, one of the officers there, refused to let his men fire. He wrote to his mother that he saw "a Massacre of three hundred Indians mostly women and children." In another letter he wrote that it was "hard to see little children on their knees have their brains beat out." Soldiers cut scalps and other body parts from the dead.

Members of a committee of Congress later wrote that Chivington "deliberately planned and executed a foul and dastardly massacre." Dastardly means cowardly and cruel. Chivington left the army and was never put on trial, and no officer or soldier was punished. In April 1865, about two months after Soule spoke against Chivington before investigators, a man shot Soule dead on a Denver street. No one was ever punished for killing him. National Park Service staff look after the place of the massacre today as the Sand Creek Massacre National Historic Site.

Lakota fighters fought the army over the Bozeman Trail in a war named for the Lakota leader Red Cloud, Red Cloud's War. After it, United States officials and Lakota leaders signed the Treaty of Fort Laramie in 1868. In it, the officials agreed to close the Bozeman Trail. They also set up the Great Sioux Reservation "for the absolute and undisturbed use" of the Lakota. It covered all of what is now South Dakota west of the Missouri River, including the Black Hills.

On January 23, 1870, Major Eugene Baker's cavalry came to a camp of Piikani (Piegan Blackfeet) people on the Marias River in Montana. His scout, Joe Kipp, told him it was the camp of Heavy Runner's band, which was at peace with the United States. By one account, Baker answered, "That makes no difference, one band or another of them, they are all Piegans and we will attack them." By the best estimate, his soldiers killed 37 men, 90 women and 50 children. The army's own count was 173 dead. Neither Baker nor any of his men was ever punished.

In 1874 members of an expedition led by George Custer announced that there was gold in the Black Hills. Federal officials ignored their own 1868 treaty. In December 1875 they ordered the winter camps that were off the reservation to come onto it by January 31, 1876. When the camps did not come in, the officials sent the army.

George Custer led part of the 7th Cavalry, an army unit of soldiers on horseback, on June 25, 1876. He attacked a camp where Lakota, Cheyenne and Arapaho people had gathered as allies, meaning they had agreed to fight on the same side. The camp stood by the Little Bighorn River, also called the Greasy Grass. Fighters from the camp killed Custer and about 200 of the soldiers with him in about an hour. Those soldiers made up five companies, smaller units of the 7th Cavalry.

Crazy Horse, one of the battle leaders at the Little Bighorn, surrendered on May 6, 1877, less than a year after the battle. On September 5, 1877, at Fort Robinson, soldiers were arresting him. A Lakota man named Little Big Man jumped on his back and held him, and a soldier on guard stabbed him with a bayonet. A bayonet is a blade fixed to the end of a rifle. Crazy Horse died of the wound. Most accounts say a soldier on guard stabbed him. The name most often given is Private William Gentles, but only one witness named him, so who the soldier was is disputed. Little Big Man later told a different story, in which Crazy Horse was cut by his own knife.

Geronimo, of the Chiricahua Apache, surrendered on September 4, 1886. He was the last Native leader to formally surrender to the United States. United States officials then held the Chiricahua people as prisoners of war for 27 years. Prisoners of war are people an army holds after capturing them in a war.

Sitting Bull

Who: Hunkpapa Lakota leader and holy man. The camp that fought at the Greasy Grass gathered around him.

When and where: the northern Plains. Canada from 1877 to 1881. Killed by Indian police at Standing Rock, December 15, 1890.

Movie: *Sitting Bull: A Stone in My Heart* (2006), a documentary built from his own recorded words.

The camp on the Greasy Grass in June 1876 formed around Sitting Bull, and Crazy Horse was one of its battle leaders.

In 1877 Sitting Bull took his people north into Canada. Hunters were killing off the bison, and by 1881 there were not enough left to feed his people. He surrendered at Fort Buford in July of that year.

On June 6, 1885, at the Standing Rock Agency, he signed a contract with Buffalo Bill's Wild West, a traveling show. The show paid him fifty dollars a week for a four-month season, and only he could sell his own photographs and autographs.

On December 15, 1890, at Standing Rock, Indian police came to arrest him. Indian agents, the federal officials who ran the reservations, were alarmed by the Ghost Dance, a new religious dance spreading across the reservations. Indian police were Native men who worked as police for the agency, the government office that ran the reservation. The policemen killed Sitting Bull.

Chief Joseph

Who: Nez Perce leader in the flight of 1877. About 750 people, only some 200 of them fighters, fled with the United States Army behind them.

When and where: the Wallowa Valley of Oregon to the Bear Paw Mountains of Montana, 1877. Surrendered October 5, 1877, forty miles from Canada.

Movie: *I Will Fight No More Forever* (1975, television film).

Joseph's band of the Nez Perce lived in the Wallowa Valley of northeastern Oregon. In 1877 General Oliver O. Howard told the Nez Perce chiefs that their people had 30 days to move onto the reservation in Idaho, or the army would move them by force. That year about 750 Nez Perce people fled with the army behind them, and only about 200 of them were fighters. The rest were families.

> They traveled about 1,170 miles. That is the National Park Service's figure for the trail. Some accounts state a longer distance, up to about 1,700 miles.
>
> They surrendered on October 5, 1877, at the foot of the Bear Paw Mountains in Montana, forty miles short of the Canadian border. Lieutenant C. E. S. Wood recorded Joseph's words at the surrender: "From where the sun now stands I will fight no more forever."
>
> Colonel Nelson Miles had promised Joseph that his people would be taken back to the reservation in Idaho. General William Tecumseh Sherman, the commanding general of the army, overruled the promise, which means he cancelled it. He wanted the Nez Perce punished as an example to other nations and never allowed to go home. "I believed General Miles, or I never would have surrendered," Joseph said afterward. United States officials sent his people to Kansas, then to Indian Territory. There, many of them were sick and short of supplies, and their number fell from 410 to 391.
>
> In May 1885, 268 Nez Perce people left Indian Territory for the Northwest. Officials sent Joseph to the Colville reservation in Washington, and he died there, at Nespelem, in 1904. Officials never allowed him back to the Wallowa Valley.

The bison, and the end of treaties

There were roughly 30 million bison on the Plains in the early 1800s. One count in 1884 found 325. By 1900 there were fewer than a thousand.

Railroads carried hunters into the herds' country. Hunters made hide hunting into a large business, killing bison for their skins. Disease and drought killed others. Army officers encouraged the killing, because the herds were the Plains nations' food and the base of how they made a living, and the bison were part of their religion.

In 1871 members of Congress stopped making treaties with Native nations. They did it with a rider, a short passage attached to a spending bill called the Indian Appropriations Act. Treaties already made stayed in force. After 1871, United States officials dealt with Native nations through acts of Congress and orders from the president instead of treaties.

Allotment

Allotment means cutting land that a whole nation owned together into private pieces.

The Dawes Act, also called the General Allotment Act, became law in 1887. Under it, federal officials divided nations' land into separate parcels, or pieces. The head of a family got 160 acres, a single man got 80 acres, and each child got 40 acres. Officials called everything left

over "surplus," meaning extra, and opened it to white settlers.

Between 1887 and 1934, under the allotment that federal officials carried out, Native nations lost about 90 million acres. The land they held fell from about 138 million acres to 48 million. The lost land was about two-thirds of all the land Native nations still had in 1887. The Meriam Report, a federal study published in 1928, states the figures as 137 million and 47 million acres. The loss is about the same by either count.

In 1934 members of Congress passed the Indian Reorganization Act. In it they ended allotment, and they allowed up to $2,000,000 a year to be spent buying land for Native people.

The boarding schools

The Carlisle Indian Industrial School opened on November 1, 1879, at Carlisle, Pennsylvania. Its founder was an Army officer named Richard Henry Pratt. It was the first federal boarding school for Native children built far from the reservations. Federal officials used Carlisle as the model for the schools that followed.

Pratt stated the purpose himself. In 1892 he spoke to a national conference of charities in Denver. He said that "all the Indian there is in the race should be dead. Kill the Indian in him, and save the man." People often quote the line in a shorter form, "kill the Indian, save the man." Pratt's recorded words are the longer ones, printed in the conference's official report.

Members of Congress passed two laws to get the children into the schools. In 1891 they gave the Commissioner of Indian Affairs the power to make and enforce rules forcing Native children to attend school. The Commissioner was the federal official in charge of Native affairs. In 1893 they let federal officials hold back rations, clothing and annuity payments from parents who would not send their children. Rations, clothing and annuities were the food, goods and yearly payments that United States officials had promised a nation in its treaties.

Some Indian agents sent reservation police to seize children. An Indian agent was the federal official in charge of a reservation. Some families sent their children willingly, hoping the schooling would help them. Many families had no real choice.

When a child arrived, staff at school after school cut the child's hair and replaced the child's clothes with a uniform. They gave the child an English name and forbade the child to speak the language of home. Staff punished children for speaking their own languages. The federal investigation of the schools and survivors' own accounts document the punishments: beatings, solitary confinement, withholding food, and washing children's mouths out with soap. Solitary confinement means locking a child away alone.

Children spent half of each school day doing unpaid work that kept the school running. Pratt also ran what he called the outing system. Under it, he sent students to live and work with white families, in the summers and during school terms.

Investigators at the United States Department of the Interior studied the schools. They published their findings in 2022 and again on July 30, 2024. They counted 417 federal Indian boarding schools in 37 states and territories, open between 1819 and 1969. Their first report, in 2022, listed 408. They also found more than a thousand other places that had similar aims. At least 973 children died at the federal schools. The investigators found at least 74 marked and unmarked burial sites at 65 of the schools. The report states that its count of the dead is low.

Children kept their languages by speaking them where the staff could not hear. At these schools, children made friends with children from other nations. Those friendships were one of the starting points of the Native organizing of the next century. Some students, Zitkala-Ša among them, used the reading and writing they learned at the schools to argue against the schools.

Sarah Winnemucca

Who: Northern Paiute writer, interpreter, and lecturer who argued her people's case in front of audiences across the East.

When and where: Nevada, and the lecture halls of the East, in the 1870s and 1880s.

Sarah Winnemucca worked as an interpreter, a person who puts spoken words from one language into another.

Just before Christmas 1878, Winnemucca learned that President Rutherford B. Hayes had ordered her people taken to the Yakama reservation under an army guard. "My people were only given one week to get ready in," she wrote. Officials were punishing the whole group because a few Paiute men had fought in the Bannock War of 1878.

In 1879 United States officials forced about 550 Northern Paiute men, women and children to move 350 miles north, from the Malheur reservation in Oregon to the Yakama reservation. The march took nearly a month through snow and over two mountain ranges. The officials in charge made some of the men walk in leg irons, chains locked around the ankles. Five children, one woman and an old man died on the road. Their bodies were left beside it because the ground was too cold to dig graves. The Oregon Historical Society's

account of the march does not say who decided to leave them. The historian Sally Zanjani estimated that more than one fifth of the group died far from home after they were sent away, mostly of hunger and disease.

Winnemucca went east and gave lectures about what officials had done to her people. In 1880 she met with Secretary of the Interior Carl Schurz in Washington. He gave her a written promise that the Paiute could go back to Malheur, and then he broke it. Her people never returned there. In 1882 and 1883 President Chester Arthur ended the Malheur reservation, and white settlers could then claim its land. In 1883 she published *Life Among the Piutes: Their Wrongs and Claims*. It is the first known autobiography written by a Native American woman. An autobiography is a book a person writes about their own life. In 1884 she asked Congress to give her people back their reservation. She was also the first Native woman known to hold a United States copyright, the legal right to control who copies and sells a piece of writing.

In the mid-1880s she opened a school of her own for Paiute children near Lovelock, Nevada. The school opened in 1884 or 1885, and accounts of her life give both years. Staff at the government boarding schools forbade children to speak their own languages. At her school, Winnemucca taught in both Paiute and English.

The school ran out of money and closed within a few years.

Zitkala-Ša

Who: Yankton Dakota writer, musician, and organizer, taken as a child to a boarding school in Indiana.

When and where: the Yankton reservation, South Dakota, and Washington, D.C. Born February 22, 1876. Died January 26, 1938.

Zitkala-Ša wrote about how she left home in her essay "The Big Red Apples." She was in her eighth year, in March, when two white missionaries came to her village on the Yankton reservation. Her mother told her they had come "to take away Indian boys and girls to the East." A young white interpreter told the girl she could pick all the red apples she wanted and ride on "the iron horse," a train. "I had never seen a train, and he knew it," she wrote. She begged to go. Her mother warned her, "Their words are sweet, but, my child, their deeds are bitter." Then her mother agreed. The missionaries took the girl to White's Indiana Manual Labor Institute. The essay does not name them.

> In 1900 the editors of the *Atlantic Monthly*, a magazine, published a set of her essays about her own life. One of them was "The School Days of an Indian Girl." In the essays she described her time at the school and criticized it. She was working at Carlisle when she published them. In 1921 they appeared again in her book *American Indian Stories*.
>
> In 1926 she helped start the National Council of American Indians, and she led it until she died in 1938.

The Ghost Dance and Wounded Knee

On January 1, 1889, a Northern Paiute man named Wovoka, from the Walker Lake country of Nevada, had a vision. It came during a solar eclipse, when the moon blocked the sun. He taught that if people lived rightly and danced a round dance, a dance in which people move in a circle, the dead would return and the world would be made whole.

On reservations where people were hungry, they took up the dance, which became known as the Ghost Dance. Indian agents who were frightened by it called it the start of an uprising, meaning an armed revolt. Newspaper writers printed frightening stories that said the same.

Indian police killed Sitting Bull at Standing Rock on December 15, 1890, while they were trying to arrest him.

On December 29, 1890, soldiers of the 7th Cavalry under Colonel James W. Forsyth were disarming Spotted Elk's band, also called Big Foot's band, at Wounded Knee Creek. Disarming means taking away people's weapons. A band is a group of families who live and travel together. During the disarming, a rifle belonging to Black Coyote, a deaf man, went off. By some accounts he fired first, and by others a soldier tried to grab his gun and it went off. The soldiers opened fire.

They fired carbines, which are short rifles, and four Hotchkiss guns, which are small cannon, set on a hill above the camp. The soldiers killed between 250 and 300 Lakota people. In early January 1891 a burial party put 146 of the dead in one grave at the site. They were 84 men and boys, 44 women and 18 children. Others died later of their wounds, and some bodies were never found, so no count gives the women and children among all the dead. The killing is known as the Wounded Knee Massacre. Twenty-five soldiers also died. Writers for Britannica and History.com say that most of those soldiers were hit by their own side's fire. Twenty soldiers of the 7th Cavalry received the Medal of Honor for what they did that day. The Medal

of Honor is the top award the United States military gives for bravery in battle. Some of the medal statements praise soldiers for driving out "Sioux Indians" who were hiding in a ravine, a narrow, steep valley.

In 1900 census takers counted about 250,000 Native people in the United States. That is the lowest number on record for the Native population.

1900 to 1950

In 1900 the United States census, the official count of everyone in the country, counted about 250,000 Native people. No United States census has recorded a lower number.

Between 1900 and 1950, Native people founded national organizations that they ran themselves, starting with the Society of American Indians in 1911. Oil was found under Osage land in Oklahoma, and Osage people became rich from it. In 1921 members of Congress passed a law that put many Osage adults' money under white guardians, people given legal control of someone else's money, whom judges in local courts appointed. Guardians and husbands stole the money. In the early 1920s, Osage people who held headrights, equal shares of the nation's oil money, were murdered or died in ways that looked like murder. Counts of the dead run from about 24 to more than sixty. Federal agents proved that a cattle rancher named William Hale had ordered several of the killings. In 1929 he was sentenced to life in prison.

In 1924 members of Congress made every Native person born in the country a citizen. Ten years later they ended allotment, the cutting of nations' shared land into private pieces, which federal officials had carried out since 1887.

Native men fought for the United States in both world wars. In 1918 Choctaw soldiers passed orders in Choctaw, and German soldiers tapping the telephone lines could not read them. From 1942 Navajo Marines sent messages in a code built from Navajo, and no enemy ever broke it.

Through all fifty years, federal boarding schools stayed open, and federal officials still took tens of thousands of children from their homes to them every year.

Organizing

On October 12, 1911, a group of Native doctors, lawyers and writers met in Columbus, Ohio, and founded the Society of American Indians. It was the first national Native rights organization that Native people built and ran themselves. Its leaders included Dr. Charles

Eastman, who was Santee Dakota, and Dr. Carlos Montezuma, who was Yavapai-Apache. Zitkala-Ša edited its journal.

Many of the members had gone through the boarding schools, and some of them used that schooling to argue against federal Indian policy. The Society lasted from 1911 to 1923.

In 1912 twelve men and one woman founded the Alaska Native Brotherhood at Sitka. They wanted citizenship for Alaska Natives. The Alaska Native Sisterhood began in 1915. For the next fifty years, these two groups were the only civil rights organizations Alaska Natives had. Civil rights are the rights every citizen has to equal treatment under the law.

On November 16, 1944, eighty delegates from more than fifty tribes and associations met in Denver. Delegates are people chosen to speak for a group. At that meeting they founded the National Congress of American Indians. Native nations still use it as one of their main ways to act together.

High steel

Mohawk men from Kahnawake had worked on structural iron since the 1880s. Structural iron is the metal frame that holds up a bridge or a tall building. In 1930 and 1931, Kahnawake crews worked on the riveting gangs that put up the Empire State Building in New York. A riveting gang joined the steel beams together with hot metal pins called rivets.

Kahnawake ironworkers kept building towers in Manhattan for generations. One of them, Harold McComber, is the subject of *High Steel*. Don Owen directed that documentary film for the National Film Board of Canada in 1965.

The Osage and the Reign of Terror

In the 1920s Osage people in Oklahoma earned so much from oil that they were among the wealthiest people in the world, counted per person. White guardians and some of the men who married Osage women stole that money, and killers murdered Osage people to get it.

In 1906 Osage leaders, led by Chief James Bigheart, won their own terms in the Osage Allotment Act, which members of Congress passed that year. Federal officials had forced other nations to take 160 acres a person and sell the rest of their land. The Osage divided all of their reservation among their own people instead, 657 acres each for 2,229 people. They kept the minerals under the ground as shared property. Oil companies paid royalties, which are payments for the oil they took out. Each Osage member got an equal share of that money. The share was called a headright.

In 1921 members of Congress passed a guardianship law. Under it, judges in local courts appointed white guardians over the money of many Osage adults. A guardian is a person given legal control over someone else's money. Under the law, the guardian, not the Osage owner, controlled the money. Guardians stole from the people whose money they controlled. Some of the men who married Osage women stole from their wives.

Between about 1920 and 1925, Osage headright holders died in murders and in suspicious deaths, deaths that might have been murders. Counts of the dead disagree. Osage Nation officials count more than sixty. Writers at the Oklahoma Historical Society count about 24, and FBI writers say at least two dozen.

In 1923 the Osage Tribal Council asked the federal government to send detectives. Agents of the new Bureau of Investigation, which later became the FBI, took the case. They proved that William Hale, a cattle rancher whom people called "the King of the Osage Hills," had ordered the murders of Anna Brown and members of her family so that he could inherit their oil rights. To inherit is to receive what a person owned after that person dies. Hale's nephew, Ernest Burkhart, was married to Anna's sister Mollie.

On Hale's orders, Anna Brown was shot in May 1921. Her mother, Lizzie Q. Kyle, died in July 1921, and poison was suspected. In March 1923 a bomb blew up the house of Anna's sister Rita Smith, killing Rita, her husband Bill and their servant, Nettie Brookshire. The agents also proved that Hale had Anna's cousin Henry Roan killed for insurance money.

Burkhart pleaded guilty in 1926 and was sentenced to life in prison. Another man, Kelsie Morrison, was also sentenced to life in 1926. In 1929 Hale was found guilty and sent to prison for life, and so was a man named John Ramsey. Hale, Ramsey and Burkhart were all later let out on parole, which means freed early under watch. These years are known as the Reign of Terror.

Citizenship and the Indian New Deal

The Indian Citizenship Act became law on June 2, 1924. Under it, every Native person born in the United States became a citizen. In some states they still could not vote, because each state's lawmakers wrote that state's voting rules. The Library of Congress records that officials in some states kept Native people from voting until 1957.

In 1928 a federal survey called the Meriam Report came out. Its full title was *The Problem of Indian Administration*. It records that under allotment, tribal land had fallen from 137 million acres to 47 million. It also records the poverty and disease Native people lived with after that loss.

The Meriam Report's writers condemned the boarding schools in detail, which means they judged the schools to be wrong and showed why. One of the things they condemned was the half-day system. Under that system, school staff made children spend half of every school day on unpaid work. That work kept the schools running.

The Indian Reorganization Act became law on June 18, 1934. It was written while John Collier was Commissioner of Indian Affairs, the federal official in charge of dealings with Native nations. Collier held that job from 1933 to 1945. In the act, members of Congress ended allotment and extended the protections on land held in trust. Land held in trust is land the United States holds on behalf of a Native nation or person.

Members of Congress also allowed up to $2,000,000 a year in the act for buying land for Native people. Nations could now write constitutions, which are written sets of a government's basic laws, and set up their own governments. After 1934 federal officials began to recognize the governments that nations set up under the act. For the forty-seven years before, since 1887, federal officials had used allotment to break nations up into single landowners.

The schools continue

Federal boarding schools kept running after 1900. The federal investigators counted the schools that ran between 1819 and 1969. Some kept going after that. Enrollment, the number of children in the schools, kept climbing for decades and reached its peak of about 60,000 children in 1973.

In the 1930s Collier and the officials under him moved toward day schools, where children went home at night. They allowed some teaching in Native languages, and they closed some boarding schools. Federal officials still took tens of thousands of children from their homes to the schools every year.

Chester Nez, a Navajo boy, was one of those children. Staff at the Fort Defiance boarding school washed his mouth out with soap for speaking Navajo. In 1942 Marine Corps recruiters signed him up to help build a military code in Navajo.

The code talkers

Code talkers were Native soldiers who sent military messages in their own languages, so that the enemy could not understand them. The first code talkers were Choctaw.

In the autumn of 1918, American soldiers were fighting in the Meuse-Argonne campaign, a long series of battles in France. German soldiers were tapping American telephone lines. They were also capturing about one in four runners, the soldiers who carried messages on foot.

Choctaw soldiers of the 36th Division began passing orders in Choctaw. They sent the first secure messages, ones the Germans could not read, on October 26, 1918. When Choctaw had no word for a piece of equipment, the men made one up. A machine gun became "little gun shoot fast."

In the Second World War, Marine Corps officers had Navajo speakers do the same work. Twenty-nine Navajo recruits arrived in San Diego on May 5, 1942, and built the code. Between 350 and 420 Navajo served as code talkers, in all six Marine divisions in the Pacific. At Iwo Jima, Major Howard Connor was the 5th Division's signal officer, in charge of its messages. He said: "Were it not for the Navajos, the Marines would never have taken Iwo Jima."

No enemy ever broke the code. It stayed classified, meaning officially secret, until 1968. On July 26, 2001, the original twenty-nine received the Congressional Gold Medal, a medal that members of Congress vote to give, and the code talkers who came after them received silver medals.

Jim Thorpe

Who: Sac and Fox athlete and Carlisle student, the first Native American to win an Olympic gold medal.

When and where: Stockholm, July 1912. Olympic officials took his medals in 1913 and named him the sole champion again in 2022.

Movie: *Jim Thorpe – All-American* (1951)

Jim Thorpe was a citizen of the Sac and Fox Nation. He was a student at the Carlisle Indian Industrial School, a federal boarding school in Pennsylvania. There he was twice named a football All-American, one of the best college football players in the country.

At the Stockholm Olympics in 1912, he won the pentathlon on July 7 and the decathlon on July 15. The pentathlon is a contest of five track and field events, and the decathlon is a contest of ten. His decathlon score stood as the world record until 1927.

In 1913 Olympic officials took both medals back. In 1909 and 1910 Thorpe had played minor-league baseball for a reported two dollars a game, up to $35 a week. The Olympic rules of the time allowed only amateurs, athletes who are not paid to play. In October 1982 officials of the International Olympic Committee named him co-champion, sharing the titles with Hugo Wieslander in the decathlon and Ferdinand Bie in the pentathlon. On July 15, 2022, 110 years to the day after his decathlon win, they named him the sole champion of both events.

Ira Hayes

Who: Akimel O'odham (Pima) Marine from the Gila River community in Arizona, one of the six men who raised the second flag on Mount Suribachi.

When and where: Iwo Jima, February 23, 1945. He died in Arizona on January 24, 1955.

Movie: *The Outsider* (1961). Adam Beach also plays him in *Flags of Our Fathers* (2006).

Ira Hayes was a Marine paratrooper, a soldier trained to jump from planes by parachute. He came from the Gila River Indian Community in Arizona. On February 23, 1945, on Iwo Jima, he was one of the six men who raised the second American flag on Mount Suribachi. Americans celebrated the photograph of that flag-raising.

Hayes came home to a fame he had not asked for. On May 9, 1945, he and two other men from the photograph raised a flag at a ceremony in Washington. The ceremony started a tour to sell war bonds, which were loans people made to the government to pay for the war. Later that month the Marines ordered Hayes back to his unit. Americans celebrated the photograph, but Hayes got little help after the war. Police arrested him 52 times for being drunk in public. Years later President Dwight Eisenhower met him and called him a hero.

On the morning of January 24, 1955, Ira Hayes was found dead near an empty mud-brick hut close to his home at Sacaton, in the Gila River community. He had been drinking the night before. The coroner, the official who decides how a person died, gave the cause as exposure and alcohol poisoning. Dying of exposure means dying from being left out in the cold or in other harsh weather without shelter. He was 32.

Chester Nez

Who: Navajo Marine, one of the twenty-nine who built the code. As a boarding-school student, he was punished for speaking the language the code was made from.

When and where: the Fort Defiance boarding school, Arizona, then the Pacific, 1942 to 1945. He died June 4, 2014.

When Chester Nez spoke Navajo at the Fort Defiance boarding school, staff washed his mouth out with soap.

In 1942 Marine Corps recruiters signed Nez up. He was one of the twenty-nine who went to San Diego and built the code out of the language.

> He wrote about what happened to him in *Code Talker*, a memoir published in 2011 with Judith Schiess Avila. A memoir is a book about the writer's own life. It is the only memoir by one of the original twenty-nine. Nez outlived the other twenty-eight and died on June 4, 2014.

1950 to 2000

Members of Congress declared in 1953 that the United States should end its recognition of Native nations. Recognition means that United States officials deal with a nation as a government. Twenty-two years later, in 1975, President Ford signed a law under which Native nations could take control of their own schools, clinics and police.

The Menominee, whose nation members of Congress had terminated, meaning they had ended its recognition, organized until members of Congress restored it. Fishermen in the Northwest kept fishing until a federal judge ruled on their 1850s treaties, the written agreements their nations had made with the United States. A group called Indians of All Tribes took Alcatraz Island and held it for nineteen months. In 1980, in the Sioux Nation's Black Hills case, the justices of the Supreme Court ruled that United States officials had broken the 1868 treaty when they took the hills.

Termination and relocation

On August 1, 1953, members of Congress passed House Concurrent Resolution 108. A resolution is a formal statement of policy that members of Congress vote on. In this one they declared that the United States should end its recognition of Native nations, along with the federal services that came with it. The policy's name was termination. Termination meant that members of Congress and federal officials stopped treating a tribe as a nation with its own government, and the tribe lost its federal services.

Between 1953 and 1970, members of Congress ran about sixty termination proceedings, the formal legal steps that ended a nation's recognition. Those proceedings covered more than a hundred tribes and bands. More than 3 million acres of land stopped being held in trust, which meant the United States no longer held that land on the nations' behalf.

The Menominee of Wisconsin ran a profitable timber business. Members of Congress passed the Menominee termination act in 1954. It took effect in 1961, and the Menominee, who had done well before, became poor. Menominee people organized a movement called DRUMS, with

Ada Deer among its leaders. They kept pushing until members of Congress reversed the termination. The Menominee Restoration Act became law on December 22, 1973.

In the same years, officials of the Bureau of Indian Affairs moved Native people off reservations and into cities. The Bureau of Indian Affairs is the federal agency in charge of Indian affairs. Its officials began this relocation program between about 1948 and 1952. Members of Congress backed it with the Indian Relocation Act of 1956. People who signed up got a one-way ticket and short-term help. About 30,000 people moved in the 1950s, and more than 100,000 had moved by the time the program ended in the 1970s.

Many of them lived in poverty in the cities. They also built lasting Native communities in Minneapolis, Chicago, Oakland and San Francisco, Los Angeles, and Denver. The next Native movement started in those cities.

Red Power

In July 1968, in Minneapolis, George Mitchell, Dennis Banks, Clyde Bellecourt and about 200 other people founded the American Indian Movement, known as AIM. Its members began with street patrols against police abuse. Many Native people had moved to Minneapolis under relocation.

On November 20, 1969, a group calling itself Indians of All Tribes landed on Alcatraz Island in San Francisco Bay. They occupied the island's federal prison, which had been closed since 1963. Occupied means they moved in and held it. Richard Oakes, who was Mohawk, was among the leaders. In their proclamation, a public statement, they offered to buy the island for "$24 in glass beads and red cloth." They held it for nineteen months, until June 11, 1971.

After the occupation began, President Nixon ended termination as federal policy. On December 15, 1970, he signed a law that members of Congress had passed, H.R. 471, which gave Blue Lake and 48,000 acres of sacred land back to Taos Pueblo.

On December 18, 1971, the Alaska Native Claims Settlement Act became law. Under it, Alaska Native land claims were settled for 44 million acres and $962.5 million. To settle a claim is to end it by agreement. The land and money went to twelve regional corporations, later thirteen, and to more than 200 village corporations. A corporation is a business, and the people who own it are called its shareholders. Alaska Natives became the shareholders.

In 1973 about 200 Oglala Lakota and AIM members occupied the village of Wounded Knee, on the Pine Ridge Reservation in South Dakota. They chose it because soldiers of the 7th Cavalry, an army unit of soldiers on horseback, had killed between 250 and 300 Lakota people there in

1890. Of the 146 dead whom a burial party put in one grave there, 62 were women and children. The occupiers held the village for seventy-one days, from February 27 to May 8, against federal marshals and FBI agents, who surrounded it with armored vehicles. Federal marshals are officers who carry out the orders of the national courts. The FBI is the national police force that looks into federal crimes. The occupiers were protesting against the tribal chairman at Pine Ridge and against the treaties that United States officials had broken.

Both sides fired shots during the siege, the seventy-one days in which federal forces surrounded the village. Early in the siege, someone shot US Marshal Lloyd Grimm, and afterward he could not move his legs. Accounts of the siege do not say who shot him. On April 17 Frank Clearwater, an Eastern Cherokee man, was shot in the head while he rested in a church during a gunfight with federal forces. He died on April 25. In 2000 the FBI released a report on deaths on the Pine Ridge Reservation. It found that Clearwater was killed by gunfire from federal officers, who were firing back after people shot at them. On April 26 a federal agent firing as a sniper, a hidden marksman, shot and killed Lawrence "Buddy" Lamont, an Oglala man, with a bullet through the heart. In 1974 Judge Fred Nichol threw out the charges against the AIM leaders Dennis Banks and Russell Means. He wrote that "the misconduct by the government in this case is so aggravated that a dismissal must be entered in the interests of justice." Misconduct means breaking the rules.

The fish-ins and the Boldt decision

In the 1850s leaders of the Northwest nations signed treaties with Isaac Stevens, the governor of Washington Territory. In them they gave up land and kept the right to fish. The Treaty of Medicine Creek, signed by the Nisqually, the Puyallup and other nations on December 26, 1854, says that "the right of taking fish, at all usual and accustomed grounds and stations, is further secured to said Indians." That means the treaty protected their right to keep fishing at all the places where they had always fished. A century later, Washington State officers were arresting their people for fishing.

Through the 1960s and into the 1970s, the Nisqually, the Puyallup and other nations held fish-ins. At a fish-in, people fished in the open, in front of the state's officers, and let themselves be arrested. They did it to force the treaties into a courtroom. Frank's Landing on the Nisqually River was the center of the fish-ins.

Judge George Boldt heard the treaty case, *United States v. Washington*, in federal court. On February 12, 1974, he ruled that the treaty rights still stood. Under them, the tribes had a right to half the harvestable salmon, the salmon that could be caught each year. He also ruled that

the tribes were co-managers of the fishery, the salmon catch and the waters it comes from. That means tribal governments and the state run it together. The justices of the Supreme Court upheld the ruling in 1979, which means they let it stand.

The Black Hills

In the Fort Laramie treaty of 1868, United States officials guaranteed the Black Hills of South Dakota to the Lakota. In 1874 members of an Army expedition led by George Custer announced that they had found gold there. United States officials ignored the treaty and took the hills.

The Lakota call one mountain in the Black Hills Tunkasila Sakpe, the Six Grandfathers. It is the mountain known in English as Mount Rushmore.

In 1980, in *United States v. Sioux Nation*, the justices of the Supreme Court held that United States officials had broken the treaty when they took the hills. They awarded the Lakota compensation, which is money paid to make up for a loss.

The Lakota have refused the money. With the interest it has earned, it is now more than a billion dollars. Lakota leaders say that the Black Hills were never for sale.

Nations run their own programs

President Ford signed the Indian Self-Determination and Education Assistance Act in January 1975. Self-determination means a nation deciding its own affairs. Under the act, a nation could sign a contract with the federal government and run federal programs itself, such as its own schools, clinics and police. The word Education is in the act's name because schools were at the center of it.

For decades before 1978, workers at agencies took Native children from their families. Writers at the National Indian Child Welfare Association state that 25 to 35 percent of Native children were taken. They also state that 85 percent of them were placed outside their families, even when relatives or members of their tribe could care for them. In 1978 members of Congress passed the Indian Child Welfare Act. In it they set federal standards for those cases, meant to keep Native children with Native families. They also gave tribal courts the power to decide the cases.

In the same years, doctors at Indian Health Service hospitals sterilized thousands of Native women. The Indian Health Service is the federal agency that runs hospitals and clinics for Native people. Sterilization is an operation after which a woman can never become pregnant.

The doctors at these hospitals did two kinds of operation. In a tubal ligation, a surgeon cuts or ties the two tubes that carry eggs to the womb. In a hysterectomy, the surgeon cuts out the womb.

Investigators from the General Accounting Office, a federal office, studied 4 of the agency's 12 areas. In 1976 they reported 3,406 sterilizations of Native women there from 1973 to 1976. Writers at the National Library of Medicine state that the women had not given their permission. The investigators' report does not name the doctors. No surviving record says how many of the women had each kind of operation.

Thirty-six of the women were under 21, although a court had ordered a stop to sterilizing women that young. Two years before the report, Dr. Connie Pinkerton-Uri, a Choctaw and Cherokee doctor, had found that one in four Native women had been sterilized without agreeing to it.

The Indian Gaming Regulatory Act became law on October 17, 1988. Gaming means gambling businesses, such as casinos. The act sorts tribal gaming into three classes of games. It lets a nation and a state make a compact, a formal agreement about the games. It also set up the National Indian Gaming Commission to watch over tribal gaming. For some nations gaming became a large source of income. The amount varies a great deal from nation to nation.

The Native American Graves Protection and Repatriation Act, known as NAGPRA, became law on November 16, 1990, when President George H. W. Bush signed it. Under it, Native human remains and sacred objects held in museums and federal collections belong to the nations and families they came from. The act requires the people holding them to send them back. Repatriation means sending them home.

Nations take the schools back

Navajo leaders founded a college of their own at Tsaile, Arizona, in 1968. It was called Navajo Community College, and today it is Diné College. It was the first college in the country controlled by a Native nation. Native nations have founded dozens of tribal colleges since.

In November 1969 the senators on a Senate subcommittee on Indian education published their report. A subcommittee is a small group of senators assigned to one subject. The report's title is *Indian Education: A National Tragedy, A National Challenge*. It is known as the Kennedy Report, because Senator Robert F. Kennedy led the work at first and Senator Edward Kennedy finished it.

The report states that federal policy had been "coercive assimilation" with "disastrous effects." Coercive assimilation means forcing a group of people to give up their own language and ways of life. Its authors called for Native people to run Native schools.

Boarding-school enrollment peaked at about 60,000 children in 1973. After that it fell, as the leaders of Native nations took over schools under the 1975 law and other schools closed. A few boarding schools are still open. Tribes or the federal Bureau of Indian Education, the federal office in charge of Indian schools, run them. People who had been children at the schools began publishing accounts of what had happened to them there.

Wilma Mankiller

Who: the first woman elected Principal Chief of the Cherokee Nation.

When and where: Cherokee Nation, Oklahoma. She was chief from December 14, 1985 to August 14, 1995.

Movie: *Mankiller* (2017)

Wilma Mankiller was a child when her family moved to San Francisco under the relocation program. In 1969 Indians of All Tribes took Alcatraz, and she joined the movement during the occupation.

She went back to Oklahoma. There she worked on projects in which Cherokee communities built their own water lines and health clinics, with the people who lived there doing the work.

On December 14, 1985, when Ross Swimmer left the office, she became Principal Chief of the Cherokee Nation. The principal chief is the head of the Cherokee Nation's government. Cherokee voters elected her in her own right in 1987 and re-elected her in 1991 with 83 percent of the vote. Until August 14, 1995, she led a nation of about 140,000 citizens. In 1998 she received the Presidential Medal of Freedom, an award given by the president of the United States. Mankiller died on April 6, 2010.

Billy Frank Jr.

Who: Nisqually fisherman. Washington State officers arrested him more than fifty times for fishing under his nation's treaty.

When and where: Frank's Landing on the Nisqually River, Washington. He was first arrested at fourteen.

Billy Frank Jr. was fourteen the first time officers arrested him for fishing the Nisqually River. In all, he was arrested more than fifty times.

In the Treaty of Medicine Creek of 1854, the Nisqually kept "the right of taking fish" at all the places where they had always fished. Washington State officers arrested him anyway. He kept fishing, and in the 1960s and 1970s he and others staged fish-ins at Frank's Landing and were arrested again and again.

The fish-ins ended in the Boldt decision of 1974. Later Frank chaired the Northwest Indian Fisheries Commission.

He died in May 2014, and in 2015 he received the Presidential Medal of Freedom after his death. As of 2026, Washington State officials planned to place his statue in the National Statuary Hall in the United States Capitol.

Adam Fortunate Eagle

Who: Ojibwe writer. He was a Pipestone boarding-school student who became a lead organizer of the Alcatraz occupation.

When and where: Pipestone Indian Boarding School, Minnesota, 1935 to 1945. San Francisco Bay, 1969 to 1971.

Adam Fortunate Eagle spent ten years at the Pipestone Indian Boarding School in Minnesota, from 1935 to 1945. In those years John Collier was Commissioner of Indian Affairs, and federal officials were changing some of the schools. Three decades later, Fortunate Eagle was one of the lead organizers of the occupation of Alcatraz.

In 2010 he published his account of the school, *Pipestone: My Life in an Indian Boarding School*. In it he calls his school days there "a little bit of heaven." In the same book he writes about the harm the boarding-school system did.

Other people who were children at the schools told it differently. Staff at the Fort Defiance school washed Chester Nez's mouth out with soap for speaking Navajo. In 1900 Zitkala-Ša published essays about her own school that criticized it.

2000 to Today

There are 574 federally recognized Native nations in the United States. Federally recognized means that United States officials deal with the nation as a government. Each of these nations has its own government.

There are also nations recognized by their states, and nations still working to win federal recognition. More than 200 Alaska Native villages have their own corporations. Native Hawaiians have no federally recognized government of their own.

In the 2020 census, 9.7 million people identified as American Indian or Alaska Native, alone or together with another group. That was 2.9 percent of the people in the country. In 1900 the census had counted about 250,000.

The Navajo Nation's land covers more than 27,000 square miles across Arizona, New Mexico and Utah. It is the largest reservation in the country. The number of Cherokee Nation citizens passed 450,000 in 2023, counting enrolled citizens, people officially listed as members. Some counts in 2024 and 2025 put it above 475,000.

On September 21, 2004, the National Museum of the American Indian opened on the National Mall in Washington. About 25,000 Native people from across North and South America walked in the opening procession.

Sovereignty in court and in office

Sovereignty is the right of a nation to govern itself. When United States officials forced the Muscogee (Creek) Nation to move to Oklahoma, they promised it a reservation there. On July 9, 2020, the justices of the Supreme Court decided *McGirt v. Oklahoma*, a case about whether that reservation still existed. Five of the nine justices held that members of Congress had never ended it. Four justices disagreed.

Under the ruling, about 3.25 million acres of eastern Oklahoma, including much of Tulsa, are still reservation land. That matters for federal criminal law, the national laws about crimes. Justice Neil Gorsuch wrote the opinion, the written decision of the court. Its first sentence is: "On the far end of the Trail of Tears was a promise." The Trail of Tears was the forced removal of the Cherokee and the other Southeastern nations to Indian Territory, in what is now Oklahoma, in the 1830s. In later rulings, judges applied the same reasoning to the reservations of the other nations that United States officials had forced out of the Southeast.

On June 15, 2023, in *Haaland v. Brackeen*, seven of the nine justices upheld the Indian Child Welfare Act, which means they kept it in force. The people challenging the act had claimed that it broke the Constitution. Two justices disagreed with the ruling.

In 2018 Deb Haaland of Laguna Pueblo and Sharice Davids, who is Ho-Chunk, became the first Native American women elected to Congress. On March 15, 2021, members of the Senate voted to approve Haaland as Secretary of the Interior. The Secretary of the Interior heads the federal department in charge of the government's dealings with Native nations. She was the first Native American to hold a cabinet office, the job of heading one of the main federal departments.

Standing Rock and land back

In 2016 leaders of the Standing Rock Sioux Tribe opposed the Dakota Access Pipeline, a long pipe built to carry oil. Its route ran under Lake Oahe, upstream of the reservation. The lake is the reservation's water supply.

From April 2016, people set up camps, among them one called Oceti Sakowin. Young people carried the tribe's message on foot. They ran a 500-mile relay to the office of the Army Corps of Engineers in Omaha, and then a 2,000-mile run to Washington, D.C. The Army Corps of Engineers is the part of the army whose permission the pipeline needed. Thousands of people came to the camps. News reports at the time called the camps the largest gathering of Native nations in more than a century.

North Dakota's governor, Jack Dalrymple, declared an emergency in August 2016 and put the Morton County Sheriff's Office and other police forces under one command. On November 20, 2016, at the Backwater Bridge, officers fired tear gas, rubber bullets and bags filled with lead into a crowd of protesters. They also sprayed the protesters with a fire hose.

A protester named Sophia Wilansky was hit that night. In 2026 the judges of a federal appeals court set out her account, which they accepted as true for her appeal. Officers Dvorak, Arndt and Hanson fired rounds at her as she ducked behind a metal sheet, and one hit her arm. She ran. About 30 yards away, Officer Jonathan Moll fired a round called an aerial warning munition, which the judges described as an exploding flash-bang inside a bullet made to hurt rather than kill. "It tore the flesh off her arm, and she fell to the ground," the judges wrote. "Her left hand and forearm are permanently and severely injured." Federal judges threw out her lawsuits and those of the other injured protesters, and no officer was held responsible.

On December 4, 2016, an Army official, the Assistant Secretary for Civil Works, turned down the easement. An easement is the legal permission the pipeline needed to cross under the lake. That same week, more than 2,000 United States military veterans arrived to stand with the camps. On January 24, 2017, President Donald Trump ordered the Army to approve the pipeline quickly. Army officials granted the easement on February 8, 2017, and oil has moved through the pipeline since June 2017. In 2020 a federal judge cancelled the easement, but the oil kept flowing for about five years without one. In 2026 Army officials granted the easement again, and in June 2026 the tribe's leaders asked the court to end their own appeal.

Some land has gone back to Native nations. In 1908 federal officials took 18,800 acres out of the Flathead Reservation in Montana for the National Bison Range, a federal wildlife refuge. A wildlife refuge is land set aside to protect wild animals. In December 2020 members of Congress passed a law that gave the range back to the Confederated Salish and Kootenai Tribes, and the tribes took over running it in 2022.

The boarding-school investigation

In June 2021 Secretary Haaland started an investigation of the boarding schools. Earlier officials of her own department had run them.

The first volume of the investigators' report came out in May 2022. It identifies 408 federal schools, and marked and unmarked burial sites at 53 of them. The final volume came out on July 30, 2024. It lists 417 federal Indian boarding schools in 37 states or places that were then territories, open from 1819 to 1969. It also lists 1,025 more places with similar aims that fell outside the four rules the investigators used to count federal schools.

The report records what school staff did to the children. Staff cut the children's hair, replaced their clothes with uniforms, and gave them English names. They forbade the children to speak the languages they had grown up speaking. The punishments the report records for speaking those languages include beatings, solitary confinement, holding back food, and washing children's mouths out with soap. Solitary confinement means being locked up alone.

At least 973 children died at the schools. The investigators found at least 74 burial sites at 65 schools. The report states that the real number of deaths is higher than the number the investigators could count.

On October 25, 2024, President Biden apologized on behalf of the United States for the boarding-school system. He spoke at the Gila River Indian Community in Arizona, which was Ira Hayes's home community. It was the first formal presidential apology for the system. He called the system "a sin on our soul."

Children who died at the Carlisle Indian Industrial School are buried in a cemetery at the Carlisle Barracks, an Army post. Army officials have been digging up the children's remains and returning them to their nations. In 2017 they returned two children, Little Chief and Horse, to the Northern Arapaho. When they opened the grave of a third child, Little Plume, they found two other children in it. They found Little Plume and returned him the next year. In July 2021 nine Rosebud Sioux children went home to South Dakota, and Rosebud young people escorted them.

Languages come home

Boarding-school staff punished children for speaking Native languages. In the two world wars, soldiers used two of those languages, Choctaw and Navajo, to send messages the enemy could not read. Today Native nations run schools that teach children in their own languages.

In Hawaii, lawmakers banned teaching in Hawaiian in a law dating from 1896. In 1984 the first Pūnana Leo immersion preschool opened at Kekaha on Kaua'i. In an immersion school, teachers give every lesson in the language itself, so children learn arithmetic and reading in Hawaiian instead of learning Hawaiian as one subject. The Pūnana Leo schools were the first Indigenous-language immersion preschools in the United States. Indigenous means belonging to the people who lived in a place first.

The ban on teaching in Hawaiian was lifted in 1986, and the first public immersion classes opened in 1987. According to ʻAha Pūnana Leo, the group that started the Pūnana Leo schools, students can now be taught in Hawaiian from preschool through graduate school, the university study that comes after a first degree.

Wôpanâak, the Wampanoag language of Massachusetts, had no living speakers after the middle of the 1800s. In 1993 Jessie Little Doe Baird helped found the Wôpanâak Language Reclamation Project, and she began rebuilding the language from documents written in it. Reclamation means taking something back. Wôpanâak is the first American language with no living speakers to come back into living use. In September 2016 the project opened Mukayuhsak Weekuw, the Children's House, a school in Mashpee where Wampanoag children are taught mostly in Wôpanâak.

Cherokee, Lakota, Diné and many other nations run immersion schools of their own.

> #### Deb Haaland
>
> **Who:** Laguna Pueblo. She was one of the first two Native American women elected to Congress, and the first Native American cabinet secretary.

When and where: New Mexico and Washington, D.C., from 2018.

Deb Haaland is a citizen of Laguna Pueblo. She describes herself as a 35th-generation New Mexican. In 2018 she and Sharice Davids became the first Native American women elected to Congress.

On March 15, 2021, members of the Senate voted to approve her as Secretary of the Interior. She was the first Native American to run a cabinet department. Earlier officials of that department had run the federal boarding schools.

By her own account, her grandparents were taken to boarding school as children. Her account does not name who took them. In June 2021 she ordered officials of her department to investigate the department's own record and count what its officials had done. They published the final count on July 30, 2024, while she was still the secretary.

Jessie Little Doe Baird

Who: Mashpee Wampanoag social worker who became a linguist and brought back a language that no one had spoken since the middle of the 1800s.

When and where: Mashpee, Massachusetts, from 1993.

Movie: *We Still Live Here: Âs Nutayuneân* (2011)

By her own account, the work began with a dream about the language.

The language had no living speakers after the middle of the 1800s. Written records of it survived. Among them was the Eliot Bible, a Bible printed in Wôpanâak in 1663. Baird used that Bible and the other documents to rebuild the language.

She helped found the Wôpanâak Language Reclamation Project in 1993. She went to the Massachusetts Institute of Technology and earned a degree in linguistics, the study of how languages work. She raised her daughter speaking Wôpanâak. In 2010 she received a MacArthur Fellowship, a prize that the MacArthur Foundation gives to people for their work.

Since September 2016, Wampanoag children have been taught mostly in Wôpanâak at Mukayuhsak Weekuw, a school run by the project she helped found.

Chapter 3: Land and Environment

Before 1500

Before 1500, the Native nations of North America managed the land they lived on. In the eastern forests, people set fires on purpose to keep the woods open and to grow food for the animals they hunted. Farmers planted crops together in ways that kept the soil in good condition. In southwest Florida, the Calusa built pens in the water to hold live fish.

Beavers dammed streams across the continent. Bison grazed the Plains. Nobody knows how many bison lived there before 1500. The figure usually given is for a much later time: about 30 million in the early 1800s, before hunters killed off the herds.

Fire as a tool

For thousands of years, Native people in what is now the eastern United States burned their forests on purpose. They set low fires in the understory, the layer of brush and small plants under the tall trees. They burned the same ground again and again. The repeated fires kept the woods open and helped oaks and other trees that can live through fire. Food plants grew back after each burn, and the burns produced food for the game animals that people hunted. Game means wild animals hunted for food.

In 2019, researchers at Penn State, a university in Pennsylvania, published a study in the journal *Annals of Forest Science*. They found that which trees grew in the eastern forests depended more on Native burning than on the climate. Climate is the usual weather of a place over many years. Even small groups of people burned large areas, over and over. European colonists treated this burning as unimportant.

In the 1900s, officials of the US Forest Service tried to put out every forest fire. The Penn State researchers call the total stopping of fires after about 1940 "an ecologically transformative event in all forests." Ecology is the study of how living things depend on each other and on the land, and transformative means causing a big change.

Three crops in one field

Native farmers grew corn, beans and squash together in the same field. The three crops are known as the Three Sisters. The beans put nitrogen into the soil. Nitrogen is a natural substance that plants take up from the soil to grow. The wide squash leaves shaded the ground and held the soil in place. The tall corn stalks gave the bean vines something to climb.

Growing the three crops together kept the soil in good condition. A field planted with only one crop, year after year, wears out.

Beavers, bison and fish pens

Beavers changed whole watersheds. A watershed is all the land that drains into one stream or river. Beaver dams held back water in ponds. The ponds slowed floods, and the wet ground around them became wet meadows. Estimates of how many beavers lived in North America before the fur trade run from 60 million to 400 million. These numbers are estimates, because nobody counted the beavers. The fur trade was the buying and selling of animal skins between European traders and Native trappers.

Bison lived on the Plains, the wide grasslands in the middle of the continent. About 30 million bison lived there in the early 1800s. Estimates for the years before Europeans came are less certain.

In what is now southwest Florida, the Calusa people built watercourts between 1300 and 1400. Watercourts were pens in the water that held live fish until people needed them for food.

The 1500s

Ships from Europe brought pigs, horses, cattle and earthworms to the Americas. Pigs that escaped from the Spanish explorer Hernando de Soto and his men went wild in the Southeast. European earthworms moved into northern forests that had no worms before.

After 1492, most of the Native people of the Americas died. Most died of diseases carried by European settlers and by enslaved Africans. European soldiers and settlers killed others in wars to take Native lands, and many starved. Enslaved people were held as property and forced to work without pay. Forest grew back over the farmland of the people who died.

Pigs, horses and cattle

Pigs that escaped from Hernando de Soto's herd became the ancestors of the feral hogs of the Southeast. Feral hogs are pigs from farm stock that live in the wild.

De Soto landed near Tampa Bay, in what is now Florida, in May 1539. He brought about 600 men and a herd of pigs. An expedition is a journey made by a group for a purpose. Chronicles, the written histories of de Soto's expedition, list the first herd as 13 pigs. By the time de Soto died in 1542, the herd had grown to about 700. That count leaves out the pigs the men ate or gave away and the pigs that escaped.

Horses and cattle came with the Spanish. Columbus brought horses on his second voyage, in 1493. Spanish colonists brought horses and cattle to their colony in New Mexico in 1598.

Earthworms

Before Europeans came, the forests of northern North America had no earthworms. Glaciers, thick sheets of ice that once covered the north, had scraped the ground bare of them. For roughly the last 12,000 years, the forests that grew back after the ice stood on a thick, soft layer of fallen leaves called duff. Native wildflowers and young trees grew in the duff.

European earthworms crossed the ocean hidden in ballast soil. Ballast is heavy material carried low in a ship to keep it steady. Worms also came in the soil around the roots of plants brought from Europe. Later they spread west with wagons, horses and farms. Where European worms move into a northern forest, they eat the duff that the wildflowers and young trees need.

Forest over lost farms

After 1492, most of the Native people of the Americas died from epidemics and famine or were killed in war. An epidemic is a disease that spreads quickly to many people. A famine is a lack of food so great that people starve. European settlers brought the diseases, and so did enslaved Africans whom Europeans had carried across the ocean. The diseases included smallpox, measles and influenza, and Native people had never been exposed to any of them before. European soldiers and settlers made war on Native nations to take their land, and they enslaved Native people. Famine followed when too few people were well enough to farm.

In 2019, a team of researchers at University College London, in England, published an estimate of what those deaths did to the land. They estimated that the Native population of the Americas fell from about 60 million to about 6 million within roughly a hundred years. Other estimates of the starting number differ. For North America north of Mexico alone, estimates run from 1 million to 18 million.

The team estimated that about 55.8 million hectares of farmland grew back into forest after its farmers died. A hectare is a square of land 100 meters long on each side. The new trees took carbon dioxide, a gas that traps heat, out of the air. The team estimated that the regrowth lowered the carbon dioxide in the air by 7 to 10 parts in every million parts of air, and cooled the whole planet by about 0.15 degrees Celsius. That is about a quarter of a degree on the Fahrenheit scale used in American weather reports. All of these figures are the estimates of this one team.

The 1600s

English colonists of the 1600s treated land as property that one owner held forever, marked off with fences and recorded in deeds. A deed is a paper that says who owns a piece of land. The Native nations of New England used their land by season. They had planting grounds, fishing places and hunting grounds, and they did not treat land as something one person owned forever. The historian William Cronon describes how English colonists and Native nations in New England used land in these different ways in his 1983 book *Changes in the Land*.

The colonists brought cattle and hogs and let them roam free. The animals got into Native planting fields, and colonists and Native people quarreled over this again and again. In 1642 the Narragansett leader Miantonomi described what the English were doing to the land. In the same century, the number of beavers began a long fall as trappers caught them for the fur trade.

The beaver trade

Hat makers in Europe wanted beaver fur to make felt, a thick cloth made by pressing fur together. Native trappers caught the beavers, and European traders paid for the furs with goods made in Europe. In the 1600s the number of beavers began to fall in the Northeast.

The fall went on until about 1900. By then about 100,000 beavers were left in North America, most of them in Canada. Today there are roughly 15 million. Both of these numbers are estimates.

The first limits on cutting trees

Under a Plymouth Colony rule of 1626, no one could cut timber on the colony's land, or sell it, without official permission. Timber is wood cut for building. It was among the earliest conservation rules in the colonies. Conservation means protecting land, water, plants and

animals so that people do not use them up.

In 1681 William Penn wrote rules for settlers in Pennsylvania. For every five acres a settler cleared of trees, Penn's rules required the settler to leave one acre of trees standing. An acre is a piece of land a little smaller than a football field. The rules named oaks and mulberry trees, which were useful for silk and for ships. Settlers widely ignored this rule.

Miantonomi

Who: A sachem, or leader, of the Narragansett nation. He put into words what English settlers were doing to the land, about one generation after they began to settle there.
When and where: A speech to the Montaukett people on Long Island in 1642, written down by the English soldier Lion Gardener. Miantonomi lived from about 1600 to 1643.

In 1642 Miantonomi told the Montaukett people on Long Island what the English were doing to the land. English settlement in New England was then about one generation old. Miantonomi was a sachem, a leader, of the Narragansett nation.

His words were written down by Lion Gardener, an English soldier. Gardener wrote them in his *Relation*, an account he set down in 1660, years after the speech. By Gardener's record, Miantonomi said that "our fathers had plenty of deer and skins and our plains were full of game and turkeys." He said that the English "with scythes cut down the grass, and with axes fell the trees." A scythe is a tool with a long curved blade for cutting grass. To fell a tree means to cut it down. He went on: "their cows and horses eat the grass, and their hogs spoil our clam banks, and we shall all be starved."

The exact wording is Gardener's, set down by an Englishman years later. The complaints themselves match what colonists were doing at the time: cutting the forests and letting their cattle and hogs roam into Native fields.

In 1643 Uncas, the sachem of the Mohegan nation, captured Miantonomi and took him to Hartford. That September, the commissioners of the United Colonies of New England met in Boston. They were English officials from the Massachusetts Bay, Plymouth, Connecticut and New Haven colonies. They passed the case to a group of ministers, who were church leaders. Then the commissioners sentenced Miantonomi to death and handed him back to Uncas to carry out the sentence. Governor John Winthrop of Massachusetts Bay wrote in his journal that "they all agreed that he ought to be put to death." He gave their reason: "Uncas could not be safe while Miantonomo lived." Miantonomo is another spelling of Miantonomi. Mohegan men took him to the place near present-day Norwich, Connecticut, where he had been captured. There one of Uncas's

> men, walking behind Miantonomi, killed him with a hatchet blow to the head. Mohegan tradition and later histories name that man as Wawequa, the brother of Uncas. By the account of the historian Neal Salisbury, several Englishmen went along to make sure the killing was carried out.

1700 to 1750

Tobacco planters in colonial Virginia wore out the soil of a field in three or four years. Planters were people who owned large farms called plantations. When a field wore out, they cleared new ground farther up the rivers and moved on. In New England, cutting the largest white pines was against the law. The king's officials kept them for the masts of the Royal Navy, Britain's navy. By the middle of the 1700s, whalers from the island of Nantucket were sailing far out into the ocean to hunt sperm whales.

The king's pines

The king's officials kept the largest white pines in New England for the masts of the Royal Navy's ships. A mast is the tall pole that holds up a ship's sails. A charter is a written grant from the king or queen that sets up a colony's government. In the Massachusetts Bay charter of 1691, the rule covered every white pine 24 inches across or more.

Under the White Pine Act of 1722, cutting any white pine more than 12 inches across without a license was against the law in New Hampshire and nearby colonies. A license is written permission. The king's trees carried a mark called the Broad Arrow, which was three slashes cut with a hatchet. Royal officials enforced these laws loosely until the 1760s.

Worn-out tobacco fields

A tobacco field in colonial Virginia gave good crops for only three or four years. After that, planters cleared new ground and let the old field grow over with scrub, which is brush and small trees. The land around Jamestown wore out early. Planters moved up the rivers and reached the Rappahannock and the Potomac by about 1650. They kept moving up the rivers all through the 1700s. Because new land was cheap, planters kept wearing out one field after another.

The new land along the Rappahannock River was the homeland of the Rappahannock Tribe. The tribe's own history states that English settlement there began illegally in the 1640s. By that history, Rappahannock leaders sold their first land to the English in 1651. They spent more than ten years in county courts trying to get paid for that sale and others. They never received full payment. The tribe's history goes on to say that by the late 1660s, settlers and bands of settlers who acted as their own law had forced the Rappahannock to move. The tribe moved first inland on the north side of the Rappahannock River, and later to its old hunting grounds on the south side. In 1683, the history states, officials of the Virginia colony forced the tribe out of their homes and moved them to a place called Portobago Indian Town.

Indentured servants and enslaved Africans did the work in the tobacco fields. An indentured servant worked for a master for a set number of years, often four to seven, to pay for the trip to America. Planters held enslaved Africans as property and forced them to work without pay for life. Under a Virginia law of 1662, a child born to an enslaved mother was enslaved for life too. Growing tobacco took a great deal of hand work, and planters wanted more and more workers to do it.

Whaling from Nantucket

By the middle of the 1700s, whalers from Nantucket, an island off Massachusetts, were hunting sperm whales far out in the ocean. Before that, New Englanders hunted right whales, a kind of whale, from the beaches. On Nantucket, people tell a story that deep-sea whaling began there in 1712. In the story, wind blew Christopher Hussey's boat out to sea, and the men aboard killed a sperm whale. Obed Macy first wrote the story down in his history of Nantucket in 1835, more than 120 years later. It may be a legend. Historians at the Nantucket Historical Association call 1712 the traditional date.

1750 to 1800

In 1785 members of Congress ordered the land north and west of the Ohio River measured into a grid of squares. Then US officials could sell it. The Shawnee, Delaware, Wyandot, Miami, Ottawa, Chippewa, Potawatomi and other nations lived on that land. In January 1785, US commissioners claimed most of Ohio through a treaty signed under threat. Commissioners are officials sent to do a certain job, and a treaty is a written agreement between nations.

Surveyors measured the land under army guard. From 1790 to 1794, US generals led armies against the nations, who had joined together to stop settlement. After General Anthony Wayne's army defeated them in 1794, leaders of eleven nations signed a treaty in 1795 that handed most of Ohio to the United States.

Before independence, the king's officials had claimed New England's biggest white pines. In 1772, men in Weare, New Hampshire, beat a sheriff who came to arrest a mill owner fined for cutting them. After independence, settlers crossed the Appalachian Mountains and cleared the forest for farms.

Ebenezer Mudgett

Who: A sawmill owner in Weare, New Hampshire, fined for cutting the king's white pines, who led the Pine Tree Riot.

When and where: South Weare, New Hampshire, April 13 and 14, 1772.

Ebenezer Mudgett owned a sawmill in Weare, New Hampshire. He had been fined for cutting the king's white pines, the trees kept by law for the masts of the Royal Navy.

On April 13, 1772, Sheriff Benjamin Whiting rode into South Weare with a warrant to arrest Mudgett. A warrant is a paper from a court that allows an arrest. Mudgett told him he would pay in the morning. At dawn on April 14, Mudgett came back with 20 to 30 men who had blackened their faces with soot, the black powder that smoke leaves behind. They beat the sheriff and his deputy with rods and drove them out of town. The fight became known as the Pine Tree Riot.

In September 1772, eight men stood trial in the Superior Court at Amherst, New Hampshire, for rioting and for beating Whiting. They pleaded guilty. The four judges fined each man only 20 shillings and made them pay the cost of the hearing. A shilling was a British coin. After the riot, officials mostly stopped enforcing the law that kept the pines for the navy. Some accounts count the riot as a forerunner of the Boston Tea Party, a protest in December 1773. A forerunner is an earlier event of the same kind. No one has proved that the riot led to the Tea Party.

The grid, 1785

On May 20, 1785, members of the Confederation Congress passed the Land Ordinance. The Confederation Congress was the national government of the United States before the Constitution. An ordinance is a law. This one specified how the public land would be sold.

Public land was land that US officials claimed for the nation, and Native nations lived on much of it. Under the ordinance, surveyors had to survey that land before anyone could buy it. To survey land means to measure it and map it.

The surveyors divided the land into townships, which were squares six miles long on each side. They cut each township into 36 sections. A section was one square mile, which is 640 acres. The sections were numbered, and members of Congress set aside section 16 in every township to support public schools.

After changes to the system in 1796, surveyors carried the grid across the continent to the Pacific Ocean. People in airplanes over the Midwest can still see its checkerboard pattern on the ground.

Whose land the grid covered

In 1785 the land north and west of the Ohio River was the home of the Shawnee, Delaware, Wyandot, Miami, Ottawa, Chippewa, Potawatomi and other nations. George W. Knepper wrote a history of these lands, *The Official Ohio Lands Book*, for Ohio's Auditor of State, an official of the state government. He writes that, as members of Congress saw it, "Indian claims to that land had to be cleared." Here, cleared means ended, so that no Native nation still had a right to the land.

A commissioner is an official sent to do a certain job. A treaty is a written agreement between nations. In January 1785, four months before the Land Ordinance passed, US commissioners met representatives of several nations at Fort McIntosh. The commissioners made a treaty there. In it, they said that most of the Native people of Ohio had to stay inside a reserve between the Cuyahoga and Maumee rivers. A reserve is an area set aside for a nation to live on. Knepper writes that under the treaty, "Most Ohio lands would now be open for settlement."

Knepper writes that the Shawnee in particular "refused to abide by" the treaty. To abide by means to obey. He says the treaty was "negotiated under duress by minor tribal chiefs who lacked authority to speak for their people." Under duress means under threat or force.

On September 30, 1785, Thomas Hutchins began the first survey of this land for the national government. His title was Geographer of the United States. A geographer is a person who studies and maps the land. He and his crew worked in eastern Ohio, in an area called the Seven Ranges. On October 8 the crew heard news of an attack by Native people on the Tuscarawas River. Hutchins and his men stopped after only a few miles of their first line and went back to Pittsburgh.

Hutchins asked for soldiers to protect his crew. In 1786 Lieutenant Colonel Josiah Harmar, the commander of the US army, ordered Major John Francis Hamtramck and soldiers of the First American Regiment to guard the surveyors. A regiment is a large unit of soldiers. Under that guard, the crew ran a line 42 miles west from Pennsylvania, called the Geographer's Line. Then they cut the land into ranges, which are long strips, and into townships and sections. They measured the land for sale while the nations who lived on it still rejected the treaty.

In 1786, Knepper writes, US commissioners "coerced" the Shawnee into another treaty at Fort Finney. Coerced means forced.

The war for Ohio and the Treaty of Greenville

The nations of the region joined in a confederacy, which is a union of nations, to stop American settlement. In 1790 Josiah Harmar led a US army against them. He was the same officer who had sent soldiers to guard the surveyors, and since 1787 he had held the title of brigadier general. Warriors led by Little Turtle, a Miami war chief also known as Meshekinoquah, defeated Harmar's army.

In 1791 Major General Arthur St. Clair led another army against the confederacy. St. Clair was the governor of the Northwest Territory, the US name for the land north and west of the Ohio River. On November 4, 1791, the confederacy's warriors defeated his army at the place later called Fort Recovery. A US Army history of the campaign counts more than 900 soldiers, and women and children traveling with the army, killed or wounded. Knepper calls it "the worst defeat ever inflicted upon the U.S. Army by Indian warriors."

In 1794 Major General Anthony Wayne led an army that defeated the confederacy at the Battle of Fallen Timbers. On August 3, 1795, leaders of eleven northwestern nations signed the Treaty of Greenville. In it, a year after their defeat, they handed 16,930,417 acres to the United States. Under the treaty, the nations kept only the northwest quarter of Ohio and the lands beyond it, behind a boundary called the Greenville Treaty Line.

Clearing after independence

After independence, the British king no longer had any right to the white pines in the United States. Settlers crossed the Appalachian Mountains, some of them into the Northwest Territory, and cut down the forest to make farms.

1800 to 1850

In the first half of the 1800s, dams across the rivers of New England stopped the salmon from swimming upstream to lay their eggs. By 1850 farmers had cut down most of New England's forest, and a boom in sheep raising was one cause.

In 1832 the painter George Catlin wrote about keeping a huge park for the bison and the Plains nations, which he called "a nation's park." He meant a park that would hold both the bison and the Native nations who lived there. In these same years John James Audubon painted the birds of North America. Henry David Thoreau lived for two years in a cabin he built at Walden Pond, in Massachusetts.

Dams stop the fish

Atlantic salmon live in the ocean but swim up rivers to spawn, which means to lay their eggs. A dam across a river blocks them on the way. The first dam across the Connecticut River went up at Turners Falls, Massachusetts, in 1798. It cut the salmon off from the water where they spawned. By the War of 1812, no salmon came into the Connecticut River at all.

Workers for the Essex Company, a company formed to use the river's water to power mills, built the Great Stone Dam across the Merrimack River at Lawrence, Massachusetts. They finished it in 1848. It stood 30 miles from the sea, and salmon could not get past it. By 1865 the salmon runs were gone from the rivers of southern New England. A run is the yearly trip of fish up a river. The runs of shad, another fish, collapsed as well.

In 1857 the writers of a report in New Hampshire named the causes. They blamed the dams, fishing with no limits, and mill machinery that killed young fish.

The bare East

By 1850 New Englanders had cut down most of their forest. Estimates of how much was cleared run from about 60 percent to 80 percent of the land, and some places were cleared even more. One estimate puts the forest left in 1850 as low as a quarter of New England.

A boom in Merino sheep, a kind of sheep raised for its wool, was one cause of the clearing. By 1840 New England farmers kept about 4 million sheep, more sheep than there were people. Farmers cleared still more forest to feed them.

Across the eastern United States, the forest reached its smallest size around 1872. By then it covered roughly half the land it had covered in 1620. After that, many eastern farmers left their farms and moved west. Trees grew back on the fields they left behind.

A park for people and bison

In 1832 the painter George Catlin traveled far up the Missouri River, into the West. He feared that the bison and the Plains nations would be destroyed together. He wrote of "a magnificent park," which he called "a nation's park, containing man and beast, in all the wild and freshness of their nature's beauty." In Catlin's plan, the people who lived on the land would stay on it with the animals.

Forty years later, in 1872, President Ulysses S. Grant signed a law, and under it Yellowstone became the first national park. In 1879 Philetus W. Norris, Yellowstone's superintendent, the official in charge of the park, had the Tukudika people who lived there forced out and taken to a reservation. A reservation is land set aside for a Native nation to live on.

John James Audubon

Who: A painter and naturalist, a person who studies animals and plants in the wild. He painted *The Birds of America*, 435 life-size pictures of birds.

When and where: He lived from 1785 to 1851. His book came out from 1827 to 1838. In 1813, on the way to Louisville, Kentucky, he saw a flock of passenger pigeons that he figured at more than 1 billion birds.

Movie: *John James Audubon: Drawn from Nature* (PBS American Masters, 2007)

John James Audubon painted the birds of North America at their real size. His book *The Birds of America* contains 435 of these paintings. It came out from 1827 to 1838. Audubon worked on it for about 18 years.

In 1813 Audubon was riding to Louisville, Kentucky, when a flock of passenger pigeons flew over him. Passenger pigeons were wild pigeons that flew in huge flocks. In Audubon's own account, one flock darkened the sky for three days. He did the arithmetic himself and put that single flock at more than 1 billion birds.

Henry David Thoreau

Who: A writer who also worked as a land surveyor, measuring woodlots for a living.

When and where: He lived from 1817 to 1862. He lived in a cabin at Walden Pond, near Concord, Massachusetts, from July 4, 1845, to September 6, 1847.

Henry David Thoreau wrote about wild nature, and he earned his money measuring land. He worked as a land surveyor, a person who measures land and maps it. Thoreau measured woodlots, pieces of land kept for growing trees.

> On July 4, 1845, Thoreau moved into a cabin he had built himself at Walden Pond, near Concord, Massachusetts. He lived there until September 6, 1847, which comes to two years, two months and two days. His book about those years, *Walden*, came out in 1854.
>
> On April 23, 1851, Thoreau gave a talk called "Walking" in Concord. It came out as an essay in June 1862, just after he died. In it he wrote: "in Wildness is the preservation of the world." Preservation means keeping something safe.

1850 to 1900

In 1862 members of Congress passed laws for giving away land taken from Native nations. Under those laws, officials gave the land to railroad companies, to settlers called homesteaders and to the states for colleges. By one historian's count, US officials took more than 1.5 billion acres from the nations between 1776 and 1887.

On the Plains, hide hunters killed most of the bison for their skins, which are called hides. About 30 million bison lived there in the early 1800s, and fewer than 1,000 were left by 1900. The Plains nations lived on the bison. Army generals wrote in favor of the killing, to take away the nations' food and force them onto reservations. Columbus Delano, the Secretary of the Interior and one of the president's top officials, wrote that he would not seriously regret the bison's disappearance. Without the bison, he wrote, Native people would have to live by farming. Professional hunters also killed passenger pigeons at their nesting grounds, a reported 50,000 birds a day for months at one Michigan nesting in 1878.

In 1851 volunteer soldiers drove the Ahwahneechee people out of Yosemite Valley. President Abraham Lincoln signed the Yosemite Grant in 1864. In 1872 President Ulysses S. Grant signed a law, and under it Yellowstone became the first national park. In 1879 Philetus W. Norris, the park's superintendent, had the Tukudika people forced out and taken to a reservation. In 1892 John Muir helped found the Sierra Club, a club formed in part to protect the forests and mountains of California's Sierra Nevada.

Land taken from Native nations, in acres

From 1776 to 1887, US officials took more than 1.5 billion acres from Native nations. They took it by treaty and by executive order. A treaty is a written agreement between nations, and an executive order is a command from the president. Historian Claudio Saunt, of the University of

Georgia, made this count. He built it on maps that Charles C. Royce published in 1899. Royce mapped every piece of land that US officials took from the nations by treaty or order from 1784 to 1894.

Once officials had taken the land, it counted as public land, meaning land that US officials claimed for the nation. Members of Congress then passed it on to railroads, settlers and colleges.

On July 1, 1862, President Abraham Lincoln signed the Pacific Railway Act. Under it, railroad companies received "every alternate section of public land, designated by odd numbers." They got five of these sections for each mile of track on each side of the line. Alternate means every other one. A section is one square mile, or 640 acres. The act also states: "The United States shall extinguish as rapidly as may be the Indian titles to all lands falling under the operation of this act." To extinguish a title means to end someone's legal ownership of land. The lawmakers were telling officials to end the nations' ownership of the land along the railroads as fast as they could.

From 1850 to 1871, members of Congress granted railroad companies about 129 million to 131 million acres. The counts differ, and some reach 175 million acres by including grants the companies later lost. State lawmakers granted the railroads about 51 million acres more. The Northern Pacific railroad alone got about 44 million acres.

Lincoln signed the Homestead Act on May 20, 1862. Under it, a person could claim up to 160 acres of public land. A person who lived on the land or farmed it for five years got to keep it. Over the life of the law, US officials handed 270 million acres to private owners this way, which is 10 percent of the area of the United States. A National Park Service page states that much of this land "was seized from the Native Americans who previously inhabited it." Seized means taken by force.

On July 2, 1862, Lincoln signed the Morrill Act. Under it, each state received 30,000 acres of public land for each of its senators and representatives in Congress. State officials sold the land to pay for colleges of "agriculture and the mechanic arts," which means farming and the use of machines. A page about the act from the National Archives, the office that keeps the government's records, states that the act "resulted in the expropriation of over 10 million acres from Native American tribal lands." Expropriation means taking property away from its owners.

In 2020 the reporters Robert Lee and Tristan Ahtone, writing for the magazine *High Country News*, traced 10.7 million acres of this land. It came from nearly 250 tribes, bands and communities. US officials got it through more than 160 takings of land that the reporters call "violence-backed," meaning that violence or the threat of it forced the nations to give it up. US officials paid less than $400,000 in all to end the nations' ownership of it. By the early 1900s, sales of the land had raised $17.7 million for 52 universities. In 2020 the universities still held more than 500,000 acres of it.

One example comes from Minnesota. In the summer of 1851, four bands of Dakota people signed treaties at Mendota and Traverse des Sioux. The reporters describe the conditions as "withholding of rations, the threat of violence, enforced starvation." Rations are supplies of food. The Dakota received "less than 2.4¢ per acre." The University of Minnesota's share of the money from the land came to "nearly $580,000."

Members of Congress passed the Dawes Act in 1887. A reservation is land set aside for a Native nation to live on. Under the Dawes Act, US officials cut reservations into separate plots, 160 acres for a family farm or 320 acres for grazing animals. This is called allotment. Officials then sold the land left over, which they called "surplus." By the National Park Service's count, reservation land fell from 138 million acres in 1887 to 48 million acres in 1934, a loss of 65 percent. The Meriam Report, a 1928 study of Native life made for Secretary of the Interior Hubert Work, records 137 million and 47 million. Either way, the nations lost about 90 million acres.

Fire made a crime, 1850

On April 22, 1850, California's state lawmakers passed a law called the *Act for the Government and Protection of Indians*. Under Section 10 of the law, it was a crime to set the prairie on fire, or to refuse to help put out a prairie fire. Section 10 states that such people "shall be subject to fine or punishment, as a Court may adjudge proper." That means a judge would choose the punishment.

Section 10 speaks of "any person or persons." The whole law was about Native people, though, and burning the land on purpose was a Native practice. Reporters at the news outlet ICT write that under California law, cultural fire was "explicitly banned" for more than 150 years. Cultural fire means burning done by Native people to care for the land.

Under other sections of the same law, white people could take custody of Native children until the children were grown. Custody means control over a child and where the child lives. Officials could also arrest Native people they called "vagrants," meaning people with no home

or work. Within 24 hours, officials could hire those people out "to the best bidder" for up to four months. This was forced labor: the arrested person had to work for whoever won the bidding.

Yosemite and the Ahwahneechee

The Ahwahneechee people lived in Yosemite Valley, in California's Sierra Nevada mountains. Their headman, or leader, was Tenaya. In 1851 volunteer soldiers burned their villages and their food and drove them out of the valley.

James D. Savage was a trader who had moved onto Ahwahneechee land to mine gold and to trade. In December 1850, Ahwahneechee fighters attacked his trading post on the Fresno River. One account says Chowchilla fighters joined them. They took his supplies and killed two of his men.

Early in 1851, California's governor, John McDougal, called for volunteers after attacks on miners and traders. About 200 men on horseback formed the Mariposa Battalion on January 24, 1851. A battalion is a unit of soldiers. Their commander was Major James D. Savage. State officials supplied their camp gear and supplies. Federal money paid for the battalion, through federal officials called US Indian commissioners.

The battalion's men first entered Yosemite Valley on March 27, 1851, by the Park Service's date. A National Park Service page states that they "systematically burned villages and food supplies and forced men, women, and children away from their homes."

Lafayette H. Bunnell rode with the battalion and wrote an account of it in 1880. He writes that in Captain John Boling's company, men on foot had orders "to burn any caches they might find." A cache is a hidden store of food. Acorns were the people's main food for the winter.

On the upper San Joaquin River, next to Yosemite, Bunnell says the huts and "adjacent supplies of acorns, were at once given to the flames." He estimated the acorns burned there at 800 to 1,000 bushels, and pine nuts too. A bushel is a measure of dry goods that fills a large basket. In Yosemite Valley, Bunnell found that "nearly all the acorns had been burnt." The battalion's men marched Tenaya and his people to a reservation on the Fresno River.

Battalion men held Tenaya's youngest son and another young man as hostages, tied to a tree. A hostage is a person held prisoner to force others to do something. Bunnell writes that the guards let the two untie themselves "in order to fire upon them, expecting to kill them both." One guard shot Tenaya's son in the back and killed him. The other young man escaped.

Bunnell describes the shooter only as "a young man" urged on by "an old Texan," and he names neither of them. Captain Boling told the guards "that they had committed murder." Bunnell writes that "no punishment was ever inflicted upon the perpetrators," meaning the men who did it. Tenaya was killed in 1853 in a fight with Mono Lake Paiutes. Accounts of why the fight happened differ.

On June 30, 1864, President Lincoln signed the Yosemite Grant. With it, US lawmakers set aside Yosemite. It was the first land that the nation's lawmakers set aside to protect and to keep for public use. California's state officials took charge of it under the grant. Yosemite became a national park on October 1, 1890. The National Parks Conservation Association is a group that campaigns for the parks. An article by the group states that the 1890 park came "with authorization to remove anyone making homes without permission." Authorization means official permission. Ahwahneechee families came back and lived in the valley anyway, and they worked for the hotels and the park.

A Park Service page states that by 1910, more than 90 percent of the Ahwahneechee who had lived in the valley were dead or missing. The page does not say how each of them died or went missing. To Tu Ya, also called Maria Lebrado Ydrte, saw the 1851 raid as a child. She saw the battalion's men destroy her home in Yosemite Valley, and during the raid she saw her uncle murdered. To Tu Ya was Tenaya's granddaughter, so her uncles were Tenaya's sons. The Park Service page does not state which uncle was killed or who killed him. It describes her as the last survivor of the raid. In the late 1920s she came back to Yosemite and told her story.

Hide hunters and the railroads

Hide hunters, who sold the skins for money, killed most of the Plains bison. About 30 million bison lived on the Plains in the early 1800s. By 1900 fewer than 1,000 were left, and one count in 1884 found only 325. The hunters called themselves "buffalo runners," because bison are also called buffalo.

The first railroad across the country, finished in 1869, carried hunters out to the herds. In 1871 leather makers at a tannery in Pennsylvania found a way to turn bison hides into leather for harnesses and machine belts. A tannery is a place where animal skins are made into leather. Each hide sold for $1 to $3. The Kansas Pacific and the Atchison, Topeka and Santa Fe railroads carried the hides east.

Lieutenant Colonel Richard Irving Dodge, an army officer, made an estimate of the hides shipped. By his figures, three railroads carried 1,378,389 hides from the southern Plains in 1872, 1873 and 1874. He counted 459,463 hides on the Santa Fe line and guessed that each of

the other two lines carried as many. Dodge also figured that before 1874, hunters wasted so many hides that for every hide shipped, about three bison had been killed. His totals were 3,158,730 bison killed by white hunters and about 1,215,000 killed by Native hunters. William T. Hornaday of the Smithsonian Institution reported these totals in 1889. They are Dodge's estimates, not counts.

Dodge described Kansas in the fall of 1873: "Where there were myriads of buffalo the year before, there were now myriads of carcasses. The air was foul with a sickening stench." Myriads means huge numbers. Carcasses are the dead bodies of animals.

Officers who wanted the bison gone

Army officers encouraged the hide hunters. Several officers also wrote that killing the bison would force the Plains nations onto reservations.

Historians disagree about whether the army had an official plan to wipe out the bison. Historian David D. Smits argues that the army followed a plan that was mostly never written down. Historians Robert M. Utley and Robert Wooster write that the army had no such official policy. Smits reports that no one has found a written order to kill off the bison. Utley writes that officials "applauded the slaughter," because they saw that it would "force the Indian onto the reservation." Historian William A. Dobak questions how much of the killing the army caused.

In 1867 an Englishman named W. F. Butler told Dodge he was sorry for killing more than 30 bulls, which are grown male bison. Butler wrote in 1911, decades later, that Dodge answered: "Kill every buffalo you can! Every buffalo dead is an Indian gone."

On May 10, 1868, General William T. Sherman wrote to General Philip H. Sheridan: "as long as Buffalo are up on the Republican the Indians will go there." The Republican is a river on the Plains. Sherman went on: "I think it would be wise to invite all the sportsmen of England and America there this fall for a Grand Buffalo hunt, and make one grand sweep of them all." In 1869 Sherman became the commanding general of the whole army.

Sheridan answered in a letter of October 15, 1868: "The best way for the government is to now make them poor by the destruction of their stock, and then settle them on the lands allotted to them." By "stock," Sheridan meant the nations' bison and horses. A month earlier, Lieutenant Colonel Luther P. Bradley had written in his journal that his orders were "to kill all the buffalo we find, and drive the Arapahoes and Cheyennes south, and the Sioux north."

At least one officer disagreed. On January 20, 1872, Colonel William B. Hazen wrote: "The theory that the buffalo should be killed to deprive the Indians of food is a fallacy." A fallacy is a false idea. He called the killing "wicked and wanton waste." Wanton means done for no good reason.

Officers at army posts, among them Forts Griffin, Dodge, Concho and Richardson, gave the hunters protection and supplies and helped them ship hides. In 1873 hide hunters asked Dodge, then in command at Fort Dodge, what he would do if they hunted south into Texas. The 1867 Medicine Lodge Treaty had reserved that hunting ground for the Kiowa, Comanche, Southern Cheyenne and Arapaho. The hunter J. Wright Mooar recalled Dodge's answer in 1930: "Boys, if I were a buffalo hunter I would hunt buffalo where buffalo are."

In December 1874, during the Red River War of 1874 and 1875, Colonel Nelson A. Miles wrote out his plan: "I would leave as few Indians or Buffalo behind, and as little for them to subsist on as possible." To subsist means to stay alive. In a book about his own life, published in 1896, Miles wrote that "the buffalo, like the Indian, stood in the way of civilization and in the path of progress, and the decree had gone forth that they must both give way." A decree is an order.

Officials in Washington

Leaders of the Plains nations asked officials to stop the hunters, and the officials did not stop them. In 1871 a Sioux delegation asked Columbus Delano to keep white hunters out of Sioux country. A delegation is a group sent to speak for its people. Delano was the Secretary of the Interior, one of the president's top officials. He refused.

In 1872 Colonel Edward Wynkoop reported words that Little Robe, a Cheyenne chief, had said to him. Wynkoop had been the government's agent to the Cheyenne. An Indian agent was the US official in charge of a reservation. Little Robe said: "What do you think my people ought to do when they see their cattle, the buffaloes, killed by your race when they are not hungry?" Only Wynkoop's report records these words.

Delano's yearly report for 1873 records that he "would not seriously regret the total disappearance of the buffalo from our western prairies, in its effect on the Indians." He saw the loss of the bison as "a means of hastening their sense of dependence upon the products of the soil and their own labors." He meant that without the bison, Native people would have to live by farming.

Members of both houses of Congress passed a bill to protect the bison in 1874. Under it, no one but a Native person could kill a female bison, or more males than needed for food. The fine would be $100 for each animal. President Grant did not sign the bill. Members of Congress

ended their meeting before he signed it, so the bill never became law. This is called a pocket veto.

Grant had promised a Southern Cheyenne and Arapaho delegation that hunters would be kept out of their country. On September 30, 1874, their agent, John D. Miles, wrote that "they looked in vain." In vain means without success: they watched for the hunters to be kept out, and the hunters kept coming.

Texas lawmakers brought in their own bill to protect the bison in 1875. The *Handbook of Texas*, published by the Texas State Historical Association, states that Sheridan protested it, "contending that peace with the Indians could be maintained only if their food supply was eliminated." The lawmakers did not pass the bill.

A speech that Sheridan is said to have given against the bill comes from one source only. The former hide hunter John R. Cook wrote about it in 1907, about 32 years later. Cook wrote that Sheridan told the lawmakers to give each hunter "a medal of bronze, with a dead buffalo on one side and a discouraged Indian on the other." In Cook's account, Sheridan also said: "let them kill, skin, and sell until the buffaloes are exterminated." Exterminated means killed off completely. Smits reports that no official record of Sheridan speaking to the lawmakers has turned up, but he judges Cook believable. Writing in *Harper's* magazine in 2008, Christopher Ketcham called the speech "believed to be apocryphal," which means probably made up.

Frank Mayer

Who: A buffalo runner, one of the hunters who killed bison for their hides, from 1872 to 1878.
When and where: The Plains in the 1870s. He died in Fairplay, Colorado, in February 1954, at a reported age of 104.

Frank H. Mayer killed bison for their hides from 1872 to 1878. At about age 100 he told his story to a writer, Charles B. Roth. It came out in 1958 as a book, *The Buffalo Harvest*, four years after Mayer died. The book describes the business: the rifle, the wagons, the skinners who cut the hides off the dead animals, and hides that sold for a dollar or two each.

Mayer said that "army officers in charge of plains operations encouraged the slaughter of buffalo in every possible way." They gave hunters "free ammunition, all you could use." "All you had to do to get it was apply at any frontier army post," he said. "I received

> thousands of rounds in this way." Mayer also quoted an officer he did not name: "if we kill the buffalo we conquer the Indian." The last part of the book records Mayer's regret for what the runners did.
>
> Mayer told this story when he was very old. The numbers in it are his own, and some people have questioned even his age.

The pigeon nestings

Professional hunters killed passenger pigeons where the birds gathered to nest, and by the mid-1890s the wild flocks were almost gone. At their peak, an estimated 3 to 5 billion passenger pigeons lived in North America. They may have made up four of every ten birds on the continent.

In 1871 an estimated 136 million pigeons nested across about 850 square miles of Wisconsin. In 1878 professional netters, who caught the birds in nets, and shooters worked one of the last great nesting grounds, near Petoskey, Michigan. They killed a reported 50,000 birds a day for months. Railroads carried the dead birds to city markets. Hunters learned where each big nesting ground was from telegraph messages, which were sent over wires.

Yellowstone and the Tukudika

On March 1, 1872, President Grant signed a law, and under it Yellowstone became the first national park. In the law, members of Congress set the park apart "for the benefit and enjoyment of the people." The Tukudika, a band of Mountain Shoshone also called the Sheep Eaters, already lived there. A Park Service page states that they had lived in that area "for thousands of years." The Shoshone, Bannock, Crow, Blackfeet and other nations also have ties to the park's land.

Philetus W. Norris was Yellowstone's superintendent, the official in charge, from 1877 to 1882. In the fall of 1879 he found a Tukudika camp near Bunsen Peak that its people had just left. Norris asked the Indian agent at Fort Washakie for help. An Indian agent was the US official in charge of a reservation. The writer John Clayton, in a 2024 article in *Mountain Journal*, names that agent as James Patten. The agent sent a party of Shoshone, who found the Tukudika and brought them to the Wind River Reservation.

In the words of a Park Service page, the Tukudika "were forcibly removed to reservations." Forcibly means by force. The letters between Norris and Patten have not survived. The records do not say how many Tukudika were taken or what force the Shoshone party used.

In the spring of 1880, Norris met in Washington with a Crow delegation. Officials were asking the Crow to give up 1.6 million acres. That spring Norris also got a "solemn promise" from people at the Lemhi agency, the office of another Indian agent, and at the Wind River Reservation to stay out of the park.

A Park Service page states that early superintendents "actively discouraged tribes from visiting the newly established park to hunt or collect resources." In his reports, Norris called the Tukudika "feeble and harmless." Feeble means weak. He wrote that Native people stayed away from the geysers out of "superstitious awe," meaning fear that came from beliefs about spirits. The writer John Clayton, in *Mountain Journal* in 2024, reports that historians and Shoshone scholars treat that claim as false. With that claim, Norris helped support a false story that no one had lived on the park's land.

In 1896 justices of the US Supreme Court decided a case about a Bannock man named Race Horse. He had hunted elk in Wyoming under the 1868 Fort Bridger Treaty, in which US officials promised a right to hunt on "unoccupied lands." Wyoming officials arrested him. Justice Edward Douglass White wrote the Court's decision, in *Ward v. Race Horse*. He called the treaty right "temporary and precarious," which means easily lost. He ruled that the right had ended when Wyoming became a state. After the ruling, hunting under the treaty in and around Yellowstone was a crime under Wyoming law. On May 20, 2019, in *Herrera v. Wyoming*, the justices threw out the 1896 decision. They ruled that the Crow people's treaty right to hunt had not ended when Wyoming became a state.

The forest reserves

In 1864 George Perkins Marsh, a scholar and diplomat from Vermont, published a book called *Man and Nature*. A diplomat is a person who represents a country in other countries. In the book, Marsh argued that whole societies collapse when their people destroy the forests and wear out the soil. Writers at the Forest History Society and the National Park Service link his book to the Forest Reserve Act of 1891. Under that law, a president could set aside public forest land. Those forest reserves were the start of the national forests.

> ### John Muir
>
> **Who:** A writer born in Scotland who wrote magazine articles about Yosemite and helped found the Sierra Club.
>
> **When and where:** He lived from 1838 to 1914. He came to California in 1868 and was president of the Sierra Club from 1892 to 1914.
>
> **Movie:** *John Muir in the New World* (PBS American Masters, 2011)

> John Muir was born in Scotland in 1838 and came to California in 1868. He wrote magazine articles about Yosemite. Readers across the country learned about Yosemite from them, and protecting it became a national cause.
>
> On May 28, 1892, Muir and others founded the Sierra Club in San Francisco. It started with 182 members. The founders wrote down the club's aims. One was "to explore, enjoy, and render accessible the mountain regions of the Pacific Coast," which means to make them easy for people to reach. Another was to win the help of "the people and government in preserving the forests and other natural features of the Sierra Nevada." Muir was the club's first president, and he led it until he died in 1914.

1900 to 1950

Federal officials took charge of hundreds of millions of acres of land in these years. President Theodore Roosevelt alone put about 230 million acres under federal protection from 1901 to 1909. The officials ran national forests, parks, bird refuges and monuments. Some of the protected land had belonged to Native nations. Glacier National Park was created in 1910. Most of it lies on land that federal officials count as sold by the Blackfeet in 1895. Before the sale, about 600 Blackfeet had starved to death in one winter. Many Blackfeet say they only rented the land out.

The last passenger pigeon died in the Cincinnati Zoo in 1914, and in Yellowstone park managers poisoned wolves until they killed the park's last pack in 1926. Farmers had plowed up the grass that held the soil of the southern Plains, and in the 1930s that soil blew away. Forest Service leaders ordered crews in 1935 to bring every wildfire under control by 10 the next morning. Young men in the Civilian Conservation Corps planted billions of trees.

Roosevelt's acres

From 1901 to 1909, President Theodore Roosevelt put about 230 million acres under federal protection. The land included 150 national forests, 5 national parks, the first 18 national monuments, 51 federal bird reservations and 4 national game preserves. Some counts combine the bird reservations and game preserves into one figure of 55. A national forest is public land where federal foresters manage the trees. Foresters are people who study forests and manage them. A bird reservation is land kept safe for wild birds, and a game preserve is land where wild animals are protected.

Pelican Island, in Florida, became the first federal bird reservation when Roosevelt named it one on March 14, 1903. It became the first piece of what is now the National Wildlife Refuge System. The U.S. Forest Service began in 1905, with Gifford Pinchot as its first chief. Its foresters ran the national forests.

The Antiquities Act, which Roosevelt signed on June 8, 1906, let a president protect land by proclamation, which is an official announcement. Land protected this way is called a national monument. Devils Tower became the first one that September 24.

Many national forests were made from the ancestral lands of Native nations, the lands their ancestors lived on. In 2018 Arthur Blazer, the president of the Mescalero Apache Tribe, told a Senate committee that the US Department of Agriculture, which runs the Forest Service, "has acknowledged that the vast majority of federal forest lands are carved out of the ancestral homelands of Indian tribes." Forest Service staff in North Carolina state that the national forests there lie on the ancestral lands of many Native nations. The staff of Olympic National Forest state that all the land in present-day Washington, national forests included, is the ancestral land of Native peoples. A Park Service web page states that Devils Tower is sacred to dozens of Native nations, including the Arapaho, Cheyenne, Crow, Kiowa, Lakota and Shoshone. The Lakota name for it is Mato Tipila, which means Bear Lodge.

Theodore Roosevelt

Who: The president from 1901 to 1909. In those years he put about 230 million acres of land under federal protection.

When and where: The White House, 1901 to 1909. Yosemite, California, in May 1903.

Movie: *The Roosevelts: An Intimate History* (PBS, Ken Burns, 2014), a documentary about the whole Roosevelt family

In May 1903 President Theodore Roosevelt went camping in Yosemite with John Muir, the first president of the Sierra Club. Muir wanted the best of the wild land left wild. The two men spent three nights sleeping in the open. They camped first under the Grizzly Giant, a giant sequoia tree, on May 15. Roosevelt slept under a pile of about 40 wool blankets. The next night, near Sentinel Dome, a snowstorm dropped five inches of new snow on top of about five feet of old snow. They spent the last night in a meadow near Bridalveil Fall.

Glacier and the Blackfeet

Most of Glacier National Park lies on land that federal officials say the Blackfeet sold to the United States in 1895. The deal came after a winter in which about 600 Blackfeet starved to death. Many Blackfeet say the tribe only rented the land out and never sold it.

In 1870 US Army troops attacked Heavy Runner's camp of Piikani people on the Marias River and killed more than 200 men, women and children. The Piikani are one of the Blackfeet peoples. By 1880 hide hunters had killed nearly all the bison. Members of Congress then cut the money for annuities. Annuities were the food and goods that US officials had promised a tribe every year in a treaty, as payment for land.

Early storms held up supplies in the winter of 1883 and 1884. In December a wagonload of bacon reached the Blackfeet agency near Browning. An agency was the office of the US official who ran a reservation, which is land set aside for a Native nation to live on. The Montana Historical Society's textbook describes it as "so old it was contaminated with maggots." Maggots are the young of flies, and they feed on rotting meat. The textbook states that 600 Blackfeet died of starvation, about one in four of the tribe. Other accounts list counts from 500 to 800. The Assiniboine, another nation, lost about 300 people. That winter is known as the Starvation Winter.

No record names the person who sent the spoiled bacon. John Young had been the Indian agent for the Blackfeet since December 1876. An Indian agent was the US official in charge of a reservation. In 1881 Young went to Washington and got $15,000 put back into the reservation's budget. He protested against shrinking supplies and more cuts to the agency's budget. No one acted on his protests, and in September 1883 he resigned. The records do not name the officials who ignored him. The new agent, R. A. Allen, did not arrive until the middle of March 1884.

The same textbook states: "After Starvation Winter, the tribes sold the only resource they had left: land." In 1895 the Blackfeet sold a strip of about 800,000 acres for $1.5 million. Prospectors, people who search for gold and other metals, hoped the strip held gold. Many Blackfeet say the tribe offered the land as a 99-year lease, which is a rental, and never sold it. They also say that because of a surveying mistake, US officials took another 45,000 acres. Under the agreement, the Blackfeet kept the right to hunt, fish, cut wood and gather plants on the land.

Little Dog told the US commissioners, the officials sent to buy the land, that the Blackfeet "did not ask the government to come and buy their land." White Calf, a Piikani chief, said of Chief Mountain: "Chief Mountain is my head. Now my head is cut off."

Prospectors found no gold. In 1897 the strip became a forest reserve. Forest reserves were public forest lands that a president could set aside under an 1891 law. On May 11, 1910, members of Congress made most of the strip Glacier National Park. After that, the Blackfeet's rights on the land "essentially vanished." Those words come from an article by the National Parks Conservation Association, a group that campaigns for the parks.

After the park was created, judges ruled that the Blackfeet's right to go into the mountains in the park no longer counted. A 2019 *High Country News* report states that hunting and fishing rights ended in 1910 and that only the right to gather plants remained. By 1912 a park ranger had arrested a Blackfeet tribal member for hunting in the park. The accounts of that arrest name neither the ranger nor the hunter. In 1932 a judge of a US District Court ruled that the Blackfeet had no right to hunt in the park. In 1973 a judge ruled that Blackfeet people could enter the park without paying the entrance fee.

Hetch Hetchy

People who wanted to protect land split into two sides over Hetch Hetchy Valley. Conservation means protecting land, water and wildlife. Gifford Pinchot's side said conservation meant using the land carefully, forever. The side of John Muir, the first president of the Sierra Club, said the best of it should be left wild.

Hetch Hetchy Valley lies inside Yosemite National Park. After the earthquake and fire of 1906, San Francisco's city leaders wanted the valley for a reservoir. A reservoir is a lake made by a dam to store water. Pinchot backed the city. Muir and the Sierra Club fought the dam for years.

Members of Congress sided with the city and passed the Raker Act. The act let the city dam the valley. President Wilson signed it on December 19, 1913. Muir died a year later, on December 24, 1914. The O'Shaughnessy Dam was finished in 1923, and the valley is under water today.

On August 25, 1916, members of Congress passed the National Park Service Organic Act. With it they created a new federal office, the National Park Service, whose officials took charge of protecting the parks. Lawmakers passed it partly in reaction to the Hetch Hetchy fight.

> ### Gifford Pinchot
>
> **Who:** The first American trained as a professional forester, and the first chief of the U.S. Forest Service. Later he was twice governor of Pennsylvania.
>
> **When and where:** He lived from 1865 to 1946. He ran the Forest Service from 1905 to 1910.
>
> **Movie:** *Seeking the Greatest Good* (WVIA and PBS, 2013)

Gifford Pinchot was the first American trained as a professional forester. A forester is a person who studies forests and manages them. He defined conservation as "the greatest good to the greatest number for the longest time." To Pinchot, that meant using the public lands carefully and keeping them useful forever.

Pinchot became the first chief of the Forest Service in 1905. In 1909 a federal land investigator, Louis Glavis, accused Secretary of the Interior Richard A. Ballinger of mishandling claims to federal coal lands in Alaska. A claim here was a legal right to mine a piece of public land. Pinchot took Glavis's side. In early January 1910, Pinchot had Senator Jonathan Dolliver of Iowa read a letter to Congress that attacked Ballinger. President Taft stood by Ballinger and fired Pinchot on January 7, 1910, for refusing to obey his bosses. The fight became known as the Ballinger dispute. Pinchot and John Muir had been friends until they took opposite sides over Hetch Hetchy. Pinchot later served two terms as governor of Pennsylvania.

The last passenger pigeons

The passenger pigeon died out on September 1, 1914, when the last bird of the species died at the Cincinnati Zoo. The last wild one that anyone confirmed was shot in Ohio in 1900. A few people reported seeing wild passenger pigeons until about 1902. No one confirmed those sightings.

Press Clay Southworth

Who: A 14-year-old boy who shot the last confirmed wild passenger pigeon.

When and where: Pike County, Ohio, on March 24, 1900.

On March 24, 1900, Press Clay Southworth, age 14, shot a passenger pigeon in Pike County, Ohio. He asked his mother first, then used his family's 12-gauge shotgun. His bird is the last wild passenger pigeon that anyone has confirmed. His family had it mounted, which means stuffed and set up for display. It got buttons for eyes, so people called it "Buttons." The Ohio History Connection, in Columbus, keeps it today. Southworth told the story himself decades later.

The last passenger pigeon of all was a bird named Martha. She died at the Cincinnati Zoo on September 1, 1914, at about 29 years old. Her body was frozen in a 300-pound block of ice and shipped to the Smithsonian Institution, which still has it. Sol Stephan, the zoo's

> general manager, had cared for Martha, and he saved her feathers in a cigar box. His accounts of where Martha came from changed over the years. The zoo's own records do not agree with each other about her either.

Yellowstone's wolves

Between 1914 and 1926, park managers in Yellowstone killed at least 136 wolves. In 1926 they killed the park's last wolf pack. The National Park Service gives these numbers. The *Idaho Capital Sun* and other later accounts report that park rangers shot the last two wolf pups near Soda Butte that year.

The managers used poison, especially one called strychnine. They put it inside the bodies of dead animals for wolves to eat. Dan Stahler, a biologist, told *Smithsonian* magazine in 2026: "We're talking crates and crates of this poisoning." In 1915 the park's superintendent, the official in charge of the park, called wolves "a decided menace" to the animals they hunted. A menace is a danger.

The killing in Yellowstone was part of a program to wipe out predators on public lands across the whole country. A predator is an animal that hunts other animals for food. The program's targets were wolves, bears, cougars and coyotes. Rewards for dead wolves went back almost 300 years. The first recorded wolf bounty in the colonies dates from Massachusetts in 1630. A bounty is a reward paid for each dead animal.

The Dust Bowl

In the 1930s, wind carried away the soil of the southern Plains, because farmers had plowed up the grass that held it. Wheat sold at high prices during World War I. Farmers with tractors plowed up tens of millions of acres of shortgrass, the short native grass of the southern Plains. The roots of that grass formed sod, a thick mat of roots and earth that held the soil in place. A drought, a long time with too little rain, began in 1931. With the sod gone, the dry soil blew away.

By December 1934, about 35 million acres of farmland had been ruined for growing crops, by the count of the US Department of Agriculture. The same count listed 100 million acres that had lost all or most of their topsoil, the top layer of soil where crops grow. Another 125 million acres were losing it fast. In 1935 alone, an estimated 850 million tons of topsoil blew off the southern Plains.

The worst single dust storm struck on April 14, 1935, a day called Black Sunday. It crossed the Plains as a black wall of dust moving at 60 miles an hour.

That spring, a soil scientist named Hugh Hammond Bennett was testifying, or giving evidence, at a hearing in Washington. Dust from the Plains darkened the sky outside. Bennett said: "This, gentlemen, is what I've been talking about." Accounts of the hearing differ about the day. Some put it in late March 1935, and others in early April.

Members of Congress declared soil erosion "a national menace." Erosion is the wearing away of soil by wind or water. The Soil Conservation Service began on April 27, 1935, with Bennett as its director. The methods that followed included contour plowing, which means plowing along the curves of a slope instead of up and down it. They also included shelterbelts, which are rows of trees planted to slow the wind, and planting grass on the land again.

Caroline Henderson

Who: A farmer and writer who homesteaded in the Oklahoma Panhandle and stayed on her land through the dust years.

When and where: Near Eva, Oklahoma, from 1907. She lived from 1877 to 1966.

Caroline Henderson graduated from Mount Holyoke College. In 1907 she began homesteading near Eva, in the Oklahoma Panhandle. Homesteading meant claiming public land and farming it for years in order to own it. When the dust storms came in the 1930s, she kept farming there and did not leave.

Henderson wrote letters about the dust years, and the *Atlantic Monthly* magazine printed them as "Letters from the Dust Bowl." One appeared in May 1936. That same month, Henry A. Wallace, the Secretary of Agriculture, wrote to praise her. Across her whole life, her letters run from 1908 to 1966. The University of Oklahoma Press later collected them in a book, *Letters from the Dust Bowl*.

Every fire put out

Forest Service rules from 1935 to 1978 required crews to control every wildfire by the morning after someone spotted it. In 1910 a fire called the Big Burn covered 3 million acres of the Northern Rockies and killed at least 78 people. After it, Forest Service leaders tried to put out every fire. In 1935 they made the "10 a.m. policy." Under it, crews had to bring each fire under control by 10 o'clock the morning after it was spotted.

From 1933 to 1942, about 3 million young men worked in the Civilian Conservation Corps, a federal work program. Because the corps had so many men, Forest Service leaders could carry out the 10 a.m. policy. Estimates of the trees the corps members planted run from more than 2 billion to 3.5 billion. The figure most often given is about 3 billion. The corps members also fought fires, worked to stop erosion and did building work in more than 800 parks.

In 1944 Forest Service officials worked with the Ad Council, an advertising group, to start the Smokey Bear campaign. Its slogan, "Only YOU can prevent forest fires," dates from 1947. In 1950 a bear cub was rescued from the Capitan Gap fire in New Mexico, and the cub became the living Smokey Bear.

Aldo Leopold

Who: A forester for the U.S. Forest Service who later became a professor at the University of Wisconsin. He wrote *A Sand County Almanac.*

When and where: He lived from 1887 to 1948. He worked in New Mexico in the 1920s and later in Wisconsin.

Movie: *Green Fire: Aldo Leopold and a Land Ethic for Our Time* (2011)

Aldo Leopold began as a forester for the U.S. Forest Service. In 1924 he got the Gila Wilderness, in New Mexico, set aside. It was the first area in the world officially named a wilderness area, which is land kept free of roads and buildings. Frank C. W. Pooler, the Forest Service official in charge of the region, approved Leopold's plan on June 3, 1924. It covered about 755,000 acres. Under the plan the area had no roads, cabins or other buildings. People could still hunt and fish there, and ranchers could let their animals feed on its grass.

The Gila had been a homeland of the Chiricahua and Warm Springs Apache, and Mogollon and Mimbres people had also lived in the region. Before Leopold came to New Mexico, US Army soldiers, federal officials and white settlers had forced many Apache people onto reservations. Army soldiers imprisoned Chiricahua and Warm Springs Apache people for defending their land. Of the thousands of Chiricahua and Warm Springs Apache who had lived in the Gila, only a few hundred were still alive after the Army imprisoned them. US officials later sent the survivors to Fort Sill, Oklahoma, more than 500 miles away.

Leopold later taught at the University of Wisconsin. He bought a worn-out farm in Wisconsin and rebuilt its soil and its woods. On April 21, 1948, he had a heart attack and died while helping to fight a grass fire on a neighbor's land.

> His book *A Sand County Almanac* came out in 1949, the year after he died. In it he called for a "land ethic." An ethic is a set of ideas about right and wrong. In Leopold's land ethic, people count themselves as members of the land community and stop acting as its conquerors. The book includes his "green fire" essay, about watching a wolf die after it was shot.

1950 to 2000

Between 1970 and 1973, members of Congress passed the Clean Air Act, the Clean Water Act and the Endangered Species Act, and the Environmental Protection Agency opened. In the years before those laws, DDT, a chemical for killing insects, left bald eagles with eggs so thin they broke. In 1969 oil and trash on the Cuyahoga River in Cleveland caught fire. That same year, Park Service officials forced the last Native families in Yosemite Valley out of their homes. Later in the 1970s, families at Love Canal, in Niagara Falls, New York, found chemicals seeping into their basements. They lived on and beside more than 20,000 tons of buried chemical waste.

In 1982 residents of Warren County, North Carolina, lay in the road in front of trucks carrying poisoned soil to a landfill in a mostly Black community. A landfill is a place where trash and waste are buried. In a 1983 federal study, investigators looked at four landfills for dangerous waste in eight southeastern states. All four were in areas where Black residents were 38 to 90 percent of the people. In a 1987 national study, Charles Lee found that race was the strongest clue to where such waste sites stood. That year Rev. Benjamin F. Chavis Jr. named the pattern "environmental racism."

DDT and the eagles

DDT is a pesticide, a chemical made to kill insects. It was in wide use from the mid-1940s. DDT thinned the eggshells of raptors, which are birds that hunt other animals. The shells grew so thin that the eggs broke in the nest. By 1963 only 417 nesting pairs of bald eagles were left in the lower 48 states, meaning every state except Alaska and Hawaii.

> ### Rachel Carson
>
> **Who:** A marine biologist, a scientist who studies life in the sea, and a writer. She had worked as a writer and editor for the U.S. Fish and Wildlife Service. She wrote *Silent Spring*.

When and where: She lived from 1907 to 1964. *Silent Spring* came out in September 1962. She died in Silver Spring, Maryland.

Movie: *Rachel Carson* (PBS American Experience, 2017)

Rachel Carson first became famous for a book called *The Sea Around Us*. In September 1962 she published *Silent Spring*. In it she laid out what persistent pesticides were doing to birds, soil, water and people. A persistent pesticide is one that stays in the soil, water and living things for a long time.

People in the chemical industry attacked her. Carson answered them with evidence. On April 3, 1963, she spoke on the television program *CBS Reports*. By then she was already sick with breast cancer. She died of it on April 14, 1964. In 1972 officials of the Environmental Protection Agency banned DDT.

Yosemite's last village

In 1969 Park Service officials evicted the last Native families who lived in Yosemite Valley. To evict means to force people out of their homes. Park Service officials destroyed their cabins.

In the 1920s, Ahwahneechee and Paiute families lived in a village in the valley and worked in the park. The Ahwahneechee are also called the Southern Sierra Miwok. Native workers helped build the Ahwahnee Hotel, which was finished in 1927. In 1933 Park Service workers built cabins at a new site, called Wahhoga, for families that park officials had moved out of the old village. Charles Goff Thomson was Yosemite's superintendent, the official in charge of the park, from 1929 to 1937. A history published by Brigham Young University states that Thomson wanted to use the new village to control the Native people in the park. The families paid rent, and they paid for their power and water.

In 1953 Park Service officials made a housing rule. Under it, only permanent government workers could live in the village. As each home fell empty, the officials destroyed it. In 1969 they evicted the families who were still there.

Deborah Tucker's parents lived in the village. She told the National Parks Conservation Association: "The Park Service came and burned the cabins out." Some later magazine accounts say the empty cabins were burned in a firefighting training exercise. A Park Service web page states that a Native home near Camp 4 "was razed in the 1960s when the last Indian village was removed from Yosemite Valley." Razed means torn down completely. Jay Johnson, the last Native park worker who lived in the valley, retired and left in 1996. Erin Davenport is a

Yosemite park historian. She told the National Parks Conservation Association that park historians have found no record of why the village was torn down in 1969. No record names the official who ordered it.

The river that burned

On June 22, 1969, oil and trash floating on the Cuyahoga River in Cleveland, Ohio, caught fire. The fire burned for about 20 to 30 minutes before it was brought under control. The river had burned at least 13 times since 1868. The 1912 fire killed five men, and the 1952 fire did $1.3 million in damage.

The river ran past steel mills and other factories. A 2019 *Smithsonian* magazine article names American Ship Building, the Sherwin-Williams Paint Company, Republic Steel and Standard Oil as Cleveland companies whose success left the river full of poisonous waste. A Cleveland State University history states that the river was "polluted from decades of industrial waste." The 1969 fire started in oil and trash caught under two railroad bridges near the Republic Steel mill. A flare thrown from a passing train most likely lit it. Investigators from Cleveland's Bureau of Industrial Wastes looked into the fire. No record names the company whose oil burned.

On August 1, 1969, editors at *Time* magazine published a story on the burning river, and readers across the country saw it. Carl Stokes was Cleveland's mayor and the first Black mayor of a major US city. The day after the fire, he held a news conference at the river and called on the state and federal governments to act.

On January 28, 1969, five months before the Cuyahoga fire, an oil well blew out under Platform A. It was a Union Oil Company drilling platform about 5.5 miles southeast of Santa Barbara, California. A blowout is an uncontrolled burst of oil and gas up a well. Officials of the U.S. Geological Survey, the federal agency that approved offshore drilling, had excused Union Oil from federal safety rules when they approved its drilling permit. Federal and state investigators found that extra steel pipe lining the well would have prevented the blowout. About 100,000 barrels of oil leaked out by December 1969, and the oil blackened the beaches at Santa Barbara. By one estimate, about 9,000 birds died.

Earth Day and the new laws

On April 22, 1970, an estimated 20 million Americans took part in Earth Day events. Earth Day was a day set aside for events about protecting the land, air and water. The 1970 census, the national government's count of everyone in the country, counted 203,392,031 people in the

United States, so about one in ten Americans took part. Senator Gaylord Nelson organized Earth Day with Denis Hayes.

The National Environmental Policy Act became law on January 1, 1970. Under it, federal officials had to study how a big federal project would affect the land, air and water before they went ahead. The Environmental Protection Agency, called the EPA, opened on December 2, 1970. Its officials enforce the federal laws against pollution. Members of Congress passed the Clean Air Act in 1970. In 1972 EPA officials banned DDT, and members of Congress passed the Clean Water Act. The Endangered Species Act became law on December 28, 1973. An endangered species is a kind of plant or animal in danger of dying out.

After the DDT ban, bald eagles came back. They grew from 417 nesting pairs in 1963 to about 10,000 pairs by 2007. That year, federal officials took the bald eagle off the endangered list.

Love Canal

From the 1940s into the 1950s, workers for Hooker Chemical buried more than 20,000 tons of chemical waste in an old canal in Niagara Falls, New York. Families later lived on and beside it, and the chemicals seeped into their homes.

The canal, called Love Canal, covered 15 acres. Hooker Chemical and Plastics Corporation began using it in 1942. The records give the amount and the years in three ways. One figure is about 21,000 tons from 1942 to 1953. A timeline kept by the University at Buffalo states "over 20,000 tons of toxic chemicals" from 1942 to 1952. In a 1981 report, officials of New York State's health department wrote that Hooker "admits" burying 21,800 tons of chemical waste between 1942 and 1953. Investigators later found more than 200 chemical compounds there. The timeline lists 200 tons of dioxin. Dioxin is a group of chemicals that cause cancer and harm babies before they are born.

In a 1994 decision, federal judge John T. Curtin wrote that Hiram Young, Hooker's works manager, was responsible for the company's waste disposal. The court record does not say who first decided to use the canal as a dump. In 1946 Ansley Wilcox, Hooker's lawyer, visited the dump and saw children with swimsuits. He warned Hooker's president, E. R. Bartlett, that the company was "running a real hazard," and he suggested guards or a fence. Hooker's executives talked about his ideas, but they never built the fence. City officials of Niagara Falls also used the canal as a dump for the city's own waste until 1953.

In 1953 Hooker sold the covered canal to the Niagara Falls Board of Education for $1. Hooker's officials wrote into the deed "a disclaimer of responsibility for future damages due to the presence of buried chemicals." A deed is the paper that passes ownership of land to a new

owner. A disclaimer is a statement that refuses blame. That same year, Hooker officials told Board members "that homes could not be built at the Canal site."

In 1954 the members of the Board of Education had a public elementary school, the 99th Street School, built on the middle third of the canal. That January their architect, Charles Thiele, wrote that the builders had dug into two pits of chemical waste, some of it in 55-gallon drums. He wrote that it was "poor policy to attempt to build over this soil." Building of homes on 97th and 99th Streets, beside the canal, began in 1954. The Board of Education later sold part of the canal land to others. In 1957 Board members talked about a plan to sell a piece of it to developers for building homes. Hooker's lawyer Arthur Chambers told the Board on November 7, 1957, that the land was "unsuitable for construction" where "basements, water lines, sewers and such underground facilities would be necessary." Unsuitable means not fit. By the spring of 1978, 99 homes had backyards that touched the canal. No record names the companies that built the homes.

By the 1970s, chemicals were coming up into yards and basements. On October 3, 1976, chemicals from the buried waste were reported "seeping into basements of homes." In November 1976, testers found 15 chemicals, including three toxic chlorinated hydrocarbons, a kind of chemical that contains chlorine. Families in the neighborhood counted miscarriages, birth defects and illness. A miscarriage is the death of an unborn baby before it can live outside its mother's body. A birth defect is a problem in a baby's body that is there when the baby is born. Dr. Beverly Paigen, a scientist, found a "high rate of birth defects and miscarriages among Love Canal families."

On August 2, 1978, Dr. Robert Whalen, New York State's health commissioner, the state's top health official, declared a state of emergency, an official order saying that people were in danger and needed help fast. He closed the 99th Street School and ordered pregnant women and children under 2 moved out. On August 7, President Jimmy Carter approved emergency federal money so that state officials could buy homes. State officials moved the first 236 families out, at a cost of $10 million. Other counts say 239 families.

In April 1980, New York State's lawyers sued Occidental Petroleum, which owned Hooker by then, and two Hooker companies for $635 million. On May 17, 1980, scientists in a study paid for by the EPA found chromosome damage in 11 of the 36 residents tested. Chromosomes are the strands in each cell that carry a person's genes. Damage to them can raise the risk of cancer, and of birth defects in the person's children. That month, residents held two EPA

officials for about six hours to demand that the rest of the families be moved. Carter then declared a second emergency, which opened the way to move 710 more families. In all, about 950 families left.

In December 1980, members of Congress passed a law called Superfund. Under it, federal officials could make companies that polluted a site pay for cleaning it up. In 1994 and 1995 Occidental agreed to pay New York State and the federal government more than $225 million for the cleanup and the moves.

Lois Gibbs

Who: A 27-year-old housewife at Love Canal whose son went to the 99th Street School. She started the Love Canal Homeowners Association.

When and where: Love Canal, in Niagara Falls, New York, from 1978 to 1980.

Movie: *Lois Gibbs and the Love Canal* (CBS television movie, 1982), with Marsha Mason playing Gibbs

Lois Gibbs was 27 years old and a housewife when she learned about the buried chemicals at Love Canal. Her son went to the 99th Street School, which stood on and beside the old canal. Officials brushed off her worries. In August 1978 she organized her neighbors into the Love Canal Homeowners Association.

Gibbs later founded the Center for Health, Environment & Justice. Through it, she has helped other neighborhoods fight the pollution near their homes. In 1990 she won the Goldman Environmental Prize, an award given to people who protect the environment. A CBS television movie about her aired on February 17, 1982.

Warren County

In September 1982, residents of Warren County, North Carolina, lay down in the road in front of trucks. The trucks carried soil poisoned with PCBs to a new landfill near Afton, a mostly Black community. An exhibit by the University of North Carolina Library and other histories describe the protest as the start of the environmental justice movement. People in that movement fight a pattern in which companies and government officials put polluting sites next to poor, Black, brown and Native communities.

PCBs are a group of chemicals made by people. They were used in electrical, heating and hydraulic equipment, which means machines worked by liquid under pressure. An EPA web page states that PCBs cause "a variety of adverse health effects in animal and humans."

Adverse means harmful.

The poisoned soil came from roadsides. Robert Ward, of the Ward Transformer Company of Raleigh, hired Robert Burns and his sons to get rid of oil that contained PCBs. The Burns family ran a business called Transformer Sales, in Allegany, New York. In the summer of 1978, the Burns men sprayed about 31,000 gallons of the oil from their trucks at night. They sprayed it on the shoulders, or edges, of about 240 miles of roads in 14 North Carolina counties.

In December 1978, Governor James B. Hunt Jr. announced a plan to bury about 60,000 tons of the soil scraped from those roadsides. He chose a landfill at Afton, in Warren County. State officials bought farmland there from a farmer who was in money trouble. Warren County had the highest share of African American residents in North Carolina, and it was one of the poorest counties in the state. The Afton community was 84 percent African American.

Most people near Afton drank water from wells. The water table there, the level underground where the soil is full of water, was only about 5 to 10 feet down. The U.S. Commission on Civil Rights later wrote that the site "was not scientifically the most suitable site, because the water table was a mere 5-10 feet below the surface."

Residents formed a group called Warren County Citizens Concerned About PCBs and sued. They lost in 1982. In September 1982 the trucks began to deliver the soil, and protesters lay in the road. Officers arrested about 500 people. One later count says more than 500. State officials went ahead and built the landfill. Governor Hunt promised that the soil would be cleaned of poison once a way to do it existed. The cleanup was finished by 2003 and cost $17.1 million.

Counting who lives near the waste

In the 1980s, the authors of two studies counted who lived near hazardous waste sites, and both found the answer tied to race. Hazardous waste is waste that can harm people's health. Communities of color are places where most people are not white.

Members of Congress asked the US General Accounting Office, a federal office that investigates for Congress, to study landfills for hazardous waste in eight southeastern states. Its report came out on June 1, 1983. The report named four landfills in those states that took other people's waste for pay. One was the Warren County landfill. The others were in Sumter County, Alabama, Chester County, South Carolina, and Sumter County, South Carolina. All four were in areas where Black residents made up 38 to 90 percent of the population.

In 1987 the Commission for Racial Justice of the United Church of Christ published a national study, *Toxic Wastes and Race in the United States*. Charles Lee wrote it. He found that race was "the most potent variable in predicting where these facilities were located, more powerful than household income, the value of homes and the estimated amount of hazardous waste generated by industry." The race of the people nearby predicted where a waste site stood better than how much money they had.

When the report came out, the commission's leader, Rev. Benjamin F. Chavis Jr., gave a name to "intentionally selecting communities of color for wastes disposal sites and polluting industrial facilities." He called it "environmental racism." The authors of a follow-up study in 1994 found that people of color were "47 percent more likely to live near a hazardous waste facility than white Americans."

On February 11, 1994, President Bill Clinton signed Executive Order 12898. An executive order is a written command from the president to the people who run the federal government. In it he directed federal agencies to find and deal with pollution that fell hardest on communities of color and poor communities. A 2007 report by the United Church of Christ states that the EPA "has failed to implement" the order, meaning its officials had not carried it out.

Wolves back in Yellowstone

Starting in January 1995, gray wolves brought from Canada were released in Yellowstone National Park. By the end of 1996, 31 wolves had been moved there. Park managers had killed the park's last wolf pack in 1926. For most of the 1900s, elk had eaten the park's willows and other woody plants so heavily that the plants could not grow tall. After the wolves came back, the willows began to grow. Park Service scientists wrote in 2019 that most studies agree on that growth. They still debate how much of it the wolves caused, by hunting the elk and changing where the elk fed.

2000 to Today

The year 2024 was the warmest ever measured, both for the whole world and for the lower 48 states. Heat and drought dried forests that had filled up with fuel during about a century of stopping fires. In 2020, fires burned about 4.2 million acres of California. Lake Mead and Lake Powell, two reservoirs on the Colorado River, fell to record lows in 2021 and 2022. Fire managers now set fires on purpose again, and Yurok people teach cultural fire to government fire crews.

In Louisiana, Shell's managers agreed in 2002 to pay to move the families of Old Diamond, a neighborhood beside a Shell chemical plant. In 2023 federal lawyers sued the owner of a plant near an elementary school in LaPlace, and in 2025 they dropped the suit. Bald eagles grew from 417 nesting pairs in 1963 to about 71,400 in the 2020s. The bison, fewer than 1,000 in 1900, now number more than 400,000, most of them in herds raised for sale. Wolves, wiped out of Yellowstone by 1926, numbered 2,797 in seven western states at the end of 2022. On July 13, 2026, President Donald Trump cut Bears Ears National Monument, in Utah, by about 91 percent. As of September 26, 2026, the land he removed was open to mining claims, and lawsuits against the cut were waiting in federal court.

The warmest year

In January 2025, scientists at NOAA, the federal agency that tracks weather and climate, reported that 2024 was the warmest year on record for the planet. The world averaged 1.29 degrees Celsius above the average for the 20th century, the years 1901 to 2000. Scientists at NASA and other groups agreed. The lower 48 states averaged 55.5 degrees Fahrenheit in 2024, which was 3.5 degrees above their 20th-century average. Seventeen states set records.

Fire comes back bigger

After about a century of stopping fires, the woods held heavy loads of fuel, the dead wood and brush that burns. Heat and drought dried that fuel out.

On November 8, 2018, the Camp Fire killed 85 people in California and destroyed nearly all of the town of Paradise. Those figures are the ones given by the encyclopedia *Britannica* and by a timeline from the National Institute of Standards and Technology, a federal science agency. About 19,000 buildings burned. The Camp Fire was the deadliest wildfire in the United States in a century.

In 2020, fires burned about 4.2 million to 4.3 million acres of California, about 4 percent of the state. By the count of CAL FIRE, California's fire agency, that was the most in modern records. One fire, called the August Complex, passed 1 million acres. It became known as the first "gigafire" in the state's modern history, meaning a fire that burned more than a million acres.

Fire managers at government agencies now set fires on purpose to burn off fuel. These planned fires are called prescribed burns, and prescribed burning is official policy again.

Margo Robbins

Who: A member of the Yurok Tribe who helped found the Cultural Fire Management Council, to bring traditional burning back to Yurok land.

When and where: The Klamath River country of northern California. The first community burn was in 2012, and the council formed in 2013.

Margo Robbins, a member of the Yurok Tribe, wanted hazel for weaving baskets. When hazel is burned, it sends up new shoots that grow straight, and weavers need straight shoots. Her first goal was to weave baskets to carry her grandchildren.

Robbins and others held their first community burn on Yurok land along the Klamath River in 2012. In 2013 they formed the Cultural Fire Management Council. Cultural fire means burning done by Native people to care for the land. In 1850 California's state lawmakers had passed the *Act for the Government and Protection of Indians*. Other sections of the same law let white people take custody of Native children and let officials hire out Native adults to the highest bidder. Under Section 10 of that law, setting the prairie on fire was a crime, and burning the land on purpose was a Native practice. After the council's burns, deer came back to the burned ground at Weitchpec. Council members now run training exchanges, called TREX, that teach cultural burning to fire crews.

The shrinking river

From 2000 to 2021, the Southwest had its driest 22 years in at least 1,200 years. Scientists from UCLA and Columbia University found this by studying tree rings, which show how much a tree grew each year. In February 2022 they published their study in the journal *Nature Climate Change*. They found that about 42 percent of how bad the drought was came from climate change caused by people.

About 40 million people depend on the Colorado River for water, and so does much of the country's winter vegetable crop. Lake Mead and Lake Powell, two reservoirs on the river, fell to record lows in 2021 and 2022, news reports stated. By the middle of 2022, Lake Mead was about a quarter full.

In May 2023, officials of Arizona, California and Nevada agreed to cut their use of the river by at least 3 million acre-feet through the end of 2026. News reports gave that figure from the federal Bureau of Reclamation. An acre-foot is enough water to cover one acre of land one foot deep. The cut is about a tenth of the water those three states are allowed to take. Federal officials agreed to pay the states for the water they gave up.

Cancer Alley

The stretch of Louisiana between Baton Rouge and New Orleans holds a long line of chemical plants. A 2007 report by the United Church of Christ describes this strip as "so-called 'cancer alley,' the chemical manufacturing corridor between Baton Rouge and New Orleans." A corridor is a long, narrow strip of land. The towns of Norco and LaPlace are both in it.

The same report records who lived near commercial hazardous waste sites across the country in 2000, using census figures. In neighborhoods with such sites, 56 percent of the people were people of color. Elsewhere, 30 percent were. The poverty rate was 18 percent near the sites and 12 percent elsewhere. Forty of the 44 states with such sites showed the same gap.

Margie Richard

Who: A schoolteacher from the Old Diamond neighborhood of Norco, Louisiana, who led her neighbors' campaign to make Shell pay to move them away from its plant.

When and where: Norco, Louisiana. The campaign ended in 2002. She won the Goldman Environmental Prize in April 2004.

Four generations of Margie Richard's family lived in the Old Diamond neighborhood of Norco, Louisiana. Their home stood 25 feet from the fence of a Shell Chemical plant. Shell had bought land in Diamond and built the plant there in the early 1950s. The neighborhood sat between the chemical plant and a Shell refinery, a plant that turns crude oil into fuels. Residents of Old Diamond kept a record of the cancers and birth defects among their neighbors.

In 1973 gas leaked from a Shell pipeline. A spark from a lawnmower set it on fire. The fire burned Leroy Jones, age 16, to death while he was cutting grass. It also burned to death Helen Washington, who was resting on her porch. In 1988 an explosion at the Shell refinery killed seven workers and damaged homes in Diamond.

In a 2004 interview with *Grist* magazine, Richard remembered: "The elder people were always coughing ... black soot falling on the grass, on our houses." She also said: "My sister died at a very early age from a rare bacterial disease."

Richard led the neighborhood's campaign for about 13 years. Residents tested their own air with buckets built to catch air samples. They took their case to Shell's shareholder meetings, where the company's owners gather, and to Shell in the Netherlands. In 2002 Shell's managers agreed to pay to move every Old Diamond family that wanted to leave.

> They also agreed to cut the plant's emissions, the pollution it sends into the air, by 30 percent, and to put $5 million into a community fund. Shell paid at least $80,000 for each house and $50,000 for each trailer, about $30 million in all.
>
> In April 2004 Richard became the first African American to win the Goldman Environmental Prize.

The plant by the school

Federal lawyers sued the owner of a plant in LaPlace, Louisiana, in 2023, and they dropped the suit in 2025. The plant released a chemical likely to cause cancer into the air near an elementary school.

The plant is in St. John the Baptist Parish. A parish in Louisiana is like a county in other states. The company DuPont built the plant to make neoprene, a kind of man-made rubber. The Japanese company Denka bought it about 2015, according to AP news reporting in 2025. To make neoprene, the plant used a chemical called chloroprene, and it released chloroprene into the air.

In 2010 EPA scientists found that chloroprene is "likely to be carcinogenic to humans." Carcinogenic means causing cancer. They also found that children breathing it build up a lifetime risk of cancer faster than adults do.

In 2023, more than 300 children went to the 5th Ward Elementary School, about 450 feet from the plant. The EPA's recommended long-term level for chloroprene is 0.2 micrograms in each cubic meter of air. A microgram is one millionth of a gram. In their 2023 lawsuit, federal lawyers reported the averages at the five air monitors closest to the plant. The lowest was "more than four times" the recommended level. The highest was "more than 14 times" that level.

In March 2025, AP reporters wrote that the community around the plant is about 59 percent Black. They also reported that the plant's air pollution posed the highest cancer risk from any single source to a mostly Black population in the country.

On February 28, 2023, lawyers for the US Justice Department, acting for the EPA under President Biden, sued Denka under the Clean Air Act. They asked the court to force deep cuts in the plant's chloroprene pollution. A trial was set for April 2025. On March 7, 2025, under President Trump, Justice Department lawyers dropped the suit. Their press release stated that dropping it carried out the president's order called "Ending Radical and Wasteful Government DEI Programs and Preferencing." DEI stands for diversity, equity and inclusion.

On May 13, 2025, Denka's managers announced that the LaPlace plant would not start making chloroprene again "for an indefinite period," meaning with no end date. They named losses of more than $100 million, rising costs, falling production and problems keeping enough staff. Articles in trade magazines also listed the pollution rules as a reason. The plant was not making chloroprene as of May 2025.

Plastic in the rain

More than 1,000 tons of tiny plastic pieces fall each year on protected land in the western United States. Janice Brahney, a scientist at Utah State University, and her team found this in a study published in the journal *Science* on June 12, 2020. The pieces are called microplastic, which means bits of plastic too small to see easily. They fall with rain and with dust. The team sampled 11 parks and other protected areas. Each year's total is about as much plastic as more than 120 million plastic bottles. Most of the pieces were tiny fibers from clothing.

Comebacks

People nearly wiped out the bald eagles and the bison, and wiped out the wolves of Yellowstone and of public lands across the country. All three live in far larger numbers now. Hide hunters killed the bison, park managers and others poisoned and shot the wolves, and DDT that people sprayed thinned the eagles' eggshells. In the 2020s, the U.S. Fish and Wildlife Service counted about 71,400 nesting pairs of bald eagles. In 1963 there had been 417.

About 30 million bison lived on the Plains in the early 1800s, and fewer than 1,000 were left by 1900. A count in 2008 found about 20,500 Plains bison in 61 herds kept for conservation. It also found about 400,000 bison in commercial herds, which are raised for sale. A U.S. Fish and Wildlife Service web page now lists about 420,000 bison in commercial herds.

At the end of 2022, state wildlife officials estimated 2,797 wolves in seven western states. At the end of 2024, Park Service biologists counted 108 wolves in nine packs in Yellowstone National Park. At the end of 2025, the park's lead wolf biologist, Dan Stahler, gave a count of 84 wolves in eight packs. People are still fighting in court over whether wolves should stay on the endangered list.

Land given back

In December 2020, members of Congress passed a law returning the National Bison Range to the Confederated Salish and Kootenai Tribes. The range is an 18,800-acre bison refuge on the Flathead Reservation. A refuge is land where wild animals are kept safe. The tribes took over full management of the range in 2022.

The tribes had lost that land in 1908. On May 23, 1908, President Theodore Roosevelt signed a law. Under it, federal officials could spend money to buy land on the reservation for a bison range. The tribes objected strongly. Federal officials took the land anyway and paid about $1.56 an acre. The Fifth Amendment to the Constitution requires fair payment when the government takes private property for public use. In 1971 judges of the U.S. Court of Claims ruled that the price had been below the land's fair value. That federal court heard claims for money against the national government. That made the taking a break of the Fifth Amendment. The judges awarded the tribes about $231,548.

In 2018, Park Service officials in Yosemite agreed to share the care of Wahhoga, the site of the valley's last Native village, for 30 years. They share it with the American Indian Council of Mariposa County. In the winter of 2025, a roundhouse, a round building for gatherings, was finished there.

Bears Ears

Since 2016, three presidents have created, cut, restored and cut again Bears Ears National Monument in Utah. As of September 26, 2026, most of the land was out of the monument and open to mining claims, and no court had ruled on the latest cut.

On December 28, 2016, President Obama created the monument, with 1.35 million acres. Five tribes had proposed it: the Hopi Tribe, the Navajo Nation, the Ute Mountain Ute Tribe, the Ute Indian Tribe and the Pueblo of Zuni. In December 2017, President Donald Trump cut it by about 85 percent, to about 201,876 acres. On October 8, 2021, President Biden restored it. In June 2022, the five tribes signed an agreement with the Bureau of Land Management and the Forest Service to manage the monument together.

On July 13, 2026, Trump signed a proclamation that cut Bears Ears to 121,096 acres, a cut of about 91 percent. Reporters for the *Moab Sun News* published these figures on July 18, 2026. About 1.24 million acres left the monument. What is left is two pieces, Shash Jáa, about 106,816 acres, and Indian Creek, about 14,279 acres. The proclamation lists minerals in the removed land: silver, copper, uranium, vanadium and zinc. The same day, Trump cut Grand Staircase-Escalante National Monument from about 1.87 million acres to about 181,500 acres.

In the July proclamation, Trump also ended the Bears Ears Commission. Elected representatives of the five tribes sat on it, and they had managed the monument with federal officials under the 2022 agreement. Reporters for the *Moab Sun News* wrote that a committee that only gives advice took its place, with tribes holding 5 of about 15 seats. The tribes say

Interior Department officials promised in writing in June 2025 to ask the commission's views before any change to the boundaries, and that no one asked it before July 13. Their statement said: "Our Tribes were not informed of or asked about this decision, and that's unacceptable."

Under the proclamation, the removed land opened on September 11, 2026, to new mining claims, mineral leasing, grazing and timber cutting. A mining claim is a legal claim to the right to mine minerals on public land. Mineral leasing means renting out the right to take minerals from the ground. By noon on September 11, 16 claims had been recorded in San Juan County. By September 23, staff of a conservation group called SUWA counted 23 claims in the removed Bears Ears land. Kimmerle Mining had filed 20 of them, after trying to file 7 claims on July 14, before the land opened. George W. Schultz had filed 3. Kyle Kimmerle, of Kimmerle Mining, had been a plaintiff, a person who brings a lawsuit, in one of the suits against Biden's 2021 restoration.

On September 2, 2026, three sets of plaintiffs went to the U.S. District Court for the District of Columbia, a federal court in Washington. Eight groups asked the court to reopen their 2017 case, which the court had closed for the time being, and to add a complaint against the July 13 proclamation. Among the eight are Utah Diné Bikéyah, Archaeology Southwest and the National Trust for Historic Preservation. Two more sets of groups asked to start up their own 2017 cases again. The conservation groups NRDC and SUWA led one set, and The Wilderness Society led the other. They argue that the Antiquities Act of 1906 lets a president create a monument and does not let a president undo one. Utah's members of Congress called the cuts "a return to an appropriate application of the Antiquities Act." The tribes' own 2017 case, *Hopi Tribe v. Trump*, is still pending, which means undecided, in the same court. As of September 26, 2026, no court had ruled on the 2026 cuts, and no judge had ordered them stopped.

PART 2

Coming, Moving, Settling

Chapter 4: Immigration to America

Before 1500

Before 1500, hundreds of Native nations lived in the land that is now the United States, and their people spoke hundreds of different languages. No one from across the ocean had come to settle there for good. Every group of newcomers who came later arrived on land where people were already living.

Nobody knows how many people lived north of Mexico in 1492, and the estimates differ widely. William Denevan, a geographer who studies the history of people and places, puts the number at about 3.8 million. A book of world population maps published in 1978 lists only about 1 million north of the Rio Grande, the river along the border with Mexico. Some later researchers argued for as many as 18 to 20 million. The historian Donald Fixico gives a range from a few million to 15 million.

The land bridge and the Norse

The first people to reach this land came on foot from Asia, long ago. They walked across the ice-age land bridge, a stretch of dry ground that joined Asia to North America.

Before Columbus, only one group from across the ocean is known to have built a camp in North America, and it did not stay. Around the year 1000, about 500 years before Columbus sailed, Norse sailors from Greenland built a camp at L'Anse aux Meadows. The Norse are often called Vikings. The camp is in Newfoundland, in what is now Canada. Two old Icelandic stories, called sagas, describe a voyage that Leif Erikson, the son of Erik the Red of Greenland, led to a place he named Vinland. Scientists counted the tree rings in wood the Norse cut at the camp with metal blades. The Norse cut those trees down in 1021. It is the only exact date known for Europeans in the Americas before Columbus.

Native people had lived at that spot long before the Norse came. Five Native groups had lived there, the oldest about 6,000 years ago. The Norse stayed only a short time and then left. Estimates of how short run from a few years to about twenty. The Norse built no settlement that lasted.

The 1500s

Europeans reached these coasts in the 1500s, but almost none of them stayed. Most were soldiers, explorers, sailors and missionaries. A missionary is a person sent to bring other people into a religion, and these missionaries were Christian. They came to conquer land and to explore it. Native nations held almost all of the land for the whole century.

St. Augustine, and the failures

St. Augustine, Florida, is the oldest town that Europeans founded in the continental United States, the part of the country on the North American mainland. People have lived in it without a break since it began. The Spanish navy commander Pedro Menéndez de Avilés founded it on September 8, 1565. He named the town for Saint Augustine, because he had first sighted land on that saint's feast day. A feast day is a day the church sets aside to honor a saint. St. Augustine is 42 years older than the English town of Jamestown and 55 years older than Plymouth.

Menéndez landed at Seloy, a town of the Timucua people. Counts of the people who came with him differ. The National Park Service's St. Augustine pages list about 600 soldiers and settlers. The Florida Museum of Natural History's timeline lists about 800, including 26 women and an unknown number of enslaved Africans. The newcomers used the council house of the Timucua chief, also named Seloy, as their first fort. A council house is a building where leaders meet. Timucua fighters attacked again and again to drive the Spanish away. In May 1566 Menéndez moved the settlement across the bay to Anastasia Island. By about 1572 the Spanish had moved back to the place where the town stands today.

Two other attempts to stay failed. In 1564 René de Laudonnière founded Fort Caroline, a French settlement near where Jacksonville, Florida, stands today. The French there met Timucua people. One of their leaders was Athore. The French settlers were Huguenots, which means French Protestants. Protestants are Christians whose churches split away from the Catholic Church, the church led by the pope in Rome. In 1565 Menéndez destroyed Fort Caroline and killed most of the French defenders. The Spanish were Catholics, and the fight between them and the French was partly over religion.

Nobody knows what happened to the 117 English settlers who landed on Roanoke Island in 1587. The island lies off the coast of what is now North Carolina. The island and the coast around it were the land of the Roanoke, Secotan and Croatoan peoples. Sir Walter Raleigh

organized the colony, a settlement ruled from a faraway country, and John White led it. On August 18, 1587, a settler named Eleanor Dare gave birth there to a daughter, Virginia Dare. Virginia Dare is the first English child recorded as born in the Americas.

The settlers sent White back to England for supplies. Before he left, they agreed on a signal. If they moved, they would carve the name of their new place on a tree or a post. If they were in trouble, they would carve a cross above the name. In 1588 Queen Elizabeth I took every English ship for her navy, to fight the Spanish Armada, a fleet of Spanish warships. White could not get back until 1590. He went ashore on August 18, 1590, Virginia Dare's third birthday. He found a wall of upright logs, the houses gone, and no people. Someone had carved CRO on a tree and CROATOAN on a post, with no cross. Croatoan was a nearby island, where a man named Manteo was born. White wrote that its people were friends of the English. A storm blew White's ship out to sea before he could search there, and no one found the settlers.

The 1600s

People from Europe began coming to stay in the 1600s. Some came so that they could worship in their own way. Others came to make money by farming, trading or growing tobacco. Most English people who went to Virginia and Maryland paid for the voyage with years of their own labor.

The colonists settled along the Atlantic coast, on land where Native nations already lived. English colonists built Jamestown on Powhatan land and Plymouth on the site of a Wampanoag town. Dutch colonists built New Amsterdam on Lenape land, and Quakers under William Penn settled Pennsylvania on Lenape land too.

Jamestown and indentured servitude

In 1607 English colonists founded Jamestown, Virginia, the first English settlement that lasted. The Virginia Company of London paid for it. It was a joint-stock company, which means many people bought shares in it, hoping to split a profit. The colonists built their fort inside Tsenacomoco, the land of the Powhatan. The Powhatan were a union of Native towns and peoples under one head chief. Jamestown Island was a hunting ground of the Paspahegh, one of those peoples, and Paspahegh fighters attacked the new settlement on May 26, 1607.

In the first years many colonists died of disease and hunger. In the fall of 1609 the Powhatan leader, also called Powhatan, cut off the food trade with the colonists and surrounded their fort. About 500 colonists were alive at the start of that winter, and about 61 were alive by

spring. In the 1610s John Rolfe began growing tobacco for sale overseas. Once tobacco sold well, more settlers came to Virginia to grow it, and they took more Powhatan land without paying for it. On March 22, 1622, fighters from an alliance of Virginia Indian nations, led by Opechancanough, attacked the English settlements and killed as many as 347 colonists.

Most early English arrivals in the Chesapeake came as indentured servants. The Chesapeake is the country around the Chesapeake Bay, in Virginia and Maryland. An indentured servant signed a contract, called an indenture, and gave up four to seven years of work in exchange for the trip across the ocean. The contract often promised food, a place to live, and a payment at the end called freedom dues.

In the Chesapeake in the 1600s, about 80 to 90 percent of European immigrants came as indentured servants. Across all the British colonies over the whole colonial period, the share was lower: about one-half to two-thirds of white immigrants came this way.

Africans brought by force, 1619

In late August 1619, an English privateer called the *White Lion* brought more than twenty Africans to Point Comfort, near the mouth of the James River in Virginia. A privateer was a privately owned armed ship whose crew attacked the ships of enemy countries. These Africans had been seized in wars around the kingdoms of Kongo and Ndongo, in West Central Africa, in what is now Angola. In 1618 and 1619 Luis Mendes de Vasconçelos, the Portuguese governor of Angola, led two attacks on the people of Ndongo. He fought alongside the Imbangala, African fighters paid to fight for others, and together they captured thousands of people. Their captors marched them to the Portuguese port of Luanda and loaded them onto the Portuguese ship *San Juan Bautista*, with about 350 captives bound for Mexico.

Two English privateers, the *White Lion* and the *Treasurer*, attacked that ship in the Gulf of Mexico. Their crews took 50 to 60 of the Africans between them. The *White Lion* carried its share, more than twenty people, to Virginia. They are the first Africans recorded in English Virginia, and their landing began the forced arrival of Africans in the English mainland colonies.

> #### Richard Frethorne
>
> **Who:** An English boy who came to Virginia as an indentured servant and wrote home begging for help.
>
> **When and where:** Arrived in December 1622 on the *Abigail*. Martin's Hundred, Virginia. Listed among the dead there by February 1624.

> Richard Frethorne is one of very few ordinary people in the early colonies whose own words survive. He was an English boy who came to Virginia as an indentured servant. He arrived in December 1622 on a ship called the *Abigail*, and he worked at a place called Martin's Hundred.
>
> In March and April 1623 he wrote letters to his parents in England. He begged them to buy out his indenture, which meant paying to free him from the rest of his years of work. If they could not do that, he asked them to send food. "I never ate anything but peas and loblollie," he wrote. Loblollie was a thick porridge. In another line he wrote, "there is nothing to comfort us."
>
> By February 1624 his name was on a list of the dead at Martin's Hundred. The list does not give the cause of his death.

Plymouth and the Puritans

Farther north, the *Mayflower* carried about 102 passengers across the Atlantic in 1620. They founded Plymouth, in what is now Massachusetts, on the site of Patuxet, a Wampanoag town. Between 1616 and 1619 a disease had killed many of Patuxet's people. The Pilgrims among the passengers were English Separatists. They wanted to worship apart from the Church of England, the official church of their country. Before crossing the ocean, they had first moved to Leiden, in Holland.

A larger group followed ten years later. In 1630 John Winthrop led a fleet of 11 ships to Massachusetts Bay with about 700 passengers. His flagship, the ship that carried the fleet's leader, was the *Arbella*. These colonists were Puritans, English Protestants who disagreed with how the Church of England was run.

King Charles I made William Laud Archbishop of Canterbury, the head of the Church of England, in 1633. Laud wanted every church to follow the same rules and ceremonies. Judges in a royal court called the Star Chamber and in a church court called the High Commission took church jobs away from many Puritan ministers, the men who led church services, or banned them from preaching. In 1637 judges sentenced the Puritan writers William Prynne, Henry Burton and John Bastwick for writing against Laud. Their punishment was to have their ears cut off and their cheeks branded. Branding means burning the skin with a hot iron to leave a mark that never goes away.

About 20,000 Puritans came to New England over the 1630s, in what is called the Great Migration. They were one part of a larger movement. About 80,000 people left England in that decade. Roughly 20,000 went to each of four places: Ireland, the West Indies, the Netherlands and New England. The West Indies are the islands of the Caribbean Sea.

Anne Hutchinson

Who: An English woman who followed her minister to Boston, was put on trial and banished three years later, and was killed by Siwanoy fighters in 1643.

When and where: Crossed on the *Griffin* in the fall of 1634. Boston, then Rhode Island, then land the Dutch claimed.

Anne Hutchinson crossed the Atlantic to follow her minister, the preacher who led her church. Three years after she landed, the leaders of the Massachusetts colony put her on trial and banished her. Banished means ordered to leave and never come back.

She was born in 1591 in Alford, England. In the fall of 1634 she sailed on the *Griffin* with her husband, William, and their children. About 200 passengers were on board. The Hutchinsons were following their minister, John Cotton, to Boston.

In November 1637 the colony's lawmakers and judges, sitting as the General Court of Massachusetts, tried her at Newtown, now Cambridge. Governor John Winthrop led the questioning. At the end he told her, "you are banished from out of our jurisdiction as being a woman not fit for our society." She answered, "I desire to know wherefore I am banished?" Jurisdiction meant the land the court ruled, and wherefore means why. Winthrop replied, "Say no more, the court knows wherefore and is satisfied."

In 1638 she moved to Portsmouth, Rhode Island. Later she moved again, into territory the Dutch claimed, near what is now New York City. There the Dutch governor, Willem Kieft, was fighting the Native nations nearby, in a war now called Kieft's War. On the night of February 25, 1643, Kieft's men killed at least 80 and perhaps as many as 120 Munsee people. Later that year, in August or September, Siwanoy fighters attacked Anne Hutchinson's household near Pelham Bay. They killed Anne Hutchinson, her servants, and all but one of the children who were with her.

The Dutch and the Swedes

Dutch settlement began earlier than the Puritan fleet, in the 1620s, between Virginia and New England. Dutch colonists founded a colony called New Netherland. Its main town was New Amsterdam, on the island of Manhattan, in Lenapehoking, the homeland of the Lenape people. From 1638 to 1655, Swedish and Finnish settlers ran a small colony called New Sweden along the Delaware River. In 1655 the Dutch took over New Sweden.

In 1664 four English warships arrived at New Amsterdam. The Dutch governor, Peter Stuyvesant, surrendered without a fight. The papers of surrender were signed in late August 1664. The English renamed the colony New York, after James, the Duke of York, the younger brother of King Charles II of England.

The first Jewish refugees, 1654

Twenty-three Jewish refugees landed at New Amsterdam in 1654 on a ship called the *Ste. Catherine*. A refugee is a person who flees home to escape danger. They came from Recife, in Brazil. The Dutch had held that part of Brazil, and the refugees left after Portuguese forces took it back. Another Jewish man, Jacob Barsimson, had arrived earlier that year.

Governor Peter Stuyvesant tried to force the refugees out of the colony. Leaders of the Dutch West India Company, the trading company that ran New Netherland and gave the governor his orders, overruled him.

Catholics, Quakers and Huguenots

Other groups also crossed the ocean for their religion. Catholics settled in Maryland from 1634. Quakers, members of a Protestant group also called the Society of Friends, settled in Pennsylvania under William Penn from 1681. The Lenape people lived on both sides of the Delaware River there.

In 1685 King Louis XIV of France canceled the Edict of Nantes. King Henry IV had made that law in 1598. Under it, French Protestants could worship in the towns they held. Huguenots fled France, and most went to other countries in Europe. By 1700 only about 1,500 to 2,000 had reached the American colonies. They settled in places such as New York, Massachusetts, and Charleston, South Carolina.

1700 to 1750

In the first half of the 1700s the colonists still lived in a thin strip along the Atlantic coast. The land farther inland was still Native land.

Large numbers of newcomers who were not English came in these years. About 200,000 Scots-Irish, Presbyterians from Ulster in the north of Ireland, came between 1710 and 1775. About 2,100 Germans reached New York in 1709 and 1710, and about 12,000 German speakers had come to Pennsylvania by 1749. Small Jewish communities grew in port towns. Many other arrivals came as bound workers, who could not leave their work for years or for life. Indentured servants had signed contracts for years of work. Merchants sold British convicts as laborers. Slave traders brought enslaved Africans by force.

Germans and Scots-Irish

German newcomers came from southwest Germany and from the lands along the Rhine River, including the Palatinate. The Palatinate is a region along the Rhine, and people from there were called Palatines. People left to escape war, taxes and failed crops, and they came for cheap land. About 2,100 Palatines reached New York in 1709 and 1710.

A larger number of Germans went to Pennsylvania, mostly between about 1725 and 1775. By 1749 about 12,000 German speakers had come to Pennsylvania. By the time of the Revolution, Germans made up about one-third of the people in that colony. The name Pennsylvania Dutch comes from *Deutsch*, the German word for German.

The Scots-Irish were Presbyterians, members of a Protestant church, from Ulster in the north of Ireland. Their ancestors were Scots who had settled in Ulster. Between 1710 and 1775 about 200,000 of them came to the land that later became the United States.

They left to escape high rents and a law called the Test Act. Ireland's lawmakers passed it in 1704. Under it, only people who took communion in the Church of Ireland could hold a public job. Communion is a church ceremony of bread and wine. That rule shut Presbyterians out of public jobs. Marriages performed by Presbyterian ministers did not count under the law, so the law said the children of those marriages were born outside a lawful marriage. Pennsylvania was the main place where the Scots-Irish landed. Many then moved south along the Appalachian backcountry, the land in and near the Appalachian Mountains, far from the coast. That backcountry was Native land.

John Peter Zenger

Who: A boy from the German Palatinate who reached New York at 13, after his father died on the crossing, and trained as a printer.

When and where: Arrived in New York in June 1710. Died July 28, 1746.

John Peter Zenger reached New York in June 1710, at the age of 13. His father, Nicolaus, had died on the voyage.

John Peter was born in 1697 in Rumbach, in the Palatinate. In late 1709 his family joined the Palatine migration and traveled first to England. They sailed for New York in April 1710. John Peter landed with his widowed mother, Johanna, and his two siblings. In 1711 he began work as an apprentice to the New York printer William Bradford. An apprentice is a young worker who learns a trade by working for a master for several years.

In 1733 Zenger became the printer of the *New-York Weekly Journal*, a newspaper started by men who opposed the governor, William Cosby. Cosby had copies of the paper burned. Two judges on Cosby's side, James De Lancey and Frederick Philipse, ordered Zenger's arrest. On November 17, 1734, the sheriff took him to jail. He was charged with seditious libel, the crime of printing words that blame a public official or the government. His bail was set at 400 pounds. Bail is money paid to a court so that a person can leave jail until the trial. Zenger did not have that much money, so he stayed in jail until his trial, almost nine months later. His wife, Anna, and his apprentices kept printing the paper, and only one issue was missed. On August 4, 1735, a jury found Zenger not guilty. He died on July 28, 1746.

Jewish communities

Most of the Jews in the colonies were Sephardic Jews, whose families had come from Spain and Portugal. After the first group landed at New Amsterdam in 1654, Jewish communities formed at Newport, Rhode Island, and at Charleston, New York and Savannah, Georgia. On July 11, 1733, 42 Jews landed at Savannah.

Convicts sent as bound labor

Under a British law of 1718, the Transportation Act, merchants shipped about 50,000 convicts, people found guilty of crimes, from Britain to the American colonies. Some counts put the number as high as 60,000, and more than 20,000 went to Virginia. Officials of the British treasury, the office that handled the government's money, paid the merchants for each convict.

The first merchant to get this contract was Jonathan Forward. In the colonies the merchants sold the convicts as bound laborers, workers who had to work for a buyer for a set number of years. Most had to work seven years, and some had to work fourteen. Buyers included merchants, tradesmen, shipbuilders and ironworks owners, because a convict cost less than an indentured servant or an enslaved African. The shipping went on until 1775.

Convicts made up roughly a quarter of the people who emigrated from Britain in the 1700s. To emigrate means to leave one's own country to live in another. Indentured servants also kept coming alongside the convicts.

Forced arrival through Charleston

In these years the number of enslaved Africans that slave traders brought to the mainland colonies rose sharply. Rice planters in the South Carolina Lowcountry, the low coastal land, bought large numbers of West and Central Africans. Some planters chose Africans who already knew how to grow rice. Charleston, South Carolina, was the main mainland port where enslaved Africans arrived. Many were held first at a quarantine station on Sullivan's Island, at the mouth of Charleston's harbor. Quarantine means keeping new arrivals apart so that any disease they carry does not spread. They were kept in buildings called pest houses, where people who might carry disease were held apart, and checked for disease there. The histories of the island do not name the people who kept them. Then slave traders took them to Charleston and sold them at public auction.

In 1974 the historian Peter Wood wrote that Sullivan's Island "might well be described as the Ellis Island of black Americans." Ellis Island was the New York station where millions of European immigrants later arrived. Published estimates put at least 200,000 Africans through Charleston harbor, and that about 40 percent of African Americans today have an ancestor who came that way. Nic Butler, a historian at the Charleston County Public Library, argues that the share credited to Sullivan's Island is too high.

Across the whole slave trade, slave traders forced about 12.5 million Africans onto ships. About 10.7 million lived through the crossing. About 1.8 million died on the slave traders' ships on the way. Fewer than 4 percent of the people who lived through the crossing were brought to mainland North America. About 305,000 came straight from Africa, and close to 388,000 came in all, counting those brought by way of the Caribbean.

1750 to 1800

Fewer people crossed the Atlantic to settle during the American Revolution, from 1775 to 1783, than before it. After the war, members of Congress passed the national government's first law on who could become a citizen, a full legal member of the country. They limited it to free white people. In the 1790s thousands of refugees arrived from a revolution in the Caribbean.

Alexander Hamilton

Who: An orphaned clerk from the Caribbean whose writing about a hurricane led men on St. Croix to pay for his schooling in North America. He came as a teenager and stayed.

When and where: Born on Nevis. Sailed from St. Croix in late 1772 or early 1773. King's College, New York.

Movie: *Hamilton* (2020), the filmed Broadway stage musical with its original cast, released on Disney+ on July 3, 2020. It is a dramatization, not a documentary.

Alexander Hamilton came to North America from the Caribbean as a teenager, to go to school. Men on the island of St. Croix paid for it.

He was born on the Caribbean island of Nevis on January 11. The year is disputed. Accounts of his life give either 1755 or 1757. He was an orphan, which means both of his parents had died. He worked on St. Croix as a clerk, a worker who keeps written records for a business.

On August 31, 1772, a hurricane struck St. Croix. Hamilton wrote a letter describing the storm, dated September 6, 1772. It was printed in a newspaper called the *Royal Danish American Gazette* on October 3. After reading it, men on the island raised money to send him to school in North America.

He sailed in late 1772 or early 1773. Accounts differ on the date. He studied at King's College in New York, and he stayed. Later he worked for the new national government at the Treasury, the department that handles the government's money.

The Revolution and the Loyalists

The Revolutionary War lasted from 1775 to 1783. During those years fewer immigrants crossed the Atlantic than in the years before. The shipping of British convicts to the colonies ended in 1775. During and after the war, tens of thousands of Loyalists left the country, many of them for Canada. Loyalists were colonists who sided with the British king against the Revolution.

Under the peace of 1783, the western border of the United States was the Mississippi River. Spanish and French officials claimed the land beyond the river. Most of the land away from the Atlantic coast was still Native land.

The Naturalization Act of 1790

In 1790 members of Congress passed the Naturalization Act. Naturalization is the legal process by which a person born in another country becomes a citizen. The act was the national government's first law on who could become a citizen. It allowed naturalization only for "a free white person" of "good character." To qualify, a person had to live in the United States for two years, including at least one year in the state where they applied, and swear loyalty to the Constitution. Children born abroad to citizens were included as citizens.

Under this law, an immigrant who was enslaved or was not white could not become a citizen. Members of Congress did not fully remove the limit to white people until 1952, 162 years later.

The men who wrote the Constitution in 1787 also set a date for arrivals by force. In Article I, Section 9, they barred Congress from stopping the bringing in of enslaved people before 1808. So for about twenty more years, slave traders could legally bring captives into the country.

> ### Pierre Toussaint
>
> **Who:** A man born enslaved in Saint-Domingue and brought to New York by the family that enslaved him. He became a leading hairdresser and was freed in 1807.
>
> **When and where:** Brought to New York in 1787. Freed July 2, 1807. Died in New York, June 30, 1853.
>
> In 1787 the Bérard family took Pierre Toussaint, whom they enslaved, from Saint-Domingue to New York. Saint-Domingue was a French colony in the Caribbean. Toussaint was born enslaved there in about 1766, though some recent accounts give 1781. The Bérards were fleeing fighting and disorder in the colony. They came four years before the revolution in Saint-Domingue began.
>
> In New York he trained under a hairdresser and became one of the city's leading hairdressers. The husband of Marie Elisabeth Bérard, of the family that enslaved him, died, and Toussaint supported her. He was still enslaved at the time.
>
> Marie Elisabeth Bérard had married again, to a Mr. Nicolas, and she died in 1807. On her deathbed she made her second husband promise to free Toussaint. Mr. Nicolas kept the promise, and Toussaint was free on July 2, 1807. If Toussaint was born in about 1766, he

was about 41 when he was freed. One account says he was 45. He took the surname Toussaint to honor Toussaint Louverture, a leader of the revolution in Saint-Domingue.

Toussaint used his money to care for orphans and to fund early Catholic charities in New York, groups that helped the poor. During a yellow fever outbreak in New York in 1798, he nursed sick people who were kept apart from others. Yellow fever is a deadly disease spread by mosquitoes. In 1811 he married Juliette Noel, an enslaved woman, after he paid for her freedom.

He died on June 30, 1853. In 1990 Cardinal John O'Connor, the head of the Catholic Church in New York, had his remains moved to the crypt of St. Patrick's Cathedral in New York, a burial room beneath the church. In 1996 Pope John Paul II declared him Venerable, a title the pope gives to a person whom church leaders are studying as a possible saint.

Refugees from Saint-Domingue

On August 21, 1791, enslaved Africans in Saint-Domingue rose up against the French planters who enslaved them and against French rule. Saint-Domingue was a French sugar colony. The fighting went on until January 1, 1804, when Saint-Domingue became the independent country of Haiti. Refugees fled to cities in the United States. They included white planters and free people of color, meaning people of African or mixed descent who were not enslaved. They also included enslaved people, whom their owners brought with them.

That first year a ship called the *Charming Sally* carried 15 refugees to Philadelphia. By 1794 more than 3,000 refugees had come to that city. Nearly 20,000 refugees from Saint-Domingue came to the United States across the 1790s and the 1800s.

1800 to 1850

In the first half of the 1800s, the first large wave of people who chose to come here arrived, mostly from Germany and Ireland. Germans were the largest group of newcomers from about 1840. Between 1845 and 1855, during and after a famine in Ireland, a time when food ran so short that many people died of hunger, more than 1.5 million Irish people reached American ports. New York was the main port where they landed. Large numbers also came ashore at

Boston and at New Orleans. Protestant mobs attacked Catholics near Boston in 1834 and burned Irish Catholic homes in Philadelphia in 1844. Protestants are Christians whose churches split away from the Catholic Church, the church led by the pope in Rome.

Early in these years, on January 1, 1808, a national ban on bringing enslaved people into the country from abroad began.

The end of legal arrival from Africa

On March 2, 1807, President Thomas Jefferson signed a law that banned bringing enslaved people into the United States from other countries. It is called the Act Prohibiting Importation of Slaves. Importation means bringing people or goods in from abroad. The ban began on January 1, 1808, the earliest date the Constitution allowed.

After 1808 no one could legally bring an enslaved African across the ocean. Smugglers kept bringing in captives against the law. From then on, the number of enslaved people in the country grew mainly through children born to enslaved mothers. Enslavers held those children as property from birth.

Germans and the Forty-Eighters

From about 1840 to 1890, more immigrants came from Germany than from any other country. Many Germans left home because their crops had failed. They came for farmland, most of all in the Midwest. Roughly three out of every five German immigrants settled there to farm. About 6 million Germans came to the United States between 1820 and World War I.

In 1848 and 1849, revolutions broke out in Germany. The people who fought in them wanted democratic government, in which the people choose their leaders. Soldiers from Prussia, a kingdom in what is now Germany, crushed the revolutions, and some of the revolutionaries fled abroad. The ones who came to the United States are called the Forty-Eighters, after the year 1848. There were only about 4,000 to 10,000 of them. Many were journalists or professionals, meaning people trained for skilled work such as law or medicine. Some of them later became leaders in their new country.

> #### Jette Bruns
>
> **Who:** A German woman who settled in Missouri with her doctor husband and wrote letters home to her brother for more than fifty years.
>
> **When and where:** Born 1813 in Oelde, Westphalia. Arrived at the Westphalia Settlement, central Missouri, in 1836. Died 1899.

> Jette Bruns came from Germany to a settlement in Missouri in 1836. For more than fifty years afterward she wrote letters home to her brother Heinrich. Her full name was Henriette Geisberg Bruns.
>
> She was born in 1813 in Oelde, a town in Westphalia, a region of Germany. She arrived at the Westphalia Settlement in central Missouri with her husband, the doctor Bernhard Bruns. Their baby son came too, along with her two brothers and a maid.
>
> Her husband Bernhard became mayor of Jefferson City, the capital of Missouri. He died in office during the Civil War. After he died, Jette had almost no money. She ran a boardinghouse, a house where people paid to sleep and eat, across from the Missouri state capitol. The capitol is the building where the state's lawmakers meet. She died in 1899.
>
> Her letters survive. In 1988 the University of Missouri Press printed them, along with a short account of her life that she wrote after the Civil War. Adolf E. Schroeder edited them and translated them into English. The book is called *Hold Dear, As Always: Jette, a German Immigrant Life in Letters*.

Mobs against Catholics, 1834 and 1844

Some Protestant Americans turned against the Irish newcomers and against Catholics. Before the Irish famine, Protestant mobs attacked Catholics in two cities and burned their buildings.

On the night of August 11, 1834, a mob of mostly Protestant workmen burned a Catholic convent school in Charlestown, near Boston. A convent is a home for nuns, women who give their lives to the church. The nuns and 47 girl students were inside, and only six of the girls were Catholic. One Boston newspaper put the mob at 50 to 60 men, and another put it at 150 to 200. About 2,000 people gathered to watch. The mob broke down the doors and windows, set fire to the buildings and burned them to the ground. The men also broke open the tomb where several dead nuns were buried. The records of the attack list no deaths.

Police arrested 13 men. At trial, juries found 12 of them not guilty, including their leader, John R. Buzzell. He later wrote that the evidence against him was enough "to have convicted twenty men, but somehow I proved an alibi." Convicted means found guilty. An alibi is proof that a person was somewhere else when a crime happened. The one man found guilty was 16 years old. Governor John Davis pardoned him, which means the governor forgave the crime and ended the punishment. Massachusetts lawmakers at first voted down a request from Catholic church leaders to be paid for the loss. In 1846 they voted the church $10,000. Church leaders put the loss at about $100,000 and refused the money.

In Philadelphia in 1844, the fighting began over schools. Teachers in the public schools made Catholic children read the Protestant version of the Bible. Francis Patrick Kenrick, the Catholic bishop of Philadelphia, the leader of the city's Catholic churches, objected. Nativists, people who wanted power kept for native-born Protestants, then claimed that Catholics were trying to throw the Bible out of the schools. On May 6, 1844, nativists held a rally in Kensington, a mostly Irish Catholic neighborhood. Shooting and fighting broke out between the nativists and the Irish Catholics. An 18-year-old nativist named George Shiffler was shot dead. The records do not say who fired the shot.

On May 7 and 8, nativist crowds burned Irish Catholic homes, a fire station and a market. They also burned two Catholic churches, St. Michael's and St. Augustine's, and the school of St. Augustine's. They burned a seminary of the Sisters of Charity too. The Sisters of Charity are a group of Catholic nuns, and a seminary is a school that trains people for church work. One count gives about 30 homes burned and about 200 people driven from their homes. In July, nativist crowds learned that the brother of the priest at a third church, St. Philip de Neri, had stored guns in it to defend it. They gathered there and brought a cannon. Soldiers of the state militia under General George Cadwalader fired on the crowd. A militia is a force of citizens called up to serve as soldiers. The crowd attacked the soldiers with bricks, stones, bottles and guns.

Accounts give different counts of the dead. For the May riots, the counts run from at least 14 dead to 20 dead. One of the Catholics killed was Joseph Rice. The Encyclopedia of Greater Philadelphia lists four soldiers and "probably a dozen rioters" dead in July. EBSCO's reference articles give figures that add up to about 34 dead and at least 126 wounded in both riots together. There is no agreed total.

A grand jury charged 19 of the rioters. A grand jury is a group of citizens who decide whether there is enough evidence to put a person on trial. Juries found only a handful of the 19 guilty. In June 1844 a grand jury blamed the Catholics who had been attacked. It said the May riots came from efforts "to exclude the Bible from the public schools." Catholics answered that the jury had called no Catholic to testify. That October, Philadelphia voters elected Lewis Levin to Congress. Levin was a newspaper editor who had founded the nativist group that held the Kensington rally.

The Irish famine

From 1845 to 1852, a plant disease called potato blight rotted Ireland's potatoes. The blight is a water mold, a tiny living thing that grows on the plant and makes it rot. At least two out of every three people in Ireland lived mainly on potatoes. People starved, and about 1 million people in Ireland died. This is called the Great Famine.

Since 1801 Ireland had been part of the United Kingdom, ruled by the government and the lawmakers in London. Ships kept carrying food from Ireland to Britain while people starved. The historian Christine Kinealy counted almost 4,000 ships that carried butter, grain and farm animals from Ireland to British ports in 1847. Soldiers guarded some of those shipments. About 400,000 people in Ireland died that year. Accounts still differ about how much of the need that food could have met. In an earlier food shortage, in the 1780s, British officials had banned grain from leaving Ireland, and the ban had worked. In 1846 and 1847, Prime Minister Lord John Russell and his ministers refused to ban grain from leaving Ireland again. A prime minister is the head of the British government, and the ministers were the officials who ran its departments. They also made Irish taxpayers pay for famine relief, the food and work given to people who were starving.

Charles Trevelyan was the senior official at the Treasury, the government's money department, who ran famine relief. In December 1846, writing to Lord Monteagle about Ireland, he said that the real problem was not the famine. He said it was "the selfish, perverse and turbulent character of the people," meaning the Irish. Perverse means stubbornly wrong, and turbulent means unruly. In 1847 members of the British Parliament, the lawmakers in London, added a rule to the law on help for the poor. The rule was named for one of them, William H. Gregory. Under it, a family holding more than a quarter of an acre of land could get no relief. To get food, a family had to give up its land.

Tenants are families who rent the land they farm. Landlords forced tenant families off their land and often pulled their houses down. This is called eviction. Police records list almost 250,000 people evicted from 1849 to 1854. The historian James S. Donnelly Jr. judged that count too low. He also counted families forced to give up their land in other ways from 1846 to 1854. He wrote that the total "would almost certainly exceed half a million persons." Lord Palmerston, a minister in the British government, cleared about 2,000 tenants from his land in County Sligo and paid their fares overseas. Major Denis Mahon evicted thousands of tenants in County Roscommon.

Most of the people who died in the famine died of disease, which people then called fever. Officials in Ireland did not record deaths then, so the numbers are estimates. They run from about 1 million to 1.5 million dead.

At least 2.1 million people left Ireland from 1845 to 1855, and most of them went to the United States. People called the crowded ships of those years "coffin ships." In 1847 the *Virginius* sailed to Canada with 496 passengers. A report in the Toronto *Globe* said that 158 of them had died, "nearly one third." More than 1.5 million Irish people arrived at American ports between 1845 and 1855. Most of them were poor when they landed. They settled in cities of the Northeast, such as New York and Boston, and in other cities in Pennsylvania, Massachusetts and beyond.

Patrick Kennedy and Bridget Murphy

Who: Two people from County Wexford, Ireland, who married in Boston during the famine years. Patrick was the great-grandfather of President John F. Kennedy.

When and where: Patrick left Ireland in 1848 or 1849. They married in September 1849. East Boston, Massachusetts.

Patrick Kennedy left Ireland during the Great Famine and made a new home in East Boston, Massachusetts. He was born in 1823 at Dunganstown, in County Wexford. Accounts differ on whether he left Ireland in 1848 or in 1849. In East Boston he worked as a cooper, a person who makes barrels.

In September 1849 he married Bridget Murphy. She also came from County Wexford, from a place called Owenduff. The couple had five children.

Patrick died of cholera on November 22, 1858, at the age of 35. Cholera is a disease people catch from dirty water or food. It causes heavy diarrhea, and a sick person can lose so much water from the body that they die within days.

Patrick's son Patrick Joseph Kennedy, known as P.J., had a son named Joseph P. Kennedy. Joseph's son was John F. Kennedy, who later became president of the United States.

1850 to 1900

Between 1855 and 1890, about 11 million immigrants arrived through the port of New York alone. Germans still came in the largest numbers in the 1850s. Chinese immigrants began arriving on the West Coast in 1849. Toward the end of the century, Italians, Poles, Hungarians, Greeks and Jews from the Russian Empire came in growing numbers.

From 1871 to 1887, mobs in the West killed Chinese immigrants and drove whole Chinese communities out of their towns. In these years lawmakers also began to shut some immigrants out. The Chinese Exclusion Act of 1882 was the first law in the United States to bar a group of people because of their nationality, meaning the country they came from.

Germans and the Know-Nothings

More than 950,000 Germans came to the United States in the 1850s. About 220,000 of them arrived in 1854 alone.

In the 1850s, members of secret societies that opposed immigrants and Catholics formed a political party. Its official name was the American Party. Members who were asked about the group answered, "I know nothing," and the party came to be called the Know-Nothings. The Know-Nothings feared that Catholics were a danger to the Protestant faith and to democracy. In the 1854 elections in Massachusetts, Know-Nothing candidates won all but 3 of the 400 seats in the state's lawmaking body.

On Monday, August 6, 1855, Know-Nothing mobs attacked immigrants in Louisville, Kentucky. It was election day, and people call it Bloody Monday. Irish and German immigrants made up about a third of the city. In the weeks before the vote, George D. Prentice, editor of the *Louisville Journal*, wrote newspaper articles against immigrants.

On election day, Know-Nothing gangs stopped immigrants from voting. Mobs led by party members attacked the German neighborhoods east of downtown and the Irish neighborhoods to the west. They set fires and robbed homes and businesses, and they damaged more than 100 homes and businesses. Accounts written later say the mob burned Quinn's Row, a row of houses owned by an Irishman named Quinn, and shot people as they ran from the flames. A study published in the 2020s in the Kentucky Historical Society's journal uses court statements from the 1850s to challenge many of the stories told about the riot.

The Kentucky Historical Society lists at least 22 dead. Other counts give 19 to 22, and Catholic leaders at the time put the number at well over 100. Most of the dead were Irish and German. A grand jury charged five people, and none was found guilty. No one paid the victims for their

losses. The Catholic bishop, Martin John Spalding, asked Catholics to stay calm and not to take revenge.

Then the party's members split over slavery. By 1860 the party had broken apart, and many of its members had joined the new Republican Party.

Carl Schurz

Who: A German revolutionary who fled after the revolutions of 1848 and 1849 failed. In the United States he became a Union general, a senator and Secretary of the Interior.

When and where: Born March 2, 1829, in the Rhine Province of Prussia, near Cologne. Settled in Watertown, Wisconsin, in 1852. Died May 14, 1906.

Carl Schurz was one of the Forty-Eighters. He came to the United States in 1852 as a refugee, a person who flees danger at home, after the German revolutions failed.

He was born on March 2, 1829, near the city of Cologne, in the Rhine Province of Prussia. Prussia was a kingdom in what is now Germany. Schurz joined the revolutions of 1848 and 1849. When Prussian forces crushed them, he fled to France and then to London. In 1852 he crossed the Atlantic and settled in Watertown, Wisconsin.

In the Civil War he served as a general in the Union army, the army of the United States government, which fought the Southern states that had broken away. From 1869 to 1875 he represented Missouri in the United States Senate, as the first senator born in Germany. President Hayes then chose him as Secretary of the Interior, one of the heads of government departments who advise the president. He held that job from 1877 to 1881, and he died in 1906.

The last known slave ship

Around July 8, 1860, a sailing ship called the *Clotilda* carried about 110 African captives to Mobile, Alabama. Bringing captives into the country had been against the law for 52 years. The businessman Timothy Meaher paid for the voyage, reportedly to win a bet that he could smuggle captives in. The *Clotilda* is the last documented slave ship to reach the United States.

One of the captives was Oluale Kossola, born in about 1841 in what is now Benin, in West Africa. Accounts say soldiers of the kingdom of Dahomey captured him in a raid and took him to the coast. In Alabama, Meaher, his brothers and some friends enslaved the captives for the next five years, until slavery ended in 1865. The ship's captain, William Foster, set the *Clotilda* on fire near Twelve-Mile Island. After the end of slavery the survivors could not pay for the trip

home. They built their own town near Mobile and called it Africatown. In 1927 the writer Zora Neale Hurston interviewed Kossola, and her book about him, *Barracoon*, came out in 2018. The wreck of the *Clotilda* was found in the Mobile River and confirmed in 2019.

Chinese immigrants in the West

Chinese immigration to the United States began with the California Gold Rush, when crowds of people went to California to look for gold. About 325 Chinese people came in 1849. Three years later, in 1852, some 20,000 came. Between 1851 and 1860 about 40,400 arrived in all. Most came from Guangdong province, also called Canton, in southern China. By 1880 about 105,465 Chinese people lived in the United States.

Between 1865 and 1869, managers of the Central Pacific Railroad had about 10,000 to 12,000 Chinese workers on the job at any one time. These workers built the western part of the first railroad to cross the country. About nine out of every ten of the railroad's workers were Chinese. Chinese workers earned about $35 a month and paid for their own food and housing. White workers got about $42 a month plus housing.

In June 1867 thousands of Chinese workers went on strike, which means they stopped work together to press for better terms. They asked for $40 a month, a 10-hour workday instead of 11 hours, and shorter shifts in the tunnels. Charles Crocker was the railroad director in charge of building. He cut off all food and supplies to their camps and brought in the sheriff and his deputies. After about eight days the workers went back to work.

The railroad's managers kept no record of how many workers died. A figure of about 1,200 dead comes from one newspaper report in 1870. A reporter for the *Sacramento Reporter* wrote that a train had brought in "the accumulated bones of perhaps 1,200" Chinese men from along the line. Chinese aid societies paid to send such bones home to China. On the same day, the *Sacramento Union* reported about 50 dead. Researchers at a railroad history museum think about 100 to 150 Chinese workers died building the railroad. Other estimates run from hundreds to thousands. No one knows the real count.

Snow, explosions and disease killed Chinese railroad workers. In the winter of 1866 and 1867, 44 storms hit the Sierra Nevada mountains. An avalanche is a mass of snow sliding down a mountainside. One avalanche at Strong's Canyon carried away the camp of two work crews of Chinese workers who were building tunnels there. One worker's body was not found until spring. Workers blasted through solid granite rock with black powder, an early kind of

gunpowder. From 1867 they also used nitroglycerin, a liquid explosive that can go off from a jolt. Smallpox broke out in 1868 and 1869. Smallpox is a disease that passes from person to person and covers the body in sores.

The Page Act and the Chinese Exclusion Act

In 1875 members of Congress passed the Page Act, the national government's first law to limit immigration. Under it, contract laborers from China and other Asian countries could not come in. A contract laborer was a worker brought over already bound by a contract to work for someone. The law called these workers by an insulting name used then for Asian laborers. Immigration officers at the ports decided which women to turn away, and in practice they kept out most Chinese women under the Page Act. The stated reason for keeping them out was to stop prostitution, which means selling sex for money. That reason was a pretext, meaning a false excuse.

On May 6, 1882, President Chester A. Arthur signed the Chinese Exclusion Act. Exclusion means shutting people out. Under the act, Chinese laborers could not immigrate for 10 years. It was the first law in the United States to bar a group of people because of their nationality or their ethnicity. Ethnicity means the group of people, with its own language and ways, that someone belongs to. Members of Congress later renewed the law and made it wider. They did not cancel it until 1943, 61 years after Arthur signed it.

Attacks on Chinese immigrants, 1871 to 1887

Before and after the Exclusion Act, mobs in the West attacked Chinese immigrants. In the cases below, juries and judges punished almost none of the attackers.

In Los Angeles on October 24, 1871, a gunfight broke out between two groups of Chinese residents. A local rancher, Robert Thompson, fired into a Chinese store. He was hit by return fire and died about an hour later. A mob of about 500 non-Chinese men then spent about two hours pulling Chinese people out of the Chinese part of town. They shot, beat and hanged them, and they robbed Chinese homes and stores.

They killed 18 Chinese men and boys, about one in ten of the city's Chinese people. Only one of the dead is thought to have taken part in the first gunfight. The mob hanged seven men from the wooden crossbar of a porch and three more from the side of a wagon. The dead included Chee Long Tong, a doctor who healed people with herbs, and a teenager, Ah Loo. Dr. Tong offered the mob money and the diamond ring on his finger if they would spare his life. The geographer Reece Jones writes that a man in the crowd shot him in the mouth and cut off his

finger to take the ring. The mob also hanged him. A grand jury charged 25 men. By one account eight were found guilty of manslaughter, and by another account nine. Manslaughter is the crime of killing someone without planning to. A judge sentenced them to two to six years in San Quentin prison. About a year later the judges of the California Supreme Court threw out the guilty verdicts because of a mistake in how the charges were written. None of the men was tried again.

On September 2, 1885, 100 to 150 armed white miners and railroad workers attacked the Chinese miners they worked beside in Rock Springs, Wyoming Territory. A territory was land the national government ran before it became a state. Managers of the Union Pacific Railroad had hired the Chinese miners at lower pay. Most of the attackers were immigrants themselves, from Britain, Ireland, Wales and Scandinavia. The attackers shot Chinese miners, struck them with picks, hatchets and clubs, and burned all 79 houses in the Chinese part of town. Some Chinese people burned to death in their cellars. About 600 Chinese people fled.

The Wyoming State Historical Society lists 28 Chinese killed and 15 wounded. Other counts put the dead at 40 to 50, because some who fled were never found. President Grover Cleveland sent army troops, and the railroad's managers brought the Chinese miners back to work under army guard. Officials arrested 16 men, or 22 by some accounts. A grand jury charged none of them. It said that no one had been able to testify to "a single criminal act committed by any known white person that day."

Other mobs drove Chinese people out of their towns. In Eureka, California, in February 1885, a stray bullet from a gunfight between two Chinese groups killed a city councilman, David Kendall. That night more than 600 white residents gathered and put up a gallows, a frame for hanging people. City leaders ordered every Chinese resident to leave within 24 hours. A committee of white residents put about 480 Chinese people, nearly all of the town's Chinese residents, on two steamships to San Francisco. No one was killed. The Chinese families left behind their furniture, goods, shrimp boats and vegetable farms. Chinatown was torn down, and the accounts do not name who did it. In 1886 a Chinese aid group, the Six Companies, sued the city, and the case was dropped. Rules keeping Chinese people out stayed in Eureka's city charter, its basic set of laws, until 1959.

In Tacoma, Washington Territory, Mayor Jacob Weisbach led a year-long campaign to drive the Chinese out. He called them "a curse." Tacoma's leaders ordered all Chinese residents to leave by November 3, 1885, and about 150 left before that date. On November 3, a mob forced about 200 more Chinese residents out of their homes in the rain and onto trains out of town. The mob then burned their houses. Officials charged 27 Tacoma men, Weisbach among them,

and later dropped every charge. In February 1886 mobs in Seattle forced more than 300 Chinese residents to the docks, and ships carried about 300 of them away. Of 13 men tried for the Seattle riot, none was found guilty.

In May 1887, a gang of white horse thieves shot and killed as many as 34 Chinese gold miners. The miners were camped in Hells Canyon, on the Snake River in Oregon. They took the miners' gold dust. One of the gang, Frank Vaughan, confessed that they had agreed nearly a year earlier to murder the miners. Vaughan testified for the state and was not tried. Three of the accused men fled before trial. A jury found the three who stood trial not guilty. A stone marker placed at the site in 2012 states, "No one was held accountable." Its words are in English, in Chinese and in Nez Perce, a Native American language.

Jews from the Russian Empire, and others from southern and eastern Europe

Italians, Poles, Hungarians and Greeks came in growing numbers late in the century. So did Jews from the Russian Empire.

In March 1881 revolutionaries murdered the ruler of the Russian Empire, Tsar Alexander II. Six weeks later, on April 15, 1881, a crowd attacked Jews in the town of Elisavetgrad, in what is now Ukraine. It was the first of about 250 pogroms, violent riots in which a crowd attacks Jewish people and their homes, shops and synagogues, the buildings where Jews worship. The pogroms went on until 1884, in Kiev, Warsaw and many other places. Another count gives 259 pogroms from 1881 to 1883.

The historian John Klier describes many of the attackers as laborers who drifted from place to place looking for work. Railroad workers, factory workers and local business rivals of Jews also took part. Peasants, poor farm workers, joined in mostly to steal. The attackers robbed and wrecked Jewish homes and shops. They beat, raped and killed Jews. Rape means forcing a person into sex. Counts of the dead differ. One count says at least 40 Jews were killed from April to December 1881. Klier counts about 50 deaths in the whole wave. About half of those dead were Jews, and about half were rioters killed while the tsar's officials put down the riots.

For many years, accounts said that officials of the tsar's government had planned the attacks. Later, Hans Rogger, I. Michael Aronson and John Klier looked for evidence of that and found none. Some local officials helped stir the attacks up. Klier writes that more than a thousand rioters were punished in some way. Another account says the tsar pardoned most of the rioters who were brought to trial. The two accounts do not agree.

In May 1882 Nikolai Ignatiev, the tsar's minister in charge of the police and of other matters inside the country, proposed rules called the May Laws. Tsar Alexander III approved them. Ignatiev blamed the pogroms on the Jews themselves. The rules were for Jews in the Pale of Settlement, the region of the Russian Empire where Jews were allowed to live. Under the May Laws, Jews could not move to new homes outside towns. They could not buy or rent land in the countryside, and they could not trade on Sunday mornings or on Christian holidays.

More than 2 million Jews from the Russian Empire came to the United States between 1881 and 1914. Many of them were escaping the pogroms and the May Laws. Over 1.5 million of them had arrived by 1910, most of them from Russia.

The Statue of Liberty and Emma Lazarus

The Statue of Liberty, a gift from France, was opened with a ceremony in New York Harbor on October 28, 1886.

Three years earlier, in 1883, the poet Emma Lazarus wrote a poem called "The New Colossus." She wrote it to help raise money for the statue's pedestal, the stone base it stands on. The poem includes the lines "Give me your tired, your poor, / Your huddled masses yearning to breathe free." Nobody read the poem at the opening ceremony in 1886, and people mostly forgot it.

Lazarus was born in New York in 1849, into a Sephardic Jewish family, whose ancestors were Jews of Spain and Portugal. She had worked with Jewish refugees from Russia who arrived in the 1880s. She died in 1887. Later her friend Georgina Schuyler had the poem cast on a bronze plaque, and in 1903 the plaque was mounted inside the pedestal. After that, people began to link the statue with the idea of America as a refuge, a safe place, for immigrants.

Castle Garden and Ellis Island

From August 1855 to April 1890, most immigrants who landed at New York passed through Castle Garden. It stood at Castle Clinton, in Battery Park, at the southern tip of Manhattan. It was the country's first official depot for immigrants, a building where officials received newcomers, checked them and recorded them. New York State and New York City officials ran it together. About 11 million immigrants arrived through New York in those years, and about 8 million of them passed through Castle Garden.

People had complained that officials at Castle Garden were dishonest. When it closed in 1890, officials of the national government took charge of immigration. On January 1, 1892, they opened Ellis Island, the national government's immigration station on an island in New York Harbor, in its place.

Annie Moore

Who: A 17-year-old from County Cork, Ireland, the first immigrant processed at Ellis Island. For about a century, another woman's life was told as hers.

When and where: Arrived January 1, 1892, on the steamship *Nevada*. Lived on the Lower East Side of New York. Died in 1924.

Annie Moore was the first immigrant processed at Ellis Island, on the day it opened, January 1, 1892. She was 17 and came from County Cork, Ireland. She arrived on the steamship *Nevada* with her two younger brothers, Anthony, who was about 15, and Philip, who was about 12. She received a $10 gold piece, a gold coin worth ten dollars.

For about a century, writers described the wrong woman as Annie Moore. That woman went west and died in Texas, and she had been born in Illinois. In 2006 the genealogist Megan Smolenyak offered $1,000 to anyone who could find the real Annie. A genealogist is a person who traces family histories through old records. Researchers who took up the challenge found her.

The real Annie Moore never left New York. She lived in a tenement, a crowded apartment building, on Monroe Street on the Lower East Side. She married a clerk at a fish market. She died in 1924, at the age of 50. A headstone was placed on her grave in 2008. Statues of her stand at Ellis Island and at Cobh, in Ireland.

Irving Berlin

Who: A Jewish boy from the Russian Empire who arrived at Ellis Island at five and grew up to write "White Christmas" and "God Bless America."

When and where: Born in 1888 in the Russian Empire (the place is uncertain). Arrived at Ellis Island September 14, 1893. Died September 22, 1989, at 101.

At the age of five, Irving Berlin arrived at Ellis Island. He later wrote the songs "White Christmas," "Easter Parade" and "God Bless America."

He was born Israel Beilin in 1888 in the Russian Empire. The place of his birth is uncertain. Recent research points to Tyumen, in Siberia, and older accounts give the region around Mogilev. His family used May 11 as his birthday, but one account gives May 23.

His memory of Russia was of his family's house burning during violence against Jews. No record says who set the fire. The family arrived at Ellis Island on September 14, 1893. In America their surname became Baline.

He wrote his songs under the name Irving Berlin. He wrote a first version of "God Bless America" in 1918. The singer Kate Smith first performed it for the public in 1938. Berlin died on September 22, 1989, at the age of 101.

Wong Kim Ark

Who: A cook born in San Francisco to Chinese immigrant parents. Officials refused to let him back into the country, and his case went to the Supreme Court.

When and where: Born 1873, San Francisco. Refused landing August 1895. Supreme Court decision March 28, 1898.

In 1895 John H. Wise, the official in charge of collecting taxes on goods coming into the port of San Francisco, refused to let Wong Kim Ark back into the United States, the country where he was born. Wise acted under the Chinese exclusion laws. His case reached the Supreme Court, and he won. The justices, the judges of the Supreme Court, ruled that anyone born in the United States is a citizen.

He was born in San Francisco in 1873. His parents were Chinese immigrants, and he worked as a cook. In August 1895 he was coming home from a visit to China on the steamship *Coptic*. Wise said Wong was not a citizen, because his parents had not become citizens, and he held Wong on the ship.

On October 2, 1895, a writ of habeas corpus was issued for him in the national government's court in San Francisco. A writ of habeas corpus is a court order. It requires the people holding someone to bring that person before a judge and give a lawful reason for holding them. Judge William Morrow ruled that Wong was a citizen and ordered him freed. Henry Foote, the national government's lawyer in San Francisco, had brought the case against Wong. Lawyers for the national government took it higher. The case, *United States v. Wong Kim Ark*, went on to the Supreme Court. On March 28, 1898, the justices decided it 6 to 2. They ruled that under the Fourteenth Amendment, an addition to the Constitution, everyone born in the United States is a citizen.

1900 to 1950

The great wave of newcomers to the United States peaked in the early 1900s. In 1907 alone, officials at Ellis Island admitted 1,004,756 people. Then members of Congress passed quota laws in 1921 and 1924. A quota is a fixed number of people allowed in. Under the 1924 law, no more than about 165,000 immigrants could come each year, and almost no one from Asia could come at all. On the West Coast, officials at Angel Island held Chinese arrivals anywhere from a few days to many months.

From 1929 to 1936, officials pushed somewhere between 500,000 and 2 million people of Mexican descent out of the country. By the two larger counts, about 6 in 10 of them were US citizens. In 1939 officials in Cuba, the United States and Canada refused to let a ship full of Jewish refugees land.

Ellis Island's busiest years and the melting pot

Ellis Island's busiest year was 1907. Officials there admitted 1,004,756 immigrants that year. On the busiest single day, April 17, 1907, 11,747 people came through. From 1892 to 1954, about 12 million immigrants passed through Ellis Island. Older claims of about 17 million are too high.

On October 5, 1908, a play by Israel Zangwill called *The Melting Pot* opened in Washington, D.C. Theodore Roosevelt watched the first night from his box and praised it. After that, the phrase "melting pot" spread. A melting pot is a pot in which different metals melt together into one. People used the phrase to mean that newcomers from many lands would blend together into one nation.

Frank Capra

Who: A boy from Sicily who crossed to America in the cheapest part of a ship in 1903. He grew up to win three Academy Awards for directing films.

When and where: Born May 18, 1897, in Bisacquino, Sicily. Came through Ellis Island in 1903, then went on to Los Angeles.

Movie: *Frank Capra's American Dream* (1997), a documentary made for television. Kenneth Bowser directed it, and Ron Howard hosted it.

Frank Capra came to the United States from Sicily in 1903 as a young boy. As a grown man he directed films, and in the 1930s he won three Academy Awards as best director.

He was born Francesco Rosario Capra on May 18, 1897, in the town of Bisacquino. Sicily is an island that belongs to Italy. His family crossed the Atlantic on the ship *Germania*. They traveled in steerage, the cheapest space on a ship, below the decks. They passed through Ellis Island and then rode a train across the whole country to Los Angeles.

In 1946 he made the film *It's a Wonderful Life*.

Doukenie Bacos

Who: A Greek girl who reached Ellis Island at 16. She was traveling underage and was afraid officials would send her back.

When and where: Born December 18, 1904, to a Greek family in Thrace. Sailed from Piraeus, Greece. Reached Ellis Island January 5, 1921.

Doukenie Bacos reached Ellis Island at the age of 16. She was traveling underage, which means she was younger than an adult. She was afraid the officials would send her home.

Her full name was Doukenie Babayanie Bacos. She was born on December 18, 1904, to a Greek family in Thrace, a region of southeastern Europe now divided among Greece, Turkey and Bulgaria. She sailed on the ship *King Alexander* from Piraeus, the port city of Athens. She left on December 22, 1920, and reached Ellis Island on January 5, 1921. Some records give 1919 as the year she left, and National Park Service staff marked that year as a mistake.

Officials at Ellis Island held her for three days. Her uncle was a bachelor, a man who had never married. The officials would not hand a girl her age to a bachelor alone, so he had to find a family for her to live with. She was afraid they would send her back, and she later said she had thought of jumping into the water rather than be sent home. On the third day the officials let her go. That night her uncle came with a woman he called her "aunt," and Doukenie went to live with that family. In 1991 she told her story to the Ellis Island Oral History Project, which records interviews with people who came through the island. Her interview is number 49 in its EI series.

Angel Island

Angel Island Immigration Station opened in 1910 on an island in San Francisco Bay. The officials who worked there mainly enforced the Chinese Exclusion Act, an 1882 law that barred Chinese workers from coming in, and other laws against Asian immigrants. They held many

Asian arrivals for days or months. The National Park Service states that some stays lasted several years, while the longest stay in other records is 22 months. Officials refused entry to about 18 out of every 100 people who arrived at Angel Island. At Ellis Island the figure was 1 to 3 out of every 100.

Station officials kept the detainees, the people being held, locked in crowded dormitories. A dormitory is a large room full of beds. No detainee could leave it without a guard. Officers read every letter the detainees sent or received. No one could visit a detainee until the officials had decided the case.

Doctors from the Public Health Service examined the arrivals. They turned people's eyelids inside out to look for trachoma, an eye infection that can cause blindness. They took samples of blood, spit, urine or stool, which means bowel movements. They tested Asian arrivals for worms that live inside the body, such as hookworm. When officials doubted a person's age, doctors made the person strip naked. The doctors then examined the person's hair, skin, teeth, voice and genitals, the private parts of the body.

Under the exclusion laws, most Chinese people could get in only by showing a family tie to a US citizen. Some claimed a tie that was false. They were called "paper sons" and "paper daughters," because the family tie existed only on paper. To catch them, a group of officials called a Board of Special Inquiry questioned each Chinese applicant about home villages and relatives. The board was made up of two inspectors, a translator and a stenographer, a clerk who wrote down every word. One inspector said in 1934 that "well over ninety percent" of his time went to questioning arriving Chinese people.

Some detainees killed themselves. The historian Judy Yung said in 2026 that a few were driven to it, most of them by hanging themselves in the bathrooms. She gave no names and no count.

Detainees carved poems into the wooden walls of the barracks where they were held. The poems were almost lost before a park ranger, Alexander Weiss, found them in 1970, and then they were saved.

Counts of the Chinese people who passed through the station differ. One count is about 175,000 between 1910 and 1940, and the National Park Service states 250,000.

On August 12, 1940, a fire burned the station's main office building, and the station closed soon after.

Lee Puey You

Who: A Chinese woman who came as a "paper daughter" in 1939. Officials held her on Angel Island for about 20 months and then sent her back to China.

When and where: Arrived at Angel Island in 1939. Deported to China in November 1940. Came back in 1947 and settled in San Francisco.

Officials held Lee Puey You on Angel Island for about 20 months, one of the longest stays known for a Chinese detainee. Then they refused to let her in and deported her, which means they forced her to leave the country.

She arrived in 1939 as a "paper daughter." Inspectors asked her about 170 questions. In November 1940 officials sent her back to China. She later said she "cried a bowlful of tears."

In 1943 members of Congress canceled the Chinese Exclusion Act. In 1947 Lee Puey You came back to the United States as a war bride, meaning a woman engaged or married to a man who served in the war. She married and settled in San Francisco. Judy Yung later wrote about her in an article called "A Bowlful of Tears Revisited."

The quota laws of 1921 and 1924

In 1921 members of Congress passed the Emergency Quota Act, the first law to put number limits on immigration. The yearly quota for each nationality was 3 percent of the people born in that country who lived in the United States in 1910. That count came from the census, the official count of everyone living in the country.

In 1924 members of Congress passed the Immigration Act of 1924, which set much lower limits. It is also called the Johnson-Reed Act, after the two lawmakers behind it. Representative Albert Johnson of Washington State was chairman of the House committee on immigration. David Reed was a senator from Pennsylvania. President Calvin Coolidge signed the law on May 26, 1924.

Under the 1924 law, each country's quota was 2 percent of the people born there who lived in the United States in 1890. Lawmakers picked 1890 because it came before the large wave from southern and eastern Europe. Italy's yearly quota fell from more than 42,000 to fewer than 6,000. Lawmakers also shut out anyone "ineligible for citizenship," meaning anyone who could not become a citizen under US law. At that time the law let only white people and people of

African birth or descent become citizens. In 1922 and 1923 the justices, the judges of the Supreme Court, ruled that immigrants from Japan and from India could not count as white. Under that rule, almost no one from Asia could come in.

Lawmakers capped the total at about 165,000 people a year. Under the 1921 law it had been about 355,000. About 86 of every 100 quota places went to northern and western Europe. About 9 went to southern and eastern Europe. Under those limits, the great rush of newcomers from Europe came to an end.

In December 1923, in his first message to Congress, Coolidge had said, "America must be kept American. For this purpose, it is necessary to continue a policy of restricted immigration." The State Department's Office of the Historian states: "The most basic purpose of the 1924 Immigration Act was to preserve the ideal of U.S. homogeneity." Homogeneity means sameness.

Eugenics and the men behind the 1924 law

The men who shaped the 1924 law argued for it with eugenics. Eugenics was a false belief that a nation could improve its people by controlling who had children and who came into the country. Its believers ranked groups of people as "better" or "worse" by birth.

Harry H. Laughlin ran the Eugenics Record Office at Cold Spring Harbor, New York. He testified, meaning he spoke under oath at a hearing, to Johnson's committee three times between 1920 and 1924. He claimed that immigrants from southern and eastern Europe had higher rates of "feeblemindedness, insanity, criminality, and dependency." He meant mainly Italians and Jews. Those were old words for low intelligence, mental illness, crime and needing public charity. He said that too many of the people in mental hospitals came from southern and eastern Europe. His own figures showed high rates for German and Irish immigrants as well. Johnson named Laughlin the committee's "expert eugenics agent."

In 1922 Laughlin also wrote a model law for forced sterilization. A model law is a sample law for lawmakers to copy. Sterilization is an operation after which a person can never have a baby. For a woman, a doctor cut or tied the two tubes that carry eggs from the ovaries to the womb, or cut out a piece of each tube, so that no egg could reach the womb again. For a man, a doctor cut the tubes that carry sperm. The operation could not be undone.

In part because of Laughlin's work, lawmakers in dozens of states passed laws that let officials force people to be sterilized against their will. By the 1960s doctors in the United States had sterilized more than 62,000 people this way, about 60 out of every 100 of them women. On May 2, 1927, in the case Buck v. Bell, the justices of the Supreme Court ruled 8 to 1 that

Virginia could sterilize Carrie Buck, a Virginia woman, against her will. On October 19, 1927, Dr. John H. Bell cut out a piece of each of her tubes. In 1933 the Nazis, the party of Adolf Hitler that then ruled Germany, passed a forced sterilization law based in part on the American practice. Under it, special courts of a judge and two doctors decided each case, and an approved doctor did the operation. About 400,000 people in Nazi Germany were sterilized this way. In 1936 leaders of the University of Heidelberg, in Germany, gave Laughlin an honorary degree, a degree given as an honor instead of for study.

Madison Grant was a New York lawyer. In 1916 he wrote a book called *The Passing of the Great Race*. In it he claimed that a "Nordic race" from northwestern Europe was better than all other people. Grant helped Johnson write the 1924 law. Hitler wrote to Grant and called the book his "Bible."

Mexican arrivals and the Mexican Repatriation

The Mexican Revolution was a war in Mexico that lasted from 1910 to 1920. During those years about 350,000 people fled north across the border into the United States. More kept coming in the 1920s.

From 1929 to 1936, officials pushed people of Mexican descent out of the United States. This is called the Mexican Repatriation. Repatriation means sending people back to their own country. By the larger counts, most of the people sent to Mexico had been born in the United States, so they were being sent out of their own country. It happened during the Great Depression, the years when many people in the United States had no work.

Secretary of Labor William N. Doak, who served under President Herbert Hoover, led a national campaign to remove Mexicans. He claimed they were taking jobs from other workers. In Los Angeles, Charles P. Visel, head of the city's unemployment relief committee, planned a publicity campaign. Relief was public money for people without work.

Officials raided Mexican American neighborhoods and public places. County welfare officers, the officials who handed out relief money, told families that their relief money would stop unless they took free train tickets to Mexico. Officials of the Los Angeles County welfare office ran the trains, and the first one left on March 23, 1931. Hospital staff carried patients on stretchers to trucks bound for the border. Families lost their property. In a 2005 California law, state lawmakers wrote that this property "often was sold by local authorities" as "payment" for the cost of removing the families.

On February 26, 1931, immigration agents blocked the exits of La Placita, a park in Los Angeles, while about 400 people were inside. Accounts of what happened next differ. According to the California Migration Museum, the agents arrested about a dozen people and deported a few. According to a History.com article, they rounded up more than 400 people and deported them.

Counts of the people removed run from about 500,000 to about 2 million. The California Migration Museum states about 1 million, following the historians Francisco Balderrama and Raymond Rodríguez. By that count, about 60 of every 100 were citizens born in the United States. The 2005 California law states about 2 million, and about 1.2 million of them had been born in the United States. Officials pushed about 35,000 people out of Los Angeles, about a third of the Mexican people living there.

California lawmakers apologized for the removals in that 2005 law. In February 2012 the members of the Los Angeles County Board of Supervisors, who run the county, apologized and put up a plaque, a metal sign with words on it, at LA Plaza. No apology from the federal government, the national government in Washington, is on record.

In August 1942, US and Mexican officials started the Bracero Program. Under it, Mexican farmworkers came to the United States on contracts to work for a set time and then go home. Bracero is a Spanish word for a man who works with his arms, from *brazo*, the word for arm.

The St. Louis and the first refugee law

On May 13, 1939, the German ship *St. Louis* left Hamburg for Havana, Cuba, with 937 passengers. Almost all of them were Jewish refugees, people fleeing their country to escape danger. Cuba's president, Federico Laredo Brú, canceled their papers to land, and Cuban officials let only 28 passengers off at Havana. The passengers asked President Franklin D. Roosevelt for help, and he never answered them. State Department officials told them they must "await their turns on the waiting list." Canadian officials refused them too.

The passengers were fleeing attacks on Jews that had grown worse in 1938. The Nazi government of Germany had taken over Austria in March 1938. On the night of November 9 and 10, 1938, Nazi leaders set off attacks on Jews across Germany. Nazis burned more than 1,400 synagogues, the buildings where Jews worship, wrecked thousands of Jewish-owned shops and broke into Jewish homes. German police locked about 26,000 Jewish men in concentration camps, prison camps for people the Nazis targeted, just because they were Jewish. That night is called Kristallnacht, the Night of Broken Glass. Afterward Nazi officials seized property that Jews owned.

On June 6 the ship turned back to Europe. The passengers went to four countries: 288 to Britain, 224 to France, 214 to Belgium and 181 to the Netherlands. Of the 620 who went back to the European mainland, 87 moved on to other countries before the German army invaded in 1940. Of the rest, 254 were killed in the Holocaust, and 278 survived. The Holocaust was the murder of Jews and other people by the Nazis, the party that ruled Germany, during World War II.

In 1948 members of Congress passed the Displaced Persons Act. It was the first refugee law in the United States. Displaced persons were Europeans who had lost their homes in the war. Under the law, 200,000 people could come at first. They were counted against the yearly quotas. In 1950 lawmakers raised the total. Between 1948 and 1952 about 350,000 to 400,000 European refugees settled in the United States. One count gives 393,542.

1950 to 2000

In 1954 federal officers rounded up Mexicans and Mexican Americans and sent them to Mexico. Many of the people they sent were US citizens. In 1965 members of Congress ended the quota system that had favored northern and western Europe since the 1920s. After that, the main sources of immigration shifted to Asia, Latin America, Africa and the Caribbean.

Refugees came from Cuba after 1959 and from Vietnam, Laos and Cambodia after 1975. Counts credited to the United Nations refugee agency give at least 200,000 Vietnamese who died at sea while escaping by boat, from storms, hunger, disease and attacks by pirates. About 2.7 million people who had lived in the country for years without legal permission got legal status under a 1986 law.

The braceros and the 1954 deportations

The Bracero Program lasted until 1964. Over those years, Mexican farmworkers signed about 4.5 million short-term contracts to work in the United States. The workers came for the length of a contract and were expected to go home afterward.

In 1954 federal officers carried out a mass deportation of Mexicans. It was a federal operation whose official name used an insult for Mexican people. The insult was aimed at Mexicans who crossed the border without papers, and it suggested that they had swum across the Rio Grande, the river along the border between Texas and Mexico.

Attorney General Herbert Brownell Jr., the head of the US Justice Department, pushed for the operation. He served under President Dwight D. Eisenhower. General Joseph M. Swing ran it. He was the commissioner, or head, of the Immigration and Naturalization Service (INS), the federal office in charge of immigration. Swing announced the operation on June 9, 1954. INS officials planned it with officials of the Mexican government. Officers started in California and Arizona and moved into Texas in the middle of July.

Border Patrol officers, the federal agents who guard the border, ran the roundups in a military style. Newspapers covered them heavily. Officials meant the coverage to scare people into leaving on their own. On the first day in Texas, July 15, 1954, officers caught 4,800 people. Officers sent people south by truck, bus, train and plane. From Port Isabel, Texas, they also put people on two ships, the *Emancipation* and the *Mercurio*, bound for Veracruz, Mexico. About a quarter of the people removed from Texas went by ship. A History.com article states that the ships were later compared to slave ships.

Seven deportees jumped from the *Mercurio*. The *Handbook of Texas* says a mutiny followed, meaning the people on board rose up against the crew. Other accounts say the seven drowned. After protests in Mexico, officials stopped sending people by ship.

The historian Mae M. Ngai reports that in July 1955 officers rounded up workers in 112-degree heat, and 88 braceros, Mexican farm workers hired under contract, died of sunstroke as a result. Sunstroke is an illness in which the body gets so hot that it can no longer cool itself. A labor official told Ngai that more would have died without help from the Red Cross.

Ngai also quotes a Mexican labor leader. He reported that deportees were carried into Mexico on trucks "like cows" and unloaded in the desert, fifteen miles down the highway from the border. US immigration officials also left deportees in Mexicali, a Mexican border city where the summer heat averages 108 degrees. No record says whether the 88 were left in the desert, and no record names the officers who ran that roundup. Other deportees died of disease and other causes while officers held them. No full count of the dead is on record, and no record shows that any official was charged for the deaths.

INS officials claimed that as many as 1,300,000 people had left. That count included people who, officials said, had fled out of fear. An INS report gave nearly 1.1 million people caught. Katrina Burgess, a professor at Tufts University, wrote in 2024 that the 1.1 million figure covered a whole government year, which ended in June 1954. The operation was announced on June 9, 1954, so most of those people had been caught before it began. Burgess also wrote that many of the arrests were the same people caught again, sometimes on the same day. The real number of arrests was far lower. In the San Antonio district, officers caught slightly more than

80,000 people. In Texas in July 1954, officers held 42,000 people, and more than 63,000 left on their own. The historian Kelly Lytle Hernández puts the true number deported at "likely closer to 300,000." Many of the people deported were US citizens of Mexican descent. No one knows how many.

Antonio García

Who: A Mexican farmworker who joined the Bracero Program at seventeen, after having his military ID card changed to say he was eighteen.

When and where: Born June 13, 1937, in Tepehuanes, Durango, Mexico. Worked on contracts in Texas, California, Colorado and New Mexico into the early 1960s. Told his story in Chicago in 2003.

To get into the Bracero Program at seventeen, Antonio García had his military ID card changed to say he was eighteen. He then worked in the United States on and off for years as a contract farmworker.

He was born on June 13, 1937, in Tepehuanes, in the Mexican state of Durango. He grew up in Nuevo Ideal and left school after fourth grade. He signed up at the contracting centers in Chihuahua and in Empalme, Sonora, where Mexican workers signed contracts to work in the United States. His first contract was for work in the cotton fields of Texas. Within a week he was seriously ill. He kept working on contracts into the early 1960s, in California, Colorado, New Mexico and Texas.

On March 12, 2003, Claudia Morales Haro recorded his life story in Chicago. The recording is item 162 in the Bracero History Archive, which contains more than 700 such interviews. His record does not say whether he settled in the United States for good.

The 1965 law

In 1965 members of Congress passed the Immigration and Nationality Act, also called the Hart-Celler Act. With it, lawmakers ended the national-origins quotas, the rules that had limited immigration country by country since the 1920s. Under the new law, people got in mainly through family ties to people already here or through their job skills. Lawmakers also ended the bars against Asians and against southern and eastern Europeans.

For the first time, lawmakers also set a limit on the number of immigrants from the Western Hemisphere, the half of the world that includes North and South America. That limit included Mexico. Over the following decades, the main sources of immigration shifted away from

Europe, toward Asia, Latin America, Africa and the Caribbean.

Cubans and the Mariel boatlift

In 1959 Fidel Castro led a revolution in Cuba. Through the 1960s, many Cubans came to the United States, especially to Florida.

In 1980 Castro briefly let people leave. From April to October 1980, about 125,000 Cubans crossed by boat from the port of Mariel to Florida. This was the Mariel boatlift.

About a month before the boatlift began, members of Congress passed the Refugee Act of 1980. With it, lawmakers created a permanent system for admitting refugees. They defined a refugee the same way the United Nations does: a person outside their own country who cannot go back because of a real fear of being harmed for their race, religion, nationality, group or political beliefs.

Reinaldo Arenas

Who: A Cuban novelist whom Cuban government officials persecuted and jailed for his writing and for being gay. He left Cuba in the Mariel boatlift.

When and where: Born July 16, 1943, near Holguín, Cuba. Left through the port of Mariel in May 1980. Lived in New York. Died December 7, 1990.

Movie: *Before Night Falls* (2000), a drama based on his life story. Julian Schnabel directed it. Javier Bardem played Arenas, a role that earned an Oscar nomination.

Reinaldo Arenas was a novelist whom Cuban government officials put in prison for his writing and for being gay. Gay means loving people of the same sex. In May 1980 he left Cuba through the port of Mariel. He was one of about 125,000 Cubans in the boatlift.

He was born on July 16, 1943, near Holguín, in Cuba. Cuban officials persecuted him, which means they punished him again and again for who he was and what he wrote. In 1973, according to records at Princeton University Library, officials charged him with "ideological deviation." That means holding ideas that Cuba's rulers banned. The second charge was publishing his books in other countries without permission. Other accounts differ. One says the court found him guilty of being "extravagant," which here means living too freely, and "immoral." The Mexican writer Rafael Lemus writes that officials accused him in 1973 of abusing children. Lemus says Arenas hid for four months and was held from January 1974.

> Arenas escaped from prison and tried to leave Cuba by floating away on a tire inner tube. Cuban officers caught him and locked him in El Morro, an old fort in Havana used as a prison. Officers of State Security, the political police of Fidel Castro's government, moved him to their headquarters, called Villa Marista. Lemus writes that at Villa Marista officers sent steam into the prisoners' closed cell until it became a steam room. There officers forced Arenas to sign a paper saying he was sorry for being gay and for his books. He was released in 1976, after he signed a promise not to write again. No record names any of the officers who held him.
>
> In the United States he lived and wrote in New York. He wrote the story of his own life, called *Before Night Falls*. It was published in 1992, and in English in 1993.
>
> He became sick with AIDS, a disease caused by a virus that destroys the body's defenses against other illnesses. On December 7, 1990, at the age of 47, he killed himself.

Refugees from Southeast Asia and the boat people

In 1975 North Vietnamese soldiers took Saigon, the capital of South Vietnam, at the end of the Vietnam War. After that, refugees fled Vietnam, Laos and Cambodia. They included the Hmong, an ethnic group from the mountains of Laos. Many Vietnamese escaped in small boats, and they became known as the boat people.

Storms, hunger, disease and pirates killed many of them at sea. Counts credited to the United Nations refugee agency run from 200,000 to 400,000 dead. The journalist Barry Wain estimated 30,000 dead by 1981. No one knows the exact number.

According to a UN refugee official in 1986 and a later study, the pirates were Thai fishermen in the Gulf of Thailand. Robert C. McCabe, a researcher at Maynooth University in Ireland, writes that some fishermen turned to piracy after big commercial fishing boats had cut the catch in their villages. No record names a single pirate.

Pirates robbed and raped refugees, murdered some and set others adrift. Rape means forcing a person into sex. In 1981 alone, the UN refugee agency counted 452 boats that reached Thailand with 15,479 refugees. Pirates had attacked 349 of those boats, on average three times each. They kidnapped 228 women, and 881 people were dead or missing.

In June 1982 officials of the UN refugee agency and of the Thai government started a program against the pirates. The governments of twelve countries paid for it, and the US government gave $1.2 million of the $3.67 million. By October 1987, 96 suspects had been arrested. No

record names the officers who arrested them. Judges gave sentences of two to fifty years in prison, and one pirate was sentenced to death in December 1986.

From 1975 to 1997, US officials accepted 402,382 Vietnamese refugees from camps in Southeast Asia and Hong Kong, more than any other country. A different count gives nearly 281,000 Vietnamese refugees settled in the United States from 1981 to 1990 alone. About 500,000 more Vietnamese came to the United States by 1994 through the Orderly Departure Program, a legal way to leave Vietnam without the boat trip.

Tung Trinh

Who: One of 52 survivors of a refugee boat from Vietnam that drifted at sea for 37 days in 1988.

When and where: Left Vietnam by boat in 1988. Brought ashore at Bolinao, in the Philippines. Later settled in Orange County, California.

Movie: *Bolinao 52* (2008), a documentary directed by Duc Nguyen. It won two regional Emmy awards in 2009.

In 1988 Tung Trinh was one of 110 people on a small boat that left Vietnam. The boat's engine stopped working, and the boat drifted at sea for 37 days.

More than 20 ships passed the boat during those days. On June 10, 1988, one of them, the USS Dubuque, a ship of the United States Navy, stopped. The ship's commanding officer ordered food, water and sea charts given to the people on the boat. The sailors guessed 50 to 70 people were on the boat, not 110. Then the Dubuque left, and the boat stayed adrift.

As many as 58 of the 110 people on board died. An estimated 20 had died before the Dubuque came, and the others died after it left. During the drift, some of the people on the boat ate human flesh to stay alive. Eating human flesh is called cannibalism.

On August 11, 1988, Navy leaders removed the Dubuque's commanding officer from his command. At his own request, he was tried by a military court, and its officers found him guilty of breaking orders to help people in danger at sea, and he received a letter of reprimand, a written scolding.

Filipino fishermen found the boat and brought the 52 survivors to Bolinao, in the Philippines. Tung Trinh later came to the United States and settled in Orange County, California.

Sergey Brin

Who: A Jewish boy from Moscow whose family left the Soviet Union in 1979. In 1998 he started Google with Larry Page.

When and where: Born 1973 in Moscow. Arrived in the United States October 25, 1979, at six.

Sergey Brin came to the United States from the Soviet Union on October 25, 1979, when he was six. In 1998 he and Larry Page started the company Google.

He was born in Moscow in 1973. The Soviet Union was a communist country, where the government owned the businesses and only one party was allowed, and Moscow was its capital. His family was Jewish. In the Soviet Union his parents were held back in their careers and harassed because they were Jews. The accounts of his life do not name the people who did it.

In 1979 the family got permission to leave. About 51,000 Soviet Jews left that year, the most in any single year. In the United States his father, Michael, taught mathematics at the University of Maryland. His mother, Eugenia, became a researcher at NASA, the US space agency.

The 1986 law

On November 6, 1986, President Ronald Reagan signed the Immigration Reform and Control Act, called IRCA. About 2.7 million people who had lived in the country for years without legal permission got legal status under it. To qualify, they had to show they had lived in the country without a break since before 1982. Certain farmworkers could also qualify.

The same law, for the first time, let the government punish employers who knowingly hired workers without legal permission. These punishments are called employer sanctions. After 1986 the number of people living in the country without legal permission grew again.

2000 to Today

About 47.8 million people living in the United States in 2023 had been born in another country, by the Census Bureau's count. That was 14.3 percent of the population, the highest share since 1910. More of them came from Mexico than from any other country.

The US Border Patrol counted 895 migrant deaths along the border with Mexico in the year ending September 2022, the most on record. In April 2018 Attorney General Jeff Sessions announced a "zero tolerance" policy: every adult who crossed the border illegally was to be charged with a crime. Border Patrol agents then took thousands of children from their parents. In January 2026 immigration officers held more than 71,000 people in detention, the most ever, according to a report by two human rights groups.

Who comes now

In 2023 the Census Bureau's American Community Survey counted about 47.8 million foreign-born people in the United States. Foreign-born means born in another country. They made up 14.3 percent of everyone living here. That was the highest share since 1910, when it was 14.7 percent. The highest share ever recorded was 14.8 percent, in 1890. The lowest was 4.7 percent, in 1970.

The Pew Research Center counted where the immigrants living here in 2023 were born. About 11 million came from Mexico, 22 of every 100 immigrants. India came next with 3.2 million, then China with 3 million, the Philippines with 2.1 million and Cuba with 1.7 million. About 52 of every 100 immigrants were born in Latin America, and 27 of every 100 in Asia. The Pew researchers found that immigration from Mexico has slowed since about 2007.

The number of immigrants from Africa south of the Sahara Desert roughly tripled from 2000 to about 2.5 million in 2024, the Migration Policy Institute found. Communities of people born in Jamaica, Haiti, the Dominican Republic and other Caribbean countries also grew.

Pew and the Department of Homeland Security both publish estimates of how many people live in the country without legal permission. Their estimates reached about 12 million in 2007, then fell to about 11 million, and rose again in the 2020s. The estimates are uncertain.

Homeland Security and DACA

On September 11, 2001, hijackers from the group al-Qaeda flew planes into the World Trade Center in New York and the Pentagon near Washington, and a fourth plane crashed in Pennsylvania. They killed 2,977 people. After those attacks, members of Congress passed the Homeland Security Act of 2002. With it, lawmakers created the Department of Homeland Security (DHS), which began work in 2003. Lawmakers ended the old INS and gave its immigration work to three new DHS agencies: US Citizenship and Immigration Services

(USCIS), Immigration and Customs Enforcement (ICE) and Customs and Border Protection (CBP). ICE officers arrest and hold immigrants inside the country. CBP officers, including the Border Patrol, work at the borders.

On June 15, 2012, DHS officials started DACA, short for Deferred Action for Childhood Arrivals. Under DACA, some people who were brought to the country as children can apply to have their removal from the country deferred, or put off, and to work legally. DACA has faced challenges in court again and again. In September 2017 Sessions advised ending it, and Elaine Duke, the acting Secretary of Homeland Security, ended it. On June 18, 2020, the justices of the Supreme Court ruled that the way officials had ended DACA broke federal law, so DACA stayed. On January 17, 2025, a federal appeals court ruled that its work permits were unlawful and limited that ruling to Texas. About 455,000 people held DACA status on March 31, 2026, according to the National Immigration Forum, an immigrant rights group, using USCIS figures.

Deaths at the border

Every year hundreds of migrants die trying to cross from Mexico into the United States. Border Patrol officials count these deaths by the federal budget year, which runs from October to September. Their count was 281 in 2018, 300 in 2019, 254 in 2020, 568 in 2021 and 895 in 2022. The 2022 count is the highest on record. For 2023, a report of April 2025 from the Government Accountability Office, which checks federal agencies for Congress, gives 704 deaths and more than 5,800 rescues.

In 2022 the government's own auditors found that the Border Patrol's counts were too low. Border Patrol officials had not collected complete records of migrant deaths. They had left out deaths found by sheriffs, by medical examiners, the doctors who find out why a person died, and by other agencies. The auditors later reported that Border Patrol officials had made the changes they asked for.

People die of heat and thirst in the desert, drown in the Rio Grande, or die during or after chases by Border Patrol agents. Some die in custody, meaning while officers are holding them. Investigators inside CBP counted 171 deaths in the 2022 budget year in which CBP officers were involved "in some way." Of those people, 52 died in CBP custody.

The International Organization for Migration (IOM), a United Nations agency, keeps a second count. Its staff recorded 686 deaths and disappearances on the US-Mexico border in 2022, and they called it "the world's deadliest migration land route." Of those people, 307 died crossing

the Sonoran and Chihuahuan deserts, most of them from heat. IOM staff call their figures minimums. Texas county coroners, the officials who look into deaths, and Mexican search teams do not report every death to the IOM, so the real numbers are higher.

For 2025, the IOM counted 409 migrant deaths in all of North and South America, the lowest count since 2014. Its staff linked the drop to fewer people trying to cross the US-Mexico border and the Darién, a jungle between Colombia and Panama. In February 2026 they said the 2025 figures would not be final until the middle of 2026.

Children taken from their parents, 2018

On April 6, 2018, Attorney General Jeff Sessions announced a "zero tolerance" policy. The Attorney General is the head of the Justice Department. Sessions told federal prosecutors along the southwest border to charge with a crime every adult whom DHS officers sent to them for crossing the border illegally. That included parents who came with their children. Officers sent the parents to jail to face criminal charges, and Border Patrol agents took their children away from them.

Inside DHS, three agency heads proposed charging those parents in a memo dated April 23, 2018. They were Kevin K. McAleenan, the head of CBP, Thomas Homan, the acting head of ICE, and L. Francis Cissna, the head of USCIS. They recommended sending every adult who crossed illegally to be charged, "including those initially arriving or apprehended with minors." Apprehended means caught, and minors are children. Sessions urged Kirstjen Nielsen, the Secretary of Homeland Security, to approve the memo's plan. She was the head of DHS, and she approved it on May 4, 2018.

Border Patrol leaders told their commanders along the Mexican border to begin on May 5. McAleenan left out parents with children under five who were crossing illegally for the first time. Agents asked a federal refugee office to take each child, and ICE officers held the parents. In a later court case, government lawyers wrote that there was "no prescribed specific course of action for reunification." That means no one had set a plan for putting the families back together.

On May 7, 2018, Sessions said in a speech, "If you are smuggling a child, then we will prosecute you and that child will be separated from you as required by law." In 2017, under a trial program in El Paso, Texas, officials had already separated about 280 families.

Michael Horowitz, the Justice Department's inspector general, later investigated. An inspector general is an official who checks the work of a government department. In January 2021 Horowitz reported that Sessions and a small number of other Justice Department officials

knew, when the policy was issued in April 2018, that DHS "would change its long-standing practice" and separate families. He found that the Attorney General's office "was a driving force" in that change. He also wrote that the department's "single-minded focus on increasing immigration prosecutions came at the expense of careful and appropriate consideration of the impact of child separations."

Officials deported hundreds of parents without their children before a court ordered the families put back together in June 2018. Counts of the children differ, because each measures something different. Staff of a federal group, the Family Reunification Task Force, counted 3,924 children taken from their parents between January 20, 2017, and January 20, 2021. In February 2023 task force staff said that more than 600 had been reunited by then. They said that 998 were still separated and that the true number still apart was "likely greater than 1,000."

On December 11, 2023, a federal judge approved a settlement in a lawsuit brought by the American Civil Liberties Union, called *Ms. L. v. ICE*. A settlement is an agreement that ends a lawsuit. It covers an estimated 4,500 to 5,000 children and their parents. By March 20, 2024, task force staff had confirmed 1,120 separated children as part of that group. No final count of children returned to their parents is on record. As of September 2026, no record shows that any official had been charged for the separations.

Arrests, detention and deportation, 2025 and 2026

Chief Justice John G. Roberts Jr. swore in Donald Trump as president on January 20, 2025, in the Rotunda, the round central hall of the US Capitol. A year later, in January 2026, ICE officers held more than 71,000 people in detention, a record. Detention means holding people in custody while officials decide whether to deport them. Human Rights Watch and Physicians for Human Rights gave that figure in a report of June 25, 2026. ABC News reported on July 21, 2026, that ICE officers held 65,765 people, citing figures ICE had posted.

The same report counted 52 people who died in ICE custody from January 20, 2025, to June 4, 2026. Thirty-nine of them died in the first year. Of those 39, seven were apparent suicides, meaning they appeared to have killed themselves, and five died of injuries. The others died of strokes, heart failure, long-term illness and failure to breathe. The death rate reached about 8.4 for every 10,000 people held, which the report describes as "nearly four times" the rate under the previous president.

The report lists how each of the five died of injuries. An ICE officer shot Silverio Villegas González during an arrest near Chicago on September 12, 2025. Twelve days later, on September 24, a gunman fired on a van of detainees at the ICE office in Dallas, Texas. Two of the men in the van died of their wounds. Norlan Guzmán-Fuentes of El Salvador died that day, and Miguel Ángel García-Hernández of Mexico died on September 30. The gunman, Joshua Jahn, 29, shot and killed himself, NBC News reported. In Virginia on October 23, José Castro-Rivera of Honduras, 24, ran into traffic while ICE officers chased him to arrest him. A vehicle hit and killed him, and the report does not name the driver.

Geraldo Lunas Campos, 55, from Cuba, died on January 3, 2026, inside Camp East Montana, an ICE camp at Fort Bliss in El Paso, Texas. The El Paso County medical examiner ruled his death a homicide, the El Paso TV station KFOX14 reported. On a death record, homicide means that another person caused the death. The ruling is not a finding that anyone broke the law. The medical examiner found that pressure on his neck and torso, the middle of his body, kept him from breathing. The report states that the pressure came from force that ICE staff used on him. In a later death report of their own, ICE officials said he had tried to harm himself and that staff used force to stop him. The report names none of the staff involved.

Removal is the government's word for deportation. ABC News reported that ICE had posted 356,389 removals in the 2026 budget year through about July 21, 2026. For the 2025 budget year, the immigration researcher Austin Kocher counted about 329,018 ICE removals. On January 20, 2026, DHS officials claimed "more than 675,000 deportations" and "an estimated 2.2 million self-deportations" in the year since January 20, 2025. Self-deportation means leaving the country on one's own, without being deported by officers. Kocher notes that DHS officials have not published how they count these numbers. He found that ICE's own removals made up only about 54 percent of an earlier DHS claim of 605,000. In the year after January 20, 2025, DHS officials counted 90,084 people caught along the southwest border.

Federal immigration officers shot and killed at least four people from January 2025 to late January 2026, PBS NewsHour reported. One was Silverio Villegas González, a citizen of Mexico. On September 12, 2025, ICE officers stopped his car in Franklin Park, a suburb of Chicago. He had just dropped his children at school. One officer shot him in the neck, and he died. ICE officer Jonathan Ross shot Renée Nicole Good, a US citizen, in Minneapolis on January 7, 2026. CBP officers shot Alex Pretti in Minneapolis on January 24, 2026. As of that report, no officer had been charged.

DHS officials said that Villegas González drove his car at officers and dragged one of them, and that the officer fired "fearing for his own life." In body-camera video, an agent described his own injuries as "nothing major." Federal officials have not released the name of the officer who shot him, and federal prosecutors declined to charge that officer. In spring 2026, at the request of the Franklin Park police, investigators of the Illinois State Police opened their own case. It was still open in September 2026, the Chicago Sun-Times and WBEZ reported.

Giannis Antetokounmpo

Who: A basketball player born in Greece to Nigerian parents. He grew up a citizen of no country and came to the United States when a National Basketball Association (NBA) team picked him in 2013.

When and where: Born December 6, 1994, in Athens, Greece. Came to the United States in 2013, at 18, to play for the Milwaukee Bucks.

Movie: *Rise* (2022), a Disney+ drama about the Antetokounmpo family, made with the family. It is a dramatization, not a documentary.

Giannis Antetokounmpo grew up stateless, meaning no country counted him as its citizen. In 2013, at the age of 18, he came to the United States to play basketball for the Milwaukee Bucks.

He was born in Athens on December 6, 1994. His parents, Charles and Veronica Antetokounmpo, were immigrants from Nigeria with no legal status in Greece. Under Greek law, a child does not become a citizen just by being born in Greece. As boys, Giannis and his brothers sold goods on the street.

Greek officials made him a citizen in 2013. A few weeks later, in June 2013, the Bucks' managers picked him 15th in the NBA draft, the yearly event in which teams choose new players. He was named the league's Most Valuable Player in 2019 and in 2020. In 2021 he won the NBA championship with the Bucks and was named the most valuable player of the finals. His parents and brothers joined him in the United States.

Peter Dut and Santino Chuor, Lost Boys of Sudan

Who: Two Dinka teenagers whose parents were killed when government forces attacked their villages in Sudan's civil war. They lived for years in a refugee camp in Kenya. They were among the "Lost Boys" resettled in the United States.

When and where: From Sudan. Kakuma refugee camp, Kenya. Houston, Texas, in their first year in the United States, during the resettlement that began in 2001.

Movie: *Lost Boys of Sudan* (2003), a documentary that records the lives of these two young men. Megan Mylan and Jon Shenk made it. It was nominated for an Emmy and won the Truer Than Fiction Award at the Independent Spirit Awards.

Peter Nyarol Dut and Santino Majok Chuor were two of about 4,000 young refugees from Sudan who were resettled in the United States starting in 2001. They were called the "Lost Boys of Sudan."

They were Dinka, an ethnic group of southern Sudan. Sudan's civil war was a war inside one country, between the government in the north and rebels in the south. Military forces of the central government attacked the boys' villages, destroyed them and killed their families, according to the notes for the PBS film about them. Those notes do not state which soldiers or fighters killed each boy's parents. Researchers at Human Rights Watch report that in these years Sudan's rulers gave modern weapons to militias, armed groups outside the regular army, called the muraheleen. The militia fighters burned Dinka villages, stole cattle and food, and carried off women and children as slaves. Human Rights Watch does not say that these militias attacked the two boys' own villages. The rebel army of the south, the Sudan People's Liberation Army, also took many of the older Lost Boys as soldiers. The two boys survived a long walk out of Sudan and then spent years in Kakuma, a refugee camp in Kenya.

The documentary records their first year in the United States, which began in Houston. After a time, Peter left Houston for Kansas to go to high school.

Chapter 5: Migration Across America

Before 1500

People were moving across this land for thousands of years before any European saw it. The first people came on foot from Asia during the ice age. Their descendants kept moving after that. Some built towns and later left them, and whole peoples traveled south over a long time. Many families moved with the seasons to hunt, fish and gather food.

Hundreds of Native nations lived here. There were no horses and no wagons. Trails and trade paths crossed the continent, and later newcomers followed many of them.

Cahokia and Chaco Canyon: towns people built and left

Cahokia was the largest town north of Mexico. It stood on the Mississippi River, near where the city of St. Louis is today, on the Illinois side. People lived there from about the year 700 to about 1400. Around 1100, between 10,000 and 20,000 people lived in the city. Some estimates put as many as 50,000 people in the area around it. That made Cahokia about as big as London was at the time.

By about 1350 most of the people of Cahokia had moved away, and by the 1400s the town was nearly empty. Nobody knows for sure why they left. The main explanations are drought, floods, and a shortage of wood and food. A drought is a long time with little or no rain. No single cause has been settled.

Chaco Canyon, in what is now New Mexico, was a center of the Ancestral Puebloan people, the ancestors of today's Pueblo peoples. Around 1140, after a run of bad droughts, people started to leave the canyon. By the end of the 1100s most of them had gone. They moved out and joined the Pueblo communities of the Southwest.

The Navajo and Apache move south

The ancestors of the Navajo and the Apache came from the far north. They lived in what is now western Canada and eastern Alaska. The Navajo call themselves the Diné. Their long move south is called the Athabascan migration.

Over a long time, groups of them moved south. They traveled along the edge of the Rocky Mountains and the Great Plains toward the Southwest. Accounts differ about when they arrived. Many place their arrival between the 1400s and about 1525. Others argue that they came earlier, in the 1200s.

Seasonal rounds and trade paths

Many peoples moved in a pattern called a seasonal round. A seasonal round is a yearly circuit from one camp to the next. Over a year, a family moved between its fishing places, its hunting grounds and the spots where wild plants ripened.

Trade goods also moved across the land. Traders passed turquoise, seashells, copper and obsidian from nation to nation along trade paths. Obsidian is a natural black glass made by volcanoes. Some of these goods ended up hundreds of miles from where they were found.

The 1500s

In the 1500s the whole land from coast to coast was still Native land. Europeans reached its edges, but no crowds of settlers moved across the interior. Two things changed in this century. Spanish colonists brought horses back to North America. Then, in 1598, Juan de Oñate led Spanish colonists north into what is now New Mexico. They came with their families, wagons and herds, and they meant to stay.

The horse comes back

Horses lived in North America during the ice age. They died out here thousands of years ago. Spanish sailors and colonists brought them back.

Christopher Columbus carried horses on his second voyage across the Atlantic, in 1493. Spanish expeditions, groups of men sent out to explore, then brought horses onto the mainland. Francisco Vázquez de Coronado's expedition had them from 1540 to 1542, and Juan de Oñate's colonists brought them to New Mexico in 1598. Horses changed how people lived on the Great Plains in the next century, the 1600s.

Oñate's colony on the Camino Real, 1598

Juan de Oñate and his colonists left Santa Bárbara, a town in northern New Spain, in January 1598. New Spain was the Spanish colony that included Mexico. Earlier Spanish expeditions had followed the Conchos River north. Oñate's column, the long line of people, wagons and

animals, cut straight across the Chihuahuan Desert instead.

In late April the column reached the Rio Grande at El Paso del Norte, near where El Paso, Texas, and Ciudad Juárez, Mexico, stand today. On April 30, 1598, Oñate claimed New Mexico for Spain in a ceremony called La Toma, which means "the taking." In July he set up the colony's headquarters at San Juan Pueblo, which its people call Ohkay Owingeh.

The colonists moved onto land that was the homeland of the Pueblo peoples. Families from Chaco Canyon had joined the Pueblo communities after the droughts of the 1100s, about 400 years earlier. The road the colonists traveled was later called El Camino Real de Tierra Adentro, the royal road of the interior. It ran from Mexico City to northern New Mexico. With his march, Oñate made that road more than 600 miles longer. Its stretch inside the United States is a National Historic Trail today.

Before Oñate, two groups of Spanish colonists had come to what is now the United States by sea. In 1559 Tristán de Luna y Arellano brought about 1,500 people in 11 ships to Pensacola Bay, in what is now Florida. They were soldiers, colonists, enslaved people and Aztec allies. A hurricane a month later sank many of the ships, and in 1561 Spanish ships took the survivors back to Mexico. In 1565 Pedro Menéndez de Avilés founded St. Augustine, also in Florida, with about 600 settlers.

Juan de Oñate

Who: The Spanish leader of the first known colonists to travel over land, with families, wagons and herds, into what is now the United States.

When and where: From Santa Bárbara in northern New Spain to San Juan Pueblo (Ohkay Owingeh), New Mexico, January to July 1598.

Juan de Oñate led a colony north in 1598, and its people meant to stay. His column had about 400 men, about 130 of them with their families, and 83 wagons and carts. The colonists also drove more than 7,000 head of livestock, which means farm animals. Horses were among them.

The colony included soldiers, Franciscan friars, farmers, workers and servants. A friar is a man who belongs to a Catholic religious order, and the Franciscans were one of those orders. Enslaved people also walked in the column. The surviving records do not say how many.

> In December 1598 Oñate's nephew, Juan de Zaldívar, went to Acoma Pueblo with about thirty soldiers to demand food. In the Acoma people's own account, the soldiers also raped an Acoma woman. Rape means forcing a person into sex. The Acoma killed Zaldívar and between eleven and fourteen of his men.
>
> In January 1599 Oñate sent Zaldívar's brother, Vicente de Zaldívar, with about seventy soldiers. Acoma stands on top of a mesa, a steep hill with a flat top. The soldiers climbed it, killed Acoma men, women and children, and burned much of the town.
>
> Nobody counted the Acoma dead at the time. Estimates run from about 300 to about 1,500. About 800 is the number given most often. Pueblo leaders gave that number in a 2023 statement from the All Pueblo Council of Governors. Its members are the 20 Pueblo nations of New Mexico and Texas, and each of those nations is led by a governor.
>
> The soldiers captured about 500 people. In February 1599 Oñate sentenced the men over 25 to have a foot cut off. He also sentenced them to be forced to work as slaves for twenty years. Reporters for AP and NPR, and Pueblo leaders, say it was the right foot. News reports and the Acoma's own account, passed down since 1599, give the number of men whose feet were cut off as 24. Two historians, Marc Simmons and John Kessell, doubt that the feet were ever cut off. Simmons had once written that they were.
>
> Oñate sentenced boys and men from 12 to 25, and girls and women over 12, to twenty years of forced work as slaves as well. He ordered the children under 12 taken from their families and given to the friars. A National Park Service page on the Camino Real states that about 70 Acoma girls were sent down the road to convents in Mexico. A convent is a home for nuns, women who have given their lives to the church. The same page states that probably none of the girls ever came home. Pueblo leaders count 60 children taken to Mexico, and they say none came home.

The 1600s

In the 1600s the biggest change in how people moved came from the horse. Horses spread among the Native nations of the Plains and the Rocky Mountains. People on horseback could travel farther and faster than on foot, and they could follow the buffalo herds.

English, Dutch and other colonists settled along the Atlantic coast in this century. Jamestown was founded in 1607 and Plymouth in 1620. Almost none of them went far inland. The Appalachian Mountains were hard to cross, and many Native nations lived on the far side of

them. The few colonists who moved inland went short distances. Thomas Hooker's group walked from Massachusetts to the Connecticut River in about two weeks.

The horse spreads to Native nations

There are two accounts of how horses spread. The timing is still not settled.

The older account starts with the Pueblo Revolt of 1680. In 1675 the Spanish governor, Juan Francisco Treviño, had ordered the arrest of 47 Pueblo medicine men, who were religious leaders, on a charge of sorcery, or witchcraft. Spanish officials sentenced four of them to be hanged. They hanged three, and the fourth killed himself. Treviño's men whipped the others in public and put them in prison. Pueblo people went to Santa Fe and demanded that the prisoners be let go, and the Spanish freed them. One of the freed men was Popé, a religious leader of the Tewa, one of the Pueblo peoples. In 1680 Popé led the Pueblo peoples of what is now New Mexico in a rising against Spanish rule. They killed about 400 Spaniards and drove the rest out of New Mexico for more than a decade. The Spanish left behind large numbers of horses, perhaps more than 1,500. It was the largest number of horses to pass into Native hands at one time.

In that account, the horses then moved north and east through trade. The Ute, Navajo and Apache got them first, and then the Comanche, Kiowa and Shoshone. Over the next few decades horses reached the nations of the northern Plains, among them the Lakota, Crow, Cheyenne, Blackfoot and Nez Perce.

The newer account comes from a study published in 2023 in the journal *Science*. The archaeologist William Taylor led it, working with Lakota, Comanche, Pawnee and other Native partners. An archaeologist studies the past through the things people left behind. The team tested horse bones from Kansas, New Mexico and Wyoming to find their age. Some dated from the 1500s and 1600s.

Marks on the teeth and bones showed that people had put bridles on these horses and fed them corn. So people were keeping and caring for them. The team found that many nations across the Plains and the Rocky Mountains had horses by the early 1600s. That is decades before the Pueblo Revolt. The finding matches what Native people have long said in their nations' own histories, passed down by word of mouth.

Over the next century, horses changed how the Comanche, Lakota, Cheyenne and the other Plains nations hunted and traveled.

The first colonial moves inland

In 1636 two English ministers moved out of the colony of Massachusetts Bay and started new towns in what are now Connecticut and Rhode Island. Thomas Hooker chose to go. He led about 100 members of his church west to the Connecticut River.

The other minister, Roger Williams, did not choose. The leaders of Massachusetts ordered him out of the colony for what he preached. He taught that the government should not force religious beliefs on people. He fled in the winter rather than be sent back to England. Wampanoag people helped him survive. Then, with help from Wampanoag and Narragansett people, he traveled by canoe to a freshwater spring at a place called Moshassuck. He settled there with the permission of the Narragansett and named the place Providence. In 1638 two Narragansett sachems, or leaders, named Miantonomi and Canonicus signed a deed for the settlement. A deed is a signed paper that says who owns a piece of land.

Thomas Hooker

Who: A minister who led about 100 members of his church from Massachusetts to the Connecticut River, where they settled Hartford.

When and where: From Newtown (now Cambridge), Massachusetts, to Hartford, Connecticut, May and June 1636.

Thomas Hooker was the pastor of the church at Newtown, a town that is now Cambridge, Massachusetts. A pastor is the minister who leads a church. In May and June of 1636 he led about 100 members of his church west to the Connecticut River. The walk took about two weeks.

They drove 160 cattle with them and lived partly on the cows' milk. They followed Native trails. Later people called the route the Old Connecticut Path. John Winthrop, a leader of Massachusetts Bay, wrote about the departure in his journal on May 31, 1636: "Mr. Hooker, pastor of the church of Newtown, and most of his congregation, went to Connecticut." A congregation is the people who belong to a church. Winthrop also noted that Hooker's wife rode on a horse litter, a stretcher carried by horses.

The place where they settled was Suckiaug, which means "black earth." It was the main village of the River Indians, and their sachem, or leader, was Sequassen. In 1636 Sequassen and his people signed the land over by deed to Samuel Stone and William Goodwin, two men in Hooker's group. The land ran along the river between the towns of Wethersfield and Windsor, and six miles west of the river.

> Nobody wrote the deed into the official land records at the time. The settlers and the Native owners argued over its terms for generations. The histories of the deed do not say what Sequassen's people received for the land. Dutch traders had also built a fort there, the House of Hope, before Hooker's group came. The town the settlers built there is Hartford. In 1639 the people of Hartford and the towns near it adopted a plan of government called the Fundamental Orders of Connecticut.

1700 to 1750

Settler families began moving inland from the Atlantic coast in the first half of the 1700s. Land near the coast had filled up, and it had grown expensive. Families moved into the valleys and hills behind the older settlements, an area colonists called the backcountry. The main route inland was the Great Wagon Road.

Native nations were moving too. After a war with colonists in North Carolina, the Tuscarora walked north to New York. On the southern Plains, the Comanche moved in on horseback and took control, and many Apache there fled south. The country beyond the Appalachian Mountains was still Native land.

The Great Wagon Road and the backcountry

The Great Wagon Road ran about 730 miles. It started in Philadelphia and went southwest through the Shenandoah Valley of Virginia. Then it ran down through the hill country of the Carolinas, called the Piedmont, toward Augusta, Georgia. Heavy traffic began in the 1720s.

Many of the families on the road were German or Scots-Irish. The Scots-Irish were Protestants, Christians whose churches had split from the Catholic Church. Their families had moved from Scotland to the north of Ireland in the 1600s and then on to America. Both groups had come to Pennsylvania and found land there too costly. The Germans were called the "Pennsylvania Dutch." The word Dutch came from *Deutsch*, the German word for German. Moravians, members of a Protestant Christian church from central Europe, came along the road as well.

The road followed an older Native path. Colonists called it the "Indian Road." When settlers began arriving in the Shenandoah Valley in about 1729, Shawnee people were the main residents near the present-day town of Winchester, Virginia. Iroquois, Delaware and Conoy

people also used the valley. The Iroquois were the Haudenosaunee, a league of six nations, also called the Six Nations. The valley's north-south trail was a war path between the Seneca and Delaware nations to the north and the Catawba nation to the south.

In 1744 officials sent by Virginia's governor, William Gooch, met Six Nations leaders at Lancaster, Pennsylvania. A treaty is a written agreement between nations, and the one they signed there is the Treaty of Lancaster. In it, Gooch's officials bought the Six Nations' claim to the valley, meaning their right to the land. Under the treaty, colonists also got the right to use the Indian Road. Accounts of how much the officials paid do not agree. After 1744, even more settlers traveled the road.

The Tuscarora walk north, 1713 to 1722

The Tuscarora nation moved about 500 miles north, from North Carolina toward Pennsylvania and New York, after colonists defeated them in war. The move took from 1713 to 1722, and they traveled in stages.

The war ended at Neoheroka, a Tuscarora fort on Contentnea Creek in what is now Greene County, North Carolina. Colonel James Moore of South Carolina led the attack. He commanded militia from both Carolinas and Native warriors who fought on the colonists' side. Militia were colonists called up to fight as soldiers. The siege began on March 1, 1713. In a siege, an army surrounds a fort or town and attacks it until the people inside give up or are beaten. Moore's men dug under an outer wall and set the fort on fire. It fell on March 23.

History pages from North Carolina's state government list 950 Native people killed or captured at Neoheroka. They list about 1,000 Tuscarora sold into slavery during the whole war. The colonists and allies who won the war sold these captives. Those state pages do not name who bought them. The colonists' side also forced more than 3,000 other Native people from their homes. About 200 colonists and about 1,000 Native people died in the war.

About 1,500 Tuscarora survivors made the walk north. The Oneida nation sponsored them in the Haudenosaunee league, which means the Oneida backed their joining. In 1722 the Tuscarora became its sixth nation.

The Comanche move onto the southern Plains

By the early 1700s the Comanche had moved onto the southern Plains. They became the strongest power there. The land they held became known as Comanchería, which means Comanche country.

Apache groups were already living on the southern Plains. The Handbook of Texas, a history reference, states that by 1700 the Comanche, Wichita and Tejas Indians were "better armed through trade with the French." Those nations took control of the southern Plains, and the Apache began moving southwest. Many Apache, most of all the Lipan and the Mescalero, "fled southward into Central Texas as well as into northern Mexico."

1750 to 1800

In 1755 British officers began forcing French-speaking Acadians out of Nova Scotia, north of the British colonies. They removed about 10,000 to 11,500 people, and about 2,600 to 3,000 of them later made their way to Louisiana.

Large crowds of settlers crossed the Appalachian Mountains for the first time after 1775. From that year, as many as 300,000 of them went through the Cumberland Gap into Kentucky and beyond by about 1810. After the Revolutionary War ended in 1783, more settlers moved into the Ohio Valley. The land they moved onto belonged to Native nations. In 1785 and 1787 the members of Congress passed two laws that set out how western land would be measured, sold and governed.

The Acadians forced from Nova Scotia, 1755

The Acadians were French-speaking Catholic farm families in Nova Scotia and the land around it, in what is now eastern Canada. Between 14,000 and 18,000 Acadians lived there in 1755. Nova Scotia was a British colony. Charles Lawrence was the colony's lieutenant governor, one of the top British officials there. On July 28, 1755, Lawrence and his council of advisers in Halifax decided to remove the Acadians from the colony. Admiral Boscawen, a navy commander, and Chief Justice Belcher, the colony's top judge, sat on the council that day. Some council members had recently come from New England and wanted the Acadians' farmland.

Lawrence had first asked Acadian delegates, men chosen to speak for their villages, to swear loyalty to Britain with no conditions. When they refused, Lawrence and his council had them jailed. Lieutenant Colonel John Winslow commanded New England troops. On September 5, 1755, he ordered every Acadian male aged 10 and older at Grand-Pré to gather in the church there at 3 p.m. He held them there. The order read to them said that their land, houses, cattle and other livestock now belonged to the Crown, meaning the British king. They could keep their money and household goods, and they would be removed from the colony. Winslow wrote

that the order was "very disagreeable to my nature," but that his job was "to obey such orders as I receive." Colonel Robert Monckton and Major John Handfield led arrests and removals in other districts.

Charles Morris, a New Englander, drew up the plan. Soldiers would surround the churches on a Sunday morning and capture as many men as they could. Then they would break the earth walls that kept the sea off the Acadians' fields, and burn their houses and crops. In 1755 New England and British soldiers did burn many Acadian houses, barns and churches. Around the Minas Basin, where Grand-Pré stands, they set fire to about 700 houses, barns and other buildings. Winslow kept his own list of what the soldiers under him burned there by November 1755. It counts 255 houses, 276 barns, 155 smaller farm buildings, 11 mills and one Catholic church, 698 buildings in all. When the men refused to go, the soldiers threatened their families with bayonets. A bayonet is a blade fixed to the end of a gun. By the fall of 1755, soldiers had put about 1,100 Acadians on ships bound for South Carolina, Georgia and Pennsylvania, the historian James H. Marsh writes. Winslow's own table counts the people shipped from the Minas district alone, to all places: 1,510 by Winslow's men and 732 by the company of Captain Phineas Osgood, 2,242 in all.

British officers and soldiers kept removing Acadians until 1764. One count gives about 10,000 Acadians forced out between 1755 and 1763. Another gives about 11,500 between 1755 and 1764. British ships carried them to the thirteen colonies, to England and to France. Many Acadians escaped into the forests, and British soldiers hunted them for the next five years. In French the forced removal is called *Le Grand Dérangement*, the great upheaval.

Counts of how many Acadians died differ. One count says close to 5,000 died of disease, shipwreck or violence. Other counts put the dead at as many as half of those forced out. In one group of about 3,100 Acadians removed in 1758, about 1,649 died by drowning or disease.

The road to Louisiana and the Cajuns

Between 1764 and 1785, about 2,600 to 3,000 Acadians made their way to Louisiana. Louisiana was then a Spanish colony. The largest group came in 1785. That year, Spanish officials paid for seven ships that carried 1,596 Acadians from Nantes, in France, to Louisiana. The first of them reached New Orleans on July 29, 1785.

The Acadians settled along the bayous and prairies west of New Orleans. A bayou is a slow-moving stream through low, wet land. Their descendants are the Cajuns. The word Cajun comes from the word Acadian.

Joseph Broussard (Beausoleil)

Who: An Acadian who fought the British removal of his people, then led one of the first Acadian groups to Louisiana.

When and where: Acadia (Nova Scotia and New Brunswick), 1755 to 1762. New Orleans and the Attakapas district of Louisiana, 1765. Born about 1702, died 1765.

Joseph Broussard led about 200 Acadians to Louisiana in 1765. He was one of the first Acadians to settle there. People called him Beausoleil. He was born in about 1702.

When British officers began forcing the Acadians out in 1755, Broussard organized armed resistance. He and his men raided British troops. British soldiers captured him and held him at Halifax until 1763. That year Britain and France signed the Treaty of Paris, a peace agreement that ended their war.

In late 1764 Broussard and about 600 Acadians hired a ship to carry them to Saint-Domingue, the island colony that is now Haiti. In February 1765 he and about 193 to 200 of them sailed on to Louisiana. They reached New Orleans in late February. On April 8, 1765, colonial officials named him a militia captain, an officer over citizen soldiers. They also made him the commander of the "Acadians of the Attakapas." The Attakapas district was the area around the present-day town of St. Martinville.

A sickness spread through the new settlement that year. Most accounts say it was yellow fever. Broussard died of it in October 1765. Officials at Parks Canada, the Canadian government office that runs historic sites, have named him a National Historic Person. Canadian officials give that title to people who were important in Canada's history.

The Wilderness Road and the Cumberland Gap

The Cumberland Gap is a low notch through the mountains near the place where Kentucky, Virginia and Tennessee meet. In 1775 Daniel Boone and about 30 axmen cut a road through it called the Wilderness Road. As many as 300,000 settlers traveled that road into Kentucky and beyond between 1775 and about 1810. Kentucky filled with settlers and became a state in 1792.

Boone cut the road for Richard Henderson's Transylvania Company, a business formed to buy up wild land and open it to settlers. From March 14 to 17, 1775, at Sycamore Shoals on the Watauga River, Henderson got a deed from Cherokee leaders. Attakullakulla, Oconostota and

Old Tassel were among them. The deed covered about 20 million acres between the Cumberland and Ohio rivers. That was most of Kentucky and part of Tennessee. In return the Cherokee received trade goods. One estimate values the goods at about 10,000 British pounds.

Dragging Canoe, Attakullakulla's son, spoke against selling land that the Cherokee nation held in common, and he rejected the sale. Other nations had claims to the land too. The Shawnee had once lived on part of it. The Tennessee Encyclopedia describes the Cherokee claim as the strongest of these. By buying the land, Henderson broke a British rule of 1763, the Royal Proclamation, which banned private buyers from buying Native land. Officials in Virginia and North Carolina and members of the Continental Congress, the meeting of leaders from the colonies, all refused to accept Henderson's colony as lawful.

Into the Ohio Valley, and a grid laid over the land

The Revolutionary War ended in 1783. Settlers then moved in large numbers into the Ohio Valley and the Northwest Territory. The Northwest Territory was the land north of the Ohio River that later became the states of Ohio, Indiana, Illinois, Michigan and Wisconsin. It was the land of the Shawnee, Miami, Delaware and other nations. In the 1790s those nations and the settlers fought each other.

On May 20, 1785, the members of Congress adopted the Land Ordinance. An ordinance is a law. Under it, surveyors measured the western land into squares called townships, each six miles on a side. Each township was divided into 36 sections of 640 acres. In the law, the members of Congress set aside one section in every township to pay for public schools. Because of that grid, much of the American countryside is laid out in squares today.

On July 13, 1787, the members of Congress passed the Northwest Ordinance. In it they wrote the rules for governing the territory, set out how parts of it could become new states equal to the original thirteen, and banned slavery north of the Ohio River. Five states later came from the territory.

1800 to 1850

In 1803 the United States about doubled in size, and by 1850 its land reached the Pacific Ocean. Hundreds of thousands of people moved west. Families drove wagons over the Oregon, California and Mormon trails, and from 1848 to 1855 about 300,000 people rushed to California for gold.

Other journeys were forced. United States soldiers drove the Cherokee, Choctaw, Muscogee, Chickasaw and Seminole nations from their homelands in the Southeast. Slave traders and enslavers forced more than a million enslaved Black people to move from the Upper South to the Deep South, in chains or in ships.

The Louisiana Purchase, 1803

In 1803 American officials bought about 827,000 square miles of land west of the Mississippi River from France. The price was 15 million dollars. After the purchase, the country was about twice as big as before. All or part of 15 later states came from this land.

Thousands of Native people, in dozens of nations, already lived on this land. None of them had a part in the sale. After the purchase, American settlers began moving onto it, into the interior of the West.

The domestic slave trade: a forced march south

Between about 1790 and 1860, slave traders and enslavers forced more than one million enslaved people to move. They took them from the Upper South to the Deep South. The Upper South meant Virginia, Maryland, the Carolinas, and later Kentucky and Tennessee. The Deep South meant the cotton lands from Georgia west to Texas.

From 1820 to 1860, traders and enslavers moved about 200,000 people this way every ten years. This trade inside the country was later called the "Second Middle Passage." The first Middle Passage was the voyage of captured Africans across the Atlantic Ocean.

Traders moved people south in two ways. They marched some on foot in coffles. A coffle is a line of enslaved people chained together and marched over land. They shipped others down the coast to New Orleans, which had the largest slave market in the country.

The largest slave-trading company in the country was Franklin and Armfield, founded in February 1828 in Alexandria, Virginia. John Armfield bought people in Alexandria. Isaac Franklin sold them in Natchez, Mississippi, and after 1829 in New Orleans. Rice Ballard joined them in the early 1830s and ran their office in Richmond. Franklin, Armfield and Ballard bought, moved and sold more than 8,500 people. In their busiest years, the mid-1830s, the partners moved 1,000 to 1,500 people a year.

Near the end of each summer, the partners sent coffles "in chains over the mountains." Each coffle held from several dozen to several hundred people. The partners timed each coffle to reach the Deep South for the fall selling season. The partners also owned three ships fitted to

carry enslaved people, named the *Tribune*, the *Uncas* and the *Isaac Franklin*. The voyage from Virginia to Louisiana took about three weeks. At the busiest time, one of these ships left every two weeks. The last shipload left in November 1836.

Historians disagree about how many of these people were sold to traders and how many were forced to move when the enslavers who held them moved to new land and took them along as slaves. Their estimates of the traders' share run from about 16 percent (the historians Fogel and Engerman) to about half (Jonathan Pritchett). Walter Johnson counts about two-thirds sold and one-third taken along by their enslavers. Michael Tadman puts the traders' share at 60 to 70 percent of moves from one state to another after 1808.

Charles Ball

Who: An enslaved man who was chained into a coffle and marched from Maryland to South Carolina. He later escaped and told his life story.

When and where: Sold in Maryland about 1805. Marched to Columbia, South Carolina. His story was printed in Philadelphia in 1837.

In about 1805, in Maryland, the man who held Charles Ball in slavery sold him away from his wife and children. The man who bought him was a slave trader from Georgia. The trader chained Ball into a coffle of 52 people and marched them south.

The trader locked a strong iron collar around each person's neck. A padlock on each collar closed on a link of one chain about 100 feet long. He also handcuffed the men in pairs. The coffle walked for more than a month, from Maryland to Columbia, South Carolina. Ball was then sold again, into Georgia.

Years later Ball escaped. He walked north back to Maryland, hiding by day and moving at night. He was captured again and held as a slave, and he escaped a second time. He settled near Philadelphia.

Ball told his story to Isaac Fisher, a white abolitionist. An abolitionist was a person who worked to end slavery. Fisher wrote it down, and it came out in 1837 as *Slavery in the United States: A Narrative of the Life and Adventures of Charles Ball*. Because Fisher did the writing, the book records Ball's story in Fisher's words. Many of the dates in Ball's life are known only roughly. He was born in about 1780 in Calvert County, Maryland.

Indian removal and the Trail of Tears

In 1830 President Andrew Jackson signed the Indian Removal Act. Jackson then directed the removal of the Cherokee, Muscogee (Creek), Choctaw, Chickasaw and Seminole nations from their homelands in the Southeast. Federal troops forced them to Indian Territory, which is now Oklahoma.

Federal troops removed the Choctaw from 1831 to 1833. The troops forced the first groups out in snow and river ice. Andrew K. Frank, writing for the Oklahoma Historical Society, counts more than 14,000 Choctaw removed and says hundreds died. Other counts give about 15,000 removed and about 2,500 dead.

In August and September of 1836, after a war with the Creek, United States troops marched the remaining Creek people west in five large groups. Soldiers put chains on Creek men taken prisoner in the war and marched them to Montgomery, Alabama. Their families followed in wagons. More than 14,500 Creek were removed. Several hundred died on the way. About 3,200 more died after they arrived, from disease, hunger and exposure. Exposure means harm to the body from cold and bad weather.

In October 1837 the steamboat *Monmouth*, carrying about 600 Creek people, was in a collision. About half of the Creek on board died.

More than 500 Chickasaw died of smallpox during their removal.

The Cherokee removal of 1838 and 1839 is called the Trail of Tears. In May 1838, United States Army troops under General Winfield Scott began rounding up Cherokee people who had not moved west. President Martin Van Buren had sent Scott with about 7,000 soldiers, and state militia, including Georgia's, joined them. Militia are part-time soldiers called up by a state. Soldiers took families from their homes and farms, often with no time to pack.

The soldiers held about 16,000 Cherokee in stockades in Tennessee and Alabama. A stockade is a pen with walls of tall logs. Soldiers sent three groups west by river in June 1838. After that, Scott agreed to let John Ross organize the rest. Ross was the Cherokee's Principal Chief, their top leader. Ross organized fourteen groups, which left between August and December 1838. The walk over land was about 800 miles. People died on the way from cold, hunger and disease.

The number of Cherokee dead is not settled. The National Park Service's history of the trail states that more than 1,000 people died on the journey itself, and "perhaps several thousand" more died later because they had been forced from their homes. The count most often given is about 4,000. An article on the History.com website states a figure above 5,000. In 1984 Russell

Thornton, a scholar who studies population, estimated that about 8,000 or more Cherokee died because of the removal, twice the usual figure. Andrew K. Frank, writing for the Oklahoma Historical Society, says as many as one in four Cherokee died.

Rebecca Neugin

Who: A Cherokee woman who, at about three years old, was forced west on the Trail of Tears. She told what she remembered when she was 97 or 98.

When and where: Soldiers took her from Georgia in 1838. Interviewed in 1932 in what is now Oklahoma.

Rebecca Neugin was about three years old in 1838 when soldiers rounded up her family in Georgia. Her father was Tickaneesky, and her mother was Sallie Ketcher. The soldiers held the family in a camp in Tennessee.

In September 1838 the family started west with the group led by Mose Daniel and George Still. Rebecca and the smaller children rode in a wagon. Her mother, her father and her older brother Dick walked the whole way.

In 1932 the historian Grant Foreman interviewed her. She was 97 or 98 years old and one of the last living people who had made the journey. Her memory of it is one of the few first-hand accounts by a survivor. She died on July 15, 1932.

The overland trails

Most of the western trails started from towns on the Missouri River, mainly Independence and St. Joseph, in Missouri.

The Santa Fe Trail opened in 1821. That fall, William Becknell led the first trading trip from Missouri to Santa Fe, which then belonged to Mexico. The Santa Fe Trail was mainly a road for traders hauling freight.

The Oregon Trail ran about 2,000 to 2,170 miles, from Independence, Missouri, to the Willamette Valley in Oregon. The trip took four to six months. On May 22, 1843, about 1,000 people set out with about 120 wagons and thousands of oxen and cattle. They reached Oregon that fall. This trip was called the "Great Migration" of 1843. After it, other families knew that wagon trains could make the whole journey. Hundreds of thousands followed over the next twenty years. From the 1840s on, tens of thousands of them came to the Willamette Valley, where at least twenty Native nations lived, among them the Kalapuya, Molala and Chinook peoples.

The California Trail split off from the Oregon Trail and turned southwest toward California. Traffic on it grew fast after gold was found in 1848.

Life and death on the wagon trails

About one in ten people who set out on the wagon trails died on the way. That was between 20,000 and 30,000 people. Most of the dead had cholera or typhoid. Cholera is a disease that causes severe diarrhea and vomiting. Typhoid is a disease that causes a high fever. Both spread through dirty water at crowded camps. Other emigrants died in accidents, or drowned while crossing rivers. An emigrant is a person who leaves one home to settle in another. Later stories often showed Native people attacking wagon trains. Most of the emigrants who died on the trails died of disease, not in attacks.

Families traveled in groups for safety, in covered wagons pulled by oxen.

The Latter-day Saints move west

Members of the Church of Jesus Christ of Latter-day Saints, also called Mormons, moved west after armed men attacked them in Missouri and in Illinois. On October 27, 1838, Missouri's governor, Lilburn Boggs, ordered that the Latter-day Saints be driven out of Missouri. If necessary, in the order's own word, they were to be "exterminated." To exterminate people means to kill them all. Three days later, on October 30, about 200 armed Missourians led by Colonel Thomas Jennings attacked the Mormon settlement at Haun's Mill. They killed seventeen or eighteen men and boys. One of the boys, Sardius Smith, was ten years old. No record shows that anyone was ever tried for the killings.

That year both sides in Missouri used force. The Missouri State Archives records that mobs of older Missouri settlers and armed Mormon groups roamed the countryside. In mid-October 1838, armed Mormon groups raided the towns of Gallatin and Millport and burned property there. Over the next year, about 8,000 church members left Missouri for Illinois, many of them ragged and stripped of their property. They settled at Nauvoo.

On June 27, 1844, about 100 men from Illinois militia units broke into the jail at Carthage, Illinois. They killed the church's founder, Joseph Smith, and his brother Hyrum. Five men were tried for the killings, and all five were found not guilty. Vigilantes then attacked Mormon farms around Nauvoo. A vigilante is a person who uses force to punish others without any legal right to do so.

Brigham Young, a leader of the church, planned to move about 15,000 people west. On February 4, 1846, the first wagons crossed the Mississippi River into Iowa. By March 1 about 500 wagons were on the move. By 1869 more than 70,000 Latter-day Saints had traveled the Mormon Trail. Some of the poorer groups pulled handcarts instead of driving wagons. A handcart is a small two-wheeled cart that people pull by hand.

The Salt Lake Valley lay between the lands of the Ute, to the south, and the Shoshone, to the north. A few Native people crossed the valley itself, but none had camps there. The Ute, Goshute, Shoshone, Paiute and Navajo peoples lived in what is now Utah, and their homelands had been there for thousands of years.

Brigham Young

Who: The Latter-day Saint leader who led the first company of Mormon emigrants to the Salt Lake Valley.

When and where: From Winter Quarters, in what is now Nebraska, to the Salt Lake Valley, in what is now Utah. Arrived July 1847.

Brigham Young led the first company of Latter-day Saints to the Salt Lake Valley in 1847. Before that, after Illinois militiamen killed Joseph Smith in 1844, Young had planned the move of about 15,000 people out of Nauvoo, Illinois, which began in February 1846.

The Saints called the 1847 group the vanguard company, which means the group that goes ahead of the rest. About 148 people traveled in it.

Counts of who was in the company differ. One count lists 143 men, 3 women and 2 children. Three of the men were enslaved Black men: Hark Lay, Green Flake and Oscar Crosby. William Lay and his wife, Sytha, held Hark Lay in slavery and took him along. James Madison Flake held Green Flake in slavery, and William Crosby held Oscar Crosby, according to the Century of Black Mormons project at the University of Utah. The two enslavers sent Green Flake and Oscar Crosby ahead to build shelters and plant crops for their white families, who came later. The three enslaved men hunted for the travelers, guarded the animals, and went into the Salt Lake Valley on July 22, 1847, ahead of most of the company.

The company started from Winter Quarters, a camp in what is now Nebraska, and traveled about 1,300 miles. Its members reached the valley in July 1847. Young himself arrived on July 24.

New land from Mexico, and the Gold Rush

In 1845 a journalist named John O'Sullivan wrote the phrase "Manifest Destiny" in the *Democratic Review*. It named an idea that many Americans held. They believed the United States was meant to spread across the continent to the Pacific Ocean. People used the idea to argue for moving west and for going to war with Mexico.

The Mexican-American War lasted from 1846 to 1848. It ended with the Treaty of Guadalupe Hidalgo in 1848. A treaty is a written agreement between nations. In this one, Mexican officials, after losing the war, gave up California, Nevada and Utah, most of Arizona and New Mexico, and parts of Colorado and Wyoming. This land is called the Mexican Cession. Texas had already been annexed in 1845, which means it was made part of the United States. In 1846 officials of the United States and Britain agreed on the border of Oregon.

In early 1848, gold was found at Sutter's Mill in California. The rush came in 1849. About 80,000 people, called forty-niners, arrived that year. From 1848 to 1855 about 300,000 people came to California. About half came by sea, and about half came over land on the California Trail.

California's population, not counting Native people, grew from about 14,000 in 1848 to about 250,000 in 1852. San Francisco grew from about 200 people in 1846 to about 36,000 in 1852.

The forty-niners arrived on the land of California's Native nations. About 150,000 Native people lived in California in 1848. By 1870 only about 30,000 were left, about 120,000 fewer. The historian Benjamin Madley documents the causes: killings, kidnapping, forced labor, disease, hunger, and newcomers driving Native people off their land. Between December 1849 and May 1850, vigilantes and United States Army soldiers killed 1,000 or more Native people. On the last day of 1854, 116 volunteer militiamen attacked the Tolowa people and killed hundreds of them. One militiaman died. Madley documents that state and federal officials took part in the killings, and that taxpayers paid for militia campaigns.

1850 to 1900

In the second half of the 1800s, settlers moved onto the Great Plains and the far West, where Native nations lived. Under a law of 1862 they could claim free farmland, and settlers filed about 4 million claims under it. After 1869 a railroad could carry them across the country in about a week. Tens of thousands of Black Southerners also moved west, to Kansas, to get away from violence and cheating in the South.

As the settlers came, United States soldiers forced Native nations onto reservations. A reservation is an area of land that federal officials set aside for a Native nation, often far from its homeland. In 1864 soldiers marched about 8,500 Navajo people more than 300 miles to one of them. By 1890 the officials who counted the country's population no longer found a clear line between settled land and thinly settled land in the West.

Amelia Stewart Knight

Who: A wife and mother who kept a diary, day by day, of her family's wagon journey on the Oregon Trail.

When and where: From Monroe County, Iowa, to the Willamette Valley near Milwaukie, Oregon Territory, April to September 1853.

Amelia Stewart Knight crossed the Oregon Trail in 1853 while she was pregnant, and she kept a diary of the trip. She traveled with her husband and their seven children. They left Monroe County, Iowa, in April.

Her diary records rain and mud, dust, sick children and hard river crossings. It also records the daily work of handling the wagons and the cattle.

The family reached Oregon on September 17, 1853. The next day, September 18, she gave birth to her eighth child, a son named Adam. Her diary does not mention that she was pregnant until the day the baby was born.

The handcart companies, 1856

In 1856 more than 1,000 Latter-day Saint emigrants set out late in the season to walk to Salt Lake City pulling handcarts. A handcart is a small two-wheeled cart that people pull by hand. Many of them were trapped by snow in what is now Wyoming. Counts of the dead run from about 170 to about 250.

The emigrants traveled in two companies. The Willie company, about 500 people, left Florence, in Nebraska Territory, on August 17. A territory was land the United States governed that was not yet a state. The Martin company left on August 27.

An early blizzard struck on October 19, 1856. The Martin company had just waded across the North Platte River, near where Casper, Wyoming, is today. More than 300 rescuers came from Salt Lake with wagons. They brought the survivors in through November.

Counts of the dead differ. Modern counts give about 67 to 77 dead in the Willie company and about 103 to 150 in the Martin company. Older accounts say about 200 to 250 people died in the stranded companies and the wagon trains traveling with them.

Levi Savage

Who: A leader in the Willie handcart company who warned the emigrants not to leave so late, then stayed with them through the blizzards. His journal records what happened.

When and where: From Florence, Nebraska Territory, to Salt Lake City, August to November 1856. Born 1820 in Ohio.

Movie: *17 Miracles* (2011), a film directed by T. C. Christensen about the Willie handcart company. It draws on Savage's journal.

Levi Savage warned the Willie handcart company that leaving so late would bring snow and deaths. He was 36 and one of the company's sub-captains, the leaders under the captain.

At a camp meeting at Florence on August 13, 1856, Savage spoke to the roughly 500 emigrants. They still had more than 1,000 miles to go. He urged them to wait until spring. In his journal, Savage wrote that most of the emigrants still meant to go on if the church's leaders said go. At later meetings, church leaders urged them to go forward whatever happened. On September 12, out on the trail, the church leader Franklin D. Richards scolded Savage "very severely in open meeting for his lack of faith in God."

Savage went with the company anyway. When the blizzards came, he worked through them to keep people alive. His journal survives, and most modern accounts of the Willie company rely on it.

The Weeping Time, 1859

The domestic slave trade went on through the 1850s. The largest single sale took place on March 2 and 3, 1859, at the Ten Broeck Race Course near Savannah, Georgia. Pierce Mease Butler sold between 429 and 436 enslaved men, women and children to pay his gambling debts. The sale brought him $303,850. It rained hard on both days of the sale.

A broker is a person who arranges sales for others. The broker who ran this sale was Joseph Bryan, the largest slave dealer in Savannah. For weeks he advertised it in newspapers across the South, from Richmond to New Orleans. Bryan sold people in family groups as far as the

terms of the sale allowed. Those same terms sometimes kept husbands and wives from being bought together. The surviving accounts do not say where the buyers took the people they bought.

Mortimer Thomson, a reporter for the *New York Tribune*, came to the sale dressed as a buyer and wrote a long account of it. Black Georgians remembered the sale as "the weeping time."

Free land and the railroad

President Abraham Lincoln signed the Homestead Act on May 20, 1862. Under it, an adult who headed a household could claim up to 160 acres of public land for free. Federal officials had taken much of that land from the Native nations who lived on it. After living on the land and farming it for five years, the settler owned it. Women could claim land. After the Civil War, freed people could claim land too, and so could immigrants who planned to become citizens.

Over the years the law was in force, settlers filed about 4 million claims. Settlers and other private owners got about 270 million acres this way. That was about 10 percent of all the land in the United States. Many settlers moved onto the Great Plains to claim land under the law.

The first railroad across the country was finished at Promontory Summit, Utah, on May 10, 1869. By wagon, a trip from coast to coast took four months or more. By train it took about a week. Under the Pacific Railroad Act, which Lincoln signed in 1862, each railroad company got 6,400 acres of federal land for every mile of track it built. They sold that land to settlers and carried settlers and immigrants west by the trainload.

The Long Walk of the Navajo, 1864

From 1863 to 1866, United States soldiers forced more than 10,000 Navajo people from their homeland in what is now Arizona and New Mexico. General James Henry Carleton ordered Colonel Christopher "Kit" Carson to make the Navajo surrender. From August 1863, Carson's troops, guided by Ute scouts and warriors, burned Navajo fields, took their animals and destroyed their food. The troops took more than 5,000 sheep, goats and mules and destroyed more than 75,000 pounds of wheat and the Navajo peach orchards.

By March 1864, 6,000 Navajo had gathered at Fort Canby and Fort Wingate, starving. Soldiers then marched about 8,500 people more than 300 miles to the Bosque Redondo reservation at Fort Sumner, New Mexico. The walk took from 18 to 40 days. The soldiers gave them food planned to last 8 days. This march is known as the Long Walk.

About 200 people died on the march, in winter. Navajo accounts passed down in families say soldiers shot people who could not keep up, among them old people, sick people and pregnant women. Soldiers held more than 8,000 Navajo and Mescalero Apache people at Bosque Redondo. Thousands more died there. On June 1, 1868, Navajo leaders signed a treaty with the United States, and under it the Navajo could go home. Through the 1870s and 1880s, soldiers forced many other nations onto reservations.

Laura Ingalls Wilder

Who: The author of the Little House books. As a child she moved with her family by covered wagon again and again.

When and where: Born February 7, 1867, near Pepin, Wisconsin. Family moves from 1869 to 1879. Her own last move, to Mansfield, Missouri, in 1894.

Movie: *Little House on the Prairie* (NBC series, 1974 to 1983). It ran for nine seasons and 205 episodes, with Michael Landon as Charles Ingalls. It is loosely based on the books.

Laura Ingalls Wilder's family moved six times between 1869 and 1879. She was born near Pepin, Wisconsin, on February 7, 1867.

In 1869 the family moved to Montgomery County, Kansas, near the town of Independence. Their cabin stood on the Osage Diminished Reserve, land that still belonged to the Osage Nation. The family had no right to be there. They left in 1871 and went back to Pepin.

The family moved to Walnut Grove, Minnesota, in 1874, and swarms of grasshoppers ate their wheat crops there in 1875 and 1876. Then they moved to Burr Oak, Iowa, where they helped run a hotel from 1876, then Walnut Grove again in 1877. In 1879 they settled at De Smet, in Dakota Territory. There Laura's father, Charles Ingalls, took a job at a railroad camp and then claimed a homestead.

Laura married Almanzo Wilder in 1885. In 1894, a year of drought, Laura, Almanzo and their daughter Rose drove a covered hack, a light wagon with a cover, about 650 miles from De Smet to Mansfield, Missouri. She kept a diary of the trip. It was published in 1962 as *On the Way Home*. In Mansfield she later wrote the Little House books.

The books came out from 1932 to 1943. In them, Wilder changed the real story. In *Little House on the Prairie*, Laura is several years older than she really was in Kansas, where she was 2 to 4 years old. The books leave out the Burr Oak years completely. They also do not say that the family was living on Osage land.

The cattle drives

After the Civil War, cowboys drove herds of longhorn cattle north from Texas to Kansas. They took the cattle to railheads, the towns at the end of a railroad line, where the cattle were loaded onto trains. Abilene was one of these towns. The railroad reached Abilene in 1867, and after that the Chisholm Trail from Texas was used heavily.

About 5 million cattle or more were driven north from Texas between 1866 and 1884. Some estimates put the total for the whole era at about 6 million. In 1871 alone, about 700,000 cattle reached the railheads in Kansas.

The long drives ended in the mid-1880s for several reasons. Barbed wire fences went up across the open range. Railroads reached deeper into Texas, so the cattle no longer had to walk to Kansas. In 1885 and 1886 Kansas lawmakers passed a quarantine law to keep Texas cattle out of the state. A quarantine keeps animals or people apart to stop the spread of disease. Then the cold of the winter of 1886 and 1887 killed much of the cattle herd.

The Exodusters, 1879

In 1879 thousands of Black Southerners left their homes and moved to Kansas. People called them Exodusters. The name comes from the Exodus, the story in the Bible of the Israelites' escape from slavery in Egypt. Many came from Mississippi, Louisiana, Texas and Tennessee. As many as 40,000 moved to Kansas, Oklahoma and Colorado between about 1879 and 1881. About 6,000 reached Kansas in the spring of 1879 alone.

They left because former Confederates took away their votes, white landowners cheated them, and armed white men attacked them. The Confederates were the Southerners who had fought against the United States in the Civil War to keep slavery. After the presidential election of 1876, former Confederates took back control of the Southern states, and they took away Black Southerners' right to vote. The historian Damani Davis calls what Black Southerners faced "relentless terror."

Many Black Southerners were sharecroppers. A sharecropper farms someone else's land and pays with a share of the crop. Benjamin Singleton, who led many of the migrants to Kansas, was angry that white landowners cheated the Black sharecroppers who farmed their land.

In Louisiana, the Black organizer Henry Adams collected the names of nearly 700 Black people who had been attacked. For each one he listed where it happened and what was done. Most of them had been whipped, beaten, shot or killed by white men, often by armed groups. Some entries name the man. One entry says that a white man, Dr. Moore, killed a Black man named Calvin in 1871, after Calvin was accused of cursing a white woman.

Many Exodusters traveled up the Mississippi River by steamboat. Crowds of them waited on the docks at St. Louis. In 1880 members of a United States Senate committee looked into why they had left. The members who disagreed with the majority wrote their own report. It said the migrants had fled because they could no longer bear the hardship, unfair treatment and suffering that "a class of Democrats in the South" had brought on them. The migrants saw Kansas as a safe place. John Brown, who fought to end slavery, had lived there. Before the Civil War, many Kansans had wanted it to be a free state, a state without slavery.

Benjamin "Pap" Singleton

Who: A man born into slavery who organized Black Southerners to move to Kansas. He called himself the "Father of the Exodus."

When and where: Born enslaved in Nashville, Tennessee, about 1809. Led the move to Kansas in the late 1870s. Died 1900.

Benjamin Singleton helped thousands of Black Southerners move to Kansas in the 1870s. He called himself the "Father of the Exodus."

He was born into slavery in Nashville, Tennessee, in about 1809. He ran away several times. In the end he escaped to the North and to Canada. In about 1871, after the Civil War, he came back to Tennessee. He worked there as a carpenter, a cabinetmaker and an undertaker, a person who prepares the dead for burial.

Singleton was angry that white landowners cheated the Black sharecroppers who worked their land. He believed Black Southerners would never get a fair chance at land in the South. He printed handbills, short printed notices, to draw Black settlers to Kansas. He formed a group called the Edgefield Real Estate and Homestead Association to move people there.

Singleton said under oath, at a hearing, that his work helped more than 7,400 people move. Between 1877 and 1879, his group steered more than 20,000 people toward Kansas. He died in 1900.

The Oklahoma Land Run, 1889

At noon on April 22, 1889, about 50,000 people raced into central Oklahoma to claim land. The land they entered was called the Unassigned Lands. It covered about 1.9 million acres in the middle of Indian Territory. Nearly 2 million acres were claimed in a single day.

Indian Territory was the land in present-day Oklahoma where federal officials had moved many Native nations. The Unassigned Lands were the last part of it that federal officials had not given to any of those nations. Federal officials had taken land in Indian Territory from the nations there.

After the Civil War, federal officials pressed the Creek and Seminole nations to give up land. Dennis N. Cooley, the Commissioner of Indian Affairs, was the federal official in charge of dealings with Native nations. In 1865 he told the nations' leaders that they had lost their rights under the old treaties by joining the Confederacy. In treaties of 1866 the Creek had to sign over the western half of their land for $975,168. The Seminole had to sign over all of theirs for fifteen cents an acre. The Five Tribes were the Cherokee, Choctaw, Muscogee (Creek), Chickasaw and Seminole nations. With these treaties, they lost the western half of present-day Oklahoma.

From 1879 to 1888, groups of settlers called boomers, led by David L. Payne and William Couch, entered the Unassigned Lands against the law. Cavalry soldiers, soldiers who fought on horseback, arrested them and took them out again and again. In 1889 Representative William Springer of Illinois changed a bill in Congress so that President Benjamin Harrison could open the land. Harrison announced the opening on March 23, 1889.

Each settler could claim 160 acres under the Homestead Act. People who sneaked in before the start to grab land were called "Sooners." By the end of that day, Guthrie and Oklahoma City were towns of about 10,000 to 15,000 people each.

The frontier line disappears from the census, 1890

In 1890 the officials who ran the United States census reported that the country no longer had a clear "frontier line." The census is the official count of the population, taken every ten years. The frontier line had been the edge of thinly settled land in the West, where two to six people lived on each square mile.

In 1893 the historian Frederick Jackson Turner wrote an essay about that census finding. It was called "The Significance of the Frontier in American History." Many people later treated 1890 as the end of the years when settlers could still find open land in the West, land that had belonged to Native nations.

1900 to 1950

From about 1910 to 1970, roughly 6 million Black Americans left the South for cities in the North, the Midwest and the West. Most of the early travelers went by train. In the late 1930s more than 250,000 people moved from the dried-out farms of the southern Plains to California.

In 1942 United States Army officers ordered Japanese Americans out of their homes on the West Coast. Soldiers and officials forced them into camps.

The Great Migration, the first wave

The movement of Black Americans out of the rural South from about 1910 to 1970 is called the Great Migration. The first wave, from about 1910 to 1940, went mostly to cities in the North and the Midwest. Most people rode the trains north. Later travelers also went by car and by bus.

Between 1910 and 1920 the Black population of Chicago grew by about 148 percent. Detroit's grew by about 611 percent, and Philadelphia's by about 500 percent. In New York City it about doubled, from about 152,000 people to 328,000. In 1900 about 90 percent of Black Americans lived in the South. By 1970 fewer than 55 percent did.

Black Georgians had several reasons to leave. In 1915 and 1916 the boll weevil, a beetle that eats cotton plants, and floods ruined the cotton crop. Between 1880 and 1930, lynch mobs in Georgia killed more than 450 people, most of them Black. A lynch mob is a crowd that kills a person without any trial. Jim Crow laws were Southern laws that required Black people and white people to be kept apart. Under them, nearly all Black Georgians could not vote. About 74,000 Black Georgians left between 1910 and 1920, and about 260,000 more left in the 1920s.

Some people in the North urged Black Southerners to come. In 1905 Robert S. Abbott started a Black newspaper, the *Chicago Defender*. In its pages, job listings and train schedules ran beside editorials, articles that give a newspaper's opinion. The editorials urged Black Southerners to come north. The *Defender* listed May 15, 1917, as the date for a "Great Northern Drive." Some Northern employers paid migrants' train fares and then took the money back out of their wages.

White officials in the South worked to keep Black workers from leaving. A labor recruiter is a person hired to find workers. Officials in Macon, Georgia, charged Northern labor recruiters a license fee of $25,000, a payment for permission to work there.

Black people in the North also met violence. On July 27, 1919, Eugene Williams, who was 17, and four friends drifted on a homemade raft in Lake Michigan in Chicago. They crossed an unmarked line into the water off a beach at 29th Street where only white people were allowed. George Stauber, a 24-year-old white man, threw rocks at them until Williams drowned. A white police officer, Daniel Callahan, refused to arrest Stauber and stopped a Black officer from arresting him.

Five days of attacks followed, through August 3. The white attackers included youth gangs and groups that called themselves athletic clubs. Thirty-eight people were killed, 23 Black and 15 white. The histories of the riot do not say who killed each of them. About 537 people were injured, and two-thirds of them were Black. Hundreds of homes were burned or damaged. Of the 138 people charged with crimes afterward, two-thirds were Black.

Ida Mae Brandon Gladney

Who: A sharecropper's wife who left Mississippi with her family after white men nearly beat a cousin to death.

When and where: From Chickasaw County, Mississippi, by train, late October 1937. Settled in Chicago.

Ida Mae Brandon Gladney and her family left Mississippi in 1937 after a group of white men beat a cousin of theirs nearly to death. The cousin, Joe Lee, had been falsely accused of stealing turkeys. The men beat him with heavy chains. The turkeys turned up the next day, and no one apologized to him. The accounts of the beating do not name the men.

Ida Mae and her husband, George Gladney, were sharecroppers in Chickasaw County. A sharecropper farms someone else's land and pays the owner with part of the crop. They grew cotton on the plantation of Edd Pearson, whom they called Mr. Edd. After the beating, George came home and told her, "This is the last crop that we're making."

In late October 1937 the cotton was picked, and George settled with Mr. Edd over what the year's work was worth. None of the family had ever been on a train or out of Mississippi. A brother-in-law drove Ida Mae and the two children, James and Velma, in his truck to the train station at Okolona. There they met George and rode north through the night.

The family settled in Chicago. One account says they stopped first in Milwaukee, where Ida Mae's sister Irene lived. In Chicago, George hauled ice up four and five flights of stairs. Ida Mae did housework for other people and then found work as a hospital aide. In

> time the family bought a house. Ida Mae died in 2002. The writer Isabel Wilkerson told Ida Mae's life, from interviews with her, in the 2010 book *The Warmth of Other Suns*.

The Dust Bowl move

In the 1930s, drought and windstorms tore the topsoil off farms across the southern Great Plains. A drought is a long stretch of time with too little rain. The Dust Bowl was the name for those parts of Oklahoma, Texas, Kansas, Colorado and New Mexico.

From about 1935 to 1940, more than 250,000 people left the Dust Bowl states for California. Another count covers only Oklahoma but every destination. That count is everyone who left Oklahoma for any place, minus the people who moved in. By that count Oklahoma may have lost as many as 440,000 people. Many of the travelers went west on U.S. Route 66. In California the newcomers were called "Okies."

In February 1936 the Los Angeles police chief, James E. Davis, sent his officers to the state line to turn back poor migrants. People called it the "bum blockade." From February 3, 136 Los Angeles officers stood at 16 crossing points. Those points were on California's roughly 700-mile border with Arizona, Nevada and Oregon, far outside the city. Davis pointed to a 1933 state law against bringing poor people into California. His officers stopped trains, cars and people hitchhiking. They took people's fingerprints and turned back anyone they judged unable to support themselves.

On February 8 alone, the officers arrested 122 people for vagrancy, the crime of having no home or means of support. A week into the blockade, Davis announced that he would force the people arrested into unpaid labor, quarrying rock, sand and gravel for public projects. Forced labor is work people are made to do against their will. Many of the people arrested were locked up in prisons far from the state line. Quarrying means cutting and breaking stone out of the ground.

Railroad executives and some county sheriffs backed the blockade. So did the people who ran the *Los Angeles Times* and the Los Angeles Chamber of Commerce, a group of the city's business owners. California's attorney general, the state's top lawyer, Ulysses S. Webb, said Davis had "no jurisdiction beyond the city's territorial limits." That meant he had no power outside Los Angeles. Arizona's governor, Benjamin Moeur, called the blockade illegal and unconstitutional, which means against the Constitution. Davis called his officers home in early

April 1936. He claimed they had turned back about 11,000 people. Writing in *Smithsonian* magazine in 2025, Olatunji Osho-Williams reports that the real number was probably much lower.

Florence Owens Thompson

Who: A farmworker born in what is now Oklahoma, whose parents said their families were Cherokee, who moved from crop to crop in California. She is the woman in Dorothea Lange's 1936 photograph "Migrant Mother."

When and where: Born in Indian Territory in 1903. Moved to California in the 1920s. Photographed at a pea-pickers' camp in Nipomo, California, in March 1936.

Florence Owens Thompson moved to California in the 1920s, years before the Dust Bowl, and worked in its fields as a farm laborer. She was born Florence Leona Christie on September 1, 1903, in Indian Territory, which is now Oklahoma. Both of her parents said their families were Cherokee.

In 1921 she married Cleo Owens. During the 1920s they moved west with several of his relatives to Oroville, California. Cleo died in 1931. In about 1933 she and her parents moved to Shafter, California. She followed the crops from one harvest to the next.

On March 6, 1936, the timing chain in the family's car snapped. The timing chain is an engine part, and the car could not run without it. The family stopped at a camp of pea pickers near Nipomo. Freezing rain had destroyed the pea crop there. The photographer Dorothea Lange took seven pictures of Thompson in about ten minutes. One of them became known as "Migrant Mother," and it became one of the most reproduced pictures of the 1930s.

Thompson's name was not made public until 1978. That year Emmett Corrigan, a reporter for the *Modesto Bee*, found her. She died on September 16, 1983.

The forced removal of Japanese Americans, 1942

In 1942 United States Army officers forced more than 110,000 Japanese Americans out of their homes on the West Coast. On February 19, 1942, President Franklin D. Roosevelt signed Executive Order 9066. An executive order is a rule issued by a president. Under this one, military commanders could keep "any or all persons" out of areas they named. General John L.

DeWitt commanded the Army on the West Coast. In March and April 1942 he issued orders aimed at "all persons of Japanese ancestry," meaning everyone whose family came from Japan. United States citizens and people who were not citizens were ordered out alike.

On March 11, DeWitt set up an Army office to carry out the removal. Karl Bendetsen, an Army officer, commanded it. The next day, at 34, he was made a colonel. Bendetsen's staff divided the coast into 108 areas of about 1,000 Japanese Americans each. They issued a separate order for each area. Under each order, the people in that area had to report on a set day, about a week later. They could bring only what they could carry. Under the first order, issued on March 24, the 55 Japanese American families on Bainbridge Island, near Seattle, had six days to leave their homes. Army officers carried out the 108 orders and forced out 110,442 people.

Army engineers built 15 temporary camps, many of them at fairgrounds and racetracks. When people arrived, soldiers searched their bags. At the Tanforan camp in California, half of the people lived in horse stables, three to six people in a stall built for one horse. After about three months, on average, officials moved them again. This time they went to 10 larger camps run by officials of a federal office called the War Relocation Authority. The National Archives counts about 120,000 people removed in all, a larger total than the count for the 108 orders alone.

George Swanson Starling

Who: A Florida fruit picker who organized the other pickers to ask for better pay, then fled north when he learned that the grove owners were plotting to hang him.

When and where: From Wildwood, Florida, to Harlem in New York City, by train, April 14, 1945.

George Swanson Starling fled Florida on April 14, 1945, because the owners of the citrus groves where he worked were plotting to kill him.

Starling grew up in Eustis, in Lake County, Florida. He finished first in his high school class and went to Florida Agricultural and Mechanical State College in Tallahassee. In the middle of his second year, his father told him he had had enough schooling and must go to work. Starling went to work picking citrus fruit. The pickers climbed trees as tall as 40 feet. Some fell and broke arms or legs.

Starling organized the pickers to ask for about 10 cents more a box. In one dispute the price at the packing house, where the fruit was packed for sale, was ten cents a box for picking tangerines, and the pickers asked for twenty. In 1944 tangerines sold at auction for an average of $4.40 a box.

The grove owners were angry. Someone overheard them planning to take Starling and two other pickers out to the cypress swamps at Blackwater Creek and hang them. Starling left within days. A man named Roscoe Colton drove him in his truck to the train station in Wildwood. There Starling boarded the Silver Meteor, a train to New York. He rode in the Jim Crow car, the car set aside for Black passengers, where the railroad also stored luggage. The ride took 23 hours. His wife, Inez, stayed behind until he could send for her.

Starling settled in Harlem, where an aunt and many of his friends lived. He later got a steady job working on the same train that had carried him north. Isabel Wilkerson's book *The Warmth of Other Suns* also describes his life. The accounts of Starling's life do not name the grove owners who planned to kill him.

1950 to 2000

Large numbers of Americans moved from the North to the South and the West between 1950 and 2000. Between 1970 and 1990 the population of the South grew by about 36 percent, and the population of the West by about 51 percent. In the second wave of the Great Migration, many Black Southerners moved to cities on the West Coast. Federal officials paid for Native people to move from reservations to cities. Reservations are lands set aside for Native nations.

By the late 1990s more Black Americans were moving to the South than were leaving it.

The second wave of the Great Migration

The second wave of the Great Migration lasted from about 1940 to 1970, and it was larger than the first. More of its travelers went west, to Los Angeles, Oakland, Seattle and Portland. They went for factory jobs, first during World War II and then after it. These travelers are counted in the same total of about 6 million people who left the South between 1910 and 1970.

Robert Joseph Pershing Foster

Who: A Black surgeon who could not work in the hospital of his own home town in Louisiana. He drove alone to California and opened his own medical practice in Los Angeles.

When and where: From Monroe, Louisiana, to Los Angeles, California, by car, April 1953.

Robert Joseph Pershing Foster drove from Louisiana to California in 1953 because he could not work as a surgeon at home. He had served as a surgeon in the Army. When he came back to Monroe, Louisiana, he found that he could not work in the hospital in his

own home town. The people who ran St. Francis Hospital there would not let Black doctors do even a simple operation to take out a patient's tonsils. Isabel Wilkerson traced his trip in *The Warmth of Other Suns*.

Foster set out alone on Easter Monday, April 6, 1953, in his 1949 Buick Roadmaster, a dark red car with white-walled tires. He planned to send for his family once he was settled. Once he was long past Texas, he thought he was a safe distance from the South. In Arizona, motel clerks turned him away, a Black man traveling alone, even under "vacancy" signs, which tell drivers that rooms are free. One clerk told him they had forgotten to turn off the sign. Others said the rooms had just been rented. He could not find a place to stay the night, and he drove on until he reached California. Alone in the dark desert, he asked himself what he was doing. If he turned back, Wilkerson writes, "the I-knew-its would ring in his ear." The "I-knew-its" were the people who would say they had known he would fail.

In Los Angeles, Foster opened his own medical practice. Many of his patients were migrants from the South, as he was. One of them was the musician Ray Charles.

The move to the Sun Belt

After World War II, many Americans moved from the older factory states of the North to the South and the West. People later nicknamed the Northern factory states the "Rust Belt" and the South and the West the "Sun Belt." People moved for jobs, for warmer weather and for cheaper land. Air conditioning made hot places comfortable all year, and that helped the Sun Belt grow.

Between 1970 and 1990 the South grew by about 36 percent and the West by about 51 percent. By counts from the Census Bureau, the federal office that counts the population, the whole country grew by about 22 percent in those years, from about 203 million people to about 249 million. In 1962 California passed New York as the state with the most people. It had about 17 million people then, roughly three times as many as before World War II.

In 1956 members of Congress passed the Federal-Aid Highway Act. Under it, work began on the Interstate Highway System, a network of big highways across the country. The interstates made long moves by car easier. They also made it easier to live in a suburb, a town at the edge of a city.

Federal officials move Native families to cities

From about 1950 into the 1970s, officials of the Bureau of Indian Affairs paid for Native people to move from reservations to cities. The Bureau of Indian Affairs is the federal office in charge of the government's dealings with Native nations. Its officials started the program, called Relocation, between about 1948 and 1952. In 1956 members of Congress backed it with the Indian Relocation Act.

The officials gave people one-way tickets to a city and help for a short time after they arrived. About 30,000 Native people moved to cities in the 1950s. By the time the program ended in the 1970s, more than 100,000 had moved. They went to Minneapolis, Chicago, Oakland and San Francisco, Los Angeles, Denver and other cities. Many of them lived in poverty there. They also built new Native communities in those cities.

The Great Migration turns around

In the 1970s a small number of Black Americans began moving back to the South. The number grew through the 1990s. By the late 1990s the South gained more Black migrants than it lost to each of the other three regions of the country, the Northeast, the Midwest and the West. For 35 years before that, more Black Americans had left the South than moved to it. William H. Frey, a researcher at the Brookings Institution, a research group, calls this return the New Great Migration.

2000 to Today

Hurricane Katrina drove more than 1 million people out of the New Orleans area and the Gulf Coast in 2005. It was the largest sudden move of people in these years. After Hurricane María hit Puerto Rico in 2017, about 130,000 people left the island for the mainland within a year.

The steadier flow toward the South went on through these years. The Census Bureau is the federal office that counts the population. By its estimates, from 2020 to 2024 the South gained about 2.7 million more people from other states than it lost to them.

The pull of the South

Census Bureau staff count moves between states as net domestic migration. That is the number of people who move into a state from other states, minus the number who move out to other states. By this measure the South gained about 2.7 million people from 2020 to 2024.

Many of the people who moved between states left coastal states where homes cost a lot. From April 2020 to July 2022, California lost about 343,000 people to other states, and New York lost about 300,000, by Census Bureau counts. A metro area is a city together with its suburbs. The metro areas that lost the most people included New York, Los Angeles, San Francisco and Chicago. After 2020 some people could work from home. The Pew Research Center is a group that studies how Americans live and what they think. Its researchers reported that working from home let some people choose where to live by the cost of a home and the space it offered, not by where their job was.

Florida's gains from other states shrank after 2022. By Census Bureau counts, Florida had a net gain of about 311,000 people from other states in 2022 and about 184,000 in 2023. In the year from July 2024 to June 2025, Florida gained about 23,000. The Census Bureau released the 2025 figures in January 2026. In that same year North Carolina gained the most people from other states, about 84,000. Texas and South Carolina each gained about 67,000.

The National Association of Realtors, a group for people who sell houses, ranked the states from the same Census figures. In that ranking, nine of the fifteen states with the biggest gains in 2024 to 2025 were in the South. The Midwest also gained about 16,000 people from other states that year, its first such gain this decade.

The New Great Migration of Black Americans to the South went on. William Frey of the Brookings Institution found that the Black population of metro Atlanta grew about five times over from 1970 to 2020. By 2010 it had passed Chicago's to rank second in the country. From 2000 to 2018, Atlanta was the most common destination of young Black adults aged 16 to 26 who moved. Seven of their ten most common destinations were in the South.

Leaving New Orleans after Hurricane Katrina, 2005

In late August 2005, Hurricane Katrina struck the Gulf Coast, and the levees around New Orleans broke. A levee is a wall of earth or concrete built to hold back water. The storm and the broken levees forced more than 1 million people from their homes in the New Orleans area and along the Gulf Coast. A month later, the people of up to 600,000 homes were still away. These counts come from The Data Center, a research group in New Orleans, and from the federal housing department.

Many people never came back. New Orleans had 484,674 people at the 2000 census. By July 2006 an estimated 230,172 people lived there, fewer than half as many, The Data Center reported. In 2024 the city had about 363,000 people, by an estimate reported by the news site

The Center Square in 2025. That was about 120,000 fewer than in 2000. In July 2025 the seven parishes of the New Orleans metro area had 970,849 people, 3.6 percent fewer than in April 2020, The Data Center found. In Louisiana a parish is what other states call a county.

Some of the people who tried to walk out of the flooded city were stopped by police. On September 1, 2005, officers from three police forces blocked the Crescent City Connection bridge over the Mississippi River. They were the Gretna police, the bridge police and the Jefferson Parish sheriff's office. They turned back people on foot at gunpoint. Two paramedics, medical workers who ride ambulances, were in the crowd. They came from San Francisco, and they reported that police "fired their weapons above their heads."

Gretna Police Chief Arthur Lawson made the decision together with officials of the sheriff's office and the bridge police. Gretna's mayor, Ronnie Harris, defended it. He said the town was not a shelter or an evacuation route and had no running water, no electricity and no food. Members of the Gretna City Council voted to support the blockade. It lasted until Labor Day, September 5, 2005. No count survives of how many people the officers turned back.

Evacuees are people who leave a place to escape danger. By Houston officials' own estimates, reported by the *Texas Tribune* in 2010, about 250,000 evacuees came there at the peak, and about 150,000 were still there a year later. By 2010 Houston's mayor, Annise Parker, said city officials no longer counted them apart from other residents: "They are Houstonians."

Kimberly Rivers Roberts

Movie: *Trouble the Water* (2008), a documentary about Kimberly and Scott Roberts, directed by Tia Lessin and Carl Deal and built largely on her own video. It won the Grand Jury Prize for documentary at the 2008 Sundance Film Festival and was nominated for an Academy Award.

Who: A woman of 24 from the Lower Ninth Ward of New Orleans who wanted to be a rap singer. With her husband, Scott Roberts, she filmed the Katrina flood from inside it.

When and where: New Orleans, August 2005. Then Alexandria and northern Louisiana, then Memphis, Tennessee, then home to New Orleans.

Kimberly Rivers Roberts and her husband, Scott Roberts, were still in their New Orleans neighborhood when Katrina's flood came, because someone had recently stolen their car. "If I had wheels I'd be gone too," she told a neighbor. On August 28, 2005, she began filming with a camcorder she had bought for $20.

As the water rose, the couple and their neighbors climbed into an attic. They called 911 and heard that police would not come until conditions got better. A neighbor floated people to safety on a punching bag.

> Afterward the group tried to take shelter at a Navy base that stood nearly empty. The couple's film shows men at the gate turning them away at gunpoint. A voice says, "Get off our property, or we're going to start shooting." Navy officials deny that this happened. The accounts of the film do not name the men at the gate.
>
> Kimberly's grandmother died in a hospital that was not emptied of its patients. Her uncle was later found dead in his home. The accounts do not say who decided to leave the hospital's patients there, and they do not state the cause of either death.
>
> The couple went to a Red Cross shelter in Alexandria, Louisiana, then to her uncle's trailer in northern Louisiana. Next they moved to Memphis, Tennessee, to stay with one of Kimberly's cousins and try to start over. They were waiting for a promised check from FEMA, the federal office for disaster help. It did not arrive, and they had a hard time settling in a new city.
>
> Kimberly and Scott went back to their home in the Ninth Ward and set out to rebuild it. Scott got a job with a builder repairing houses that the flood had ruined. Kimberly started her own record label, Born Hustler Records.

Leaving Puerto Rico after Hurricane María, 2017

Hurricane María hit Puerto Rico in September 2017, and within a year about 130,000 people had left the island for the mainland. That was almost 4 percent of the people of Puerto Rico. The count is the Census Bureau's estimate for July 2017 to July 2018. Researchers writing in the science journal PNAS in 2020 described other counts, made from air travel records, phone records and social media data. Those estimates run from about 160,000 to 470,000, depending on which data they used.

Puerto Rico is a territory of the United States, land that belongs to the country but is not a state. Puerto Ricans are United States citizens, so a move from the island to the mainland is a move within the country. By Census Bureau figures, about a third of the people who moved from Puerto Rico to the mainland in 2018 went to Florida.

Chapter 6: City Building

Before 1500

People built planned cities on this land between about 900 and about 1350, hundreds of years before any European came here. In a planned city, people decide ahead of time where each open square, wall and mound will go, and then they build it that way. The largest of these cities stood beside the Mississippi River. In the Southwest, people cut and stacked stone to build towns. Their descendants still live in towns along the Rio Grande.

The people who built these places kept no written records. No builder's, planner's or ruler's name survives. Archaeologists, the scientists who dig up and study what people left behind long ago, know them only from the mounds, walls, rooms and roads they left.

Cahokia, a city laid out on purpose

In what is now Illinois, across the Mississippi River from where St. Louis, Missouri, stands today, people built up the city of Cahokia quickly from about 1050. It was the largest town north of Mexico before Europeans came. At its peak, around 1100, roughly 10,000 to 20,000 people lived in the center. London had about as many people at the same date. Some estimates put as many as 50,000 people in the wider settlement around the center. Those larger figures are estimates, and they do not agree.

The people of Cahokia planned where the big pieces of their city would go. At its center they raised Monks Mound, the largest prehistoric structure made of earth in the Americas. Prehistoric means built before anyone living here kept written records. The mound holds about 814,000 cubic yards of earth. Workers carried every basketload of it by hand, and they raised the mound in stages.

It has four terraces, or wide steps, and its top stands about 100 feet high. Its base covers roughly 14 acres. UNESCO is the United Nations body that keeps the World Heritage list of historic sites. Its listing for Cahokia records fourteen separate building stages in the mound.

The Grand Plaza, about 50 acres of open ground, lay at the foot of the mound. Its builders leveled the ground and filled in the low spots by hand so that it was flat. They made it flat for ceremonies and for the game of chunkey. In chunkey, one player rolled a stone disk across the ground, and the players threw spears to see whose spear landed closest to the spot where the stone stopped.

West of Monks Mound the builders set up a circle of red cedar posts. They built five of these circles, one after another, and each new circle took the place of the last. The posts line up with the points on the horizon where the sun rises at the solstices and the equinoxes. The solstices are the longest day and the shortest day of the year. The equinoxes are the two days between them when day and night are equal in length. So the posts worked as a calendar, and the builders set them into the plan of the city.

A palisade, a wall of upright logs about two miles long, ran around the central part of the city. People began it around 1100 and rebuilt it three times over about two hundred years. Each rebuilding took between 15,000 and 20,000 logs of oak and hickory, each roughly a foot thick and twenty feet tall.

By about 1350 the people of Cahokia had scattered and left the city.

Stone towns of the Southwest

In what is now northwestern New Mexico, Chaco Canyon was the center of the Ancestral Puebloan world. Ancestral Puebloan people are the ancestors of the people who live in the pueblos of the Southwest today. Pueblo is the Spanish word for a town, and Spanish colonists used it for the stone and adobe towns they found there. Adobe is brick made of mud and dried in the sun. At Chaco they built great houses, which are large buildings of shaped stone. They went on building and using the great houses for roughly 280 years, from about 900 to about 1180. One of them, Pueblo Bonito, had more than 650 rooms.

The people of Chaco also built roads, and they built them to a plan. The roads run straight for miles across the Four Corners country, where Colorado, Utah, Arizona and New Mexico meet. They average about 30 feet wide, and they connected farther-off villages to the canyon.

In southwestern Colorado, at Mesa Verde, people built rooms of sandstone blocks and mud into the hollows under overhanging cliffs. Cliff Palace is the largest of those cliff dwellings. It has 150 rooms and 23 kivas, and people built it between 1190 and 1280. A kiva is a round room, usually sunk into the ground, used for ceremonies and for meetings. More than 100 people lived at Cliff Palace.

People began leaving Chaco in the 1140s. That date marks the start of the leaving, and the years 900 to 1180 mark the whole time the great houses were built and used. The last building and the last living in the canyon came to an end by about 1180 to 1200. People had left Mesa Verde by the 1280s. The people who left both places gathered again in the pueblo towns along the Rio Grande, and their descendants still live in those pueblos today.

The 1500s

In 1565 the Spaniard Pedro Menendez de Aviles founded St. Augustine on the Florida coast, in a Timucua town. The Spanish settlers moved their town twice in its first seven years, but people have lived in St. Augustine without a break since 1565. Eight years after the founding, the king of Spain issued written orders that stated how Spanish officials must lay out every new town.

St. Augustine and the Laws of the Indies

In September 1565 Pedro Menendez de Aviles founded St. Augustine on the coast of Florida. He placed it in Seloy's town, a town of the Timucua people whose chief was named Seloy. Menendez landed there on September 8 with about 800 colonists, among them 26 women and an unknown number of enslaved Africans. The colonists moved into Seloy's town, and they used the chief's council house as their first fort. Timucua council houses were round, roofed with thatch, which is dried straw or reeds, and big enough to hold up to a thousand people.

The Timucua did not want the Spaniards living in their town. They attacked them again and again to drive them away. In 1566, according to the Florida Museum of Natural History, the Timucua shot flaming arrows at the fort. The fort was the Timucua's own council house, and the museum's account says that is why the attack did so much harm. On April 1, 1566, half of the fort burned, and the Spaniards lost all their supplies. In May 1566, about nine months after landing, Menendez moved the settlement across the bay to Anastasia Island, where the Spaniards felt safer from attack. They lived on the island for about six years. By about 1572 they had moved back to the mainland, to the site of today's St. Augustine.

The town stood in three places in its first seven years. Through both moves, people went on living in it, and people have lived in St. Augustine without a break since 1565. Of all the cities Europeans founded on the mainland of the United States, it is the oldest one that people have lived in the whole time.

In 1573 King Philip II of Spain issued a set of ordinances called the Laws of the Indies. The Indies was the Spanish name for Spain's lands in the Americas. An ordinance is a written order that people must obey as law. These ordinances stated exactly how the men who founded Spanish towns had to lay them out.

Each town began with a central plaza, which is a public square of open ground with the town built around it. The plaza's sides had to face north, south, east and west, and it had to be one and a half times as long as it was wide. The streets ran out from it in a grid. A grid is a pattern of straight streets that cross each other at right angles. The founders had to set aside certain lots, or pieces of land, for the church and for the government buildings. These ordinances were among the first written rules anywhere in the world that set the same town plan for every new town, wherever Spanish officials founded one.

St. Augustine's Plaza de la Constitucion was laid out under those 1573 ordinances, after the town already existed. Government buildings and the church faced onto it, and traders began holding a market there in 1598. It is the oldest public square in the country. Across what is now the Southwest, Spanish town-builders went on laying out towns in the same plaza-and-grid pattern.

The 1600s

Each of the colonial towns in this era went up in the homeland of a Native nation. English colonists began Jamestown in 1607 as a fort. Boston, founded in 1630, had no plan at all, and its streets formed around the houses and the hills. Spanish officials laid out Santa Fe around a plaza. In 1682 William Penn had his surveyor, the man who measured the land and marked out the streets, draw the whole of Philadelphia on paper before a single street existed on the ground. The founders of many early American towns later followed Penn's example.

Fort towns, walls, and watchmen

On April 26, 1607, three English ships sailed into the Chesapeake Bay with 144 English men and boys. They settled on Jamestown Island, on the James River in Virginia. The island lay inside the land of the Paspahegh people, who hunted there and had a town about four miles away. The Paspahegh were one of 28 to 32 nations, each with its own chief, that paid tribute to one ruler, Powhatan. Tribute is a payment of goods to a ruler. On May 26 the Paspahegh attacked the newcomers. By June 15 the colonists had finished James Fort, a three-sided fort.

Its wall was a stockade, a fence of upright oak and poplar logs about 14 feet high. In the 1620s the surveyor William Claiborne laid out a settlement east of the fort called New Towne. Archaeologists have dug up the foundations of rows of houses there.

Governor Pedro de Peralta founded Santa Fe about 1610 and planned it around a central plaza, in the Spanish pattern. He and his men laid it out at the foot of the Sangre de Cristo Mountains, on the ruins of an older Pueblo town. The Tewa people call that place O'Ga P'Ogeh, which means "white shell water place." The Palace of the Governors stands on Santa Fe's plaza. People have used it as a public building without a break for longer than any other building in the United States.

English colonists founded Boston in 1630 without any plan, on a peninsula that the Massachusett people called Shawmut. A peninsula is land with water on almost every side. The colonists put their houses up near the waterfront, and the streets formed around the hills, brooks and marshes that were already on the ground. The biggest hill was the Trimountain, a steep hill with three tops, which is now called Beacon Hill. According to a well-known story, Boston's crooked streets follow old cow paths. The story is a legend. A writer for Boston Magazine checked it in 2018 and traced it to a line that the American writer Ralph Waldo Emerson wrote in 1860.

Boston's first houses had chimneys made of wood and roofs made of thatch, which is dried straw or reeds. Several of them burned in the colony's first months. In March 1631 Thomas Dudley wrote in a letter to the Countess of Lincoln that he and the colony's other leaders had ordered "that noe man shall build his chimney with wood nor cover his house with thatch." The fires, he wrote, always began "in the wooden chimneys." That same year the people of Boston set up a night watch. The watchmen walked the streets at night to guard the town against criminals, wild animals and fire. The Boston Police Department's own history lists that watch as the start of the city's police.

Wall Street in New York City runs along the line of a wall that is long gone. The wall ran across the northern edge of New Amsterdam, the Dutch town on the southern tip of Manhattan. Manhattan was part of the homeland of the Lenape people. The wall stretched from the East River to the North River, which is now called the Hudson. In 1653 a gang of Black men dug the trench for it. The Dutch West India Company owned them, though some of them had gained what the Dutch called half-freedom. A half-free man could hold land of his own, but he still owed the Company work and a yearly payment, and his children stayed the Company's property. The Company was a Dutch trading company, and its officials ran the colony. According to a Columbia University history project, the men dug as long as daylight allowed.

Their trench was three feet deep and ran all the way across the island. They stood logs 12 feet long and 18 inches around up in it and packed dirt and stones around each one. The finished wall was made of planks and stood about five or six feet high, from river to river.

Petrus Stuyvesant and the men who ran the town, called burgomasters and schepens, ordered the wall on March 13, 1653. Stuyvesant was the director general, the man who governed the Dutch colony of New Netherland for the Company. He and the town's officials had heard that the English in New England were preparing to attack. Under their order, the soldiers, the other servants of the Company and the half-free Black men, "no one excepted," had to build up the fort. The townsmen, also "without exception," had to dig the ditch from river to river. The officials put the cost at 3,166 guilders, the Dutch money of the time. Townsmen paid that money in, and the minutes of the officials' meetings, their written record, name the men who paid. Officials reported the wall finished on July 28, 1653.

The Columbia project, called MAAP, names three of the men who dug the trench: Paulo d'Angola, Simon Congo and Anthony Portuguese. All three had what the Dutch called half-freedom. They were among eleven enslaved men who had worked for the Company for eighteen or nineteen years. The eleven asked the colony's council to free them, saying the Company had promised them their freedom. On February 25, 1644, the Company's director, Willem Kieft, and his council granted half-freedom to the eleven men and their wives, on conditions. Under half-freedom the eleven could hold land, and Kieft and his council gave them plots north of the town. But their children, "at present born or yet to be born," stayed the property of the Dutch West India Company. Each of the eleven also owed the Company a yearly payment that Dutch colonists did not owe. It was 30 skepels of grain or beans, plus one hog. A skepel was a Dutch measure for dry goods such as grain. Each also had to come back and work for the Company whenever its officials called.

On August 12, 1658, a rattle watch began walking the streets of New Amsterdam. Its members were paid night patrolmen. They carried wooden rattles, noisemakers that clack loudly when spun. The rattle watch was among the first paid public police forces in America.

Penn's plan

In 1682 William Penn made Thomas Holme his surveyor-general, the chief surveyor of his colony of Pennsylvania. The land along the Delaware River was the homeland of the Lenape people. When Penn's colonists arrived, about 2,500 Lenape and about 3,000 Europeans lived on the two sides of the river. The Europeans were Dutch, Swedish and Finnish settlers, and English settlers in West New Jersey. From 1682 to 1684 Penn bought land in southeastern

Pennsylvania from the Lenape, paying at least £1,200, which is 1,200 English pounds, in goods. Penn himself landed on October 28, 1682. Holme laid out the grid of Philadelphia in December 1682. His map, "A Portraiture of the City of Philadelphia," was printed in 1683. Penn used the map to guide the work. He also used it to advertise the town and draw settlers to it.

William Penn

Who: The founder of Pennsylvania, a Quaker, who had Philadelphia planned on paper before it existed on the ground. Quakers, also called the Religious Society of Friends, are a Christian group that began in England in the 1600s.

When and where: The grid laid out by his surveyor-general Thomas Holme in December 1682, and Holme's map published in 1683.

Movie: *Penn of Pennsylvania* (1941), released in the United States as *The Courageous Mr. Penn* (1942). The film tells Penn's life in general, not the making of the city plan.

Penn wrote down the kind of town he wanted: "a greene Country Towne which will never be burnt, and always be wholesome." He wrote those words in his instructions for laying out the town. Wholesome meant healthy to live in.

Holme drew a straight grid on the land between the Delaware and the Schuylkill rivers. Two wide main streets crossed it, Broad Street and High Street. High Street is now called Market Street. Holme drew the streets wide, partly because of the fire that burned London in 1666. Where the two main streets crossed, Holme placed a large central square, with one smaller public square in each of the four quarters of the town.

All five squares are still there. The four quarter squares are called Logan, Franklin, Washington and Rittenhouse squares, and Philadelphia's City Hall stands on the center square.

1700 to 1750

By about 1750, four colonial ports each held between 8,000 and 13,000 people. In towns that size, people organized to fight fire.

Around 1750 about 13,000 people lived in Philadelphia, about 12,000 in Boston, about 11,000 in New York, and about 8,000 in Charleston. Some of the counts for Charleston come from 1760 rather than 1750. These four were the biggest towns in the colonies. London at the same date had over 700,000 people.

Boston was the busiest port until about 1750. After that, New York and Philadelphia passed it.

Fire in wooden towns

On October 2 and 3, 1711, a fire burned through Boston. It destroyed some of the town's main buildings and left many families without homes. A few months later, twelve men became Boston's first Board of Fire Wards, a group of town officers for fires. The Boston Public Library's guide to the city's great fires does not say who chose them or list their duties. Charleston had "firemasters," officers chosen by a vote. At a fire, everyone had to obey a firemaster's orders as if they were the law.

People in Boston also formed mutual fire societies. Mutual means that the members help one another. The members of each society agreed to protect one another's houses, and they had no duty to fight a fire at the house of anyone outside the society.

In 1736 men in Philadelphia formed a company of volunteers who agreed to fight a fire at any house in the town.

Benjamin Franklin

Who: A Philadelphia printer. He helped start the first volunteer fire company in the colonies that protected a whole town rather than only its own members.

When and where: Philadelphia, December 7, 1736.

Franklin printed a newspaper, the *Pennsylvania Gazette*. On February 4, 1735, he printed an unsigned letter in it, "On Protection of Towns from Fire," which he had written himself. In the letter he warned people about carrying live coals from room to room. His advice began with the line "an Ounce of Prevention is worth a Pound of Cure." The next year he and other men in the city set up a fire company themselves.

On December 7, 1736, about twenty-five men, Franklin among them, signed the Articles of the Union Fire Company, the written rules of the group. Each member had to bring six leather buckets and two strong linen bags to every fire. Members carried water in the buckets. They used the bags to pack up people's belongings and carry them out of a burning house. Every member had to come out at every fire alarm, to any house in the town, whether its owner was a member or not.

Other Philadelphians soon set up more fire companies, among them the Heart-in-Hand, the Britannia and the Fellowship, and Franklin encouraged them. Volunteer companies fought the fires in American towns until April 1, 1853. On that day firefighters in

> Cincinnati, Ohio, began work as the first fire department in the United States whose firefighters were all paid. Miles Greenwood was their first chief.

1750 to 1800

In 1790 the members of Congress passed a law that put the capital city of the new country on the Potomac River, and in 1791 President George Washington chose the exact ground. Pierre L'Enfant drew the whole city on paper in 1791, before anyone built it. Three Native towns had once stood on that ground. By the spring of 1791 the chosen square held two towns that shipped tobacco, and enslaved people worked the farmland around them.

In 1793 yellow fever killed about one person in every ten in Philadelphia. After the fever came back in 1798, workers in Philadelphia built the first public waterworks in the country driven by steam.

The ground the capital was built on

On July 16, 1790, President George Washington signed the Residence Act, a law the members of Congress had passed. In it they placed the capital somewhere on the Potomac River, inside a square no bigger than ten miles on each side. They left it to Washington to say exactly where, and to appoint three commissioners and a surveyor for the work. The commissioners were officials put in charge of building the capital. He rode out and looked at the country himself and chose the ground at and beside Georgetown. He told Congress his choice on January 24, 1791.

Three Native towns had stood inside that square of land. The largest was Nacotchtank, on the southeast side of the Anacostia River, and the river's name comes from the town's name. A second town, Nameroughquena, stood on the west bank of the Potomac, across from today's Theodore Roosevelt Island. The third stood on a bluff, a high, steep bank, in the northwest part of today's city, and the record does not give its name.

In 1608 Captain John Smith reached that stretch of the Potomac. A National Park Service history of the Native peoples of Washington states what followed. Within forty years of that first contact, only about a quarter as many Native people lived in the region as before 1608. Many had died of diseases that Europeans brought, and others had been killed in wars. Others

joined nations to the north, south and west. The Histories of the National Mall project at George Mason University puts it this way: the Native communities on that land "had been driven away by war and disease."

Two towns stood inside the square by the spring of 1791, and both are still there. In 1749 Virginia's colonial lawmakers voted to create the town of Alexandria. The county surveyor, John West, laid out its first sixty acres around Hugh West's tobacco warehouse. In 1751 Maryland's colonial lawmakers approved the town of Georgetown. They bought sixty acres for it from George Gordon and George Beall for £280, which is 280 English pounds. The site already had a tobacco inspection house, a building where tobacco was checked before it was shipped. Georgetown grew into a tobacco port. Washington chose ground at and next to Georgetown. On March 3, 1791, the members of Congress changed the law so that the district, the land set aside for the capital, could reach south and take in Alexandria too. Jones Point, where the survey of the district's boundary began, is at Alexandria.

The rest of the land was farms, and the main crop was tobacco. Five men owned the ground where the National Mall is now: Daniel Carroll of Duddington, David Burnes, Notley Young, Benjamin Oden and Samuel Davidson. The Histories of the National Mall project reports that the men who owned this land enslaved people, and the enslaved men and women raised tobacco, corn, wheat and cattle on it.

Notley Young's tobacco plantation, a big farm worked by enslaved people, covered 800 acres. The Smithsonian's National Museum of African American History and Culture stands on part of that plantation. The museum gives the number of people enslaved there as 245, from the census of 1790. A census is a count of the people. The Histories of the National Mall project gives 260. Federal officials bought Young's land in 1791.

In all, nineteen men owned the land for the new city. Washington met them at a dinner in Georgetown, and they signed an agreement on March 30, 1791. The owners put about 6,000 acres together. They got nothing for the land that became streets. For land taken for public buildings and squares, the agreement gave them £25 an acre. The rest of the land was split into 20,272 building lots, and half of the lots went back to the owners. These men were later called the Original Proprietors, which means the owners of the land when the city was laid out.

Before anyone could build the city, a crew had to survey the boundary of the district. To survey is to measure the ground and mark exactly where its corners and edges lie. Someone also had to draw the plan of the city that would go inside it. Andrew Ellicott ran the boundary survey. Benjamin Banneker, a free Black farmer from Baltimore County, Maryland, did the astronomy

for it, working under Ellicott. Astronomy is the science of the stars and planets. Pierre L'Enfant, an engineer born in France, drew the city plan in 1791, and Washington dismissed him the next year.

Pierre L'Enfant

Who: The French-born engineer who designed the plan of Washington, D.C., and was dismissed before it was built.

When and where: The federal district, 1791 to February 1792.

In 1791 Pierre Charles L'Enfant drew the plan of the capital. He laid down a street grid and then drew diagonal avenues across it that meet at circles and squares.

Under the Residence Act, Washington appointed three commissioners, officials in charge of building the capital. The commissioners asked for his original drawing so that an engraver could cut it into a printing plate and print copies. L'Enfant refused to hand it over, and he clashed with the commissioners. In February 1792 George Washington dismissed him for insubordination, which means refusing to obey the people in charge of you.

Andrew Ellicott, with help from his brother Benjamin, rebuilt the plan and changed parts of it. He straightened Massachusetts Avenue and took out some of the squares. The engravers Thackara and Vallance made an engraving of Ellicott's version in March 1792. Copies of their engraving were the first plan of the city that many people saw. The city was built from that engraving, which was L'Enfant's plan as Ellicott had changed it.

L'Enfant died poor in 1825. He was buried on a farm in Prince George's County, Maryland, that belonged to his friend William Dudley Digges. In 1908 the members of Congress set aside $1,000 for a new grave. On April 28, 1909, his coffin lay at the U.S. Capitol for three hours, so that people could pay their respects. He was the first person from another country to be given that honor. That afternoon he was buried again at Arlington National Cemetery, on a hillside above the city he had planned.

Benjamin Banneker

Who: A free Black tobacco farmer and self-taught astronomer who made the observations that fixed the starting corner of the federal district.

When and where: The survey's base camp at Jones Point, Virginia, February to April 1791.

> George Ellicott recommended Banneker, and Major Andrew Ellicott hired him as scientific assistant on the survey of the ten-mile square. Banneker was nearly sixty. He farmed tobacco, and he had taught himself astronomy, the science of the stars and planets.
>
> Banneker worked at night. To find a position on the earth by astronomy, an observer watches particular stars cross a particular point in the sky and records the exact moment. The observer then calculates the position from those times. Banneker made those observations and did those calculations. He also kept the survey's regulator clock, a very exact clock, running true. Banneker used his observations and calculations to fix the district's south corner at Jones Point. He was paid $2 a day, an ordinary day's pay for an assistant. Andrew Ellicott was paid $5.
>
> Banneker left the survey in the spring of 1791, before the crew had run the full forty miles of the boundary. He was in poor health. His first almanac was the one for the year 1792. An almanac is a book printed once a year with a calendar and tables of the sun, moon and stars.
>
> According to a popular story, Banneker redrew the whole plan of Washington from memory after L'Enfant was dismissed. The story is a legend. Banneker had left the project about ten months before L'Enfant was dismissed, and Andrew Ellicott rebuilt the plan. The historian Silvio Bedini and writers for the National Park Service and the Library of Congress have worked through the records. They credit Banneker with the astronomy for the boundary survey.

Water after the fevers

Yellow fever is a disease caused by a virus, a germ far too small to see. People catch it from the bite of a mosquito that carries the virus. Most people who fall sick with it have fever, chills, headache and vomiting, and they get better within a week.

In about one case in seven, the fever eases and then comes back worse. In that stage the virus destroys cells in the liver. As the liver fails, the skin and the whites of the eyes turn yellow, and that color gives the disease its name. The person bleeds from the mouth, the nose and the eyes, and into the stomach. In the stomach the blood mixes with stomach acid, and the person vomits it up black. People at the time called it the black vomit. The kidneys fail as well. Of the people who reach that stage, between 30 and 60 percent die.

Yellow fever killed about 5,000 people in Philadelphia between August 1 and November 9, 1793. About 50,000 people lived in the city, so the fever killed roughly one of every ten of them. About 20,000 other people fled the city, among them the officials of the new federal government.

In 1797 a group of Philadelphians asked the city's councils to take charge of the water supply, and the council members formed a Watering Committee. The fever came back in 1798. The city's leaders then hired Benjamin Henry Latrobe, an English-born architect and engineer, to design a waterworks, and in 1799 the members of the Watering Committee accepted his design. Workers began building the Centre Square Water Works that year. Nicholas J. Roosevelt built its engines and pumps under a contract worth $33,000. The steam engine went up from February 1800.

On January 21, 1801, the steam pumps started supplying the city. The engines pumped water from the Schuylkill River through a tunnel along Chestnut Street to the pump house, a white marble building on Centre Square. From there the water ran through the streets in pipes made of hollowed-out logs. Philadelphia was the first American city with a public water supply driven by steam.

The engines broke down often and cost a great deal to keep running. Centre Square ran for only fourteen years. In 1815 the Fairmount Water Works took its place.

1800 to 1850

Rochester, New York, grew from about 1,500 people in 1820 to about 12,630 in 1834, after the Erie Canal reached it. Chicago went from about 350 people in 1833 to 4,170 in 1837. San Francisco went from about 200 people in 1846 to about 36,000 in 1852. Each of these towns grew up beside water that boats could reach, on land that had belonged to Native nations.

In New York, people drew their water from wells, springs and rain barrels, and there was no clean piped water. In 1832 cholera, a disease people catch from water with human waste in it, killed about 3,500 New Yorkers. In December 1835 a fire burned about seventeen blocks while the firefighters ran short of water. After those two disasters, New York's city leaders had workers bring water into the city through a channel forty-one miles long from the Croton River. The water arrived in 1842.

In 1811 three men finished a plan of straight streets for Manhattan, from Houston Street north. New York's state lawmakers had appointed them. Much of that ground was rocky hills or swamp, with farms, houses and barns on it. For about sixty years afterward, workers dug away hills and filled in low ground to make the island fit the plan.

Boomtowns

A boomtown is a town whose number of people grows very fast, in a few years. Rochester, Chicago and San Francisco all grew that way between 1800 and 1850.

The City of Rochester's own history and the Monroe County Library's Rochester Voices project both describe Rochester as America's first boomtown. The land there was Seneca land. In 1788 Seneca leaders signed a treaty that handed about 2,600,000 acres east of the Genesee River to two land dealers, Oliver Phelps and Nathaniel Gorham. A treaty is a written agreement between nations or governments. The Seneca leaders also granted land west of the river for a mill, on the condition that a mill be built for the Seneca to use. In 1789 Ebenezer Allen built a sawmill and a mill for grinding grain on that tract.

The Erie Canal ran through Rochester from 1825, and workers finished the whole canal across New York that October. The falls of the Genesee River turned the mills' wheels. Grain from the Genesee Valley came to the mills, and canal boats carried the flour away. Before the canal, shipping a ton of flour from Rochester cost $100. By canal it cost $7. By 1838 the mills at Rochester ground more flour than the mills of any other American city, and Rochester got the nickname the Flour City.

About 1,500 people lived in Rochester in 1820. Census takers, who count the country's people every ten years, counted 9,269 there in 1830. By 1834, the year Rochester became a city, about 12,630 people lived there. That was more than eight times as many people as in 1820.

Chicago grew where the Chicago River runs into Lake Michigan, beside Fort Dearborn, an army fort built at the river's mouth in 1803. It became a town in 1833, when about 350 people lived there. That September, in the Treaty of Chicago, Potawatomi leaders signed over their last lands in Illinois and Wisconsin and their last reservations in Michigan, about 5,000,000 acres. A reservation is an area of land kept for a Native nation. The Potawatomi leaders agreed to move west of the Mississippi River. Chicago became a city on March 4, 1837, when 4,170 people lived there.

Chicago's ground was low and flat, and its clay soil soaked up little water. Nothing drained off it, and for most of the year the streets were mud and standing water. Starting in 1855, crews raised Chicago's streets so that sewers, underground pipes that carry waste water away, could

drain the city. In January 1858 crews began raising its brick and stone buildings to match.

San Francisco grew on the homeland of the Yelamu, an Ohlone people. About 200 people lived in the town in 1846. By 1852 about 36,000 people lived there. They had come in the California Gold Rush, a race to California to dig for gold. The town was put together in a hurry. People lived in tents and in hulks, which are the hulls of old ships that no longer sailed. Between December 1849 and June 1851, six great fires burned the town. The fire of May 3 and 4, 1851, destroyed as much as three-quarters of it. People rebuilt after each one.

The 1811 grid

On April 3, 1807, New York's state lawmakers appointed three commissioners, men given the job of laying out the streets of Manhattan. They were Gouverneur Morris, John Rutherfurd and Simeon De Witt. They filed their plan in March 1811.

The commissioners laid the streets out as a grid. Their plan covered Manhattan from Houston Street north to 155th Street. It had twelve avenues and 155 numbered cross streets, which cut the land into rectangles. The commissioners drew the lines straight over the island's hills without bending them. Manhattan was Lenape land, and by 1811 much of this part of it was rocky hills, swamps and marshes, with farms, houses and barns scattered across it.

John Randel Jr. was the chief surveyor, a person who measures land and marks where lines fall on it. He was hired for the job at twenty. In 1808 he mapped the island's hills, rocks, swamps, streams and ponds, and its houses, barns, fences and fields. Then his crews set 1,549 marble markers and 98 iron bolts into the ground to fix the grid in place.

Workers then had to make the island match the drawing. To build each street, they dug away hills or filled in hollows, leveled the strip of ground and paved it. The new streets ran through the spots where about 721 of the 1,825 buildings north of Houston Street stood in 1811, so those buildings had to be moved out of the way. The work took about sixty years to reach 155th Street.

The commissioners set aside very little land for parks, and Central Park was not in their plan. State lawmakers added it in 1853, in a separate law. People already lived on part of that ground, in Seneca Village, a community of about 225 people, roughly two-thirds of them Black. New York City officials took their land, and by October 1857 they had evicted the last of them, which means they forced them out of their homes under the law.

Cholera, fire, and the Croton

Cholera is a disease people catch by swallowing water that has human waste in it. It causes watery diarrhea so heavy that the body loses its water very fast. A person with a bad case who does not get water back into the body fast enough can die of it within hours. In 1832 cholera killed about 3,500 out of about 250,000 New Yorkers. That is about one person in every seventy.

New York had no clean piped water then. People drew water from wells, ponds and springs inside the city. Workers for a private firm, the Manhattan Company, sank wells and laid wooden pipes to send the water out. Carters drove barrels of country spring water around town and sold it for a penny a gallon, and that water was often dirty too. Others caught rain in tanks called cisterns. By the 1830s the water from the downtown wells was dirty. More and more privies stood near the wells, and liquid from old graves soaked into the ground as well. A privy is an outdoor toilet built over a pit in the ground. When people sick with cholera used the privies, the waste overflowed into nearby wells and cellars.

On the evening of December 16, 1835, a fire started in a five-story warehouse on Merchant Street, near Wall Street, in lower Manhattan. A strong wind blew it toward the East River. It burned about seventeen blocks and destroyed between 600 and 700 buildings, and the damage came to about $20 million. Two people died in it. The firefighters could not get enough water onto the fire. There was little water to be had. What there was froze in the wells, in the hoses and in the hydrants, the street pipes that firefighters draw water from.

The Croton Aqueduct, a channel built to carry water a long way, became the first large city water supply in the United States that ran without a break. New York's city leaders had decided by the late 1820s that they needed a cleaner and bigger supply of water. After the cholera and the fire, they had the aqueduct built. Workers began building it in 1837, with John B. Jervis as chief engineer.

The workers dammed the Croton River in Westchester County, north of the city. Then they built a covered tunnel of brick on a stone base, forty-one miles long, to carry the water down to Manhattan. Inside, the tunnel was eight and a half feet high and seven and a half feet wide. It dropped about 13 inches in every mile, so gravity carried the water along it. Water entered the city on June 22, 1842. On July 4 the distributing reservoir at 42nd Street and Fifth Avenue began filling. It was a large basin that held the water and fed it out to the city's pipes.

On October 14, 1842, New Yorkers held a celebration across the whole city. A parade seven miles long marched through the streets, and the new fountain in City Hall Park threw water fifty feet into the air. The celebration included what people called Croton cocktails.

George Templeton Strong

Who: A young New York lawyer whose diary records how much he enjoyed bathing at home once Croton water reached his house.

When and where: New York City, 1842.

George Templeton Strong was born in 1820 and was twenty-two when the Croton water arrived. He kept a diary from 1835 until his death in 1875, and it runs to about 2,250 pages. It is a first-hand record of New York in the 1800s. Two editors, Nevins and Thomas, published it in 1952.

In 1842, while the water was still on its way, Strong wrote that "Croton Water is slowly flowing towards the city, which at last will stand a chance of being cleaned." The sentence goes on: "if water can clean it." He thought the city was so dirty that even water might not get it clean.

Once Croton water reached his house, Strong could take a bath at home, and his diary records how much he enjoyed it.

1850 to 1900

Between 1850 and 1900, builders made American cities taller, dug sewers under them, and spread them outward along streetcar lines.

Once elevators had a safety catch, people were willing to ride them to upper floors. Builders also began to hold up tall buildings with frames of iron and steel, so the outside walls no longer had to carry the weight.

Chicago's ground was so flat and wet that a sewer could not run downhill through it. Crews there laid new sewer pipes along the streets, raised the streets over them, and lifted the downtown buildings up to the new street level. In the census of 1890, Chicago had 1,099,850 people. It was the second-largest city in the country.

The first large electric streetcar line began regular service in Richmond, Virginia, on February 2, 1888. A ten-minute ride on one covered the distance of a thirty-minute walk, and builders put up houses along the tracks.

In New York in the same years, poor families crowded into tenements, apartment buildings put up to hold as many people as a plot of land would hold.

Raising Chicago's streets and buildings

Chicago's ground was low and almost level, and its clay soil took in little water. Rain and waste had nowhere to drain, so pools of dirty water stood in the streets, and for most of the year the streets were mud. Diseases spread from that standing water, among them typhoid fever and dysentery. In 1854 cholera killed six of every hundred people in the city.

In December 1855 the members of the Board of Sewerage Commissioners, the officials in charge of Chicago's sewers, hired Ellis S. Chesbrough. He had been the water engineer in Boston. His plan of 1856 was the first plan for a complete sewer system covering a whole American city. Workers laid the sewer pipes along the existing streets and then buried them under several feet of new fill, which is earth dumped on top. That raised the level of the street, by an average of four to five feet, and by as much as eight feet in places. A building left at the old level now sat below its own street, and its ground floor became a basement.

Next the buildings had to come up to the new street level. The tool for lifting them was the jackscrew, a screw inside a case that a man turned by hand with a lever. Crews set many jackscrews under a building, and the men turned them together.

The first masonry building, one built of brick or stone, went up this way in January 1858. It was a four-story brick block at Randolph and Dearborn streets that weighed about 750 tons. It rose 6 feet 2 inches on 200 jackscrews. Reporters of the time wrote that it rose "without the slightest injury" to the building. More than fifty buildings like it were raised that same year. Every figure for these raisings comes from those newspaper reports.

In 1860 a group of engineers that included George Pullman raised half a city block. It was the row of brick and stone buildings on Lake Street between Clark and LaSalle streets, 320 feet long. With its sidewalks, the row weighed about 35,000 tons. About 600 men worked about 6,000 jackscrews, and the block went up 4 feet 8 inches in five days. The shops in it stayed open the whole time, and people came and went, shopped and worked in them while the buildings rose.

Up: the elevator and the steel frame

Builders could not make tall buildings without two inventions: an elevator people trusted, and a frame that could hold the building up.

The danger in an elevator was that the rope could break and drop the platform. Elisha Graves Otis made a brake from a steel wagon spring that locked into a ratchet, a bar with teeth, and held the platform if the rope broke. In 1854 he showed it at the Crystal Palace exposition in

New York, a large public show of new machines and goods. He rode a platform up an open-sided shaft, and halfway up he had the rope cut with an axe. The brake caught, and the platform held.

On March 23, 1857, workers put the first commercial passenger elevator in the country into the E. V. Haughwout Building at 488 Broadway in New York. A commercial elevator is one sold for everyday use in a building. A steam engine drove it. It cost $300 and rose about two-thirds of a foot per second. Before elevators, the higher a room was, the lower its rent, because people had to climb the stairs to reach it. Once elevators ran, floors above the fourth or fifth could rent for as much as the floors below, or more.

In a wall-bearing building, the outside walls hold up everything. The taller the building, the thicker the walls at the bottom have to be. The Monadnock Building in Chicago, finished in 1891, is 16 stories tall, the tallest building ever held up by brick walls. Its walls are six feet thick at the bottom. In a framed building, a skeleton of iron or steel columns and beams carries the weight. The walls hang on that frame as a covering.

The Home Insurance Building in Chicago is the building most often called the first skyscraper, which means a very tall building held up by a metal frame. William Le Baron Jenney designed it, and it was finished in 1885. It stood ten stories and 138 feet tall, and builders added two more floors in 1890. Its frame of iron and steel carried loads that walls had carried in older buildings. Workers tore it down in 1931 to make room for the Field Building.

That title is in dispute. The Home Insurance Building was not built all of steel, and it was not the first building with a metal frame. Jenney's own account of the building, written in 1885, describes mostly its foundations, not a new way of holding up a building. Jason Barr, in his book *Building the Skyline* and in his Skynomics writing, traces the labels "first skyscraper" and "father of the skyscraper" partly to a later publicity campaign. People close to Jenney ran it, along with Chicago boosters, people who promoted their city to bring in money and business. Barr calls the story the "Jenney Myth."

Other buildings of the time also have a claim to be the first. New York's Equitable Life Building of 1870 was the first office building with an elevator. The Produce Exchange of 1884 had an inner skeleton designed by George B. Post. Chicago's Tacoma Building of 1889 is named as well. Builders used the frame and the elevator to roughly triple the height of buildings within one generation.

In 1893 the World's Columbian Exposition, a world's fair, opened in Chicago. Daniel Burnham directed the building work, and Frederick Law Olmsted drew the site plan, which is the layout of the grounds. Workers put up a matched set of white buildings in the style of ancient Greek and Roman buildings, with rows of columns. Electric lights lit them, and the fair got the name the White City.

The buildings were temporary, built to stand only while the fair ran. Under their fronts they were steel-framed sheds. The fronts were made of staff, a mix of plaster, cement and plant fiber that workers poured into molds, and then painted white. More than 27 million people visited the fair in its six months. Planners in the City Beautiful movement of the 1890s and 1900s took the White City as their model. They worked to bring grand public buildings, wide avenues and parks into American cities.

Ironworkers from two Mohawk communities, Kahnawake and Akwesasne, helped build bridges and tall buildings across the Northeast from 1886 on. That year, at a bridge job at Kahnawake, a Mohawk town near Montreal, Mohawk men started working high steel. Working high steel means joining the steel frames of bridges and buildings high above the ground. From Kahnawake and Akwesasne, the men traveled to bridge and skyscraper jobs wherever the steel work was, and they called that "booming out." An exhibition at the Smithsonian's National Museum of the American Indian, *Booming Out: Mohawk Ironworkers Build New York*, documents their work. It records their work in the next century on the Empire State Building, the Chrysler Building, the George Washington Bridge and the World Trade Center.

The tenement

A tenement is an apartment building put up cheaply to hold as many poor families as its plot of land will take. On May 14, 1867, New York's state lawmakers passed a tenement law, the first broad housing law in the country. Under it, cellar apartments were banned unless the ceiling stood at least a foot above the street, and every building needed fire escapes and one toilet for every twenty people. Officials did little to make builders obey it. To meet its rule about windows, builders cut windows in the walls between inside rooms, so the windows let in no outside air.

The Tenement House Act of 1879, later known as the Old Law, was the lawmakers' answer to that failure. Under it, every room a person lived in had to have a window that opened to outside air. Builders met that rule with the dumbbell tenement.

Builders pinched each building in at its middle, which left room for a narrow air shaft. Rooms in the middle of the building got their required window onto that shaft. Seen from above, the building was wide at both ends and thin in the middle. A dumbbell, an exercise weight with a ball at each end of a short bar, has the same shape.

The shaft was too narrow and too deep to bring daylight or moving air down below the top floors, so most of the rooms it was built for stayed dark and stale. The shafts filled up with garbage. The shaft also worked as a flue, a channel that draws hot air and smoke upward, as a chimney does. A fire in the shaft could climb it to the floors above.

In 1901 New York's state lawmakers passed a new Tenement House Act, later known as the New Law. In it they banned the dumbbell design and required windows facing outward in every room, along with courtyards, indoor toilets and protection against fire. The rules covered old buildings as well, so owners had to change those too.

Jacob Riis

Who: A Danish immigrant and police reporter who took up flash photography early and used it to show how the poor of a city lived.

When and where: New York's tenement districts. *How the Other Half Lives* came out in 1890.

Jacob Riis used flash photographs as evidence in an argument about how poor families in New York lived. He was born on May 3, 1849, in Ribe, Denmark, and moved to the United States in 1870. He worked as a police reporter for the *New York Tribune* and then the *Evening Sun*. As a reporter he covered the city's poorest streets, among them Mulberry Street. The police there also ran shelters for homeless people, called police lodging houses, and Riis saw inside them and wrote about them.

Around 1887 he began using magnesium flash. Magnesium powder burns for an instant with a light bright enough to record a picture on a photographic plate, a glass sheet coated with chemicals that change where light hits them. With the flash he photographed tenements, saloons and slums at night.

In 1889 Riis published an eighteen-page article in *Scribner's* magazine. In 1890 he published the book *How the Other Half Lives*, with seventeen photographs and a number of engravings, pictures printed from lines cut into metal or wood. The *Dictionary of American History* credits Riis's work, along with the work of other reformers, with

pushing New York's lawmakers toward the tenement law of 1901, which banned the dumbbell design. Theodore Roosevelt, as New York City's police commissioner, became Riis's ally. Riis died in 1914.

Bridget and Joseph Moore

Who: An Irish immigrant waiter and his wife, one tenement family the records document, whose apartment the Tenement Museum has recreated.

When and where: 97 Orchard Street, on New York's Lower East Side, 1869.

Bridget Moore married at seventeen, in 1865. Joseph Moore worked as a waiter, and some of the Tenement Museum's accounts record him as a bartender. In 1869 the couple moved with their daughters into 97 Orchard Street, a tenement built in 1863. They were one of the few Irish families in a building where most people were German. They lived there about a year.

On April 21, 1869, their daughter Agnes Mary died at five months old. The cause given in the records was marasmus. Marasmus is severe malnutrition, a form of starvation. The body gets too little food of every kind, so it uses up its own fat and then its own muscle, and the child wastes away.

The Tenement Museum's account ties two things to the deaths of babies at that time. One was swill milk. Swill milk came from cows kept in stables beside distilleries, where liquor was made. The cows ate the leftover grain mush from making the liquor. Their milk was thin and dirty, and in the 1850s New Yorkers blamed it for the deaths of many babies. The museum says Agnes Mary's marasmus came from tainted milk. The other was the building itself. The water at 97 Orchard Street came from a pump in the back yard, beside the privies.

Of the eight children Bridget and Joseph Moore had, four lived to be adults.

The building still stands, and museum staff have recreated the Moores' apartment as it was in 1869. Between 1863 and 1935, when the floors where people lived were sealed shut, an estimated 7,000 people from more than twenty countries lived at 97 Orchard Street. The Moores are one of the families among them whose names appear in the records.

Central Park and Seneca Village

The commissioners who drew the 1811 plan had left almost no land for public parks. In 1853 New York's state lawmakers set aside more than 700 acres in the middle of Manhattan for a park. Frederick Law Olmsted and Calvert Vaux won the design contest in 1858 with a plan they called Greensward, and building began that year.

People already lived on part of that land, in Seneca Village. In 1825 John and Elizabeth Whitehead had divided their farmland there into about 200 lots, or pieces of land for sale. On September 27 of that year, Andrew Williams, a twenty-five-year-old Black shoeshiner, bought the first three lots for $125. Epiphany Davis bought twelve lots for $578, and the AME Zion Church bought lots as well. By 1855 about 225 people lived in Seneca Village. Roughly two-thirds of them were African American, and Irish and German families lived there too. They had built three churches and a school.

Under New York law at the time, a Black man could vote only if he owned at least $250 worth of property. In 1845 about 100 Black men in the whole city met that rule, and 10 of them lived in Seneca Village.

New York City officials took the whole park site by eminent domain. Eminent domain is the power of a government to take private property for public use, paying the owner whether the owner wants to sell or not. Officials set a price for each piece of land, and the owners in Seneca Village were paid. Many of them said the price of their land was too low, and they objected in court. Researchers at the Central Park Conservancy, the group that looks after the park, have studied the records and found that, with few exceptions, the owners got about what their land would have sold for. In February 1856 the New York State Supreme Court, the state's main trial court, approved the prices, and the land became the city's property. The officials took the land from its owners, including Black men whose right to vote depended on owning it. The Central Park Conservancy's histories of the village do not name the commissioners who set the prices.

Many people left in 1856. Others stayed on as renters of the city. In the summer of 1856, Mayor Fernando Wood sent the people of Seneca Village a final notice to leave. In October 1857, once the money to build the park was in place, city officials evicted the last of them. In all, city officials forced about 1,600 people off the whole park site by the end of 1857.

Accounts differ on how the last people were made to leave. A New York Public Library research guide says the people of Seneca Village fought the police sent to put them out, and that in August 1857 the last Black landowners were "forcibly and violently scattered throughout the city." The historians Roy Rosenzweig and Elizabeth Blackmar studied the records from the time for their 1992 history of the park. They found that the people left "quietly and without

violence." They think the stories of police clubbing people out mix up the taking of the park land with police raids on pig farms near the park's western edge two years later. The Conservancy's researchers say their work since the early 1990s has found no sign of a fight over the taking.

Crews tore down the buildings, and workers began building the park in 1858.

Frederick Law Olmsted

Who: The designer, with Calvert Vaux, of Central Park. The Olmsted Network, a group that studies his work, calls him the founder of landscape architecture as a job in the United States.

When and where: New York from 1858, and parks in Brooklyn, Boston, Washington and Chicago afterward.

Movie: *Frederick Law Olmsted: Designing America* (PBS, 2014), a documentary that premiered June 20, 2014.

Before he designed parks, Olmsted had been a sailor on a trading voyage to China. From 1848 to 1855 he ran a farm on Staten Island, and in 1852 he published a book called *Walks and Talks of an American Farmer in England*. That year editors at the *New York Daily Times* sent him as a reporter through the Southern states, where slavery was legal. He and Calvert Vaux won the Central Park contest in 1858 with the Greensward plan. Landscape architecture means designing outdoor land: its paths, lawns, trees, water and roads.

Olmsted meant Central Park for everyone in the city, rich and poor. He and Vaux gave it meadows and woods shaped to look like open country, so that city people could get some relief from the city. Olmsted's best-known designs after Central Park include Prospect Park in Brooklyn, the Emerald Necklace in Boston, a chain of connected parks, and the grounds of the U.S. Capitol in Washington. In 1893 he laid out the grounds of the World's Columbian Exposition in Chicago, in Jackson Park.

Out: streetcar lines and streetcar suburbs

American cities of the 1800s were walking cities. Most people lived close enough to walk to their work and their shops. Horses pulled streetcars along rails in many cities, at 5 or 6 miles an hour. On February 2, 1888, cars began running on a regular schedule on Frank J. Sprague's Richmond Union Passenger Railway in Richmond, Virginia, an electric streetcar line. It started with ten cars on about twelve miles of track, and by May twenty-three cars ran on it. It was the first large electric street railway that worked well.

Electric streetcars ran at 10 to 15 miles an hour. A ten-minute ride covered ground that took thirty minutes to walk. Within two years, about 110 electric railways using Sprague's equipment were built or under contract. Builders put up houses along the new lines, out past the old edge of town, and many white city families moved out to them. These neighborhoods were called streetcar suburbs. A suburb is a neighborhood of homes at the edge of a city, where people live and from which they travel in to work.

In 1895 New York's reform mayor, William L. Strong, appointed George E. Waring Jr. as street-cleaning commissioner. Waring held the job until 1898. He put about 2,000 street sweepers in white uniforms, and people called them the White Wings. Each day they cleaned about 450 miles of street. Waring set up the first planned systems for getting rid of the city's waste and for recycling it. He also organized Juvenile Street Cleaning Leagues, clubs for children who helped keep their streets clean. Jacob Riis wrote that Waring's broom "saved more lives in the crowded tenements than a squad of doctors."

A city in one day

At noon on April 22, 1889, the land run into Oklahoma began. A land run was a race: at a set signal, settlers rushed in to claim pieces of land. That morning, Guthrie was a railroad station. By nightfall about 10,000 people were camped there.

The land was part of Indian Territory, where United States officials had forced many Native nations to move from their homelands. In 1865 Dennis N. Cooley was the federal Commissioner of Indian Affairs, the official in charge of the government's dealings with Native nations. He told the leaders of five of those nations that they had lost their rights to their land. His reason was that they had sided with the Confederacy, the Southern states that fought the United States in the Civil War. In treaties signed in 1866, the Creek signed over the western half of their land for $975,168, and the Seminole signed over all of theirs for fifteen cents an acre.

The land opened in 1889, about 1.9 million acres, was called the Unassigned Lands, because federal officials had not assigned it to any nation. Those acres lay in the middle of the land the Creek and Seminole had signed over in 1866. The 1866 treaties said that land was for other Native nations and for people freed from slavery. In early 1889, members of Congress voted to pay the Creek about $2.28 million and the Seminole about $1.91 million to drop that rule. Then settlers could claim the land.

Congressman William Springer wrote the change to a law that let President Benjamin Harrison open the land. Harrison announced the opening on March 23, 1889.

By the morning after the run, the settlers in Guthrie had set up a temporary government, along with a land office, where settlers filed their claims, a newspaper and three banks. All of them worked out of tents. Oklahoma City filled up on the same scale on the same day.

1900 to 1950

In 1916, New York's officials adopted the first rules for a whole American city on what could be built where. They divided the city into districts. They also set a formula for how far a tall building had to step back from the street as it rose. Between 1929 and 1931, builders in New York put up the tallest buildings in the world.

Between 1935 and 1940, staff at a federal agency, the Home Owners' Loan Corporation, graded the neighborhoods of 239 cities from A to D. Each grade stated how safe the staff judged it was to lend money there. If Black families lived in a neighborhood, that all but guaranteed it a D, colored red on the map. Scholars disagree about how much lenders used these maps. Economists, people who study money and business, at the Federal Reserve Bank of Chicago, a branch of the country's central bank, found lasting harm. The historian Price Fishback and three other scholars found the maps changed little. Both groups agree that federal officials refused to back home loans in the neighborhoods where Black homeowners lived.

Millions of people moved into these cities in these decades. In 1907 alone, more than a million immigrants came through Ellis Island in New York. About 6 million Black Americans left the South between 1910 and 1970. White property owners wrote clauses into their deeds, the legal papers that record who owns a house, that forbade selling or renting to Black buyers. Judges enforced those clauses, so Black families could find homes in only a few districts. Landlords there charged them more rent for each square foot than white families paid.

From 1942, workers for the Manhattan Project built whole new cities. The Manhattan Project was the Army's secret program to build an atomic bomb. One of its cities, Oak Ridge in Tennessee, went up on land where about 1,000 families had lived and farmed. In October 1942 Army officials took that land and made the families leave. No published map showed Oak Ridge.

Drinking water for Chicago and San Francisco

People in Chicago drank water from Lake Michigan, drawn in through intake pipes about two miles offshore. The city's sewers emptied into the Chicago River, and the river flowed into the lake. In 1885 a great storm carried the river's filth far out into the lake, and people feared it

would reach the intakes. The Sanitary District of Chicago, the public body in charge of the work, was set up to solve the problem.

The Sanitary District's engineers made the river flow the other way. Workers dug a canal 28 miles long, the Chicago Sanitary and Ship Canal. Through it, the river now flowed away from the lake, toward the Des Plaines River and on down to the Mississippi, carrying the city's sewage with it.

Missouri lay downstream on the Mississippi. Sanitary District officials feared that Missouri's officials would ask a court for an injunction, which is an order telling someone to stop. Partly to finish before a judge could issue that order, crews blasted out the last barrier at dawn on New Year's morning. The reversal was complete on January 2, 1900. Missouri's state officials sued the Sanitary District that year. A court later dismissed the case because Missouri could not prove that the river's pollution came from Chicago. The sewers of St. Louis also emptied that city's waste into the Mississippi.

In a 2025 study, Stephenson Strobel, a health researcher at McMaster University in Canada, estimated that the reversal cut the number of deaths in Chicago by about 4 percent in 1900. That is about 985 people who would otherwise have died that year.

On April 18, 1906, an earthquake broke the main pipes from San Francisco's reservoirs. It also broke the water mains, the large pipes that carry water under the streets, in more than 300 places. When firefighters hooked their hoses to the hydrants, no water came out. The fires burned for about three days and destroyed more than four square miles of the city. The earthquake had shown how weak the city's water system was. City officials then planned to dam the Hetch Hetchy Valley in Yosemite National Park and pipe its water to the city. Damming the valley meant flooding it. Conservationists, people who work to protect wild land, fought to stop the dam.

On December 19, 1913, President Woodrow Wilson signed the Raker Act. Under the Act, San Francisco's city officials could build the dam. No other American city has been allowed to build in a national park for its own use. The members of Congress who passed the Act wrote into it that nobody could make a private profit from that water and power. Workers finished the O'Shaughnessy Dam in 1923. By 1934 the full system was carrying water to San Francisco. City officials later sold the dam's electricity to a private company, Pacific Gas and Electric, and people fought in court for decades over whether that broke the Act.

Zoning: rules for what may be built where

Zoning means dividing a city into districts and setting rules for what may be built in each one. The rules state how tall a building may be, how close it may stand to the street, and what it may be used for. Before 1916, no American city had zoning rules that covered the whole city.

On July 25, 1916, New York's officials adopted the first citywide zoning resolution in the country. A resolution is a formal rule that officials vote to adopt.

Popular accounts say the Equitable Building, finished in New York in 1915, caused the resolution. It rose about 40 stories straight up from the sidewalk, with no setback. A setback is a place where the upper floors of a building step back from the street. The Equitable Building cast a shadow of about seven acres on the streets around it, and it cut off the sun from the buildings next to it. Jason Barr, who writes about the history of skyscrapers, states that officials had been preparing the resolution for years. In his account they would have passed it without the Equitable Building, which became the best-known example of what the rules were meant to stop.

The resolution's height rule depended on the width of the street. A building's front wall could rise straight up to a height set by multiplying the street's width by a fixed number. Above that height, the building had to step back from the edge of its lot each time it went higher. A tower could go up with no height limit if it covered no more than a quarter of the lot. Architects who followed that formula designed New York's skyscrapers of the next decades as stacked boxes, each one smaller than the one below. People called the shape a wedding cake.

The officials who wrote the resolution meant the setbacks to keep air and sunlight reaching the sidewalks.

Officials in Louisville, Kentucky, used a city law to keep Black families out of white blocks. The law barred Black buyers from buying homes on blocks where most people were white. In 1917, in *Buchanan v. Warley*, the justices of the Supreme Court all agreed that the Louisville law could not stand. William Warley, the Black buyer in the case, was a lawyer for the NAACP, a group that fought for Black Americans' rights. After that ruling, local officials turned to zoning rules that did not name race.

In 1926, in the case *Village of Euclid v. Ambler Realty Co.*, the justices of the Supreme Court ruled that a local government had the power to zone. Officials in the village of Euclid, Ohio, had banned two-family houses and apartment buildings from parts of the village. That kept out families who could not afford a whole house of their own. After the ruling, officials in cities across the country wrote zoning rules.

Daniel Burnham

Who: The Chicago architect who directed the building of the 1893 world's fair and then wrote the first comprehensive plan for a big American city.

When and where: Chicago, from the 1893 world's fair to the *Plan of Chicago* in 1909.

Daniel Burnham ran the building of the White City at the 1893 World's Columbian Exposition in Chicago. The White City was a matched set of white plaster buildings, designed together as one planned city. After the fair, Burnham applied the same idea to a real city that already existed.

Burnham and Edward Bennett published the *Plan of Chicago* in 1909. The members of the Commercial Club of Chicago, a club of the city's business leaders, commissioned the work and raised about $80,000 to pay for it. Burnham worked on it for about thirty months and charged nothing. The club spent more than $40,000 more to print 1,650 copies of the finished book. It was the first comprehensive plan for a large American city. A comprehensive plan sets out what a whole city should become, with its streets, parks and waterfront planned together.

In the plan, Burnham and Bennett called for the lakefront to stay open to the public. They also called for rings of parks around the city and for wider streets. Much of Chicago's lakefront is open to the public today because of that plan.

Many people know Burnham for the line "make no little plans." People began to credit it to him only after he died in 1912. No record from his lifetime has him saying or writing it.

The contest for the tallest building

Between 1929 and 1931, the builders of two New York towers competed to put up the tallest building in the world. Then the builders of a third tower went higher than both.

The Chrysler Building's architect, William Van Alen, was racing the builders of 40 Wall Street. His workers put together a spire, a tall pointed top, 125 feet long. They built it in secret inside the building's fire tower, a shaft that ran up through the building, where nobody outside could see it. In October 1929 they raised the spire up through the roof and fixed it in place. The spire brought the Chrysler Building to 1,046 feet. The tower at 40 Wall Street stood 927 feet tall. Some popular accounts print 1,048 feet for the Chrysler Building. The official figure, from the Council on Tall Buildings and Urban Habitat, is 1,046 feet. The Chrysler Building opened on May 27, 1930, and it was the tallest building in the world for eleven months.

The Empire State Building opened on May 1, 1931. It had 102 stories and stood 1,250 feet to the roof, taller than both. Its builders put it up in 410 days, for about $41 million. President Hoover turned on its lights by pressing a button in Washington.

The building opened during the Depression, the years of the 1930s when businesses failed and people lost their jobs. Through the Depression the building stood about half empty.

Ironworkers put together the steel frames of bridges and tall buildings. Mohawk ironworkers from Kahnawake and Akwesasne, two Mohawk communities, worked on the steel of the Empire State and Chrysler buildings. Mohawk ironworkers had done the same work on the bridges and buildings of the generation before. From the 1920s to the 1960s, Mohawk ironworkers' families lived in a Brooklyn neighborhood that people called Little Caughnawaga, after an older spelling of Kahnawake.

Where Great Migration families could live

The Great Migration was the move of about 6 million Black Americans out of the South between 1910 and 1970. In its first ten years, from 1910 to 1920, the Black population of Chicago rose 148 percent. Detroit's rose 611 percent, to about seven times its 1910 size. Philadelphia's rose about 500 percent, and New York's roughly doubled.

Black families who arrived could not live wherever they chose. White property owners wrote rules to keep them out of neighborhoods. These rules were called restrictive covenants. A restrictive covenant is a clause, or section, written into the deed of a house. The deed is the legal paper that records who owns the house. The covenant forbade the owner to sell or rent the house to a Black buyer, and sometimes to Jewish or Asian buyers as well. Each later owner of the house had to obey the clause too. Through the 1920s, white owners in Chicago and across the country signed covenants into their deeds.

Judges enforced the covenants, which means they ordered people to obey them. Because of the covenants and the judges who enforced them, Black families could rent or buy homes in only a few districts. In Chicago that was a strip of the South Side called the Black Belt. Its own residents named it Bronzeville. In New York it was Harlem. The number of people who needed rooms in those districts kept rising. In 1948, in the case *Shelley v. Kraemer*, the justices of the Supreme Court ruled that courts could no longer enforce the covenants.

Landlords in the crowded districts split their flats, or apartments, into smaller units. A landlord divided one apartment into several one-room units and rented each one separately. Each unit had a hotplate, a small electric burner for cooking, and the families shared one

bathroom. These units were called kitchenettes. Bronzeville had more than 80,000 of them. For each square foot of floor, families in the kitchenettes paid more rent than white families paid in white neighborhoods.

The maps with red lines

In 1933, during the Depression, federal officials set up an agency called the Home Owners' Loan Corporation. Its staff worked with mortgages. A mortgage is a loan to buy a house. The agency's staff bought more than a million home loans from lenders. They replaced each one with a new 15-year loan at 5 percent interest, easier terms than banks then gave. Swapping an old loan for a new one like this is called refinancing. By 1936 they had refinanced about one in ten home loans outside farms. Between 1935 and 1940, the agency's staff also made maps of 239 cities, called "Residential Security" maps.

The staff went through each city neighborhood by neighborhood. They gave each neighborhood a grade for how safe they judged it was to lend money on the houses there. A was the best grade, shaded green on the map, followed by B in blue and C in yellow. D was the worst grade. The maps described D neighborhoods as "hazardous," and the staff shaded them red. The word redlining comes from these red areas. To redline a neighborhood is to draw a line around it on a map and then refuse to lend money for houses inside that line.

The appraisers were the staff members who judged each neighborhood. Their written notes describe Black families moving in as "infiltration," a word for an enemy sneaking in. If Black families lived in a neighborhood, that all but guaranteed it a D.

Scholars disagree about how much these particular maps changed who got loans. In a 2017 study, economists at the Federal Reserve Bank of Chicago found lasting harm in the neighborhoods graded red. Economists study money and business, and the Federal Reserve Bank of Chicago is a branch of the country's central bank. In a 2021 study, Price Fishback, a historian of money and business, and three other scholars found that the maps changed little about where the government lent. They also found that officials at the Federal Housing Administration, another federal agency, had already built their own way of redlining before these maps were drawn. Both sides agree on what that agency did. Federal Housing Administration officials refused to insure home loans in the neighborhoods where Black homeowners lived. They backed loans mostly on new houses, which were sold almost only to white buyers.

In a study published in 2018, researchers at the National Community Reinvestment Coalition compared the old maps with present-day data. They found that about 74 percent of the neighborhoods graded red are low-to-moderate income today, which means the families there earn well below the typical family in their area. About 64 percent are majority-minority, which means most of the people living there are not white. Researchers at the University of Richmond scanned the maps for their Mapping Inequality project and put them online. Anyone can look up what the appraisers wrote about a street.

From 1935 to 1943, crews worked for the Works Progress Administration (WPA), a federal program that hired people to build public projects such as roads, pipes and schools. They laid about 24,000 miles of storm and sewer lines, which carry away rainwater and waste, and about 19,700 miles of water mains, the large pipes that bring clean water to a city. WPA crews also built about 500 water-treatment plants, more than 4,000 new schools, hundreds of hospitals, and airports. On the roads, they built or improved about 651,000 miles. Counts of the WPA's work differ from one record to another, so each of these figures is close but not exact.

Oak Ridge: a secret city on taken farmland

Brigadier General Leslie Groves, an Army officer, had just taken charge of the Manhattan Project. On September 19, 1942, he approved taking about 59,000 acres along the Clinch River in eastern Tennessee. Army officials called the site "Site X." In October 1942, officers of the U.S. Army Corps of Engineers took the land. About 1,000 families lived on that land. Some farmed it, and others lived in its small crossroads communities: Wheat, Elza, Scarboro (also spelled Scarborough) and Robertsville, with New Bethel and New Hope also named. Many of the families had farmed the same ground for generations. Accounts of how many people lived there differ. The Tennessee Encyclopedia states roughly 4,000 people, and other accounts state more than 3,000.

To take the land, the Corps of Engineers officers filed a paper called a declaration of taking, under eminent domain. Eminent domain is the power of a government to take private property whether or not the owner wants to sell, at a price the government sets. A declaration of taking lets the government take the land right away and settle the price later. Army officials paid an average of $46.86 an acre.

Army officials told the residents they had to leave, sometimes only by notices nailed to their front fence posts. The Tennessee Encyclopedia's account of the removals does not name the men who put up the notices. Families who had lived there for generations got a few weeks to

go, and within a year all the families were gone. Most families accepted the price the government set. A few sued in court over what their land had been valued at. About an eighth of Roane County's land and about a seventh of Anderson County's land went into the site.

From 1942, workers built a city for the Army on that ground. The site's official name was the Clinton Engineer Works, and the city built there is Oak Ridge. The plans were for about 13,000 people. By 1945 about 75,000 lived there, which for a short time made it the fifth-largest city in Tennessee.

Workers built about 3,000 houses from cemesto, ready-made panels of cement and asbestos, a mineral fiber. The houses came in a few standard types named by letters, such as the A house and the B house, so people called them alphabet houses. Workers also put up flat-tops, which were flat-roofed houses. Workers for the Tennessee Valley Authority, a federal agency, made them in pieces ahead of time, and crews put them together on the site. The city had schools, buses, a 300-bed hospital and a symphony orchestra. Fences and gates surrounded it, and people had to show a badge to get in or out.

Oak Ridge did not appear on any published map. Los Alamos in New Mexico and Hanford and Richland in Washington were built for the same program. The plants at Oak Ridge separated the uranium, a heavy metal, for the atomic bomb that American forces dropped on Hiroshima. Most of the more than 70,000 people who lived and worked there did not know what they were making until the bombs fell. They had promised not to talk about their jobs.

Colleen Black

Who: A teenager from Nashville whose family moved to a city left off every published map, and who spent the rest of her life there.

When and where: Oak Ridge, Tennessee, from 1944 until her death in March 2015.

Colleen Black was born Colleen Rowan, one of more than ten children in a Nashville family. In 1944 the family moved to Oak Ridge for war work. They lived in a trailer camp. The ground was mud, with boardwalks laid across it, and people needed a pass to get through the gates.

At nineteen, Colleen worked as a leak detector at the K-25 plant. Her employer was Ford, Bacon & Davis, a contractor, which is a company hired to do a job. Her job was to find holes in the welded joints of pipes, the places where two pieces of metal had been melted together. She climbed over the pipes with a probe that sensed helium, looking for pinhole leaks. Helium atoms are small enough to escape through a flaw too fine to see. Where the

> probe found helium, the weld was leaking. The plant had hundreds of miles of pipe, and the workers were not even supposed to say the word "helium." Years later she said, "I didn't know where those pipes were going, I didn't know what was going through them ... I just knew that I had to find the leak and mark it."
>
> She learned what the plant had been separating only after American forces dropped an atomic bomb on Hiroshima, in Japan, on August 6, 1945. The bomb killed between 90,000 and 166,000 people in the city within two to four months. That count comes from the Radiation Effects Research Foundation, a research group that the United States and Japan run together and that studies the bomb's survivors. An American survey in 1946 gave a lower count, 70,000 to 80,000. The exact number is not known.
>
> She married a man called Blackie Black and stayed in Oak Ridge for the rest of her life. In 2005 she gave an oral history, a recorded interview about her life, to the Atomic Heritage Foundation's Voices of the Manhattan Project. The K-25 Virtual Museum includes her account. She is featured in Denise Kiernan's 2013 book *The Girls of Atomic City*. She also appeared on television programs, including NBC Nightly News and the History Channel.

1950 to 2000

St. Louis lost about 60 percent of its people between 1950 and 2000, and Detroit lost nearly half. Families moved out of the centers of older American cities to new suburbs at their edges. Cities in the hot South and West grew fast. Phoenix, Arizona, went from about 107,000 people in 1950 to more than 1.3 million in 2000.

At the edges of metropolitan areas, which are cities together with their suburbs, builders put up the same kind of neighborhood again and again. It was a subdivision, a tract of land divided into lots for single-family houses. White families bought those houses with mortgages that federal officials insured. To insure a loan, federal officials promised to repay the lender if the buyer could not. Federal officials refused to insure the same kind of mortgage in the neighborhoods where Black families lived.

In the old centers, officials cleared whole neighborhoods and cut freeways through others. Under the Housing Act of 1949, city officials labeled neighborhoods blighted, which meant run-down enough to tear down, and took the property by law. They had the buildings torn down, sold the cleared land to developers, and forced at least 300,000 families out of their homes.

Federal officials also paid for new freeways with money from a highway law of 1956. Highway planners ran many of those freeways through poor neighborhoods, most of them home to Black families and other people of color.

Urban renewal: clearing neighborhoods for developers

In 1949, members of Congress voted for the Housing Act of 1949. Under Title I, one section of that law, federal officials offered money to city governments for a program the law identifies as "urban redevelopment." People later called it urban renewal.

Blighted was a legal label for an area that officials judged run-down enough to tear down. Once city officials had put that label on an area, they took the property in it by eminent domain. Eminent domain is the power of a government to take private property at a price that officials set. Then the city officials had crews tear the buildings down. Then they sold the cleared land to private developers for much less than it had cost to take and clear, and federal money covered the gap. In 1954, in *Berman v. Parker*, the justices of the Supreme Court ruled that this was allowed.

Officials ran the program from 1949 to 1974, in more than 400 cities and on more than 1,200 projects. Crews tore down about 2,000 neighborhoods. Officials forced at least 300,000 families out of their homes, and that is the lowest count the records support. Counting people instead of families, researchers estimate about 1.2 million. Black Americans were about 13 percent of the country's population in 1960, and they were at least 55 percent of the people forced out. These figures come from Brent Cebul's 2020 article in the Boston Review and from the Digital Scholarship Lab's "Renewing Inequality" project.

In a filmed interview in San Francisco in 1963, the writer James Baldwin said that urban renewal "means Negro removal." Negro was the usual word for Black Americans at the time.

Highways through neighborhoods

On June 29, 1956, President Dwight D. Eisenhower signed the Federal-Aid Highway Act. The Act provided about $25 to $26 billion for a system of 41,000 miles of freeway.

Highway planners laid many of the routes where land was cheap and where the people who lived there were least able to organize against them. Those were mostly poor neighborhoods of Black families and other people of color. Builders defended taking land in Black neighborhoods by saying it was the cheapest. It was cheap partly because of redlining: for years, lenders and federal officials had refused to lend money for homes in those neighborhoods.

Rondo, a neighborhood in St. Paul, Minnesota, is one well-documented case. About 80 percent of St. Paul's Black residents lived there. Between 1956 and 1968, crews built Interstate 94 through the neighborhood.

Counts of what Rondo lost differ. Guides from the Minnesota Historical Society state about 600 families. ReConnect Rondo and reporting in Sahan Journal state about 700 homes and 300 businesses, and they record that Rondo lost 61 percent of its residents. One in eight of St. Paul's Black residents lost a home to the building of Interstate 94.

Marvin Roger Anderson

Who: A young man whose family lost its home and its apartment buildings to a freeway, and who has spent his later years working to build a land bridge over it.

When and where: Rondo, St. Paul, Minnesota. His family learned of the freeway in 1958.

Marvin Roger Anderson was born in 1940 and grew up in Rondo. His father built Rangh Court there, twelve two-story townhomes, in 1947 or 1948. Accounts give both years. His father got "the largest Federal Housing Authority mortgage backed loan ever given to nonwhite applicants in the state" to build them. In 1958, the year Anderson finished Central High School, the family learned that the new Interstate 94 would run through their land. State officials condemned the buildings for the freeway, which means they took them by law, and called the homes "inferiorly constructed." Crews loaded the buildings onto flatbed trucks and moved them away. Four of them still stand, on other ground, on the University of Minnesota's St. Paul campus.

Anderson became the State Law Librarian of Minnesota, the librarian in charge of the state's law library. In 1983 he and Floyd Smaller founded Rondo Days to keep alive "the history, culture and memories of the Rondo that existed before the highway."

He now leads ReConnect Rondo. Its members propose to build a lid over the freeway. The lid would be a land bridge of about 21 acres, with homes, businesses and community space on top. Early design studies for the land bridge list between 350 and 1,400 homes.

The *Voices of Rondo* oral-history collection records his account, and so do press interviews.

Sprawl, and the people who left the old centers

Levittown, New York, opened in 1947. By 1951 its builders had put up more than 17,000 houses there. They mass-produced the houses, building the same house over and over. The builders, Levitt and Sons, split the work into 27 steps and trained each crew to do one step. The houses stayed in place, and the crews moved from house to house. At the busiest time, about 30 houses went up in a day. The houses sold at first for $7,990. The lease for the first houses said they could not be "used or occupied by any person other than members of the Caucasian race," meaning white people. In 1960 every family in Levittown was still white.

Builders at the edges of other cities copied the pattern. Spreading a city outward in subdivisions of houses like these is called sprawl.

In the same fifty years, the older cities lost people. Detroit had 1,849,568 people in 1950 and 951,270 in 2000. St. Louis had 856,796 in 1950 and 348,189 in 2000, a fall of roughly 60 percent. St. Louis kept losing people after that, down to about 300,000 by 2020.

Real estate agents and speculators, people who buy property to sell it again at a profit, pushed white families to sell and move out. They frightened white owners into selling cheaply by telling them Black families were moving in. Then they sold the same houses to Black families for much more, often "on contract." Under a contract sale, if a buyer missed a single payment, the seller could put the family out, and the buyer lost everything already paid. This practice was called blockbusting. In Chicago's North Lawndale neighborhood, about 3,000 buildings were sold on contract. North Lawndale went from 87 percent white in 1950 to 91 percent Black in 1960.

At the same time, federal officials insured mortgages on the new houses at the edge. To insure a mortgage, federal officials promised to repay the lender if the buyer could not. Officials set rules for which loans they would insure. Under those rules, they refused to insure mortgages in the neighborhoods where Black families lived.

Jane Jacobs and Robert Moses

Who: Robert Moses, who built roads, bridges and parks across New York for decades without ever winning an election, and Jane Jacobs, a writer who helped defeat three of the projects planned for the city.

When and where: New York City, 1950s to 1968.

Movie: *Citizen Jane: Battle for the City* (2016), a documentary directed by Matt Tyrnauer, 92 minutes.

Robert Moses held as many as twelve appointed posts at the same time, including parks commissioner and head of the Triborough Bridge and Tunnel Authority. Officials gave him every one of those posts, and he never won an election to any of them. From those posts he directed the building of 13 bridges, 2 tunnels, 658 playgrounds, 17 state parks, and hundreds of miles of parkways and expressways, which are wide roads for fast traffic. To build the Cross-Bronx Expressway, Moses's crews cut a path through crowded blocks of the Bronx and forced thousands of families out of their homes.

Jane Jacobs lived in the West Village in New York and wrote about cities. She had never been trained in a school as a city planner. In 1961 she published *The Death and Life of Great American Cities*. In it she wrote that a busy street with both homes and shops stays safe because of "eyes on the street," the people who use it and watch it.

Jacobs helped defeat three projects. In 1958 she and other opponents stopped a road planned through Washington Square Park. In 1961 and 1962 they beat city officials' attempt to label their own West Village a slum and clear it under urban renewal. The third was the Lower Manhattan Expressway, a road ten lanes wide, raised above the street, planned across what is now SoHo and Little Italy. Jacobs led the Joint Committee to Stop the Lower Manhattan Expressway. Police arrested her at a public hearing in April 1968. The charges included inciting to riot, which means urging a crowd to violence, and they were later reduced. Jacobs moved to Toronto in 1968. In 1969 Mayor John Lindsay declared the expressway "dead for all time," and city officials took it off the city's map that year.

Robert Caro's book about Moses, *The Power Broker*, came out in 1974 and won a Pulitzer Prize in 1975. It is the standard account of Moses's career, and in it Caro criticizes much of what Moses did. In 2007 the historians Hilary Ballon and Kenneth T. Jackson edited a book, *Robert Moses and the Modern City*. In it they give parts of his record, especially his parks and swimming pools, more credit than Caro gives them. The argument is not settled.

Carl Stokes

Who: The first Black mayor of a major American city, elected in the years when officials were clearing neighborhoods and building freeways through cities.

When and where: Cleveland, Ohio. Elected on November 7, 1967, and mayor from January 1, 1968, to 1971.

Carl Stokes was the grandson of a man who had been enslaved. His mother was a widow, and she raised him in the Outhwaite public housing in Cleveland. Public housing is apartments owned by a government and rented to families with low incomes.

On November 7, 1967, Cleveland's voters elected Stokes mayor. He won about 50.5 percent of the vote and defeated Seth Taft. The 1960 census had counted 876,050 people in Cleveland, the eighth-largest city in the country. Because Cleveland was one of the ten largest cities, Stokes counts as the first Black mayor of a major American city. On the same day, voters in Gary, Indiana, a much smaller city, elected Richard Hatcher their mayor. Stokes was re-elected in 1969 and served until 1971.

He had campaigned on housing, on bringing money into neighborhoods that had gone without it, and on the city's pollution. On June 22, 1969, an oil slick and piled-up trash on the Cuyahoga River caught fire under a railroad bridge, set off by sparks from a passing train. It burned for about twenty minutes and damaged two railroad bridges. It was at least the thirteenth fire on that river since 1868. For a century, people had used the working river as a sewer. The next day Stokes held a press conference on the riverbank and demanded that state and federal officials act. In October 1972 the members of Congress passed the Clean Water Act over President Richard Nixon's veto. A veto is a president's refusal to sign a law. The members of Congress can still pass the law if two-thirds of them in each house vote for it. Stokes was one of the local leaders who had pushed for the Clean Water Act.

Black mayors followed Stokes in other big cities. By 1972 voters had elected Kenneth Gibson in Newark, James McGee in Dayton and Ted Berry in Cincinnati. In 1973 they elected Tom Bradley in Los Angeles, Maynard Jackson in Atlanta and Coleman Young in Detroit.

Growth in the Sun Belt

While Detroit and St. Louis lost people, cities in the Sun Belt, the warm states of the South and the West, gained them. Phoenix, Arizona, had about 106,818 people in 1950 and 1,321,045 in 2000. Its metropolitan area went from about 323,000 people to about 3,014,000 in the same fifty years. The city also grew in area. It covered about 17 square miles in 1950, more than 475 square miles by the 2000s, and about 518 square miles now. City officials added that land by annexation. Annexation means that city officials move the city's legal boundary out to take in neighboring land. Houston, Texas, went from 596,163 people in 1950 to 1,953,631 in 2000, and by 1990 it was the fourth-largest city in the country.

Air conditioners cooled the air inside homes and offices, so people in Phoenix and Houston could live and work indoors through the hot summers. Land at the edge of these cities was cheap, and city officials kept annexing it. In the 1950s alone, Phoenix more than quadrupled in population.

2000 to Today

In the 2000s, people moved back into the downtowns of most big American cities. After the coronavirus pandemic of 2020, many office workers kept working from home. Companies gave up office space, and by 2024 about a fifth of American office space stood empty.

Rents and prices have risen in the neighborhoods that buyers and lenders have returned to. Some of the people who lived there can no longer afford to stay. More than 900 million square feet of office space stood empty in 2024, and builders have begun turning some of it into apartments. Cities also run several degrees hotter than the land around them, and in Miami Beach the sea now floods some streets at high tide. City officials there have raised streets and put in pumps.

Downtown living and empty offices

Researchers at the Brookings Institution studied census counts for big American cities. Between 2000 and 2010, the downtowns grew faster than the areas around them. Of 53 downtowns they studied, 42 gained people. Young adults had already begun moving in. By 2000, people aged 25 to 34 made up nearly a quarter of downtown residents, up from 13 percent in 1970.

After the coronavirus pandemic of 2020, many office workers kept working from home for some or all of the week. Companies shrank the office space they rented, and as their leases, the contracts for renting the space, ran out, they gave up floors. By 2024 about 20 percent of American office space stood empty. Figures for that year run from about 19.6 to 20.1 percent. That was the highest share since Moody's Analytics began keeping track in 1979, and it came to more than 900 million square feet of empty floor. In downtown Manhattan the share was about 23 percent. The source of these figures is Moody's Analytics, a research company, as reported by Axios and ABC News in January 2024.

Builders began turning empty office towers into apartments. In 2024, builders had plans under way to make more than 55,300 apartments out of former office buildings. That was a record, and more than four times the number in 2021. The Washington, D.C., area led, with 5,820

apartments planned. In 2025, builders had finished, or were working on, 11.8 million square feet of former office space as apartments, the highest figure on record. The source of the 2024 figures is the research firm RentCafe, as reported in Time in January 2024. The sources of the 2025 figure are industry reports from CBRE and Brevitas.

Gentrification, and who can no longer afford to stay

Gentrification is the change that follows when buyers and lenders return to a neighborhood they had avoided for years. New owners fix up the houses, and landlords and sellers raise rents and prices. The people who lived there through the years without investment can then no longer afford to stay.

Buyers and lenders have returned to close-in neighborhoods, the ones near downtown, that appraisers had marked red in the 1930s. The work of the National Community Reinvestment Coalition and the Mapping Inequality project documents that pattern.

Washington, D.C., is one documented case. In 1970 the city was 71 percent Black, and people called it Chocolate City. By 2011 the Black share of the population had fallen below half, to 49.2 percent, for the first time in about fifty years. Those are census figures. New money went mostly into Shaw, U Street and Columbia Heights, close-in neighborhoods that appraisers had redlined. Around U Street, builders put up more than 2,000 expensive condominiums and apartments between 1997 and 2007. A condominium is an apartment that each owner buys. The neighborhood went from about 60 percent Black in 2000 to about 20 percent Black in 2010.

> #### Virginia Ali
>
> **Who:** A co-founder of Ben's Chili Bowl, a diner on U Street in Washington, D.C., who has helped run it since 1958 while the neighborhood around it changed.
>
> **When and where:** 1213 U Street NW, Washington, D.C., from August 22, 1958.
>
> Virginia Rollins came from Chance, Virginia. Her husband, Mahaboob Ali, who went by Ben, had come from Trinidad. On August 22, 1958, the two of them opened a diner at 1213 U Street NW with a bank loan of $5,000.
>
> People then called U Street "Black Broadway." Hundreds of Black-owned businesses, churches and theaters lined it and the streets nearby. At the Lincoln Theatre and the Howard Theatre, Duke Ellington, Louis Armstrong and Billie Holiday performed.

> On April 4, 1968, Martin Luther King Jr. was shot and killed in Memphis, Tennessee. James Earl Ray later pleaded guilty to his murder. For the next four days, riots broke out across Washington, and the corner of 14th and U was at the center of them. Thirteen people died, and about 1,200 homes and businesses were damaged. Stokely Carmichael led the Student Nonviolent Coordinating Committee, a civil rights group. He asked the Alis to keep the Bowl open past the curfew, an order to stay off the streets at night. According to the shop's own history, they did, and they fed police officers and activists. Ben wrote "Soul Brother" in soap on the front window.
>
> In the mid-1970s, drug dealing at 14th and U rose sharply. From 1986 to 1991, crews digging the Metro, Washington's subway, tore up U Street. From the 1990s, buyers and lenders returned, and the new condominiums went up around the Bowl.
>
> Ben's is still open, and Virginia Ali, in her nineties, is still one of the people who run it. She talks openly in interviews about how the neighborhood around the diner has changed.

Building for heat and water

According to the Environmental Protection Agency (EPA), daytime air in a city is 1 to 6 degrees Fahrenheit warmer than in the areas around it. At night the air can be up to 22 degrees warmer. A roof or road in the sun can be 50 to 90 degrees hotter than the air above it. The EPA's guides state the reasons. Roads, sidewalks and buildings soak up much of the sun's heat and hold it. A city has fewer trees and plants than the country around it, so it gets less shade and less cooling from water drying off leaves. Tall buildings and narrow streets also block cooling breezes. The EPA's list of ways to cool a city includes planting trees, growing plants on roofs, and building roofs and pavements that reflect sunlight.

In Miami Beach, Florida, streets flood on clear days with no storm, when the tide is at its highest. At those tides the ocean pushes the water of Biscayne Bay back up the storm drains, and bay water pours out of the drains into the lowest streets. Seawater also rises up through the soft, holey limestone under the city. In the fall of 2014, crews began raising streets, including West Avenue and Sunset Harbour, and putting in pumps to push the water back out.

By 2016 and 2017, crews had put in twelve pump stations along the west side of South Beach. The cost was first reported as about $400 million and later as about $600 million, as the project grew. The highest tides of the year are called King Tides in Miami Beach. During the King Tides after the work, the raised and pumped blocks stayed mostly dry.

The tallest buildings now stand in other countries

Since 1998, the tallest building in the world has stood in Asia.

Chicago's Sears Tower, finished in 1974, was the last building in the United States to be the tallest in the world. It lost that title because of a rule about how to measure height. In April 1996, members of the Council on Tall Buildings and Urban Habitat ruled that a spire designed as part of a building counts toward its height. Under that rule, the Petronas Towers in Kuala Lumpur, Malaysia, measured 1,483 feet to the tops of their spires. In 1998 they became the tallest buildings in the world. The Sears Tower's roof and its highest floor that people used were both higher than those of the Petronas Towers.

The Burj Khalifa in Dubai, finished in 2010, stands 2,717 feet (828 meters). That is more than 900 feet taller than the tallest building in the United States.

One World Trade Center opened in New York in 2014 at 1,776 feet, a height its builders chose for 1776, the year of the Declaration of Independence. Workers set the last piece of its spire on May 10, 2013. That November, members of the Council on Tall Buildings and Urban Habitat ruled that its spire counts toward its height. It is the tallest building in the Western Hemisphere, the half of the world that holds North and South America. Mohawk ironworkers worked on its steel, as Mohawk ironworkers had on the towers of the 1930s and on the bridges before them.

Chapter 7: Home and Family Life

Before 1500

Before 1500, the households of Native nations were built around kin. Kin are a person's relatives by birth or by marriage. Each nation built a kind of house that suited its climate and the way its families got their food. In many nations, several related families lived under one roof. Children learned to work by working beside adults, and old people lived in the same household as the young.

The longhouse

The Haudenosaunee are several Native nations joined together in one union. In a Haudenosaunee longhouse, every family traced itself back through the mothers' side. The longhouse was a long building with a frame of wooden posts, covered with bark. One longhouse held many related families. Two families lived in each section of the house, one on each side of an aisle, and they shared one fire in the middle. By different counts, one house held 30 to 60 people, or 20 families or more.

Each longhouse family began with one woman who lived long ago, and everyone in the house came down from her. The head of the house was the clan mother, the eldest or most respected woman of the clan. A clan is a large group of families who come down from the same ancestor. Women ran the longhouse and owned its everyday goods.

A woman's daughters and granddaughters lived in their longhouse all their lives. When they married, their husbands came to live with them. A son moved out when he married, into his wife's longhouse. He still belonged to his mother's longhouse.

The earth lodge

Among the Mandan, Hidatsa and Arikara nations on the upper Missouri River, women built the houses and owned them. Their house was the earth lodge, a dome made of timber and packed over with earth. An older woman directed the building, and women kept the lodge in repair.

One earth lodge held about 10 to 20 people, most often sisters and their families. Markers put up by the State Historical Society of North Dakota state that most lodges were 35 to 45 feet across, and that one lodge took about 150 trees to build. A lodge lasted about ten years, and then the women built it again. The large villages had more than 100 lodges each.

Pueblos, wigwams and tipis

A pueblo is a Native town of many homes joined together and stacked on top of one another. Taos Pueblo is the northernmost of the nineteen Pueblos of what is now New Mexico. Its people built their homes of adobe, which is earth mixed with water and straw. They poured the adobe into molds or shaped it into bricks and dried them in the sun. The two main buildings, the North House and the South House, rise five stories high. By the Pueblo's own estimate, people built them between about 1000 and 1450. Families have lived in them ever since. People have lived at Taos Pueblo without a break for more than 1,000 years.

In the Eastern Woodlands, the forests of the eastern part of the continent, many families lived in wigwams. A wigwam had a frame of saplings, which are thin young trees, covered with bark or with woven mats. On the Plains, the grasslands in the middle of the continent, families lived in tipis covered with animal hides. A family could take a tipi down and pack it up, so the household could move with the hunt.

The 1500s

Few European families lived on this land in the 1500s. Most of the Europeans who came were soldiers, priests and sailors. Native households went on living in their own towns. The European newcomers carried diseases that Native people had never had before. Those diseases made Native people sick and killed many of them. About 200,000 Timucua people lived in what is now northern Florida and southern Georgia before the Spanish came. After one outbreak of disease after another, only about 2,000 were left by the 1650s. No record counts how many died in the 1500s alone. At St. Augustine in Florida, marriages between Spanish soldiers and Native women were common.

St. Augustine, built in Seloy's town

In September 1565, the Spanish sea commander Pedro Menéndez de Avilés and about 800 colonists came ashore at Seloy, a town of the Timucua people. Its chief was also named Seloy. The colonists included 26 women and an unknown number of enslaved Africans. Enslaved

people were owned by other people as property and forced to work without pay. Menéndez and his colonists made their first settlement inside Seloy's town. Seloy offered Menéndez his council house, the building where the town held its meetings, and the Spanish used it as their first fort. Seloy's town covered more than 12 acres. Its remains lie under what is now the Fountain of Youth Park in St. Augustine.

The settlement Menéndez started became St. Augustine. People have lived there ever since. It is the oldest European settlement on the US mainland where people have lived without a break.

The Timucua traced their families and their inheritance through the mother's line. Fewer than half of the Spanish men in St. Augustine were married, and fewer than half of the married men had a Spanish wife. From 1565 on, many Spanish soldiers married Native women.

Church officials in the town wrote down the names of the church's members. A parish is the group of people who belong to one church, and these are called the Cathedral Parish records. They begin on January 24, 1594. They are the oldest church records that survive in the United States. The first marriage in them is dated February 2, 1594, and the first baptism June 25. A baptism is a church ceremony that welcomes a person, often a baby, into the church.

> ### Teresa and Francisco Camacho
>
> **Who:** A Spanish soldier, his Native wife, her sister and her sister's son, living as one household.
> **When and where:** St. Augustine, Florida, 1580.
>
> In 1580 one household in St. Augustine held four people. They were Francisco Camacho, his wife Teresa, Teresa's sister Catalina and Catalina's son Juan. Teresa was a Native woman. The account of this household does not name Teresa's nation.
>
> Francisco came to Florida in the 1560s from San Lúcar de Barrameda, a town near Cádiz in Spain. He was a soldier in a regiment, a unit of the army. He also worked as a fisherman.

The 1600s

In 1600s Massachusetts, the usual English colonial house had one room. The household cooked and worked in that room, around the hearth, the open fireplace. The fire in the hearth gave the room its heat and light. Many boys left home for good at about 14 to learn a trade in

another household.

Plymouth, built at Patuxet

The English who founded Plymouth Colony in 1620 built their houses at Patuxet, a Wampanoag village on Plymouth harbor. The Wampanoag are a Native nation of the coast of what is now Massachusetts. Between 1616 and 1619, before they came, a disease killed most of the Native people living on the southeast coast of what is now Massachusetts. Estimates of the deaths run from one-third of the people to as many as 90 percent. Nobody knows for certain what the disease was. Researchers have proposed several deadly diseases, among them plague, yellow fever and smallpox.

In 1614 an English sea captain named Thomas Hunt kidnapped 20 Native people from Patuxet and 7 from Nauset, another Native community. He took them to Spain to sell them as slaves. One of the Patuxet men was Tisquantum, also known as Squanto. He made his way home to Patuxet in 1619. He found the houses empty and the cornfields grown over. When the English arrived the next year, he was one of the last of the Patuxet people.

One room, then two

The basic English house in Massachusetts had a single room, called the hall. Next to the hall stood the chimney bay, the part of the house that held the chimney, the front door and the stairs. The hearth in the hall was where the family cooked, kept warm, had light and did its work.

The next step up was a house with a second room, called the parlor. This plan is called the hall-and-parlor house. The hall was still for cooking and work. The parlor was the best room, and it usually held a bed. Colonists went on building one-room houses well into the 1700s.

Births, deaths, servants and apprentices

A New England mother had about 8 babies, on average, and about 6 of them lived to grow up. People in New England lived long lives for the time. In the Chesapeake, the colonies around Chesapeake Bay, far more children died. About 1 baby in 4 died as an infant. About another 1 in 4 died before the age of 20. Most children in the Chesapeake lost a mother, a father or both before they reached their teens.

A household also held people who were not family. Indentured servants lived and worked in the house as members of the household. An indentured servant had signed a contract to work for a master for a set number of years. During the 1600s, colonists also owned more and more

enslaved people, whom they forced to work in their households without pay.

At about 14, and sometimes younger, a boy could leave home for good. His parents and a master signed a written contract, called an indenture. Under the indenture, the boy had to live with the master and work for him. The boy served the master until the age of 21, for as long as 7 years, and learned the master's trade.

The master took the place of a parent. In the indenture, he promised to feed the boy, give him a place to sleep, train him in the trade and give him some schooling. About two-thirds of these contracts required the master to teach the boy reading or writing. At the end, the young man got freedom dues, a payment of clothes, tools or money.

Mary Ring

Who: A widow in Plymouth Colony whose will and list of belongings survive.
When and where: Plymouth Colony. She came in 1629 or 1630 and died in July 1631.

After Mary Ring died, her belongings were written down one by one. A list like this is called an inventory. Her inventory survives, and it records what one Plymouth household owned.

Mary Ring's husband, William Ring, died in the city of Leiden, in the Netherlands, sometime between 1620 and 1629. In 1620 the couple had planned to sail to America. They were among 20 people who could not go when their ship, the Speedwell, turned back. In 1629 or 1630 Mary Ring came to Plymouth as a widow with her three children, Elizabeth, Susanna and Andrew. She died in July 1631.

She wrote her own will and signed her name to it. A will is a paper that says who gets a person's belongings after death. Her will was proved in court on October 28, 1633. That means the colony's court officials agreed the will was real, so it could be carried out.

Her inventory lists her books. They were a Bible, a psalm book, and books called *A Plea for Infants* and *Garland of Virtuous Dames*. A psalm book contains the songs from the Bible's Book of Psalms. Her clothes came in violet, red, blue, grey, white and black, and in a mixed color. Her will lists green cloth "to make a coat."

The inventory also lists money owed to her. Governor William Bradford owed her 2 pounds in English money, and Edward Winslow owed her beaver fur. All three of her children married in the colony.

1700 to 1750

Wealthy colonists of the early 1700s built houses in which each room had its own use. Most families still lived in houses of one or two rooms. Women and children made much of what a household used, from cloth to candles, and much of that work went on at the hearth.

The Georgian house

Wealthy colonists built a style of house now called Georgian. A Georgian house was built to match on both sides. Its builders based its balanced look on ancient Greek and Roman buildings. A central hall ran through the middle of the house, with rooms opening off it. The formal rooms, the parlors and the dining room, were at the front. The rooms for work were farther back. Some Georgian houses had four chimneys, one to heat each of the four main rooms.

In a house with separate rooms, the people in a family could be apart from one another. Being apart like this is called privacy. Houses like this belonged to wealthy families.

The hearth as a workplace

Cooks worked over the open fire in the hearth. Around that fire, a household made much of what it used. Its members spun and wove cloth, and they made candles, soap, butter and cheese. They also preserved food so it would keep. Women and children did most of this work. The historian Laurel Thatcher Ulrich described this work in northern New England in her 1982 book *Good Wives*.

> ### Sarah Kemble Knight
>
> **Who:** A Boston businesswoman who rode from Boston toward New Haven and New York and kept a journal of the households where she stayed.
>
> **When and where:** October 1704 to early 1705, on the road from Boston to New Haven and New York and back. She lived from 1666 to 1727.
>
> Sarah Kemble Knight kept a journal, a written record of each day, on a trip she made on horseback in 1704. In it she wrote about the road, the inns and the households where she stayed the night. An inn was a house where travelers paid for a bed and a meal. Few pieces of writing by American women survive from that time, and her journal is one of them.

> Knight lived in Boston, where she ran a business and also taught. In October 1704 she set out from Boston for New Haven and New York on legal business. The journal records what she saw inside the houses where she stopped along the way.
>
> She stayed in New York for about two weeks. On December 21 she started home. Near Eastchester, New York, her party got lost in a great storm of wind and snow. One woman would hardly let them through her door. The woman's son invited them in. He showed Knight a bed "as hard as it was high," and he warmed it with a hot stone at her feet. The family had nothing in the house but milk. They boiled it and sweetened it with molasses for her.
>
> Her journal stayed unprinted for about 120 years, until Theodore Dwight printed it in 1825.

1750 to 1800

Families on the frontier lived in log cabins in the late 1700s, and families in older settlements lived in farmhouses. The frontier was the edge of the colonists' settlements, on land where Native nations lived. Households of both kinds made most of what they used. Spinning, weaving, making candles and soap, and preserving food were the work of women and children. When men left home during the Revolutionary War, women ran the households.

Where the log cabin came from

Settlers from Sweden and Finland brought the log cabin with notched corners to America. In a cabin like this, the builders cut notches near the ends of the logs so that the logs locked together at the corners. These settlers came to the colony of New Sweden on the Delaware River from 1638. Among them were the Forest Finns, who were skilled at building with logs. The Nothnagle Log House in Greenwich Township, New Jersey, was built in about 1638 to 1643, and it still stands.

New Sweden was built on Lenape land. In the spring of 1638, Peter Minuit's Swedish and Dutch crew sailed up the Delaware River. They made agreements with several sachems, or leaders, of the Lenape and Susquehannock nations. With the sachems' permission, the crew built Fort Christina. Several thousand Lenape lived in separate communities along the river,

and people at the time counted them as the owners of the land beside it. The Lenape welcomed the colony because its people brought goods to trade. New Sweden lasted 17 years before the Dutch took control of it.

A common story says the first English colonists lived in log cabins. The English at Plymouth and at Jamestown did not build them. By the second half of the 1700s, the log cabin was the usual first house of a family on the frontier.

Abigail Adams

Who: Ran her family's farm, its money and her children's education through the Revolutionary War while her husband, John Adams, was away.

When and where: Braintree, Massachusetts, in the part that is now the city of Quincy, 1774 to 1784.

Movie: *John Adams* (2008), a miniseries made for HBO. It is about John Adams and his family, and Abigail Adams is one of its main characters.

From 1774, Abigail Adams ran the family farm at Braintree, Massachusetts, and managed its money. Her husband, John Adams, was away for years at a time. First he served in the Continental Congress, the meeting of leaders from the colonies. Then he worked in Europe as a diplomat, a person who represents a country to other governments. Abigail taught the children herself. She and John wrote each other more than 1,100 letters. In 1784 she and their daughter Nabby sailed to Europe to join him.

In July 1776 she took her four children to Boston to be inoculated against smallpox. To inoculate a person meant giving a healthy person smallpox on purpose, so that the person got a milder case. Caught the natural way, smallpox killed about 30 of every 100 people who got it. A doctor cut the skin with a small blade called a lancet. Then he put in a thread soaked in pus from a smallpox sore. Pus is the thick yellowish liquid inside a sore. About 2 or 3 of every 100 people inoculated died. People who lived through smallpox usually did not catch it again, so inoculation gave them that protection at far less risk.

On July 13, 1776, Abigail wrote to John from Boston: "I yesterday arrived and was with all 4 of our Little ones innoculated for the small pox." Their doctor was Dr. Bulfinch. She wrote that the children "stood the opperation Manfully," which meant they were brave about it. Nabby, who was 10, broke out in many painful sores, while 9-year-old Johnny

had a light case. Charles was 6, and he had to be inoculated three times before he caught the smallpox. Thomas, the fourth child, showed no sickness at first and had to be inoculated again.

Martha Ballard

Who: A midwife in Maine whose daily diary, kept for 27 years, records the work of an ordinary American household.

When and where: Hallowell, Maine. The diary runs from January 1785 to 1812.

Movie: *A Midwife's Tale* (1997), a documentary made for the PBS series *American Experience*. It is about Martha Ballard.

Martha Ballard wrote in her diary nearly every day for 27 years, from January 1785 to 1812. It contains about 10,000 entries over 9,965 days. She was a midwife in Hallowell, Maine. A midwife is a woman who helps other women give birth. The diary records 816 births that Ballard helped with, each one with a name and a number.

Around those births, the diary records the daily work of her own household. It describes her garden, spinning, weaving, quilting and brewing, along with the work her daughters did, the visitors who came and the weather each day.

In 1990 the historian Laurel Thatcher Ulrich published a book about the diary, *A Midwife's Tale*. Ulrich received the Pulitzer Prize, a yearly American prize for writing, for the book. The whole diary can be read online at DoHistory.org.

1800 to 1850

Middle-class families in towns and cities began, in the early 1800s, to treat the home as a place set apart from paid work. Middle-class families were the families in between the rich and the poor. In the 1830s cooks began to trade the open hearth, the open fireplace where food cooked over the fire, for the iron stove. On farms, children's chores came first and school fitted around them. In the South, enslavers could sell any member of an enslaved family at any time. Lawmakers and courts in the slave states did not count enslaved people's marriages as legal marriages.

The parlor and the home apart from work

In the early 1800s, many middle-class families lived in towns and cities. They came to see the home as a place apart, and paid work happened somewhere else. In this view the home was the mother's to run. The parlor, the front room where the family received visitors, became the room for showing off the family's best things. Domestic means having to do with the home. These ideas are called the cult of domesticity. Here a cult means a set of beliefs that many people held strongly.

Catharine Beecher's 1841 book, *A Treatise on Domestic Economy*, described how to run a home of this kind. A treatise is a long book that explains one subject, and domestic economy meant running a home. Readers used the book as a guide for running a home in this way.

The stove takes the place of the fire

Iron cookstoves spread through American kitchens from the 1830s. Foundries, the workshops where iron was melted and poured into molds, made stoves of many designs. By 1850 most middle-class kitchens in the cities had a stove in place of the open hearth. Poorer families and families far from towns changed over later.

For the woman who did the cooking, a stove meant less bending and lifting. It gave off less smoke, and no ash fell into the food. But a stove took hard work to clean. Stoves were also drafty and hard to control. In 1846 the writer Henry David Thoreau complained that the stove "concealed the fire." He wrote that cooking had become "merely a chemic process," by which he meant a kind of chemistry.

A child's day, and where school fit in

On a farm, a child's chores came first. Country schools, called district schools, usually held two terms a year. The summer term ran from about May to August, for the younger children, and women usually taught it. The winter term ran from about November to April. Older boys could go then, because they were not needed for work on the farm. Men were often hired to teach the winter term. Children missed school when the weather was bad or when there was work to do at home.

The teacher often lived with the students' families, staying with one family and then the next. People called this boarding around.

At home, parents expected children to obey. Many parents hit their children with a rod, a stick or switch used for punishment. They pointed to a verse in the Bible's book of Proverbs: "He that spareth his rod hateth his son: but he that loveth him chasteneth him betimes." It means

that a father who does not use the rod hates his son. A father who loves his son punishes him early. In the 1800s some writers of advice books for parents began to tell parents to punish children calmly and firmly instead. One of them told parents never to punish a child in anger.

Home under slavery

Enslavers could break up an enslaved family on any day. They sold enslaved people, and slave traders bought them and moved them. Between about 1790 and 1860, traders forced more than 1 million enslaved people to move from the Upper South to the Deep South. The Upper South was the more northern of the Southern states, and the Deep South was the states farther south. From 1820 they moved about 200,000 people every ten years. Traders marched them overland in chained lines called coffles, or shipped them by sea to New Orleans. New Orleans had the largest slave market in the country.

The Equal Justice Initiative is an American organization. By its count, the traders separated nearly half of the people they moved from a husband, a wife or a parent. Lawmakers and courts in the slave states did not count the marriages of enslaved people as legal marriages. Enslavers sold husbands and wives apart.

> ### Catharine Beecher
>
> **Who:** Wrote a book of instructions for running an American home, and argued that keeping house was a skill to be studied and taught in schools.
>
> **When and where:** Born September 6, 1800, in East Hampton, New York. Her *Treatise on Domestic Economy* came out in 1841. She died on May 12, 1878, in Elmira, New York.
>
> Catharine Beecher wrote *A Treatise on Domestic Economy*, published in 1841. It was the first American book to describe every part of running a home. Economy here means managing a household. Printers issued it in about 15 editions and put out new copies nearly every year for years.
>
> Beecher argued that housekeeping was a profession. By that she meant a skilled job that people should study and that schools should teach. In 1823 she founded the Hartford Female Seminary, a school for girls and young women, in Connecticut. Later she wrote another book about the home with her sister Harriet Beecher Stowe. It was called *The American Woman's Home*, and it came out in 1869.

Buffalo Bird Woman (Waheenee)

Who: A Hidatsa woman who grew up in her mothers' earth lodge and later told the story of her life to the anthropologist Gilbert Wilson.

When and where: About 1839 to 1932. Born by the Knife River and raised at Like-a-Fishhook village on the Missouri River, in what is now North Dakota.

Buffalo Bird Woman grew up in an earth lodge in the 1840s. An earth lodge was a large round house with a frame of timber, covered over with packed earth. Her household held her father, his four wives, her grandmother and her great-grandmother. Late in her life she told the story of that household to Gilbert Wilson, an anthropologist, a scientist who studies how groups of people live. He interviewed her every summer from 1906 or 1907 to 1918. The National Park Service gives 1906 as the first year. She spoke Hidatsa and never learned English. Wilson published her story in 1921 as *Waheenee: An Indian Girl's Story*. Her son, Edward Goodbird, drew the pictures for Wilson's books.

She was born in an earth lodge near where the Knife River meets the Missouri. The National Park Service gives her birth year as about 1839. She said she was born "three years after the smallpox winter," and Wilson dated that winter to 1837 and 1838, which would make it about 1840 or 1841.

Smallpox is a deadly disease that spreads from person to person. In June 1837 the steamboat *St. Peters*, owned by the American Fur Company, carried passengers sick with smallpox up the Missouri River. Francis A. Chardon ran Fort Clark, a trading post near the Mandan and Hidatsa villages. At a trading post, traders swapped goods for furs. Chardon met the boat 30 miles downstream and heard that people on it were sick. The boat landed at Fort Clark on June 18, by the State Historical Society of North Dakota's account, or June 19, by others. In less than a day, workers from the boat and the fort unloaded goods and loaded furs, and villagers came and went from the boat.

About 2,000 Mandan people were alive in the spring of 1837. By October, smallpox had killed all but 138 of them. Buffalo Bird Woman's great-grandmother told her: "More than half of my tribe died in the smallpox winter. Of the Mandans only a few families were left alive. All the old people and little children died."

When she was ten days old, an old man named Nothing-but-Water gave her the name Good Way. Later her father gave her the name Waheenee-wea, Buffalo Bird Woman, because she was a sickly child. People believed a new name could move the gods to help her. Her father, Small Ankle, was a Hidatsa chief. He had four wives, and they were

sisters. Her mother, Weahtee, was one of them. The others were Red Blossom, Stalk-of-Corn and Strikes-Many Woman. "I was taught to call all these my mothers," she said. "Such was our Indian custom." Her great-grandmother White Corn and her grandmother Turtle lived with the family too.

When she was four, the Mandan and Hidatsa chiefs moved their people together to one new village, at Like-a-Fishhook Point on the Missouri. The village stood by 1845. The chiefs made the move to protect their people from attacks by the Dakota and the Yanktonai. Women and dogs carried the family goods there. Some loads went on their backs, and dogs dragged others on travois. A travois is a frame of two poles that a dog dragged along the ground. The people built about seventy summer earth lodges at the new village, most of them in the second summer. For the winter, families built small huts in the woods, and the June flood often swept them away.

In the first hard winter, the family camped at Many-Frogs Brook, three miles from the village. Smallpox broke out with the first snow. "My brother, my mother Weahtee, and her sister Stalk-of-Corn, died," she said. Her grandmother Turtle made her a doll of deerskin with eyes of bone beads.

The women of a household owned its earth lodge. Her mothers' lodge had a floor more than forty feet across. The fire burned in the center. A screen of upright split logs stood between the fire and the door and kept out drafts and dogs. Her father's bed, of cottonwood planks and buffalo robes, stood in front of the fire. The oldest person in the family usually slept there, because it was the warmest place. The rest of the family slept in covered beds against the back wall. The buffalo-skin bedding could not be washed, so her mothers aired it on the raised platform, called a stage, where they dried their corn. The family believed that "an earth lodge was alive and had a spirit."

Her first husband was Magpie. Her son, Edward Goodbird, was born in 1869. A reservation is land set aside for a Native nation to live on. In the late 1880s, federal officials, the officials of the national government, carried out a law of 1887 called the Dawes Act. They divided reservation land into allotments. An allotment was a plot of reservation land that federal officials assigned to one family. Federal officials sold the land left over after the allotments. Native nations held about 138 million acres in 1887 and about 48 million in 1934. By the late 1880s, as the allotments began, the people of Like-a-

> Fishhook village had left it. In 1921 she said: "We no longer live in an earth lodge, but in a house with chimneys." She added that "my son's wife cooks by a stove." She still got up at daybreak to hoe her corn and sing to it. She died in 1932.

1850 to 1900

Between 1850 and 1900, American families lived in many kinds of homes. In New York, a family might live in a tenement flat of small rooms, with shared toilets out in the yard. A middle-class family might have a house with a parlor for guests, a dining room for meals, and a paid servant to help run it. On the plains, where few trees grew, settler families cut their houses out of the ground. State lawmakers began to require children to go to school, and federal officials took Native children away from their homes to distant schools.

The tenement flat

A tenement was a building of small apartments, called flats, rented to working families. Builders put up the tenement at 97 Orchard Street in New York in 1863. Over the years, about 7,000 people from more than 20 countries lived there. Families lived in small rooms, and some took in boarders, people who paid to sleep in the family's rooms. They carried water into the flat by hand and shared privies, outdoor toilets, in the yard.

Lawmakers in New York began to change what a tenement had to include. Under the Tenement House Act of 1879, builders added air shafts, narrow gaps between buildings meant to let in air and light. In 1900 Governor Theodore Roosevelt appointed a group of people, called a commission, to study the housing laws. Lawrence Veiller, the commission's secretary, did most of the investigating and helped write a new law. New York's state lawmakers passed it on April 12, 1901. It required a window in every room and a toilet in every new apartment. Owners of old tenements had to give them better light and add one toilet for every two families.

Bigger houses and paid help

Families who could pay for them built houses with a parlor for guests and a separate dining room. City homes got running water inside the house first, and farm families waited decades longer. In 1890, 24 of every 100 American households had running water, and 8 of every 100 had electricity.

Some middle-class homes also had paid help. The census is the count of the country's people taken every ten years. The census of 1870 was the first to record the jobs of working women in full, by a set method. The census takers counted 867,354 women in domestic service, which means paid work in another family's home. That was about 47 of every 100 women who worked for pay. It was by far the most common paid job for women.

Sod houses and dugouts

The plains had few trees, so settler families there could not build with logs. They built with sod instead. Sod is the top layer of prairie soil, held together by the roots of the grass. Settlers used a plow to cut about an acre of ground into strips 12 inches wide and 4 inches thick. They cut the strips into pieces about three feet long. Builders laid these sod bricks grass side down, turning each layer lengthwise and then crosswise, to make walls two feet thick. Most early sod houses had dirt floors. Women who lived in them complained about the dirt, the bugs, the snakes, the leaking roofs and the poor light.

Some families dug their home into the side of a hill or a creek bank. A house like this is called a dugout, and it took less work to build than other kinds of house. In May 1874 Charles and Caroline Ingalls settled in a dugout on Plum Creek, near Walnut Grove, Minnesota. Their crops failed three years in a row, and in 1876 they left. The hollow in the creek bank where the dugout stood is still there, on what was once the Gordon farm.

Walnut Grove lies on land the Dakota signed away under treaties in 1851. A treaty is a written agreement between nations. At Traverse des Sioux on July 23, 1851, three men bargained with the Sisseton and Wahpeton Dakota for about 24 million acres. They were Luke Lea, the official who spoke for the US government, Alexander Ramsey, the governor of Minnesota Territory, and Henry Sibley. A territory was land the United States held that was not yet a state. The three men agreed to pay about 7.5 cents an acre. The Dakota believed US officials would take the land by force if they refused. After the treaty was signed, the fur trader Joseph R. Brown had Dakota leaders sign another paper. No one read it aloud to them or translated it. That paper let traders take the annuity money, the yearly payments promised to the Dakota, for debts the traders claimed the Dakota owed them. Within ten years, more than 100,000 white settlers moved onto the land.

School laws and the boarding schools

In 1852 Massachusetts lawmakers passed a law that required children to go to school. The law applied to children aged 8 to 14, for twelve weeks a year. By 1900, 32 states had such a law, and by 1918 every state had one. Mississippi was the last. Under these laws, families had to send

their children to school for part of the year.

Federal officials took Native children from their families to boarding schools far away. On November 1, 1879, Richard Henry Pratt, an Army officer, opened the Carlisle Indian Industrial School, a boarding school for Native children. In 1891 members of Congress gave the Commissioner of Indian Affairs the power to make and enforce rules forcing Native children to attend school. He was the federal official in charge of Native affairs. In 1893 members of Congress allowed officials to hold back food rations, clothing and payments owed to parents who refused to send their children.

At the schools, staff cut the children's hair, took away their clothes and gave them English names. Staff beat children who spoke their own language, locked them up alone, held back their food or washed their mouths out with soap. Survivors and a federal investigation later reported these punishments.

In 2022 and 2024, officials of the US Department of the Interior reported on these schools. They counted 417 federal boarding schools for Native children in 37 states or territories, open between 1819 and 1969, and at least 973 children who died at those schools. Their report states that this count is low.

Nathalie Gumpertz

Who: A tenement mother of four who became a dressmaker after her husband disappeared.
When and where: 97 Orchard Street, New York. Her husband Julius disappeared in 1874. A judge declared him dead in 1883.

Nathalie Gumpertz supported her four children by sewing dresses in her tenement flat. One morning in 1874, her husband Julius left for work and never came back.

Nathalie and Julius Gumpertz were immigrants from East Prussia who lived at 97 Orchard Street. They were living there during the Panic of 1873, a money crash in which many people lost their jobs. When Julius left, Nathalie had four young children.

She became a dressmaker and worked in the front room of the flat, the parlor. She made about three dresses a week and earned 8 to 9 dollars. In 1883 a judge declared Julius legally dead, which meant that under the law he counted as dead. Because of that, Nathalie could claim 600 dollars that he was due from his father's estate, the money and property his father left when he died. She then moved the family to upper Manhattan.

Later, genealogists working for the Tenement Museum in New York found that Julius had gone to Cincinnati. Genealogists are people who trace family histories.

Rachel Calof

Who: A young woman from Russia who came to North Dakota for an arranged marriage and later wrote down what keeping a homestead house was like.

When and where: Near Devils Lake, North Dakota, 1894 to 1904. She wrote her memoir in 1936, and it was published in 1995.

In 1894, at the age of 18, Rachel Calof traveled from Russia to marry Abraham Calof. It was an arranged marriage, planned by other people rather than by the couple. Abraham was a homesteader, a settler who claimed land from the US government to live on and farm.

The couple lived in a shanty, a small, roughly built house, 12 feet by 14 feet with a dirt floor. In the winters, Abraham's parents and brothers, and the chickens, shared the one room with the couple to save fuel. Of all the hardships, she wrote, "the lack of privacy was the hardest to bear."

In 1936 she wrote a memoir, a book about her own life, in Yiddish, a language spoken by many Jews in Eastern Europe. It records her years on the homestead from 1894 to 1904. Indiana University Press published it in English in 1995 as *Rachel Calof's Story*.

The land around Devils Lake was Dakota land. Under a treaty of 1867, the land south of the lake became a reservation for the Sisseton and Wahpeton Dakota and the Cut Head band of Yanktonai Dakota. The Dakota name for the lake is Mni Wakan, Spirit Water. Settlers who were not Native illegally claimed 64,000 acres of the reservation. The Dakota bargained with the US government and accepted 345,000 dollars for that land. In 1904 federal officials opened 100,000 more acres of the reservation to settlers, at about 4 dollars and 50 cents an acre. By 1934 the Dakota owned a little more than 50,000 acres of the reservation. The State Historical Society of North Dakota's history of the reservation does not say whether the Calofs' own claim lay on land taken from it.

1900 to 1950

Running water and electric power reached most American homes between 1900 and 1950. City homes got them first, and many farm homes got them decades later. In the Great Depression, the hard times of the 1930s, families who could not pay their home loans lost their houses. Federal officials, the officials of the national government, then changed home loans so that a family could pay for a house month by month over many years. Federal officials also rated the neighborhoods where Black people lived as the worst risk, and they usually refused to back loans there. In 1947 the first families moved into Levittown on Long Island, New York. It was a new suburb, a town of houses built at the edge of a city.

Water, wires and washday

Without running water or electric power, washing a family's clothes by hand took more than one day. The person doing the wash first sorted the clothes and treated the stains. The clothes then soaked in warm soapy water for one or two days. Next the washer scrubbed them on a washboard, a ridged board set in a tub of warm water and soap. Then the washer boiled the clothes in a pot with soap and soda to kill lice, stirring them with a wooden stick called a dolly. After rinsing the clothes, the washer hung them out to dry, with the whites in the sun to bleach them. Last came the ironing, with flatirons, solid metal irons heated over the coals and held with a rag around the handle.

Some homes got water pipes and electric wires long before others. By 1940, 74 of every 100 American homes had running water and 83 had electric lights. By 1950, 83 of every 100 households had running water and 94 had electricity. The Census Bureau is the federal office that counts the country's people and homes. Its officials counted a home as having complete plumbing only if it had three things. These were hot and cold running water, a bathtub or shower, and a flush toilet. In 1940 nearly half of American homes lacked complete plumbing, and more than one home in three had no flush toilet. In about ten states, the share without complete plumbing was near 70 percent or higher. Most of the homes without running water were in the country. In 1940 more than half of American homes were heated with coal, and another quarter with wood.

Farms got electric power later than city homes. In 1935 fewer than 11 of every 100 farms had it. About half had it by 1945, and about 9 in 10 by 1950.

Families also changed how they kept food cold. In 1930, 14 of every 100 households had a modern refrigerator. The number rose to 44 in 1940 and to 80 in 1950. Households without one used an icebox, a cabinet cooled by a block of ice. They also relied on milk delivered each day, on canned food and on stores that sold fresh food.

The historian Ruth Schwartz Cowan studied what the new machines did to a housewife's work. In her 1983 book *More Work for Mother*, she argued that the machines mostly replaced work that servants, children and men had done before. At the same time, families expected clothes washed more often, houses kept cleaner and more cooking done. So, in Cowan's argument, the housewife's own hours of work did not fall. Another scholar, Joel Mokyr, took up her argument in a paper called "Why Was There More Work for Mother?" Census counts record one part of the change. The number of domestic servants fell by 32 percent between 1940 and 1950.

The bungalow and the mail-order house

The small family house of this era was the bungalow. A bungalow was a small house of one main floor, with a low roof and a front porch, and sometimes rooms tucked under the roof. In Chicago, more than 80,000 brick bungalows built between 1910 and the mid-1930s still stand today. From 1908 to 1940, Sears, Roebuck and Company sold whole houses by catalog. A buyer chose a design from the catalog. The house came by railroad in boxcars, as a kit. The average kit held about 25 tons of materials and more than 30,000 parts. Many buyers put the house together themselves with relatives, friends and neighbors. Others hired local carpenters. The first Sears house catalog, in 1908, offered 44 designs priced from 360 dollars to 2,890 dollars. Nobody kept an official count of how many kit houses Sears sold. The usual estimate is 70,000 to 75,000, and some estimates run as high as 100,000.

Sickness in a tenement flat

When Abraham Rogarshevsky died of tuberculosis in 1918, his widow kept the family in its tenement home by working for the building and renting out space. The Rogarshevskys were a Jewish family from Lithuania who lived at 97 Orchard Street in New York from about 1908. The building was a tenement, a building of small apartments rented to working families. Abraham died on July 17, 1918. Tuberculosis is a disease caused by a germ. It usually infects the lungs, and it spreads through the air when a sick person coughs or talks. Tuberculosis was then known as "the tailor's disease." After Abraham died, his widow, Fanny, became the building's janitor, the worker who cleaned the building and kept it in repair. She also took in boarders, people who paid to live in the family's rooms.

The mortgage remade

Before the 1930s, a home loan was hard to pay off. A mortgage is a loan to buy a house. If the borrower does not repay it, the lender can take the house. The usual mortgage ran for 5 to 10 years. Each month the borrower paid only the interest, the fee for borrowing the money. At the end, the borrower owed the whole amount at once. Buyers usually had to pay about half the price up front, as a down payment. In the Great Depression many borrowers could not pay. Lenders then foreclosed, which means they took the houses back.

In June 1933 members of Congress passed the Home Owners' Loan Act. Under it, federal officials set up the Home Owners' Loan Corporation, or HOLC. HOLC officials replaced families' old loans with new loans that ran for 15 years at a fixed rate, which means the interest charge never changed. The family paid the same amount every month, and each payment paid off part of the loan itself. In 1934 members of Congress set up the Federal Housing Administration, or FHA. FHA officials insured home loans, which means they promised to repay the lender if the family could not. Those loans ran 20 to 25 years and needed only a small down payment. After the Second World War the 30-year loan became the usual kind.

Between 1935 and 1940, HOLC staff graded neighborhoods in many American cities. They worked with local bank loan officers, city officials, real estate agents and appraisers. An appraiser is a person whose job is to judge what a property is worth. Each neighborhood got a letter and a color. A was green, for "Best." B was blue, for "Still Desirable." C was yellow, for "Definitely Declining." D was red, for "Hazardous." FHA officials used maps of their own. They rated neighborhoods where Black people lived "D" and usually refused to insure loans there. Drawing a red line around a neighborhood to cut it off from loans is called redlining.

Researchers at the National Community Reinvestment Coalition studied 115 of the HOLC maps. Of the neighborhoods graded "Hazardous," they found that 74 of every 100 are low or moderate income today. Nearly 64 of every 100 are neighborhoods where most people belong to racial or ethnic minority groups.

Depression households

During the Great Depression, families changed who lived together under one roof. Couples waited to marry. In 1929 there were 10.1 marriages each year for every 1,000 Americans. By 1932 there were 7.9. For the first time in US history, parents had too few babies to replace their own generation. Families doubled up in one home. Young married couples moved back in with their parents, and old parents moved in with their grown children. By 1940, 1.5 million married women lived apart from their husbands.

In Chicago, Black families who had moved north from the South settled in a South Side neighborhood called Bronzeville. On many blocks in the rest of the city, white owners signed restrictive covenants. These were written agreements that the owners would not sell or rent to Black people. Black Chicagoans were limited mostly to the Black Belt, an area between 12th and 79th streets on the South Side that took in Bronzeville. Landlords there split apartments into one-room units called kitchenettes and charged very high rents for them. Bronzeville held more than 80,000 of them. A whole family lived in one room and shared a bathroom down the hall with everyone else on the floor. Some buildings had no proper heat. Families lit kerosene lamps, and the stoves they rigged up often overheated and started fires. In one year, about 751 fires broke out in the Black Belt. The writer Richard Wright recorded this life in his 1941 book *12 Million Black Voices*.

Spanking and the new advice

In the 1920s and 1930s, many parents began to take advice from experts on child development and psychology. Psychology is the study of the mind and of how people behave. In 1928 John B. Watson published *Psychological Care of Infant and Child*, and it sold 100,000 copies within months. Watson told parents: "Never hug and kiss them. Never let them sit in your lap." He went on: "If you must, kiss them once on the forehead when they say goodnight." He advised them to "shake hands with them in the morning."

Between 1924 and 1939, parents wrote to Angelo Patri, a popular expert on raising children, to ask for advice. In 2004 three researchers published a study of 147 of these letters that mentioned corporal punishment, which means hitting a child as a punishment. Most came from middle-class parents, families in between the rich and the poor. The parents wrote more about how useful hitting was than about a child's right to be kept safe from harm. The reasons they gave most often were that the child had disobeyed or been rude. One letter in four described an argument about hitting with another adult close to the family.

The teenager, and the war at home

A new stage of life got its own name in these years. More children stayed in high school instead of going to work, and that is part of why people began to see the teenage years as a stage of their own. Writers had printed "teen ager," as two words, as early as 1913. A 1941 article in *Popular Science* printed "teen-agers," and this is usually named as the first use in print as a single word. The word spread in the late 1940s, when advertisers used it to sell goods to young people.

During the Second World War, individuals and families moved to cities with war factories to take well-paid jobs. More Americans moved from one part of the country to another in these years than in any earlier period. Richmond, California, grew from fewer than 24,000 people to more than 100,000 during the war. Six million women worked in war-industry jobs that women had not held before. At home, federal officials limited how much of twenty kinds of goods each family could buy, and families shopped with ration books.

The Baldizzi family

Who: A Sicilian immigrant family who lived through the Great Depression in a tenement flat. Museum staff later rebuilt their apartment from the daughter's memories.

When and where: 97 Orchard Street, New York, 1928 to 1935.

Adolfo and Rosaria Baldizzi raised their children, Josephine and Johnny, in a flat at 97 Orchard Street from 1928 until 1935. Adolfo came to the United States from Palermo, in Sicily, in 1923. He was a trained woodworker who made fine furniture. During the Depression he could find only odd jobs. Rosaria sewed the linings into coats in a garment factory. In the evenings the family sat at the kitchen table to play cards and listen to the radio. Adolfo built a corner cabinet himself.

In 1934 and 1935, New York City officials required owners of old tenements to make costly repairs, such as fireproofing. The owner of 97 Orchard Street chose to empty the apartments rather than pay for the work. The owner evicted the families who still lived there, which means the owner forced them to leave. Next the owner boarded up the upper windows and sealed off the floors where people had lived. The Baldizzis had to move.

After the Tenement Museum was founded in 1988, Josephine Baldizzi came back to 97 Orchard Street and recorded hours of memories of her childhood there. Museum staff rebuilt the family's apartment from what she remembered.

Theodore and Patricia Bladykas

Who: The first family to move into Levittown, with their 14-month-old twin daughters, Patricia Ann and Betty Ann.

When and where: October 1, 1947, 67 Bellmore Road, Levittown, Long Island, New York.

Theodore and Patricia Bladykas were the first family to move into a house in Levittown. They moved in on October 1, 1947, with their twin daughters, Patricia Ann and Betty Ann, who were 14 months old. A photographer from the newspaper *Newsday* took their picture

that day. The first 300 families moved into Levittown that day.

The builder was the company Levitt and Sons, run by William Levitt. The first houses rented for 60 dollars a month, and a renter could buy the house for 7,500 dollars after a year. A ranch house, a long, low house of one story, sold for 7,990 dollars in 1949. By 1951 Levitt and Sons had built 17,447 houses there. Many of the fathers who moved in were veterans just back from the Second World War.

William Levitt and his company rented and sold these houses to white families only. A lease is the paper that sets the rules for renting a home. Clause 25 of the Levittown lease stated that no "person other than members of the Caucasian race" could live in the house. Caucasian here means white. The only exception was for servants, who also had to be white. In 1948, in the case *Shelley v. Kraemer*, the justices of the US Supreme Court ruled that courts could not enforce rules like this. William Levitt dropped the written clause and kept refusing to sell to Black families. His sales contracts forbade buyers to resell their houses to African Americans. He said that if a Black family bought a house in Levittown, white families would stop buying there. In 1954 he told the *Saturday Evening Post*: "We can solve a housing problem, or we can solve a racial problem. But we cannot combine the two."

1950 to 2000

After 1950 the house in the suburbs became the common picture of American family life. Home ownership rose from 43.6 of every 100 households in 1940 to 61.9 in 1960. Lenders and sellers kept Black families out of many of the new suburbs. In Levittown, Pennsylvania, a mob attacked the house of the first Black family to move in. Inside their homes, families planned their evenings around the new television set. Later in the century, more mothers took paid jobs and the divorce rate more than doubled. Some parents began to teach their children at home.

Suburbia as the norm

Between 1946 and 1964, 76 million babies were born in the United States. People call these years the baby boom. Builders put up more towns like Levittown, including a second Levittown in Pennsylvania from 1952. From 1949 Levitt and Sons also sold ranch houses there.

After the 1948 Supreme Court ruling, builders, sellers and lenders kept up redlining and whites-only sales for many years. Activists campaigned against these practices. In 1968 members of Congress passed the Fair Housing Act, which made it against the law to refuse to sell or rent a home to someone because of race.

The TV in the living room

Most American families bought their first television set in the 1950s. About 9 of every 100 households had a set in 1950. By 1955 the figure was 64.5, and by 1960 it was 87. Families began to plan their evenings around the programs.

The household changes shape

The divorce rate more than doubled between 1960 and 1980. In 1960 there were 9.2 divorces each year for every 1,000 married women. By 1980 there were 22.6. The rate reached its peak in 1981 and then began to fall.

More mothers took paid jobs. In 1948 about 17 of every 100 married mothers were in the labor force, which means they worked for pay or were looking for paid work. By 1985 the figure was 61, and by 1995 it was about 70. Counting all mothers with children under 18, the share rose from 47 percent in 1975 to a peak of 73 percent in 2000, according to the Bureau of Labor Statistics, the federal office that keeps numbers on workers. With both parents at work, more families paid for day care.

Some children went home after school to an empty house. People called them latchkey children, because they carried their own key to the house. The people who counted them came up with very different numbers. A 1987 study by Census Bureau researchers found about 2.1 million children aged 5 to 13 regularly home alone. Advocacy groups, which campaign for a cause, estimated 6 to 7 million. In the fall of 1995 Census Bureau workers counted 6.9 million children aged 5 to 14, or 18 of every 100, who regularly looked after themselves. On average they spent six hours a week that way.

School comes home

In the 1970s and 1980s some parents began to teach their children at home instead of sending them to school. This is called homeschooling. Homeschooling had two separate starting points. John Holt wanted to change how schools taught, and in August 1977 he started a newsletter called *Growing Without Schooling*. On the religious side, Raymond Moore argued for keeping young children at home, in his 1981 book *Home Grown Kids*. In many states, homeschooling was against the law, or nearly impossible to do legally, into the 1980s. In the 1970s most state

laws did not say whether it was allowed, and many families taught their children in secret. In 1978 a judge in a Massachusetts court ruled that homeschooling was legal under three conditions. The parents had to be able to teach, they had to cover the required subjects, and they had to show that the children were learning. Over the next fifteen years, judges in other states ruled that homeschooling was legal, each state with its own rules.

In most homeschooling families the mother did the teaching, and many mothers stayed home to do it. Families also met in homeschool groups.

Daisy and William Myers

Who: The first Black family in Levittown, Pennsylvania: a war veteran, a teacher and their three small children, who stayed in their house while crowds attacked it.

When and where: 43 Deepgreen Lane, Levittown, Pennsylvania, from August 13, 1957, to 1961.

Movie: Crisis in Levittown (1957), a documentary by Lee Bobker and Lester Becker, filmed while the events were happening.

On August 13, 1957, William and Daisy Myers and their three small children moved into 43 Deepgreen Lane in Levittown, Pennsylvania. They were the first Black family to live in Levittown. William had served in the Army in the Second World War. Daisy was a teacher. Lewis Wechsler, a white Jewish friend, helped them arrange to buy the house.

Crowds of 200 to 1,000 people gathered on Deepgreen Lane for more than a week. People in the crowds threw rocks through the windows of the house and threw Molotov cocktails, bottles filled with fuel and set on fire. They burned crosses, one of them at the Wechsler house. For decades, members of the Ku Klux Klan, a group whose members bombed and attacked Black Americans, had burned crosses as a threat. In 2003 the justices of the US Supreme Court wrote that a burning cross is often meant to make its targets fear they will be attacked. Callers threatened the family by telephone. Milk, bread and oil stopped coming to the house. The Baltimore Sun's 1997 account does not say who stopped the deliveries. The family's fire insurance was canceled, and that account does not name the insurance company. On the seventh night more than 500 people gathered before state troopers, the state police, broke up the crowd.

Members of the Levittown Betterment Committee passed around a petition against letting Black families live in Levittown. A petition is a paper that many people sign to ask for something. The committee's members also organized the harassment of the family, the steady stream of acts meant to frighten them. A judge ordered the Betterment group to stop. Pennsylvania Governor George Leader sent the state police, and after about six

weeks the troopers had ended the open violence. A court found two people guilty of burning the cross on the Wechsler lawn. The Baltimore Sun's account does not name them.

Neighbors, Quaker families and church members brought the Myers family food and flowers. Quakers are members of a Christian church, the Society of Friends. The family stayed in the house until 1961, when they moved to York, Pennsylvania. Daisy Myers told the story in her memoir, *Sticks 'n Stones*, published in 2005. A memoir is a book a person writes about their own life.

Clyde Ross

Who: A Second World War veteran and soup-factory worker who could not get a mortgage and bought his Chicago house on contract.

When and where: North Lawndale, on Chicago's West Side, from 1961.

Clyde Ross bought a house in Chicago in 1961 on terms that let the seller take back everything if he missed a single payment. He was born in 1923 near Clarksdale, Mississippi. In the Second World War he was drafted, which means draft officials ordered him into the armed forces, and he served on Guam. In 1947 he moved to Chicago and took a job as a taster at Campbell's Soup.

Ross tried to get an ordinary mortgage for a house in another neighborhood. A loan officer told him there was no money to lend. The records do not name the officer or the bank. FHA officials rated neighborhoods where Black people lived "D," colored them red on their maps, and usually refused to back loans there.

In 1961 Ross bought a house in North Lawndale for 27,500 dollars. The seller was a speculator, a person who buys property to sell it again at a profit, and had paid 12,000 dollars for the house. Ross bought on contract. Under the contract the seller kept the deed, the paper that shows who owns a house, until Ross made the last payment. If Ross missed a single payment, he would lose his 1,000-dollar down payment, every monthly payment he had made, and the house. A 2014 account on BillMoyers.com gives the year as 1958 and the price as 27,000 dollars. The journalist Ta-Nehisi Coates cited one estimate that 85 of every 100 Black families who bought homes in Chicago bought them on contract.

In 1968 Ross joined the Contract Buyers League, a group of Black homeowners on Chicago's South and West Sides, and became its vice president. About 500 families in the league stopped making their payments together, as a strike against the contracts. By July 1971, the league and the sellers had worked out new terms for 155 contracts, saving each family an average of 14,000 dollars. About 70 league families lost their homes to eviction. The Chicago Reporter's account does not name who had each family put out. The league also took its fight to court and lost. Coates wrote that the league lost a jury trial in 1976. The Chicago Reporter says its last appeal, its last request for a higher court to change the ruling, was turned down in 1983. In 2014 Coates told Ross's story in *The Atlantic* magazine. Ross was 91, and he still lived in the house and owned it.

David and Micki Colfax and their sons

Who: Parents who built their own house on a ranch in California and taught their four sons at home.

When and where: Near Boonville, Mendocino County, California, from 1973.

David and Micki Colfax taught their four sons at home on a ranch in California, where the family built its own house. Their eldest son, Grant, started public school in St. Louis. After six weeks his parents took him out, because they found the lessons "very rote and uncreative." Rote learning means learning by repeating things over and over.

In 1973 the family moved to land near Boonville, in Mendocino County, California. The land had no house, no electricity and no running water. The Harvard Crimson gives the land as 40 acres, and the Anderson Valley Advertiser gives 50. Everyone, the young sons included, helped build the house, the barns and the sheds. The family raised goats, sheep, chickens and pigs and sold them to restaurants in San Francisco.

Lessons fit around the work of the ranch. "Some days we did a lot of homework, some days we had none," Reed Colfax said later. "It depended on the weather and what had to be done on the ranch." The boys studied four or five days a week, summers included. Grant, Drew and Reed went on to Harvard University and graduated in 1987, 1990 and 1992. The youngest son, Garth, was still being taught at home in 1989. That year about 500,000 American children were taught at home by their parents, according to a count reported in *The Harvard Crimson*. David and Micki Colfax wrote a book about their method, *Homeschooling for Excellence*.

2000 to Today

New American houses kept growing larger until 2015, while households kept growing smaller. In the crash that began in 2007, lenders took back millions of homes from families who could not pay their loans. In 2020, during the pandemic, a worldwide outbreak of disease, many homes became an office and a school at the same time.

More house, fewer people

The median house is the one in the middle when all are ranked by size. By Census Bureau figures, the median new house built for one family grew from 983 square feet in 1950 to a peak of 2,467 square feet in 2015. Households shrank over many of the same years. By the Census Bureau's count, the average household held 3.67 people in 1940 and 2.50 people in 2025.

The kinds of households changed too, by the Census Bureau's count. In 2025, 29 of every 100 households were one person living alone, up from 20 in 1975, and married couples made up 47, down from 66. That year 58 of every 100 young adults aged 18 to 24 lived in their parents' home.

By the Census Bureau's count, 65 of every 100 households owned their home in the second quarter of 2026, the months of April, May and June.

2008 at the kitchen table

Between 2007 and 2010, lenders foreclosed on about 3.8 million homes. Estimates for the whole crisis run from about 7.7 million to 10 million homes lost, because researchers counted in different ways. Federal Reserve History, a website of the Federal Reserve, the country's central bank, and the Federal Reserve Bank of Chicago list these figures.

In the years before the crash, lenders made many subprime loans. A subprime loan is a loan made at a higher cost to a borrower with weaker credit, a weaker record of paying back debts. In 2009 reporters at the Center for Public Integrity, a news organization, ranked Countrywide Financial the largest subprime lender of 2005 to 2007. They found that Countrywide made at least 97.2 billion dollars in high-interest loans in those years. Angelo Mozilo founded the company and ran it for 39 years.

A foreclosure filing is the paper a lender files to start taking back a home. Foreclosure filings reached their peak in 2010, at nearly 2.9 million homes. In 2025 there were 367,460, according to ATTOM, a private company that collects property records.

More Americans came to live in households of several generations, such as grandparents, parents and children together. Researchers at the Pew Research Center, which studies American life, counted them. In 1971, 7 of every 100 Americans lived in such a household. By 2021 the share was 18 of every 100, or 59.7 million people. The number grew faster during the years of the crash than in the years before.

Homelessness, counted

Each January, local volunteers count the people who are homeless on a single night. Officials of the US Department of Housing and Urban Development (HUD), the federal housing department, report the count. In January 2024 volunteers counted 771,480 people, the highest number on record and 18 percent more than a year before. The number of homeless people in families with children rose 39 percent in that year.

In January 2025 the count was 745,652 people. HUD officials called the change a drop of 3 percent. The National Low Income Housing Coalition gave the drop as 3.4 percent. People in families with children fell 11 percent, to 230,366. The number of people counted as chronically homeless, homeless for a long time, reached 155,750, the highest on record.

2020: office and school at once

In 2020 many homes became a workplace and a classroom at once. The share of workers who worked mainly from home tripled, from 5.7 percent in 2019 to 17.9 percent in 2021, according to the Census Bureau's American Community Survey. In 2025 nearly 22 percent of workers worked from home at least part of the time, according to Census data reported by the Federal Reserve Bank of Minneapolis.

Homeschooling rose too. Here homeschooling means that the family taught the children, not that teachers at a school taught them online. In the spring of 2020, 5.4 percent of households with school-age children were homeschooling. By the fall of 2020 the figure was 11.1 percent, according to the Census Bureau's Household Pulse Survey. Among Black households it rose from 3.3 to 16.1 percent.

Many children did their schoolwork online, and some homes had no fast internet connection. Broadband is the fast home internet used for online classes. Pew researchers reported that 35 percent of households with children aged 6 to 17 and incomes under 30,000 dollars a year had no broadband. Among households with incomes over 75,000 dollars, 6 percent had none.

In a survey by the National Center for Education Statistics, parents reported that 5.2 percent of children aged 5 to 17 learned at home in the 2022-23 school year. That count includes children in full-time online school. In 2018-19 the figure had been 3.7 percent. The 2020 survey and this survey asked different questions, so the exact trend cannot be measured. The share learning at home in 2022-23 was higher than before the pandemic and much lower than in the fall of 2020.

Pierre Solon and Katty Familia

Who: Immigrant parents, from Haiti and the Dominican Republic, who lost their Boston house to foreclosure.

When and where: Hyde Park, Boston, Massachusetts, about 2006 to 2010.

Pierre Solon and Katty Familia lost their house in Boston in 2009. Solon came from Haiti and Familia from the Dominican Republic. In about 2006 they bought a green wooden house in Boston's Hyde Park neighborhood for 584,000 dollars. They borrowed the whole price. The loans came from Fremont Investment and Loan, a subprime lender. Their lawyer was Nadine Cohen of Greater Boston Legal Services. She said the two mortgage payments came to almost 5,000 dollars a month more than the couple's whole income.

Each parent worked two jobs. Then each lost one. "Sometimes we don't even have food," Katty Familia said. The couple fell more than 150,000 dollars behind. Staff at Wells Fargo, the bank that collected their payments, offered lower monthly payments on a debt that would have grown to more than 600,000 dollars. The couple turned the offer down. Wells Fargo's staff then foreclosed, and late in 2009 the family moved out with their children.

In November 2010 Wells Fargo sold the house at auction, a sale where the highest bidder wins, to an investor, a buyer who hopes to sell later for more, for 115,000 dollars. Two weeks later that investor sold it to another investor for 270,000 dollars. The Massachusetts Attorney General, the state's top lawyer, sued Fremont for deceptive lending, which means lending by misleading borrowers. Fremont sold its loans to investors, then went bankrupt, which means it could not pay its debts, and closed. In 2010 the couple ran a day care center in Boston. "I worked 20 years in this country for this," Katty Familia said. The reporter Anthony Brooks told their story on the radio program *Morning Edition*, on NPR, in December 2010.

The Munoz family

Who: A Las Vegas family whose four school-age children did school online at the dining room table while both parents went out to work.

When and where: Las Vegas, Nevada, August 2020.

In August 2020, four of the five Munoz children in Las Vegas, Nevada, started the school year on laptops at the dining room table. Both parents worked in the food industry, away from home. While they were at work, the family's 10th-grade son helped the younger children. He worked with a fourth-grader with reading and a new middle-schooler with writing. When he had trouble, he emailed the teachers.

The father, Johnathan Munoz, recorded the family's first week as an audio diary for NPR's radio program *Weekend Edition Sunday*. On the second day he said, "it was a challenge because we couldn't log in." The middle-schooler said that one teacher kept marking her absent. Another teacher did not allow a brother or sister to be seen in the background.

PART 3

Making and Building

Chapter 8: Technology

Before 1500

Before 1500, people in North America made their tools from wood, stone, bone, clay, animal skin and, near Lake Superior, copper. Without any metal machines, they built traps that caught fish with the tide, fields that grew three crops together, and boats made of birch bark. The names of the people who first worked out these methods are not recorded. Some of the methods are still practiced today.

Weapons and food machines

Before the bow and arrow, hunters in western North America threw spears with an atlatl. An atlatl is a spear-thrower, a stick that holds the back end of the spear while the hunter throws it.

About 1,400 years ago, around the years A.D. 600 to 700, hunters across the West began using the bow and arrow. A study published in 2026 in the *Journal of Archaeological Method and Theory* states that date. South of an east-west line called the 55th parallel, archaeologists stop finding atlatls soon after the bow appears. Archaeologists are scientists who dig up and study objects people left behind. North of that line, hunters used both weapons side by side for more than 1,000 years.

People also built fixed traps to catch fish. A fish weir is a fence of wooden stakes set across the water, with bundles of brush woven between the stakes. Fish swim in over the mud flats with the rising tide, and the fence traps them when the water goes out. People then scooped them up with baskets and nets, or caught them by hand. Lines of wooden stakes from fish weirs lie under Boylston Street in Boston. People built these weirs in channels that filled and emptied with the tide, between about 4,700 and 3,700 years ago. They used them for more than a thousand years, until mud filled the bay around 1550 B.C., about 3,500 years ago.

Native farmers planted corn, beans and squash together in the same field. These three crops are called the Three Sisters. People also set controlled fires, which means fires they started on purpose and kept in bounds, to shape the land.

Built crafts and a calendar in wood

People made pottery from clay and wove baskets. They tanned animal hides, which means they treated the skins so they would not rot and would stay soft, and they made canoes from the bark of birch trees.

At Cahokia, in what is now Illinois, people built the largest city north of Mexico before 1500. Between about A.D. 900 and 1100, builders there raised five circles of upright wooden posts, one after another. Each circle had between 24 and 72 posts and measured about 240 to 475 feet (73 to 145 meters) across. The posts marked the places on the horizon where the sun rose at different times of the year, so the circles worked as a calendar.

Near Lake Superior, people worked copper for thousands of years. They worked the copper cold, which means they shaped it without melting it.

Wayne Valliere

Who: An Ojibwe builder of birchbark canoes and a teacher of the Ojibwe language. A National Heritage Fellow of the National Endowment for the Arts in 2020.

When and where: Lac du Flambeau, Wisconsin, in the present day.

Birchbark canoes were among the boats people built before 1500, and Wayne Valliere builds them today. He is a member of the Lac du Flambeau Band of Lake Superior Ojibwe, in Wisconsin. The National Endowment for the Arts is a US government agency that gives money and honors to artists. Its profile of Valliere describes the Ojibwe way of building canoes as handed down over many generations.

According to the profile, Valliere began learning at 16. He learned from elders, among them Joe Chosa, Marvin DeFoe and Ojaanimigiizhig. He also studied old objects kept in museums, along with writings and photographs.

Valliere builds each canoe from birchbark, cedar, spruce roots and pitch. The hull, the body of the boat, is thick birchbark. Ribs of straight-grained cedar hold the hull in shape, and spruce roots serve as thread to sew the pieces of bark together. Pitch, a sticky tree sap, is mixed with oak ash and deer tallow, which is fat from a deer, to seal the seams against water. The builder gathers each material in a different season of the year.

Valliere has taught more than 100 students. At least one of them now builds canoes without his help. A second is learning as an apprentice, a beginner who learns a craft by working beside a master. Valliere also teaches the Ojibwe language at Lac du Flambeau

> Public School. In 2020 he received a National Heritage Fellowship from the National Endowment for the Arts. It is the highest honor in the United States for folk and traditional arts, the crafts and music that families and communities hand down.

The 1500s

European metal reached Native towns on the East Coast in the 1500s, before most Europeans did. Native smiths, people who shape metal into tools, cut European copper and brass into tools of their own design. Brass is a yellow metal made by melting copper and zinc together.

Kettle metal, new tools

Copper and brass from Europe reached the East Coast through trade with Europeans along the shore. Both metals had been made in European furnaces from rock dug out of the ground. Native traders passed the metal from one group to the next, so it spread along the East Coast ahead of most Europeans. In 1524 Verrazzano, a European sailing along the Northeast coast, wrote that the Native people there had sheets of worked copper.

Some of the metal came as kettles, large cooking pots. Native smiths cut the kettles apart and hammered the pieces into arrow points, knives, pipe stems, bells and ornaments. They took the new metal and made it into the tools and goods they already used.

Spanish expeditions, groups of men sent out to explore, also crossed parts of what is now the United States in the 1500s, through lands where Native nations lived. The men on these expeditions carried iron weapons and tools. No lasting trade in tools followed their visits.

The 1600s

English colonists built water-powered mills and ironworks here in the 1600s. An ironworks is a place where workers make iron from rock dug out of the ground. Colonists dammed streams to turn waterwheels. The wheels drove grist mills, which ground grain into flour, and sawmills, which cut logs into boards. At the ironworks they worked the bellows and hammers. The first ironworks begun in the English colonies stood on Powhatan land in Virginia. The first one that ran for years stood on Pawtucket land in Massachusetts. Its workers were skilled English ironworkers, nearby farmers, at least two Native woodcutters, and Scottish prisoners of war who were forced to work there for seven years.

Falling Creek, 1619 to 1622

At Falling Creek, Virginia, colonists began the first ironworks in the English colonies. They began building it on Powhatan land at the falls of the James River, where the river drops over rocks, near present-day Richmond. The Virginia Company was the English company that ran the colony. Its officers hired Captain Benjamin Bluett in 1619 to run the ironworks. Chesterfield County's history of the site states that he sailed with 80 men. A county tourism page gives the number as 150.

Bluett died on the voyage or soon after he arrived. Others of his men died too, of what colonists called seasoning. Seasoning was the sickness that killed between 50 and 90 percent of early newcomers, according to the county's history. The men who lived could not finish the furnace, the tall oven where iron is melted out of rock. In 1621 company officers hired John Berkeley to take over. He sailed with his son Maurice and 25 other men, according to the county. He promised iron by June 9, 1622.

Opechancanough, a Powhatan leader, planned an attack on English settlements across the colony. From 1618 to 1620, English tobacco planters, owners of large farms called plantations, had taken Powhatan land without paying for it. Virginia Company officials had also pressed to take Powhatan children for English schooling.

On March 22, 1622, Powhatan warriors attacked the ironworks. They killed 27 English people there, John Berkeley among them. Two children at Falling Creek survived. The warriors left the works in ruins. Across the colony that day, Powhatan warriors killed about 350 English colonists. Maurice Berkeley was away from the works and lived. He tried to start the ironworks again and failed. Sir John Zouch tried again from 1634 to 1636 and also failed.

The records disagree about whether Falling Creek ever made iron. Virginia's official list of historic places states that workers produced iron there in 1620. The county's history states that Bluett's men could not finish the furnace, and in 1621 Berkeley was still promising iron for the next year.

Iron from water power at Saugus

The first ironworks in the English colonies that ran for years stood on the Saugus River in Massachusetts. By 1643 John Winthrop Jr. had gathered about two dozen investors for it, people who put in money hoping for a profit. They formed the Company of Undertakers of the Iron Works in New England. Undertakers here meant people who take on a big job. The works ran from 1646 to about 1670.

Seven waterwheels drove three kinds of machine. The first was a blast furnace, a tall furnace for melting iron out of rock. Air blown into its fire made the fire hot enough to do it. Bellows, giant bags that squeeze air into a fire, pumped the air. They were 18 feet long, and the fire reached about 3,000 degrees Fahrenheit. Next came a forge, where 10 to 12 men hammered the iron. The last was a rolling and slitting mill, which pressed iron into flat sheets and cut it into thin rods.

The ironworks burned more than 3,600 cords of wood a year. A cord is a stack of wood 8 feet long, 4 feet wide and 4 feet high. Workers cut the wood with axes and saws made at the works.

The Saugus works closed because of debt, high costs and competition from iron brought in from overseas. The men who had lent money sued. Some of the ironworkers, such as James Leonard, went on to run forges in other places. The works have been rebuilt on the old site, which is now the Saugus Iron Works National Historic Site.

Who did the work at Saugus

The Saugus works stood on the land of the Pawtucket, the Native people who lived there when the English arrived. Saugus had been a Native settlement. The English first called it Lynn. About 100 people worked at the ironworks. They lived in a village the company owned, called Hammersmith after the English town that many of the ironworkers came from.

The company's managers brought skilled ironworkers over from the iron-making parts of England. Colonists from nearby farms did the unskilled work. Company records show that at least two Native people cut wood for the same wages as the other workers. The records do not give their names.

Some of the workers were prisoners of war. In September 1650, Oliver Cromwell's English soldiers defeated a Scottish army at Dunbar, in Scotland, and captured Scottish soldiers. Members of England's Council of State, the group of leaders that ran England's government at the time, ordered 150 of the prisoners handed over. Sir Arthur Haselrig gave them to agents of John Becx and Joshua Foote, two of the company's investors. The agents shipped the prisoners across the ocean on the ship *Unity*, which left Gravesend, England, on November 11, 1650. How many died on the voyage is not known.

The company's agents kept 62 of the Scots. About 36 of them reached Saugus in December 1650, and the agents put them to work there. A National Park Service history states the number as about 35, arriving in 1651. The company's agents held the Scots to seven years of forced labor. The papers that bound them were called indentures. An indenture is a written contract

that requires a person to work for a master for a set number of years. The Scots cut wood, worked as colliers, who make charcoal, and did other labor. They received clothing, food and tobacco.

Some of the Scots are known by name. A list of 35 Scots at the works in 1653 includes James Adams, John Clark, Alexander Innes, Peter Grant, John Stewart and Thomas Tower. A November 1653 list of the property of the works includes Alexander Innes, with a value of 10 pounds. The Scottish Prisoners of War Society prints these lists from the company's record books.

At the forge, flying sparks and pieces of hot metal were a constant danger to the men. The forge hammer weighed 500 pounds. Many workers lost their hearing from its noise. The surviving records of the works do not give a count of deaths.

The Cambridge printing press

The first printing press in the English colonies arrived in Cambridge, Massachusetts, in 1638. A printing press is a machine that presses paper down hard onto metal letters covered in ink. The Reverend Jose Glover, a minister, bought the press and hired a locksmith named Stephen Daye to run it. Glover died on the voyage across the ocean. His widow, Elizabeth Glover, owned the press, and Daye ran it.

In 1640 Daye printed the *Bay Psalm Book* on the press. It was a book of psalms, the religious songs of the Bible, and it was the first book printed in what is now the United States.

Joseph Jenks

Who: A sword maker from London who had worked at a water-powered sword mill at Hounslow, England, and then ran the blacksmith shop at the Saugus ironworks. US Patent Office officials credit him with the first patent for a machine in what is now the United States.

When and where: Saugus, then part of Lynn, Massachusetts. At the works from 1646. Died in 1683.

US Patent Office officials credit Joseph Jenks with the first patent for a machine in what is now the United States. A National Park Service page about his shop states this. A patent is a government grant that gives an inventor the only right to make and sell an invention for a set number of years. Massachusetts leaders granted Jenks his patent in 1646.

Jenks was born in about August 1599 and baptized in a church in London. His father was a cutler, a maker of knives. In the 1630s Jenks worked for a sword maker named Benjamin Stone, who ran a sword mill powered by water at Hounslow, England. A sword

marked with Jenks's name as its maker survives in a museum in Wales. He next appears in court records in the Kittery area of Maine.

In May 1646 Jenks asked the Massachusetts General Court for the only right, for 14 years, to build water-driven mills. The General Court was the group of leaders who made the colony's laws. The mills would make scythes, long curved blades for cutting grass. He also asked to build "a new Invented Saw Mill" and other machines for making tools with edges. He explained why he wanted protection. Without it, he wrote, "Another when he seeth it makes the like." He went on, "and soe I loose the benefit." He meant that another man would see his machine and copy it, and Jenks would lose the profit. The court's magistrates, the leaders who sat as its judges, granted his request. His petition, the written request, survives in the Massachusetts Archives. The copy there is dated May 10, 1646.

On January 20, 1647, Richard Leader, the agent in charge of the ironworks, let Jenks build a water-driven hammer at the tail of the blast furnace. It ran on the water that had already turned the furnace wheel. The company owned the shop, and Jenks paid rent. There he made saw blades, felling saws for cutting down trees, and steelyards, which are weighing scales. He also drew iron into fine wire, which means he pulled it through small holes to make it thin. In 1652 he sent two saw blades for a water-powered sawmill that John Winthrop Jr. ran in Connecticut.

The ironworks company went bankrupt, which means it could not pay its debts. In September 1656 Jenks bought a share of his shop, and in October the rolling and slitting mill, with a loan from Simon Bradstreet.

By October 1667 he was "very weak in estate," which meant he had little money. He asked the court for 50 pounds to start making iron wire. He died in March 1683. His son, Joseph Jenks Jr., began working at Saugus at 16 in 1649 and built his own forge in the town of Pawtucket, Rhode Island, in 1672. That town is a different place from the land of the Pawtucket people at Saugus.

In 1952 the archaeologist Roland Robbins dug up the site of Jenks's shop. He found waterwheels, the supports of a water-driven hammer, an anvil base and a stone forge. A marker put up in 1898 states that Jenks made the dies, the stamps, for the first silver coins made in New England in 1652. No document from the time shows that he did.

1700 to 1750

At the Baltimore Iron Works in Maryland, which opened in 1731, 42 of the first 89 workers were enslaved. It was one of many iron furnaces and forges that colonists built in Pennsylvania, Maryland and Virginia between 1700 and 1750. Waterwheels still drove the machines, and the furnaces still burned charcoal. In Philadelphia, the printer Benjamin Franklin designed a new kind of stove in 1741 or 1742 and refused to patent it.

The Franklin stove

Benjamin Franklin designed a stove that sent more of a fire's heat into the room and less of it up the chimney. He made it in 1741 or 1742. The Franklin Institute, a science museum in Philadelphia, states 1742 in its history of his inventions.

Franklin's stove was a fireplace lined with metal. It stood a few inches out from the chimney. At the back was a hollow iron wall, called a baffle. Air from the room flowed into the baffle, picked up the fire's heat and came back out into the room. Behind the baffle was a U-shaped passage called an inverted siphon. The smoke had to go up over the baffle, down behind it and only then up the chimney. On that longer path, the iron took in more of the smoke's heat. The stove also made less smoke than an ordinary fireplace.

Franklin refused to patent the stove. He gave his reason later in his autobiography, the story of his life that he wrote himself. He wrote: "That as we enjoy great Advantages from the Inventions of others, we should be glad of an Opportunity to serve others by any Invention of ours." He went on: "and this we should do freely and generously." He meant that everyone gains from other people's inventions, so people should share their own inventions for free. He never patented any of his inventions.

Who worked the iron furnaces

Many of the workers at the Maryland ironworks were enslaved people or convicts. In 1719, investors in Britain set up the Principio Company in Cecil County, Maryland. In 1731 five Maryland planters founded the Baltimore Iron Works on the Patapsco River. They were Dr. Charles Carroll, another man named Charles Carroll, Daniel Carroll, Daniel Dulaney and Benjamin Tasker. Dr. Carroll put in 2,200 acres of land and served as the first manager. The five partners supplied the money and the enslaved workers.

The Patapsco valley lay in a region where the Susquehannock and the Piscataway lived. In 1652 five Susquehannock war chiefs had signed a treaty, a written agreement between nations, with Maryland colonial officials. In it they gave up their claim to the western shore of the Chesapeake Bay from the Patuxent River north to Palmer's Island. That stretch of shore includes the Patapsco. Emma Bilski, a history graduate student at Johns Hopkins University, points out that the land was not really the Susquehannock's to give away. Other nations, such as the Piscataway, lived in the region too.

The Baltimore Iron Works opened with 89 workers. Forty-two of them were enslaved. Over the years, many other workers there were convicts. They were people found guilty of crimes in Britain. Under a British law of 1718, English judges sentenced many such people to be shipped to the colonies. Merchants who held contracts with the British government carried them across the ocean and sold their labor to colonists, most often for seven years. Iron makers were among the buyers. The managers of the Baltimore Iron Works preferred enslaved workers to convicts. Many of the enslaved ironworkers were Igbo people from West Africa, who brought their own skill at working metal. By 1785 an advertisement for the works listed a workforce of "more than 200 Negroes." Negro was a word used then for a Black person.

The workers hauled charcoal, oyster shells and iron ore to the top of the furnace. They worked 12-hour shifts, day and night, six or seven days a week. The owners lived away from the works and often quarreled, and they refused to send the food and workers they had promised. In 1775 the manager, Clement Brooke, wrote to the partners: "I cannot do my job unless you send more slaves and more corn." The Mount Clare Museum's history of the works states that the workers and the animals were starving.

Each of the five owners took one fifth of the iron. In good years the partners earned 55 percent on their money each year. The works closed in 1799. In 1810 the 30 heirs of the original owners, the people who had inherited their shares, had the land that was left sold at auction. It came to more than 30,000 acres. The heirs had 200 enslaved people sold at the same auction.

Some workers ran away. In August 1754 the *Maryland Gazette* newspaper printed a notice for the capture of people who had escaped. Others worked slowly. In the spring of 1771, an enslaved blacksmith named Anthony and an indentured servant named Thomas Livy were jailed for robbing a store. They were caught with the stolen goods, most likely food. The Mount Clare Museum's account of the case does not say who caught them or who jailed them. The overseer, the man in charge of the workers, was William Hammond. He wrote about Anthony: "We shall feel the loss of Anthony's time very much, I cannot tell how we can carry on the Forge business without him."

Benjamin Franklin

Who: A Philadelphia printer who designed the Franklin stove and later the lightning rod. He refused to patent any of his inventions.

When and where: Born in Boston in 1706. Worked in Philadelphia. Died there in 1790.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS. It is about Franklin's life.

The printer Benjamin Franklin also designed devices for homes and buildings. He was born in Boston on January 17, 1706. Under the calendar used in the colonies at the time, the date was January 6. He made his living in Philadelphia, where he printed a newspaper and a yearly almanac, a book of calendars, weather guesses and sayings.

In 1741 or 1742 he designed the Franklin stove, a metal fireplace that put more of a fire's heat into the room. In the 1750s he designed the lightning rod, an iron rod that protects a building from lightning. He also ran experiments with electricity.

Franklin took out no patent on any of these inventions. In his autobiography he wrote that people gain from the inventions of others, so they should share their own inventions "freely and generously."

Franklin died in Philadelphia on April 17, 1790.

1750 to 1800

Benjamin Franklin's lightning rods went up on Philadelphia roofs in the 1750s. By 1755 the first steam engine in America was pumping water from a New Jersey mine. In 1790 Samuel Slater's cotton-spinning mill began work at Pawtucket, Rhode Island. It was the start of the factory cloth industry in the United States, and Slater hired children to run its machines. In 1793 Eli Whitney built the cotton gin. One small gin could clean about 50 pounds of cotton a day, work that took several hundred hours by hand. Planters then grew far more cotton, from fewer than 9,000 bales a year around 1790 to more than 200,000 by 1800. A bale is a large bundle of cotton pressed tight and tied. Planters also held far more people in slavery to grow it. About 700,000 people were enslaved in the United States in 1790. By 1860 the number was nearly 4 million.

The lightning rod

In a letter of 1750 to Peter Collinson, Franklin described a way to protect buildings from what he called "electrical fire." In 1752 there were lightning tests in France and then Franklin's own kite test. After those tests, the first lightning rods went up on buildings in Philadelphia.

Franklin printed instructions for making one in *Poor Richard's Almanack* for 1753. He told readers to take a small iron rod. One end went three or four feet into moist ground. The other end stood six or eight feet above the top of the building. A foot of brass wire, sharpened to a fine point, went on the top end. Small staples held the rod to the house. When lightning struck, it would hit the point and pass through the metal into the ground, "without hurting any Thing," Franklin wrote. The Franklin Institute's history of his inventions states that pointed rods soon stood on buildings throughout the colonies.

The first steam engine in America

The first steam engine in America pumped water out of a mine. It was ordered from England in 1748 for Colonel John Schuyler's copper mine, in what is now North Arlington, New Jersey. The parts arrived in 1753. An engine builder named Josiah Hornblower put it together, and it was pumping by 1755.

It was a Newcomen engine, named for Thomas Newcomen, who built the first one in England in 1712. A boiler filled a large tube, called a cylinder, with steam. Then a spray of cold water turned the steam back into water, which left the cylinder nearly empty. The weight of the air outside pushed a piston, a tight-fitting plug, down into the cylinder. The piston pulled one end of a big rocking beam, and the other end of the beam worked the pump in the mine.

The cotton gin and what it did

Upland cotton has sticky seeds caught in its fiber. Before 1793, enslaved people pulled the seeds out by hand. One worker needed many hours to clean a single pound of cotton. Planters could grow only as much cotton as their workers could clean.

Eli Whitney's cotton gin did the cleaning by machine. It used two cylinders that combed the cotton through small holes. The seeds could not pass through the holes and stayed behind. A history of the gin by the Eli Whitney Museum states that one small gin could clean 50 pounds of cotton a day. By hand, that much cotton took several hundred hours of work.

Planters used the gin to grow far more cotton. Across the United States they grew fewer than 9,000 bales of cotton a year around 1790, more than 200,000 bales by 1800 and about 4 million by 1860. A bale is a large bundle of cotton pressed tight and tied.

With the gin cleaning cotton so fast, planters wanted far more enslaved people to grow and pick it. The 1790 census, the government's count of everyone in the country, counted 697,897 enslaved people in the United States. By 1860 there were nearly 4 million, and about 2.5 million of them lived in the cotton-growing regions from eastern Maryland to Texas. Slaveholders spread slavery west across the South.

Enslaved people picked the cotton by hand in the summer sun, about 200 pounds each a day. Solomon Northup was a free Black man from New York. Kidnappers seized him in Washington, D.C., in 1841 and forced him into slavery. Slaveholders held him for twelve years. He picked cotton on Edwin Epps's plantation in Louisiana until he was rescued in 1853.

In his book *Twelve Years a Slave*, published that year, Northup described the rule: "An ordinary day's work is two hundred pounds. A slave who is accustomed to picking, is punished, if he or she brings in a less quantity than that." Each night the cotton was weighed at the gin-house, the building where the gin stood. "After weighing, follow the whippings," Northup wrote.

The punishment was the lash. A lash is one stroke of a whip on a person's bare body. Northup wrote that twenty-five lashes were "deemed a mere brush," which means they were thought of as a small punishment. Fifty was "the ordinary penalty," and one hundred was "called severe." Northup described Epps himself seizing the whip and lashing the people he enslaved. Epps once forced Northup to whip an enslaved woman named Patsey, and then took the whip himself. Northup wrote that her back was "covered with long welts," raised and swollen stripes. He wrote that "the lash was wet with blood," meaning the whip itself. Epps then had her washed with salt and water.

Enslaved people also ran the gins and the cotton presses, the machines that squeezed cotton into bales. The machines had many moving parts that could catch and injure a worker. The tiny cotton fibers the gins threw into the air damaged the workers' lungs.

The profit went to the people who owned the plantations. With the gin, Southern plantation owners gained money and political power. Their cotton supplied cloth mills in the Northern states and in Britain. By 1830, cloth and other finished cotton goods were the largest group of factory-made goods the country sold to other countries.

Planters also wanted new land for cotton. The Eli Whitney Museum's history of the gin states that this demand was "a major factor" in the removal of five Native nations from their homelands in the Southeast. They were the Cherokee, Chickasaw, Choctaw, Muscogee (Creek) and Seminole. On May 28, 1830, President Andrew Jackson signed the Indian Removal Act.

Under it, the president could trade land west of the Mississippi River for the lands of Native nations inside the states. US officials then forced the five nations west to Indian Territory. That land is now part of the state of Oklahoma. At least 60,000 people were forced to make the journey, and more than 8,000 of them died on the way.

In 1838 US Army soldiers under General Winfield Scott began forcing the Cherokee out of their homeland. Scott was sent to another post soon after the removal began. In the fall and winter of 1838 and 1839, about 4,000 Cherokee died on the march west that the soldiers forced them to make. The soldiers first held them in crowded, dirty camps, where many died. On the march they faced heavy rain, rivers blocked by ice and too little food. Many died of illness, and some died of disease after drinking dirty standing water. White landowners took the land the five nations had been forced to leave.

Eli Whitney

Who: The builder of the cotton gin, patented in 1794. He also promoted the idea of machine-made, interchangeable gun parts, which the workers at his own factory never managed to make.
When and where: Georgia and New Haven, Connecticut. Born 1765, died 1825.

The patent on the cotton gin belonged to Eli Whitney. He was born in Westborough, Massachusetts, on December 8, 1765. He graduated from Yale College in 1792 and traveled south to work as a tutor, a private teacher.

On the way, Catherine Littlefield Greene invited him to her plantation, Mulberry Grove, north of Savannah, Georgia. She was the widow of General Nathanael Greene, who had died in 1786 and left her dozens of enslaved people. Enslaved workers on the plantation grew mostly rice and some cotton. There, in 1793, Whitney built the machine that pulled cotton fiber away from its seeds. He applied for a patent in 1794, and the patent was granted on March 14, 1794.

Whitney held the patent. In 1870 the women's rights activist Matilda Joslyn Gage wrote that Catherine Greene invented the cotton gin. The Eli Whitney Museum states that it "has been suggested that Catherine Greene also contributed ideas to the design." The record does not settle how much of the design was hers.

In 1798 Whitney signed a contract to make muskets for the federal government. He promoted the idea of making gun parts by machine, so that any part would fit any gun of the same model. Parts like these are called interchangeable parts. According to a famous story, Whitney showed government officials such parts in 1801.

In 1960 the historian Robert S. Woodbury showed that Whitney did not start the idea of interchangeable parts. The credit people gave Whitney for it rests on a myth. Gunmakers at French armories, factories that made weapons, had worked on the idea before Whitney. Workers at Whitney's own factory never made parts that truly fit any gun. The best-documented first American use of interchangeable parts in a factory came at John H. Hall's rifle works at the Harpers Ferry armory. Hall's workers were putting rifles together from interchangeable parts by 1819.

Whitney died in New Haven, Connecticut, on January 8, 1825.

Samuel Slater

Who: An English mill worker who rebuilt English spinning machines from memory at Pawtucket, the start of the American factory cloth industry. He hired children to run the machines.

When and where: Trained in Derbyshire, England. The mill ran at Pawtucket, Rhode Island, from December 1790.

Samuel Slater rebuilt English cotton-spinning machines from memory in the United States. In England, Richard Arkwright had patented a spinning machine in 1769. It was called the water frame because a waterwheel drove it. Arkwright and his partners built a mill several floors high at Cromford, in Derbyshire, with waterwheels to drive the machines. He moved cotton spinning out of homes and into powered mills with hundreds of workers. Other mill owners copied his system.

Slater trained in a mill in Derbyshire that used Arkwright's machines. British law did not allow machines for making cloth to leave the country. It also did not allow skilled cloth-mill workers to move abroad. In 1789 Slater left England without telling officials that he was a trained mill worker.

In December 1789 Moses Brown hired him. Brown's family firm, Almy & Brown, put up the money and the building. With local mechanics, people who build and repair machines, among them the Wilkinson family, Slater rebuilt the carding and spinning machines from memory. A carding machine combs raw cotton so the fibers lie straight. A spinning machine twists the fibers into thread, called yarn. The machines at Pawtucket spun their first yarn in December 1790.

Slater had worked in a factory for part of his own childhood. At Pawtucket he hired children to run the machines. The machines were built for children to run. Most of the children at Slater's mill were about 10 years old. Some were as young as six. They were

> paid by the hour, and they earned much less than adults. In 1801 a Boston politician described mills that employed "children from four to Ten years old." In the mill villages that grew up later, the child workers were 8 to 14 years old. The names of the first children who worked for Slater are not recorded.

1800 to 1850

Between 1831 and 1846, inventors in the United States built machines to cut grain, plow prairie soil and sew cloth. Charles Goodyear found a way to treat rubber with sulfur so that heat did not melt it. In 1839 people in Philadelphia made a new French way of taking photographs work within weeks of hearing about it. On May 24, 1844, Samuel Morse sent a message by electric telegraph from Washington to Baltimore, 40 miles away. Morse, Goodyear, the sewing machine maker Elias Howe and the reaper maker Cyrus McCormick each held a patent. A patent is a government grant that gives an inventor the only right to make and sell an invention for a set number of years. The men whose names went on the patents had help. Morse's partner Alfred Vail built the telegraph instruments. Jo Anderson, a man enslaved by the McCormick family, worked on the first McCormick reaper.

The telegraph, 1844

The electric telegraph sent messages as pulses of electricity through a wire. At the receiving end, each pulse worked an electromagnet, a magnet that works only while electricity flows through it. The magnet moved an arm with a pen-like point, called a stylus. A clockwork motor, which ran on gears like the inside of a wind-up clock, pulled a strip of paper tape past the stylus. For each pulse, the stylus pressed a small dent into the tape, a short one for a dot or a longer one for a dash. Every letter and number had its own pattern of dots and dashes, and that pattern is called Morse code.

In 1843 Morse asked Congress for $30,000 to build a telegraph line from Washington to Baltimore. Members of the House and then senators voted for the money, and President John Tyler signed the bill. Ezra Cornell's job was to lay the wire underground. When Cornell ran into bad wire, he suggested stringing the wires overhead on trees and poles instead. A signal in a long wire grows weaker as it goes. Leonard Gale showed Morse how to boost it at points along the line with a device called a relay.

On May 24, 1844, Morse sent the first public message over the line from the US Capitol in Washington. Alfred Vail received it in Baltimore. The words were "What hath God wrought," from the Bible, in the book of Numbers, chapter 23, verse 23. They mean "What has God done." Annie G. Ellsworth chose them. She was the daughter of the commissioner of the Patent Office, the head of the government office that grants patents. The paper tape with the message still exists. The Smithsonian's National Museum of American History holds it.

Samuel Morse

Who: The inventor who held the patents on the electric telegraph and sent the first public message over the Washington to Baltimore line.

When and where: The story is that the idea came to him in 1832. The first public message went from Washington to Baltimore on May 24, 1844.

Samuel Morse held the patents on the American electric telegraph and got the fame for it. The story told in a Library of Congress history is that the idea of sending messages over a distance by electricity came to Morse in 1832. He was on a ship coming home from Europe, during a conversation on board.

Other men helped Morse build the telegraph. Leonard Gale showed him how to boost a weakening signal with a relay. Alfred Vail built and improved the instruments in the shop at the Speedwell Ironworks. The same Library of Congress history identifies hiring Vail as one of the keys to Morse's success. Vail received the first public message in Baltimore on May 24, 1844.

Who worked out the dot and dash code is still argued. Morse held the patents, and people call the code Morse code. Starting in 1887, Vail's son Stephen Vail sent letter after letter to newspaper editors claiming the credit for his father. In 1911 another son, J. Cummings Vail, had Alfred's gravestone changed to read "INVENTOR OF THE TELEGRAPHIC DOT AND DASH ALPHABET." In a 2020 article in *American History* magazine, the writer Joseph Connor credits Vail with the practical version, which gives the shortest codes to the letters people use most. According to Connor, Vail learned which letters were most common from printers, who kept the metal type for those letters closest at hand.

Sewing machines, rubber and the camera

Elias Howe patented a sewing machine on September 10, 1846. It sewed a lockstitch, in which two threads lock together through the cloth. Isaac Singer made a more practical machine, and it sold better than Howe's. Howe sued the makers who used his invention. In 1854 judges ruled that Howe's patent was good, and the makers had to pay him royalties, which are fees for using a patent. At the peak, the fees paid to Howe reached as much as $4,000 a month.

In 1856 Howe and the biggest makers, Singer, Wheeler & Wilson, and Grover & Baker, pooled their patents. That meant each member could use the others' patented inventions. Their group was called the Sewing Machine Combination. Its members controlled the sewing machine trade until 1877.

In 1839, in Woburn, Massachusetts, a piece of Charles Goodyear's mix of rubber and sulfur landed on a hot stove. The rubber charred like leather instead of melting. The stories of how it reached the stove differ. Mass Moments, a Massachusetts history site, states that he either dropped it or placed it there. A speech in his honor printed in 1860 says that the piece was in his hand and was thrown into the stove "by a violent gesture." The encyclopedia Britannica's account says it flew from his hand while he was trying to sell his rubber. It took Goodyear five more years to learn to make the change happen every time. He patented the process in 1844. Rubber treated this way is called vulcanized rubber.

In late August and September of 1839, news of the daguerreotype reached the United States. It was an early way of making photographs, invented by Louis Daguerre, a French artist. François Arago announced it at a meeting of the French Academy of Sciences in Paris on August 19, 1839. Within weeks, people in Philadelphia had made the process work for themselves. In October or November of 1839, Robert Cornelius of Philadelphia made a photograph of himself. It is the oldest surviving portrait photograph made in America. The Library of Congress holds it.

> ### Cyrus McCormick and John Deere
>
> **Who:** Two makers of farm machines. McCormick's reaper cut grain, and Deere's steel plow cut through prairie soil.
>
> **When and where:** The reaper at Walnut Grove and Steele's Tavern, Virginia, 1831. The plow at Grand Detour, Illinois, 1837.
>
> A reaper is a machine that cuts ripe grain. Cyrus McCormick held the patent on the McCormick reaper and built the business that sold it. Other people also worked on the first one.

His father, Robert McCormick, tried for several years to build a reaper at Walnut Grove, the family farm in Rockbridge County, Virginia. In 1831 he gave up. Within six weeks, Cyrus showed a working reaper by cutting oats at nearby Steele's Tavern. A blacksmith named John McCown worked on the machine. So did Jo Anderson, a man the McCormicks enslaved.

Anderson was born on Robert McCormick's plantation in about 1807. In 1885 a white interviewer, William J. Hanna, wrote down Anderson's words in dialect spelling, which tries to show how a person's speech sounded. "I was his slave," Anderson said of Robert McCormick, "but when a baby was given to Massa Cyrus." Massa meant master. Robert McCormick held him in slavery from birth. Hanna recorded Anderson as 78 years old and unable to walk. Anderson said he carried grain to the blacksmith shop to test the machine: "I fotched loose grain to the shop so he could see how it cut it." He also worked as "blower and striker for the blacksmith." That is the helper who pumps the bellows and swings the heavy hammer. The bellows is a big bag that blows air onto the fire. Anderson gave Cyrus the credit for the reaper and said Robert "tried it and gave it up." He said Cyrus freed him before the Civil War.

In December 1833 another inventor, Obed Hussey, patented a reaper. McCormick patented his own in 1834 and printed a warning against Hussey's machine in *Mechanics' Magazine*. McCormick made his first sales in 1840 and moved to Chicago in 1847. In 1859 he and his brothers made and sold more than 5,000 reapers.

John Deere made plows at Grand Detour, Illinois. The sticky prairie soil there clogged iron plows. In 1837 Deere built a plow with a polished steel moldboard, the curved blade that turns the soil over. The sticky soil slid off the smooth steel, so the plow scoured, or cleaned, itself as it moved. By 1846 Deere was selling nearly 1,000 plows a year.

Ho-Chunk people, long called the Winnebago in English, had lived in a village at the bend of the Rock River where Grand Detour stands. Settlers who came later said they could still see signs of that village. In 1832, at Fort Armstrong in Illinois, Ho-Chunk leaders signed a treaty with two men sent to make it for the United States. A treaty is a written agreement between nations. The two men were General Winfield Scott and John Reynolds, the governor of Illinois. In the treaty the Ho-Chunk signed over their lands south and east of the Wisconsin River and the Fox River of Green Bay. The boundary ran up the Rock River

> to its source. Under the treaty, US officials paid the Ho-Chunk $10,000 a year for 27 years. The records do not make clear which treaty covered the exact spot where Grand Detour stands.

1850 to 1900

After 1850, some inventors worked with patent lawyers and with teams of workers. On February 14, 1876, Alexander Graham Bell's lawyer filed an application for a telephone patent. A few hours later, papers from a rival, Elisha Gray, arrived. Thomas Edison's team at Menlo Park, New Jersey, made a long-lasting electric lamp in 1879, building on 40 years of work by other inventors. Not everyone could own an invention. In 1858 the US attorney general, the government's chief lawyer, ruled that an invention by an enslaved person could not be patented. According to the law scholar Kara Swanson, after that ruling free Black inventors could not get patents either.

Who could own an invention

By August 1857 an enslaved blacksmith named Ned, near Holmesville in Pike County, Mississippi, had invented a new farm tool. It was a "double Cotton Scraper, and two plows" that could "Scrape both Sides of the Cotton ridge at the same time, and plough out the middles." A cotton ridge is a raised row of soil where the cotton grows, and the middles are the low strips between the rows. Everything known about Ned comes from the letters of Oscar J. E. Stuart, a white planter and lawyer who claimed to own him. Ned's second name, if he had one, is not recorded. How his life ended is not known.

On November 15, 1857, Stuart applied for a patent on Ned's invention. He swore that he owned Ned and that Ned was the inventor. Stuart also threatened Ned. If Ned wrote to the Patent Office himself, Stuart said, he would "correct" Ned "according to our Southern usage." To correct meant to punish. Stuart made the threat in a letter he later sent to the secretary of the interior, one of the president's top officials. He did not write in it what the punishment would be.

The patent commissioner, Joseph Holt, sent the application back. The law required the inventor to swear an oath, a solemn promise before the law, that he had made the invention. Holt decided that an enslaved man could not take the oath. Stuart complained to Jacob

Thompson, the secretary of the interior. Thompson sent the question to the attorney general, Jeremiah S. Black, the government's chief lawyer.

In 1858 Jeremiah Black ruled that "a machine invented by a slave, though it be new and useful, cannot, in the present state of the law, be patented." He based his ruling on the *Dred Scott* decision of 1857. In that case, the judges of the Supreme Court, called justices, ruled that African Americans were not citizens. Without citizenship, Jeremiah Black reasoned, an enslaved inventor could not swear the oath. The owner could not get the patent either, because only the "original and first inventor" could. Free Black inventors had received patents before this. The law scholar Kara Swanson writes that Jeremiah Black's opinion "created a formal racial barrier" to the patent system. After it, free Black inventors could not get patents either.

Stuart asked Congress twice for a patent and failed both times. In 1859 Senator Albert Gallatin Brown of Mississippi backed a bill that would let enslavers patent the inventions of the people they enslaved. Senators never moved the bill forward. Stuart sold the "Stuart Double Plough and Scraper" anyway, without a patent. In February 1861, delegates from seven Southern states that had broken away from the United States met in Montgomery, Alabama. There they set up their own government, the Confederate States of America, also called the Confederacy. Under a Confederate patent law of May 21, 1861, enslavers could patent the inventions of enslaved people.

Benjamin Montgomery was enslaved in Mississippi by Joseph Davis. Montgomery invented a better propeller for boats. Joseph Davis tried to patent it through his brother, Senator Jefferson Davis, and failed. Once he was free, Montgomery tried to patent the propeller in his own name, and that failed too, according to his son Isaiah Montgomery. In 1865, at the end of the Civil War, members of Congress and lawmakers in the states added the 13th Amendment to the Constitution. An amendment is a change to the Constitution. With it they ended slavery everywhere in the country, except as a punishment for a crime. Under the 13th Amendment and the amendments that followed it, Black inventors could get patents again. In 1913 Henry E. Baker, a Black patent examiner who checked patent applications for the government, published *The Colored Inventor*. "Colored" was a word used then for Black Americans. He wrote it to mark 50 years since emancipation, the freeing of enslaved people. It appeared in *The Crisis*, the magazine of the NAACP, a group that works for the rights of Black Americans.

The telephone, 1876

A telephone turns the sound of a voice into electric current and back into sound. In Bell's own description from 1876, the voice makes a thin sheet, called a membrane, shake in time with the sound. The shaking makes the electric current in the wire grow stronger and weaker in the same pattern. At the other end, the changing current makes a second sheet shake, and the listener hears the voice.

On the morning of February 14, 1876, Bell's lawyer filed an application for a patent called "Improvement in Telegraphy." It was the fifth filing at the Patent Office that day. A few hours later, papers from Elisha Gray arrived as the 39th filing. Gray filed a caveat, a notice that he was working on an invention and planned to apply for a patent. Both papers described a liquid transmitter, a sending part that used a liquid. On the advice of his lawyers, Gray withdrew.

Patent Office officials issued patent number 174,465 to Bell on March 7, 1876. On March 10 Bell spoke the first sentence ever sent by telephone. He spoke to his assistant, Thomas A. Watson, who was in the next room of Bell's laboratory in Boston. Bell's notebook records the words "Mr. Watson," then "come here," then "I want to see you."

Bell filed first and held the patent. People have argued ever since about whether Bell or Gray deserved the credit. In November 2020 Benjamin Lathrop Brown published a new study of the case in an engineering journal, the *Proceedings of the IEEE*. He titled it "The Bell Versus Gray Telephone Dispute: Resolving a 144-Year-Old Controversy." Brown studied letters, notes kept by a man who worked with Bell, and the engineering details of the two designs. He concluded that Bell and his lawyers did not copy Gray's idea.

Alexander Graham Bell

Who: An inventor in Boston whose lawyer filed for the telephone patent a few hours before a rival's papers arrived. He received the patent.

When and where: Boston, 1876.

The first telephone patent, number 174,465, went to Alexander Graham Bell on March 7, 1876. His lawyer had filed the application on February 14, a few hours before Elisha Gray's papers for a similar instrument reached the Patent Office.

Gray withdrew on the advice of his lawyers, and the patent stayed with Bell. People have argued ever since about who deserved the credit.

Lewis Latimer, a draftsman at a patent law firm, made the drawings for Bell's patent application. A draftsman makes exact drawings of machines and buildings. Latimer later worked on the electric lamp.

Emma Nutt

Who: The first woman telephone operator.

When and where: Boston, hired September 1, 1878.

On September 1, 1878, Emma Nutt left a job at a telegraph office to work for the telephone dispatch company in Boston. She became the first woman to work as a telephone operator. An operator connected each caller to the person being called. Her pay was $10 a month for a 54-hour week. Her sister, Stella, started work as an operator the same day.

The first operators had been teenage boys, who were rude to callers and played pranks on them. The telephone companies' managers replaced the boys with women. By the late 1880s, almost every telephone operator was a woman. It was one of the first big jobs in a new technology open to women.

Emma Nutt worked as an operator for more than 30 years. The New England Historical Society, *Boston Magazine* and *Time* give the exact length as anything from about 33 to about 37 years.

Edison's invention factory

An electric lamp makes light when an electric current heats a thin thread inside it, called a filament, until the filament glows. Inventors had worked on electric lamps for 40 years before Edison's team made its lamp in 1879. British inventors showed arc lamps, which make light from a spark between two rods, starting in 1835. Joseph Swan in England patented a lamp design before Edison did, and so did William Sawyer and Albon Man.

Edison ran a laboratory at Menlo Park, New Jersey, with a team of workers. Among them were Charles Batchelor, John Kruesi and Francis Upton. In October 1879 the team made a lamp with a filament of cotton thread that had been baked into carbon. It burned for about 14.5 hours. Edison showed the lamps to the public at Menlo Park on New Year's Eve, 1879. The team kept testing filaments and settled on one made of bamboo. It let Edison's lamps burn for up to 1,200 hours.

Edison's team also built the other parts needed to light a whole district. These included the dynamo, a machine that makes electricity when it is turned, along with the wiring and a meter to measure how much electricity each customer used. On September 4, 1882, the Pearl Street station at 257 Pearl Street in Manhattan began supplying electricity. It lit the first district of paying customers.

The Menlo Park team built other machines too. Two years before the lamp, in early December 1877, John Kruesi built a phonograph to Edison's design. A phonograph records sound and plays it back. The first one recorded on a sheet of tinfoil. On December 6, 1877, Edison recorded himself saying "Mary had a little lamb."

Thomas Edison

Who: An inventor who ran a laboratory with a team of workers. His team made a long-lasting electric lamp, the phonograph and the system that brought electric light to paying customers.
When and where: Menlo Park and West Orange, New Jersey. Born 1847, died 1931.
Movie: *Edison* (2015), a documentary in the PBS series *American Experience*. It is about Edison's life and work.

In 1879 Thomas Edison's team made an electric lamp that burned for about 14.5 hours, and later lamps burned for up to 1,200 hours. Other inventors had built electric lamps for 40 years before that. Edison was born in Milan, Ohio, on February 11, 1847.

Edison and his team at Menlo Park found a filament that lasted. They also built the dynamos that made the electricity, the wires that carried it to customers and the meters that measured how much each customer used. In 1882 Edison's company began selling electricity from the Pearl Street station in Manhattan to the first district of paying customers.

Edison worked with a team. John Kruesi built the phonograph that Edison designed. Charles Batchelor and Francis Upton worked with him on the lamp. Lewis Latimer made patent drawings and gave expert testimony for Edison's company from 1884.

In November 1887 Edison opened a new laboratory in West Orange, New Jersey. He died at his home in West Orange on October 18, 1931.

Lewis Latimer

Who: A self-taught draftsman who later oversaw the building of electric lighting systems. He patented a better way to make the carbon filaments inside electric lamps.

When and where: Boston and New York. Born 1848, died 1928.

A patent of 1882 gave Lewis Latimer the rights to a better way of making the carbon filaments that glow inside electric lamps. The patent, number 252,386, was issued on January 17, 1882, for a "Process of Manufacturing Carbons." His method made filaments that were more even and lasted longer.

Latimer was born in Chelsea, Massachusetts, on September 4, 1848. His parents had freed themselves from slavery in Virginia by escaping. He taught himself to be a draftsman. While he worked at a patent law firm, he made the patent drawings for Bell's 1876 telephone application.

He received his filament patent while working at the U.S. Electric Lighting Company of Hiram Maxim. In 1884 he went to work for Edison's company. He made patent drawings and testified in court as an expert on patents. He also oversaw lamp factories and the setting up of electric lighting in New York, Philadelphia, Montreal and London.

On January 24, 1918, Latimer became one of the 28 first members of the Edison Pioneers, a group of people who had worked closely with Edison before 1885. He was its only Black member. From 1903 he lived in a house in East Flushing, in Queens, New York. He died in Flushing on December 11, 1928, at the age of 80. The house is now the Lewis Latimer House Museum.

Granville T. Woods

Who: A Black inventor who patented a way to send messages between moving trains and railroad stations.

When and where: Cincinnati, Ohio. Patent issued November 29, 1887.

Granville T. Woods invented a way for moving trains and stations to send messages to each other. He patented it as the Synchronous Multiplex Railway Telegraph on November 29, 1887, while working in Cincinnati. With it, the people who directed train traffic, called dispatchers, could know where the trains were.

Woods's telegraph worked by induction. In induction, a changing electric current in one wire makes a current flow in another wire nearby, without the two touching. Woods used it to carry messages between moving trains and stations.

Twice, people on Edison's side claimed that inventions Woods had patented were theirs. Each time Patent Office officials held a hearing, called an interference proceeding, to decide who had invented first. Woods won both times. Edison offered him a job, and Woods turned it down. Over his career Woods received dozens of patents for electrical and railroad inventions.

Nikola Tesla

Who: A Serbian immigrant inventor whose induction motor used alternating current to make a shaft turn.

When and where: New York. Patent issued May 1, 1888.

Alternating current, or AC, is electric current that switches direction back and forth many times each second. Nikola Tesla patented a motor that used AC to turn a shaft. His motor used induction, in which a changing current in one coil of wire makes a current flow in a part nearby without the two touching. The motor worked without brushes, the sliding electrical contacts that other motors used to carry current to their turning part.

Tesla was a Serbian immigrant who came to the United States in 1884. He filed for the motor patent in October 1887. The patent, number 381,968, was issued on May 1, 1888.

In July 1888 the Westinghouse company bought a license to Tesla's polyphase patents. A license is the right to use someone else's patent. Polyphase means his motors ran on two or more alternating currents at once. Tesla received $60,000 in cash and stock, which are shares in owning the company. Under the deal he was also to get $2.50 for each horsepower of the motors the company sold. Horsepower is a measure of how much work a motor can do.

The office and the fence line

Christopher Latham Sholes, Carlos Glidden and Samuel Soule patented a typewriter on June 23, 1868. E. Remington & Sons began making it on March 1, 1873. The Sholes & Glidden Type-Writer went on sale in 1874 for $125. Its keyboard began with the letters Q, W, E, R, T and Y across the top row of letters. That arrangement, called QWERTY, is still used on keyboards today.

On November 24, 1874, Joseph Glidden, a farmer from De Kalb, Illinois, received patent number 157,124 for barbed wire. He was a different man from the Carlos Glidden of the typewriter. Joseph Glidden's barb was a short piece of wire that locked onto a wire of two strands. He also built machines to make the wire in large amounts. Nine wire-fence designs were patented, and Glidden's was the one that sold well.

With barbed wire, farmers and ranchers could fence land where there was little wood to build fences. In the West, ranchers and homesteaders, families who had claimed farms, fenced off land and water that had been open to all. By fencing it, they ended the open range, the unfenced land where cattle had grazed freely. In Texas, New Mexico, Colorado and Wyoming, cattlemen found their old grazing land fenced off. They first asked officials for the right to use it. Then they fought what the National Archives calls "fierce range wars" against the farmers who owned the fenced land. The fences also blocked Native peoples who moved with the seasons from more of the lands they had always used, according to the National Archives. Those Native peoples called barbed wire "the Devil's rope."

1900 to 1950

Wilbur and Orville Wright flew a powered airplane in North Carolina on December 17, 1903. Ten years later, on October 7, 1913, workers at Henry Ford's car plant in Michigan started a moving assembly line. A motor and a rope pulled each car frame past 140 workers, who added parts as it moved. Over the next few decades, electric refrigerators and radios went into American homes. Chemists made new materials too, starting in 1907 with Leo Baekeland's Bakelite, the first plastic made entirely from chemicals. In February 1946 engineers at the University of Pennsylvania showed ENIAC, the first general-purpose electronic computer, one that could be set up to solve many kinds of problems. In December 1947 scientists at Bell Labs made the first transistor work. A transistor is a small part that controls the flow of electricity and can make a weak signal stronger. Transistors later replaced the glass vacuum tubes that machines like ENIAC used.

> ### The Wright brothers
>
> **Who:** Wilbur and Orville Wright, bicycle builders from Dayton, Ohio. They invented an airplane with an engine that a pilot could steer and control.
>
> **When and where:** Near Kill Devil Hills, North Carolina, December 17, 1903.

Movie: *Wright Brothers' Flying Machine* (2003), a documentary in the PBS series *NOVA*, first shown on November 11, 2003. It is about the brothers' flying machine.

On December 17, 1903, near Kill Devil Hills, North Carolina, the Wright brothers made four flights in an airplane with an engine. Orville flew first. He stayed in the air for 12 seconds and covered 120 feet. On the fourth flight of the day, Wilbur flew 852 feet in 59 seconds. Five people watched. One of them, John T. Daniels of the Life-Saving Station at Kill Devil Hills, squeezed the camera's shutter bulb and took the photograph of the first flight. It was the first photograph he had ever taken.

The brothers worked out how to steer an airplane on gliders, which have no engine, in 1901 and 1902. Besides going forward, an airplane can roll, with its wing tips moving up and down, pitch, with its nose moving up and down, and yaw, with its nose swinging from side to side. The Wrights used cables that twisted the tips of the wings up or down to control roll. In 1901 they added a movable part at the front, called an elevator, to control pitch. In 1902 they added a movable upright part at the back, called a rudder, to control yaw.

To test the shapes of wings, the brothers built their own wind tunnel, in which a fan blows a steady stream of air past a model. They also built a light gasoline engine in the workshop of their bicycle shop in Dayton.

On September 17, 1908, Army officers were testing the Wright airplane at Fort Myer, Virginia. Orville flew it with Lieutenant Thomas E. Selfridge of the Army Signal Corps as his passenger. The Signal Corps was the Army's communications branch, and it was then in charge of the Army's first aircraft. One of the propellers split and hit a wire, and the plane dived into the ground. Selfridge's skull was broken. He never woke up, and he died that evening. He was the first person killed in an airplane crash. Orville broke a leg and several ribs and spent seven weeks in the Army hospital.

Henry Ford

Who: The carmaker whose workers at Highland Park, Michigan, built the Model T on a moving assembly line.

When and where: Highland Park, Michigan. The moving chassis line started on October 7, 1913.

Movie: *Henry Ford* (2013), a documentary in the PBS series *American Experience*, directed by Sarah Colt. It is about Ford's life and his company.

> At Henry Ford's plant in Highland Park, Michigan, the time it took to build the frame of a car fell from more than 12 hours to about 93 minutes. The workers got that speed by building on a moving assembly line. On a moving line, a motor pulls the car or part past the workers, and each worker adds parts or does one task as it goes by.
>
> Ford's workers tried the line first on one part. In the spring of 1913 they put together the flywheel magneto, an engine part that makes electricity, on a line. The job was split into 29 steps done by 29 men along a moving belt. On October 7, 1913, the chassis line started. The chassis is the frame of the car, with its wheels. A motor and a rope pulled each chassis along a line 150 feet long, past 140 workers. At first the time to build one fell to under 3 hours, and later to about 93 minutes.
>
> In January 1914 Ford announced a pay of $5 for an eight-hour day. Before that, workers had earned about $2.34 for nine hours. Part of his reason was to keep workers who hated the pace of the line.
>
> The Bureau of Labor Statistics is a federal office whose staff gather facts about work. Its count for 1913 recorded about 23,000 deaths of workers in industry, among 38 million workers. That was 61 deaths for every 100,000 workers. The count covers all kinds of industrial work, not only work at machines.

The wired home

In 1906 Lee de Forest invented the Audion, a part that made weak radio signals stronger. The Audion was a vacuum tube, a glass tube with the air taken out, like a light bulb. Inside it were a thin wire called a filament, a metal plate, and a bent wire between them called the grid. A small electric current on the grid controlled a bigger current between the other two parts. The Audion could also pick up radio signals. Tubes like it made radios for the home practical.

On September 7, 1927, Philo Farnsworth, age 21, sent the first all-electronic television picture from his lab on Green Street in San Francisco. The picture was a straight line. He made it with his own camera tube, called the image dissector.

The same year, the General Electric company began selling the Monitor Top, an electric refrigerator for the home. It cost about $300. By the middle of 1929, buyers had bought more than a quarter of a million of them. It was the first home electric refrigerator sold in large numbers. The researcher Emanuela Cardia studied what American households owned, using

the census, the government's count of everyone in the country, taken every ten years. In 1930, 14 percent of households had a mechanical refrigerator, one that kept itself cold with a motor instead of a block of ice. By 1940 the share was 44 percent, and by 1950 it was 80 percent.

A plastic is a material that can be shaped while it is soft and then sets hard. In 1907 Leo Baekeland, a chemist born in Belgium who lived in the United States, made Bakelite from two chemicals, phenol and formaldehyde. It was the first fully synthetic plastic, which means it was made entirely from chemicals rather than from anything that grew. He filed for a patent in July 1907 and received it on December 7, 1909. A patent is a government grant that gives an inventor the only right to make and sell an invention for a set number of years. Nylon, a strong thread-like material made from chemicals, came from Wallace Carothers's work at the DuPont chemical company, which he joined in 1928. On February 28, 1935, Gerard Berchet made the first half ounce of nylon. DuPont officials announced it to the public on October 27, 1938.

Tractors replace horses

In 1920 census takers counted 246,000 tractors on American farms, and about 26 million horses and mules. The Fordson tractor of 1917 was cheap and made in large numbers. About three out of every four American tractors built in the 1920s were Fordsons.

In 1924 the International Harvester company began selling the Farmall. It could do the jobs other tractors did. It could also cultivate, which means breaking up the soil and clearing weeds between rows of growing crops. Cultivating was the last farm job that horses still did. The Census of Agriculture of 1954 was the first to record more tractors than horses and mules on American farms. It recorded about 4.6 million tractors and about 4 million horses and mules.

The first computers and the transistor

ENIAC, the first general-purpose electronic computer, was shown to the public at the University of Pennsylvania in February 1946. General-purpose means it could be set up to solve many kinds of problems, not only one. John Mauchly and J. Presper Eckert designed it at the university's Moore School, and the US Army paid to build it. It was built to work out artillery firing tables, charts that told soldiers how to aim their big guns. ENIAC had 17,468 vacuum tubes, weighed more than 27 tons, and filled 1,800 square feet. It could not store a program. For each new set of calculations, its programmers moved its switches and plugged its cables into new places by hand.

At Bell Labs, a group of scientists led by William Shockley looked for a replacement for vacuum tubes, which often failed. On December 16, 1947, John Bardeen and Walter Brattain placed two gold contacts, very close together, on a small slab of germanium, a chemical element. The electric push, or voltage, on one contact controlled the flow of electricity, or current, through the other. The device made a signal up to 100 times stronger. It was the first transistor. Workers at Bell Labs chose the name "transistor" in a vote, and the company's officials announced it to the public on June 30, 1948. Bardeen, Brattain and Shockley shared the Nobel Prize in Physics in 1956.

The six ENIAC programmers

Who: Jean Jennings Bartik, Betty Snyder Holberton, Kathleen McNulty Mauchly Antonelli, Marlyn Wescoff Meltzer, Frances Bilas Spence and Ruth Lichterman Teitelbaum. They were the six women who programmed ENIAC, the first general-purpose electronic computer.

When and where: University of Pennsylvania, Philadelphia, 1945 and 1946.

Movie: *The Computers* (2014), a short documentary first shown at the Seattle International Film Festival in 2014. The six programmers are its subject.

Six women programmed ENIAC, but no one invited them to the dinner held for the machine's public showing in 1946. The records do not say who made the guest list. Their names were Jean Jennings Bartik, Betty Snyder Holberton, Kathleen McNulty Mauchly Antonelli, Marlyn Wescoff Meltzer, Frances Bilas Spence and Ruth Lichterman Teitelbaum.

ENIAC had no way to store a program. At first the six had only drawings of the machine's wiring to learn from. To give ENIAC a new problem, they moved its switches and plugged its cables into new places by hand. They were hired to work out the paths of artillery shells for the Army, and later they also ran calculations for the scientists at Los Alamos, the laboratory in New Mexico where the atomic bomb was built.

Their story stayed untold for decades. Kathy Kleiman learned about the six while she was researching her college thesis, a long paper written at the end of college. She started the ENIAC Programmers Project to record their story. In 1997 the group Women in Technology International named all six to its Hall of Fame. Four of them were there to accept. Ruth Teitelbaum had died, and her husband, Adolph, accepted for her.

Ernest Lawrence

Who: A scientist who built the cyclotron, a machine that whirls particles in a spiral and uses them to smash atoms.

When and where: Berkeley, California, from 1930 and 1931.

Ernest O. Lawrence's first cyclotron was small enough to hold in one hand. He built it at Berkeley, California, in 1930 and 1931, out of glass, sealing wax and bronze. It sped up hydrogen ions, which are hydrogen atoms with an electric charge, to an energy of 80,000 electron volts. An electron volt is a very small unit of energy used for particles.

Each machine Lawrence built after that was bigger. The first model was followed by machines 11 inches, 27 inches and 37 inches across. The 60-inch cyclotron of 1939 had a magnet that weighed 220 tons. Inside each machine, particles whirled in a spiral and then struck atoms and broke them apart.

Scientists used cyclotrons to make elements that do not occur in nature. They also made radioactive materials for use in medicine. A radioactive material is one whose atoms break down and give off energy and tiny particles. Lawrence won the Nobel Prize in 1939. One later machine at Berkeley, the 88-Inch Cyclotron, still runs today.

1950 to 2000

Jack Kilby of Texas Instruments built the first integrated circuit in 1958. It put a whole electronic circuit on one small chip. On October 29, 1969, a student at the University of California, Los Angeles, or UCLA, sent the first message between two computers on ARPANET, a network that linked computers at universities. Martin Cooper of Motorola made the first call on a handheld cell phone four years later. The magazine *Popular Electronics* announced the Altair 8800, a computer sold as a kit of parts, in January 1975, and IBM began selling the IBM PC in 1981. The IBM PC became the standard office computer. All 24 satellites of the Global Positioning System, or GPS, were working by 1995.

Grace Hopper

Who: A mathematician and Navy officer who built the A-0 compiler, a program that lets people write instructions for a computer in words closer to English.

When and where: Harvard University from 1944, then Remington Rand, the company that made the UNIVAC computer. Born in New York in 1906, died in 1992.
Movie: *The Queen of Code* (2015), a short documentary directed by Gillian Jacobs, part of the FiveThirtyEight series *Signals*. It is about Hopper's life and work.

Grace Hopper built the A-0 compiler in 1951 and 1952. A compiler is a program that takes instructions written closer to human language and translates them into instructions the computer can carry out.

Hopper was born in New York on December 9, 1906, and trained as a mathematician. During World War II she served as a lieutenant in the WAVES, the women's branch of the Navy. In July 1944 she was assigned to the Harvard Mark I computer, and she became one of its first programmers. In 1946 she wrote the first long manual on how to program a computer.

She built the A-0 compiler while working on the UNIVAC computer at the Remington Rand company. From 1955 to 1959 she worked on FLOW-MATIC, a programming language for business that used English words. A programming language is a set of words and rules for writing instructions a computer can follow. Later, the designers of COBOL, another business programming language, drew on FLOW-MATIC.

Hopper retired from the Navy in 1986 as a rear admiral, one of the Navy's highest ranks. She was 79, and at that time she was the oldest officer still serving in the Navy. She died on January 1, 1992.

The chip and its two inventors

An integrated circuit, or chip, is a whole electronic circuit built on one small piece of material. A circuit is a path that electricity flows through, with parts along the way that do jobs such as switching it on and off. Two engineers working at two different companies each made a chip. The encyclopedia Britannica and the German Patent and Trade Mark Office both name the two men as its inventors.

Jack Kilby of Texas Instruments showed the first integrated circuit on September 12, 1958. He made it from germanium, and he connected its parts with wires by hand. In 1959 Robert Noyce of Fairchild Semiconductor designed a chip made of silicon, another chemical element. On Noyce's chip the wiring lay flat and was printed onto the surface. That meant factories could

make chips in large numbers. Every later chip was built in Noyce's flat form. Silicon Valley, the area south of San Francisco where many computer companies started, takes its name from this element.

Kilby received the Nobel Prize in Physics in 2000. Noyce had died in 1990. Kilby said in public that Noyce deserved to share the prize.

Martin Cooper

Who: A Motorola engineer who made the first call on a handheld cell phone.

When and where: A street in Manhattan, New York City, April 3, 1973.

The first call on a handheld cell phone was made on a street in Manhattan on April 3, 1973. Martin Cooper, an engineer for the Motorola company, made it while walking. He used the phone to call Joel Engel, his rival at Bell Labs.

The phone Motorola sold to the public came 10 years later. The DynaTAC 8000X went on sale in 1983. It cost $3,995 and weighed 28 ounces, almost 2 pounds. One charge of its battery gave about 30 minutes of talking.

The personal computer

In January 1975 the Altair 8800, a computer sold as a kit, was announced in the magazine *Popular Electronics*. A kit is a box of parts that the buyer puts together. On March 5, 1975, about 30 people came through a rainstorm to Gordon French's garage in Menlo Park, California, to see an Altair. That meeting was the first of the Homebrew Computer Club, a group of people who built their own computers.

Apple Computer was founded on April 1, 1976. Its founders were Steve Jobs, Steve Wozniak and, for a short time, Ron Wayne. The Apple II came out in June 1977. It was a finished computer that people could plug in at home. On August 12, 1981, IBM brought out the IBM PC, and its design became the standard for computers in offices.

Lee Felsenstein

Who: An engineer who ran the meetings of the Homebrew Computer Club and designed two early small computers, the Sol-20 and the Osborne 1.

When and where: Berkeley and the San Francisco Bay Area, California, from 1973. Born in Philadelphia in 1945.

In 1973, Lee Felsenstein and four other people set up a computer terminal that anyone could use, in a record store in Berkeley, California. A terminal is a keyboard and a printer or screen connected to a computer somewhere else. His partners were Efrem Lipkin, Ken Colstad, Jude Milhon and Mark Szpakowski. They called the project Community Memory. They put the terminal at Leopold's Records, next to the store's paper bulletin board. People typed notes about music, politics, housing, services, women's groups and technology, and other people read them. The Computer History Museum's profile of Felsenstein describes it as one of the earliest online communities. The last version of the project closed in 1992.

Community Memory ran on a large computer called an SDS-940, which was donated for the project. It was a time-sharing computer, which means many people could use it at once from different terminals. The project worked with Resource One. Three students who had dropped out of computer science at Berkeley started it as a nonprofit, a group run for a cause rather than for profit.

Felsenstein was born in Philadelphia in 1945. In 1964, as a student at the University of California, Berkeley, he took part in the Free Speech Movement, a protest by Berkeley students for the right to speak and organize about politics on campus. He was at the Sproul Hall sit-in, a protest in which students sat inside a campus building and refused to leave. On December 3, 1964, hundreds of police officers went into the building and arrested nearly 800 students, Felsenstein among them. He earned a degree in electrical engineering and computer science at Berkeley in 1972.

He was one of the first members of the Homebrew Computer Club. He ran its open meetings, keeping order with a blackboard pointer. With Gordon French and Bob Marsh, at a company called Processor Technology, he designed the Sol-20. It was one of the first small computers sold with its own case and keyboard. More than 10,000 were sold from 1977 to 1979. He then designed the Osborne 1 for Adam Osborne's company. It was a portable computer with a 5-inch screen. It cost $1,795, and more than 125,000 were sold in 1982.

His motto, as the Computer History Museum records it, is "To change the rules, change the tools." In 2016 the museum's leaders gave him their Fellow Award, an honor, for his influence on early personal computing.

Steve Jobs and Steve Wozniak

Who: The two founders of Apple Computer. Wozniak designed the Apple I and the Apple II. Jobs made the first sale.

When and where: Jobs's garage in California, from 1976.

Movie: *Steve Jobs* (2015), directed by Danny Boyle and written by Aaron Sorkin. It is a drama, not a documentary. Actors play the real people, and it is based on Walter Isaacson's biography of Jobs. *Steve Jobs: The Man in the Machine* (2015), directed by Alex Gibney, is a documentary about Jobs.

Steve Wozniak designed Apple's first two computers, and Steve Jobs found the first buyer. The two met while they were both working at the Hewlett-Packard company. In 1975 Wozniak began developing the Apple I. He later said that the Homebrew Computer Club was where the Apple I got its start.

To pay for the first working model, Jobs sold his Volkswagen and Wozniak sold his scientific calculator, for $1,300 in all. On April 1, 1976, they founded Apple Computer. Ron Wayne was a partner for a short time. Jobs and Wozniak built the first Apple I computers in Jobs's garage. On Jobs's first sales call, a store called the Byte Shop ordered 50 of them at $500 each. The Apple I came without a case, a keyboard, a screen or a power supply. Buyers added their own.

Wozniak designed the Apple II in 1977. It came in one case, with the electronics, the keyboard and the power supply inside. It could show color pictures. It also came with the programming language BASIC stored in its permanent memory, a part that keeps what is stored in it even when the power is off. In 1978 a floppy disk drive for storing files became available for it. In 1979 VisiCalc came out, a spreadsheet program for working with tables of numbers. With those two, the Apple II sold in large numbers. Apple's sales grew from $7.8 million in 1978 to $117 million in 1980.

The network

ARPANET was a computer network paid for by the Department of Defense to link computers at universities. On October 29, 1969, Charley Kline, a student programmer in Leonard Kleinrock's lab at UCLA, tried to log in to a computer at Stanford Research Institute. He typed "L" and "O," the first two letters of LOGIN, and then the system crashed. So the first message ever sent on

the network was "LO." About an hour later the full login worked. On January 1, 1983, the computers on ARPANET began using TCP/IP, the internet's shared set of rules for moving data between computers. ARPANET was the network from which the internet began.

Many people use "the web" and "the internet" to mean the same thing. They are two different things. The internet is the network of linked computers. The World Wide Web is a system of pages linked to one another, which people read over the internet. A British computer scientist, Tim Berners-Lee, invented it at CERN, a European physics laboratory in Switzerland. He proposed it in 1989 and opened it to the public on August 6, 1991. Americans built the program that let ordinary people use the web easily. On April 22, 1993, Marc Andreessen, Eric Bina and others at the University of Illinois released Mosaic. It was the first widely used graphical browser, a program that shows web pages with pictures.

GPS, the Global Positioning System, is a set of satellites owned by the United States. Each satellite sends out a signal that gives its position and the time. A GPS receiver picks up these signals and uses them to work out where it is. The first GPS satellite went up on February 22, 1978. The full set of 24 satellites was working in 1995. Until 2000, under a policy called Selective Availability, US government officials made the GPS signals for the public less exact on purpose, for national security. In May 2000 President Bill Clinton ordered the policy ended. After that, ordinary GPS receivers could find their place to within about 10 to 20 meters or better, close enough to give driving directions turn by turn.

The smoke detector

The ionization smoke detector, a cheap alarm made in large numbers for homes, holds about a third of a millionth of a gram of americium-241. Americium is a radioactive element, one whose atoms break down and give off energy and tiny particles. Scientists discovered it in 1944 and 1945. It gives off tiny particles called alpha particles. The particles knock bits of electric charge loose from the air in a small chamber inside the detector, so a very small electric current can flow through the air. When smoke enters the chamber, it disturbs the current, and the alarm goes off.

2000 to Today

A survey by the Pew Research Center found that 91 percent of American adults owned a smartphone in 2025. A smartphone is a pocket-sized computer that is also a phone. Apple began selling the iPhone in 2007. In 2022 the company OpenAI released ChatGPT, a program

that writes answers to typed requests. By February 2026, 44 percent of American adults told Pew they had used it. ChatGPT is an artificial intelligence, or AI, program, and AI programs also make mistakes. In 2020 Detroit police arrested the wrong man after a face-recognition search, a computer comparison of a photo of a face with a collection of photos, returned a false match.

The smartphone

Steve Jobs of Apple announced the iPhone on January 9, 2007. It went on sale on June 29, 2007, for $499 or $599, with a phone contract, a promise to pay a phone company for service every month. On September 10, 2007, Apple announced that it had sold its one millionth iPhone the day before, 74 days after the phone went on sale. A smartphone puts a computer, a camera, a phone, a GPS receiver and a music player into one machine that fits in a pocket. Social media apps, programs for posting and sharing with other people, run on these phones.

The Pew Research Center is a research group that runs large surveys. Its researchers have asked Americans whether they own a smartphone since 2011. In their first count, in 2011, 35 percent of adults owned a smartphone. In a survey of 5,022 adults from February to June 2025, 91 percent did, and 98 percent owned some kind of cell phone. Older people were less likely to own one. Among adults aged 18 to 29, 97 percent had a smartphone, against 78 percent of those 65 and older.

For some Americans, the phone is the only way to get online. In the same 2025 survey, 78 percent of adults had broadband at home, a fast internet connection that is always on. Among adults in households earning less than $30,000 a year, 34 percent reached the internet only through a smartphone. Among those earning $100,000 or more, 4 percent did.

Batteries, printers and gene tools

The battery in an electric car is a lithium-ion battery, a kind that can be recharged many times. Scientists in three countries worked on it, starting in the 1970s. M. Stanley Whittingham began work on rechargeable lithium batteries then, working for the company Exxon in New Jersey. John Goodenough, an American chemist then working at Oxford in England, found the material for the battery's cathode, its positive end, in 1980. The material was lithium cobalt oxide. Akira Yoshino in Japan built a safe early model with a carbon anode, the negative end, in 1985. In 1991 the Sony company in Japan began selling the first lithium-ion batteries. Whittingham, Goodenough and Yoshino shared the Nobel Prize in Chemistry in 2019.

A 3D printer builds a solid object out of many thin layers, one on top of another. Chuck Hull invented stereolithography, a method of 3D printing in which the machine hardens each thin layer in turn, in 1983 and 1984. He applied for a patent on August 8, 1984, and received it on March 11, 1986. In the 2010s, 3D printers spread to factories and to hobbyists' desks.

On June 28, 2012, the scientists Jennifer Doudna and Emmanuelle Charpentier published a paper on CRISPR, a tool for changing the genes of living things. Genes are the instructions inside living cells that shape how a living thing grows and works. The two shared the Nobel Prize in Chemistry in 2020.

Limor Fried

Who: An engineer trained at the Massachusetts Institute of Technology, or MIT, who founded Adafruit Industries, a company that makes electronics kits and teaches people to build with them.

When and where: MIT in Cambridge, Massachusetts, then New York City, from 2005.

Adafruit Industries began in 2005 in Limor Fried's dorm room at the Massachusetts Institute of Technology, or MIT, a university in Cambridge, Massachusetts. She had earned a bachelor's degree from MIT in 2003, and she finished a master's degree in engineering there in 2005. Adafruit sells electronics kits along with lessons on how to build them. Its designs are open source, which means anyone may copy them and change them.

According to the company's website, Fried was the first woman engineer on the cover of *Wired* magazine, and women own all of the company. Adafruit's workers make its products in the company's factory in New York City. In 2024 Adafruit moved to Industry City in Brooklyn. The company's website states that it has more than 100 employees.

AI, plainly

AI, short for artificial intelligence, is a name for computer programs that do tasks such as recognizing a face or writing a paragraph. A neural network is one kind of AI program. A computer adjusts the network's settings by running the network on a huge number of examples, so no person writes out its rules step by step. People call this tuning learning.

In 2012 a neural network called AlexNet won ImageNet, a contest in which computer programs try to name what is in photographs. Alex Krizhevsky, Ilya Sutskever and Geoffrey Hinton built it at the University of Toronto. AlexNet's top five guesses missed the right answer for 15.3

percent of the pictures. The second-place program missed for 26.2 percent. After AlexNet's win, neural networks came into wide use, a time called the deep-learning era.

On November 30, 2022, OpenAI released ChatGPT. Five days later, OpenAI's chief executive, Sam Altman, posted online that it had "crossed 1 million users." Analysts at the bank UBS estimated that by the end of January 2023, about 100 million people a month were using it. ChatGPT and programs like it produce text, pictures and computer code from requests typed in plain language.

In July 2024 staff at the National Institute of Standards and Technology, a federal agency, published a report. It describes how large language models, programs that write text, work and why they make mistakes. A program of this kind predicts the next word in a sentence, over and over. That kind of guessing can produce true statements, and it can also produce false ones. The report states that the programs give false answers in a confident way, and that people who believe them can be misled.

In 2023, in a federal court case in New York, lawyers filed court decisions that ChatGPT had made up. Roberto Mata had sued the airline Avianca, saying a metal serving cart struck his knee on a flight. On March 1, 2023, his lawyers Steven A. Schwartz and Peter LoDuca filed a court paper that pointed to earlier court decisions to support Mata's side. Those decisions did not exist. ChatGPT had produced them, with fake quotes.

Schwartz later said that he asked ChatGPT whether one case was real, and it answered that the case "does indeed exist." In written orders, the judge then asked whether the cases existed, and the lawyers kept standing by them. On June 22, 2023, Judge P. Kevin Castel found that the lawyers had acted in bad faith, which means dishonestly. He ordered the two lawyers and their law firm to pay a penalty of $5,000.

Karla Ortiz

Who: A concept artist and illustrator in San Francisco whose designs went into Marvel films. She told the US Senate how AI image programs affected artists.

When and where: San Francisco and Washington, D.C., from 2022.

On July 12, 2023, Karla Ortiz gave written testimony to a subcommittee of the US Senate Judiciary Committee about AI programs that make pictures. Testimony is a statement given to a court or to lawmakers. Ortiz is a concept artist, an artist who draws the first

designs for characters and scenes. Her designs went into Marvel films, including *Doctor Strange*, *Black Panther* and *Avengers: Infinity War*. She also worked on the video game *Final Fantasy 16* and the card game *Magic: the Gathering*.

Ortiz first saw an AI image program in April 2022. A website showed pictures made by a machine that copied the styles of named artists, her friends among them. No one had asked them. By August and September of 2022, the programs Midjourney, Stable Diffusion and DALL-E were in wide use.

In her testimony, Ortiz explained how the popular image programs were built. Their makers trained them on a collection of 5.8 billion pictures with captions, "taken indiscriminately from the web." That means the pictures were taken without anyone choosing which ones. A nonprofit group called LAION, which the company Stability AI funded, built the collection. Ortiz wrote that the collection "includes almost all of my fine art work."

She described what she had seen in her own work. "I have personally been a part of three productions where Generative AI has been utilized at different levels," she wrote. Utilized means used. Generative AI is AI that makes new pictures, text or sound. "Some of my peers have lost jobs, some have had their duties lessened (and of course, their proposed pay)." She also wrote, "I am no longer certain of my future as an artist." She worked with researchers at the University of Chicago on Glaze, a program meant to protect artists' pictures from having their style copied.

On January 12, 2023, Ortiz, Sarah Andersen, Kelly McKernan and other artists sued Stability AI, Midjourney and DeviantArt in federal court. They said the companies had broken copyright law, the law that protects an artist's right to decide who copies their work. On August 12, 2024, US District Judge William Orrick ruled that their main copyright claims could go forward toward a trial. As of October 2, 2026, the case had not gone to trial. On September 28, 2026, Judge Orrick changed the schedule so that the next major motions in the case are to be heard by September 29, 2027.

A wrongful arrest and face recognition

Face-recognition software compares a picture of a face with a collection of photos and names possible matches. In January 2020, Detroit police officers arrested Robert Williams, a Black man, at his home in Farmington Hills, Michigan. They arrested him in front of his wife and two

young daughters and in view of his neighbors. A face-recognition search had matched a blurry picture from a store's security video to his expired driver's license photo. The video showed a theft of watches from a Shinola store in Detroit in 2018. Williams was not the man in the video.

Police used the match to build a photo lineup, a set of photos shown to someone who might pick out the thief. They showed it to a contractor hired to prevent theft at the store, who had not seen the theft and knew it only from the video. Detroit police held Williams for 30 hours. The ACLU, the civil rights group whose lawyers represented him, called the place he was held "an overcrowded, dirty cell." Wayne County prosecutors dropped the charges, but they kept the right to bring them again. The county's prosecutor, Kym Worthy, apologized. "This case should not have been issued based on the DPD investigation, and for that we apologize," she said. DPD is the Detroit Police Department. His was the first publicly reported case in which police wrongly arrested someone after a false face-recognition match.

At least three Detroit arrests of this kind are publicly known, according to reporting by Michigan Public in 2024. In 2023 Detroit police wrongly arrested Porcha Woodruff for a carjacking, which is stealing a car from its driver. She was pregnant. On June 28, 2024, Williams and lawyers for the City of Detroit settled his lawsuit. Under the settlement, Detroit police may not arrest anyone based on a face-recognition result without other evidence. They may not build a photo lineup from a face-recognition match alone. They must train officers, including on the higher rate of wrong matches for people of color, and they must review cases back to 2017.

AI at work, by the numbers

In a survey of 5,119 American adults in February 2026, researchers at the Pew Research Center found that 44 percent had used ChatGPT. The share was 18 percent in 2023 and 34 percent in 2025. About half of adults in the 2026 survey used some AI chatbot, a program that answers typed questions in sentences. Among adults with jobs, 38 percent used chatbots for tasks at work. Forty percent of adults expected AI to have a bad effect on society over the next 20 years.

Some employers say AI is the reason they are cutting jobs. Challenger, Gray & Christmas is an outplacement firm, a company that helps laid-off workers find new jobs. Its staff count the job cuts that American employers announce, and the reasons the employers give. From January through August 2026, employers named AI as the reason for 116,175 announced job cuts. That was about 22 percent of all the cuts they announced, more than for any other reason. These numbers are employers' own statements. They are not a government count of jobs lost to AI.

Chapter 9: Science

Before 1500

Long before 1500, the people of Native nations here held careful, tested knowledge about the world. They watched the sky over many generations and learned where the sun rose at each time of year. They studied plants, fire, the weather and the tides. Each generation taught what it knew to the next.

People marked what they knew about the sky with posts and with carvings in rock. At Cahokia, people set up circles of wooden posts that marked where the sun rose. At Chaco Canyon, sunlight falls on two carved spirals in set places at certain times of year.

Woodhenge at Cahokia

The place where the sun comes up moves along the horizon over the course of a year. The people of Cahokia, in what is now Illinois, tracked that movement with circles of upright wooden posts. The circles are known today as Woodhenge. Nations such as the Chickasaw and the Osage descend from the people who lived at Cahokia.

They built five of these circles, one after another, between about the years 900 and 1100. Each circle had between 24 and 72 posts. The largest was about 145 meters across, which is about 475 feet. The posts marked the points where the sun rose at different times of the year.

Among them were the sunrise points on the solstices and the equinoxes. The solstices are the longest day of the year and the shortest day. The equinoxes are the two days each year when day and night are about the same length.

The Sun Dagger at Chaco Canyon

Chaco Canyon, in what is now New Mexico, was a center for the ancestral Pueblo people from 850 to 1250. Ancestral means they were the long-ago family of people living today. Their descendants include the Hopi, the Pueblo peoples of New Mexico and the Navajo Nation. In the

canyon, three slabs of sandstone lean against a cliff near the top of Fajada Butte. A butte is a steep hill with a flat top. Two spirals are carved into the rock there. A carving in rock like this is called a petroglyph.

Sunlight passes the edges of the slabs and falls on the spirals as thin blades of light, called daggers. The daggers land on the spirals in set places at the solstices and the equinoxes. Researchers in a group called the Solstice Project argue that the spirals also mark a cycle of the moon. Over 18.6 years, the points where the moon rises and sets swing out to their widest and back again. Other researchers who study ancient astronomy still debate that claim.

The daggers no longer form the way they did in 1977. That year, at the summer solstice, Anna Sofaer recorded them. She was a volunteer making a record of rock art. By the summer solstice of 1989, two of the three slabs had shifted. Visitors walking on the butte had made the ground wear away faster, even though park officials limited visits there.

Knowledge of living things

Scientists today have a name for the knowledge that Native nations built up about plants, fire, weather and the land. They call it Traditional Ecological Knowledge, or TEK for short. Part of it is knowledge of how fire changes the land and the living things on it.

Ecology is the study of how living things depend on each other and on the land around them. TEK is knowledge of those ties that people gained by watching closely over many generations. The Ecological Society of America, a group of scientists who study ecology, has a section for TEK. A botanist named Robin Wall Kimmerer helped to found that section. A botanist is a scientist who studies plants.

Robin Wall Kimmerer

Who: A botanist of the Citizen Potawatomi Nation who uses Native knowledge and laboratory science together in her work.

When and where: The present day. The State University of New York's College of Environmental Science and Forestry.

Robin Wall Kimmerer is a scientist of the present day. She is a member of the Citizen Potawatomi Nation. In her work she uses two ways of knowing about plants together. One is the knowledge that Native nations have built up and taught. The other is the science of the laboratory.

> She earned a PhD in botany, the highest degree a university gives, at the University of Wisconsin. Today she teaches at the College of Environmental Science and Forestry, part of the State University of New York. She holds the title Distinguished Teaching Professor. It is the top rank the State University of New York gives for teaching. At that college she founded the Center for Native Peoples and the Environment. Outside it, she helped found the TEK section of the Ecological Society of America.
>
> Her book *Braiding Sweetgrass* came out in 2013. It has been a New York Times bestseller since February 2020. In 2022 she was named a MacArthur Fellow, an award from the MacArthur Foundation.

The 1500s

Europeans who crossed the ocean in the 1500s studied this land only on short visits. They collected what they found here and described it in writing. Then they published their descriptions in Europe.

Thomas Hariot's report

Thomas Hariot was an English mathematician. In 1585 and 1586 he went with the English expedition that Walter Raleigh sent to Roanoke Island, among the islands and shallow waters of the Outer Banks, in what is now North Carolina. He spent a year there and recorded the plants, the animals and the foods he found. He also wrote about the Native nations who lived there, such as the Secotan. They spoke Algonquian languages, a group of languages related to each other.

In 1588 Hariot published *A Briefe and True Report of the New Found Land of Virginia*. It was the first book in English about North America written by someone who had been there. In 1590 a publisher named Theodor de Bry printed the book again, with pictures made from drawings by John White.

The 1600s

English colonists in New England founded Harvard, the first college in their colonies, in 1636. Three years later they printed their first almanac. A few colonists wrote careful records of what they saw in the sky and in the weather. One of them, Increase Mather, measured comets and

also wrote that they were warnings from God.

A college, an almanac and a telescope

In 1636 members of the Massachusetts Bay General Court, the lawmaking body of the colony, voted to found a college. It was the first college in the English colonies. John Harvard died in 1638 and left the college his books and half of everything else he owned. On March 13, 1639, members of the same court voted to name the college Harvard, after him.

That same year a mariner named William Pierce worked out *An Almanack for New England for the Year 1639*. A mariner is a sailor. An almanac is a yearly booklet with a calendar and tables of the sun and moon. Stephen Daye printed it at Cambridge, in Massachusetts. It was one of the first two things printed on the first printing press in the colonies. For the next two hundred years, ordinary families learned about astronomy from almanacs. Astronomy is the study of the sun, the moon, the planets and the stars.

John Winthrop Jr. was a governor of Connecticut. He visited London from 1661 to 1663. While he was there, members of the Royal Society, a group of scientists in London, elected him a fellow, which is a full member. He was one of the first colonists to join. In about 1672 he gave Harvard his telescope, which was 3.5 feet long. It was the college's first scientific instrument.

The comet of 1680

A comet appeared in the sky in November and December of 1680. It is called the Great Comet of 1680. Thomas Brattle, who had finished his studies at Harvard in 1676, followed it with a telescope from Boston. He worked out that the comet seen in November and the comet seen in December were one comet. It had swung around the sun between the two sightings.

In 1683 Increase Mather wrote a book about comets called *Kometographia*. In it he listed comets as warnings sent by God. He also measured comets with a method called parallax. Parallax works by looking at an object from two different places. A near object seems to shift against the stars far more than a distant one. His measurements showed that comets were distant bodies rather than vapors, a kind of gas.

That same year Mather founded the Boston Philosophical Society, a group modeled on the Royal Society in London. In those days the study of nature was called natural philosophy, so a philosophical society was a group for studying nature. Mather's group met for about three years.

In 1687 the English scientist Isaac Newton published his book the *Principia*. In it Newton set out his laws of motion and of gravity. He also wrote about Brattle's New England observations of the comet of 1680.

Rev. John Campanius Holm

Who: A chaplain in the colony of New Sweden who kept the first known weather record in what is now the United States.

When and where: Near what is now Wilmington, Delaware, 1644 and 1645.

John Campanius Holm kept the first known record of the weather in what is now the United States. He wrote down the weather twice a day through 1644 and 1645. He did it with no instruments.

Holm was a chaplain, a minister who serves a group of people away from home. He served New Sweden, a Swedish colony on the Delaware River, near what is now Wilmington, Delaware. His record was systematic, which means he made it the same way on a fixed plan, day after day.

Today, officials of the National Oceanic and Atmospheric Administration, the US government's weather and ocean agency, give the John Campanius Holm Award. It goes to volunteers who take weather readings. Up to 25 people receive it each year.

1700 to 1750

From 1730 the farmer John Bartram traveled through the colonies to collect and study American plants. In 1743 Benjamin Franklin organized a society in Philadelphia where colonists could share such work. From 1747 he ran experiments with electricity and mailed the results to London. Scientists in Britain read those letters, and Franklin became the first American scientist known outside the colonies.

The American Philosophical Society, 1743

In 1743 Benjamin Franklin organized the American Philosophical Society in Philadelphia. It is the oldest learned society in the United States. A learned society is a group of people who meet to share and discuss what they have found out.

The botanist John Bartram first suggested the idea in 1739. Franklin started the society with a pamphlet, a short printed booklet. The pamphlet was titled *A Proposal for Promoting Useful Knowledge among the British Plantations in America*. In that title, the word plantations means colonies.

The society grew out of the Junto, a club Franklin had started in 1727 with about twelve friends, most of them tradesmen. Its members met on Friday nights to argue about right and wrong, about government and about nature. Franklin meant the new society to be an American answer to the Royal Society in London.

Benjamin Franklin

Who: A Philadelphia man whose experiments with electricity made him the first American scientist known in other countries.

When and where: Philadelphia, experiments from 1747 to 1751.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS. It is about Franklin's life.

Benjamin Franklin was the first American to be known in other countries as a scientist. From 1747 to 1751 he ran experiments with electricity in Philadelphia. He reported his results in letters to Peter Collinson, a member of the Royal Society in London.

Franklin thought of electricity as a single fluid. He called an object positive when it held more of this fluid than normal, and negative when it held less. Scientists still use his words positive and negative. He also argued that electric charge is never made or destroyed. It only moves from one object to another. Scientists call this idea the conservation of charge. Franklin also proposed that lightning is electricity.

In April 1751 his letters were published in London as a book, *Experiments and Observations on Electricity*. In 1753 members of the Royal Society gave him the Copley Medal, their highest honor. He was the first person from outside Britain to receive it.

John Bartram

Who: A Quaker farmer who studied plants, built the oldest surviving botanic garden in America, and first suggested the American Philosophical Society.

When and where: Kingsessing, on the Schuylkill River. Lived 1699 to 1777.

> John Bartram and his sons introduced more than 200 American plants to science. That means scientists first learned of those plants through the Bartrams.
>
> Bartram was a farmer and a Quaker, a member of a Christian group also called the Society of Friends. In 1728 he bought a farm of 102 acres on the Schuylkill River, at a place called Kingsessing. There he built a botanic garden, a garden where plants are grown so they can be studied. It is the oldest botanic garden in America that survives today.
>
> From 1730 to 1765 he traveled to collect plants, from New York as far south as Florida. In 1739 he suggested the idea that became the American Philosophical Society. In 1765 King George III named him the King's Botanist for North America.
>
> The Swedish botanist Carl Linnaeus made the system scientists use to name living things. Other people reported that Linnaeus called Bartram "the greatest natural botanist in the world."

1750 to 1800

In 1752 a test that Benjamin Franklin designed showed that lightning is electricity. Men in France ran it first, and Franklin followed with his kite. In 1769 four men at Norriton timed the planet Venus as it crossed the sun, and members of the Royal Society in London reprinted their results.

In his book *Notes on the State of Virginia*, Thomas Jefferson used evidence to argue with a scientist in France about the size of American animals. In that same book, Jefferson wrote that Black people were inferior to white people, meaning less able, in body and mind. He called this claim "a suspicion only." Benjamin Banneker, a free Black farmer who taught himself astronomy, sent Jefferson an almanac he had calculated as proof against that claim.

The lightning test

Franklin published a plan for a test that would show whether lightning is electricity. The first people to carry it out were in France. On May 10, 1752, at Marly-la-Ville, Thomas-François Dalibard arranged the test with a tall iron rod. He followed Franklin's printed plan. On May 13 Dalibard reported the test to the French Academy, a society of scholars.

The test at Marly-la-Ville showed that lightning is electricity. Franklin ran his own test in Philadelphia with a kite. Nobody recorded the exact day or the exact spot. Franklin first described the kite in print on October 19, 1752, in the *Pennsylvania Gazette*, a newspaper. The date most often given, June 1752, comes from an account that Joseph Priestley wrote in 1767. In a 2004 book called *Bolt of Fate*, the writer Tom Tucker argued that Franklin never flew the kite at all.

Timing Venus, 1769

On June 3, 1769, the planet Venus passed across the face of the sun, as seen from Earth. This event is called a transit of Venus. Members of the American Philosophical Society chose teams of observers to time it. Astronomers in many parts of the world timed the same transit. They planned to use the times to work out the distance from Earth to the sun. This work by society members was the first large, organized science project in the colonies.

Society members planned to watch from three places. One was Norriton, the home of David Rittenhouse, in what is now Montgomery County, Pennsylvania. Rittenhouse built most of the instruments used there. At Norriton, Rittenhouse, William Smith, John Lukens and John Sellers timed Venus as it crossed the sun. Their results filled the first volume of the society's *Transactions*, its printed record of research, which came out in 1771. Members of the Royal Society in London reprinted the results.

David Rittenhouse

Who: A Pennsylvania instrument maker and astronomer who taught himself both trades. One of the four men who timed Venus at Norriton in 1769.

When and where: Pennsylvania. Born 1732, died 1796.

David Rittenhouse taught himself to make scientific instruments and to study the stars. He was one of the four men who timed the transit of Venus at Norriton on June 3, 1769.

Rittenhouse built orreries. An orrery is a machine that shows the planets moving around the sun. When its gears turn, small models of the planets move along their paths.

In 1791 he followed Franklin as president of the American Philosophical Society. Later he became the first director of the United States Mint, where the country's coins are made.

Jefferson, Buffon and the moose

A scientist in France named Buffon taught that animals and people grew "degenerate" in the Americas. By that he meant smaller and weaker. Thomas Jefferson argued against this with evidence in his book *Notes on the State of Virginia*.

Jefferson wrote the book to answer a list of questions that a French official had sent. He called each chapter a Query, an old word for a question. In the chapter called Query XIV, Jefferson made a claim about Black people. He wrote: "I advance it therefore as a suspicion only, that the blacks, whether originally a distinct race, or made distinct by time and circumstances, are inferior to the whites in the endowments both of body and mind." Inferior means lower or less able. Endowments here means natural abilities. He wrote that in reason Black people were "much inferior, as I think one could scarcely be found capable of tracing and comprehending the investigations of Euclid." Euclid was an ancient Greek mathematician. Jefferson himself enslaved more than 600 people during his life.

Jefferson also used a moose as evidence against Buffon. Jefferson was the United States minister in Paris, the country's official representative to the French government. On January 7, 1786, he wrote to John Sullivan of New Hampshire, a former general and governor. He asked for "the skin, the skeleton, and the horns of the Moose."

Sullivan's party of men killed a moose in Vermont. Its body reached Sullivan on April 3, 1787, badly rotted. The skull and antlers could not be saved, so Sullivan sent the antlers of another animal. He wrote that they were "not the horns of this moose but may be fixed on at pleasure." That meant Jefferson could attach them however he liked.

The shipment reached France in about late September 1787. Around October 1, 1787, Jefferson gave Buffon the moose's bones and skin, along with the antlers from the other animal. Jefferson wrote that the moose "convinced Mr. Buffon. He promised in his next volume to set these things right." Buffon died in April 1788 without printing a correction.

Benjamin Banneker

Who: A free Black tobacco farmer who taught himself mathematics and astronomy and calculated almanacs for the years 1792 through 1797.

When and where: Baltimore County, Maryland. Born November 9, 1731. Died 1806.

Benjamin Banneker calculated the astronomy for six years of printed almanacs, for 1792 through 1797. He worked out where the sun, the moon and the planets would be on each day. Tables like these are called ephemerides. Banneker was a free Black tobacco farmer

in Baltimore County, Maryland. He taught himself mathematics and astronomy from books and instruments that he borrowed.

He correctly predicted the solar eclipse of April 14, 1789, though better-known almanac makers had calculated it differently. In a solar eclipse, the moon passes between the earth and the sun and blocks some or all of the sun's light.

On August 19, 1791, Banneker sent Jefferson his almanac in manuscript, which means written by hand. He sent it as proof against Jefferson's claim about Black people. With it he sent a letter that challenged Jefferson about slavery. He wrote that "however variable we may be in society or religion, however diversified in situation or colour, we are all of the same family."

Jefferson wrote back on August 30, 1791: "no body wishes more than I do to see such proofs as you exhibit, that nature has given to our black brethren, talents equal to those of the other colours of men." Exhibit means show, and brethren means brothers. Jefferson sent the almanac on to a man named Condorcet in Paris.

Banneker's first almanac, for the year 1792, went on sale in December 1791. Goddard & Angell of Baltimore printed it, and it sold in Baltimore, Philadelphia and Alexandria. Joseph and George Ellicott, Banneker's Quaker neighbors, had already interested other Quakers in his work. They had also interested the abolition societies of Baltimore and Philadelphia in him. An abolition society was a group that worked to end slavery. Members of the abolition societies of Pennsylvania and Maryland promoted Banneker's almanacs. Several printers published them, and they sold in the United States and in England.

The 1792 almanac opened with words of support from James McHenry, a Maryland politician. He wrote: "I consider this Negro as fresh proof that the powers of the mind are disconnected with the colour of the skin." Negro was a word used then for a Black person.

Banneker died in 1806. Three years later, on October 8, 1809, Jefferson wrote about him in a letter to Joel Barlow: "we know he had spherical trigonometry enough to make almanacs, but not without the suspicion of aid from Ellicot, who was his neighbor & friend, & never missed an opportunity of puffing him." Spherical trigonometry is the mathematics of angles and distances on a sphere, such as the sky. Puffing meant praising someone too much. Jefferson was hinting that Banneker's neighbor Ellicott had helped him with the mathematics. Jefferson himself called this a suspicion.

Jefferson's fossil, 1797

On March 10, 1797, Jefferson presented a paper to the American Philosophical Society about a fossil animal named Megalonyx. The name means "giant claw." A fossil is the remains of a living thing kept in rock. Jefferson's paper was printed in 1799. Megalonyx was the first genus of fossil animal from the United States to receive a name. A genus is a group of closely related kinds of animals or plants.

Caspar Wistar wrote a second paper to go with Jefferson's. With it, Wistar began the study of paleontology in the United States. Paleontology is the study of ancient life through fossils.

1800 to 1850

Between 1800 and 1850, Americans founded the country's first lasting science journal, a magazine where scientists publish their research. They also founded a national center for science. Benjamin Silliman became Yale's professor of chemistry in 1802 and founded the journal in 1818. In 1846 President James K. Polk signed a law to set up the Smithsonian Institution in Washington. An Englishman who never visited the country had left the money for it. Its first head, Joseph Henry, set up a network of volunteers who reported the weather.

In Philadelphia in the same years, a doctor named Samuel George Morton collected hundreds of human skulls. Some of the men who supplied him robbed graves to get them. Morton measured the skulls and used the numbers to rank the races of people. The idea that skull size shows the intelligence or worth of a group of people is false.

A professor, a fallen stone and a journal

Benjamin Silliman became Yale's professor of chemistry and natural history in 1802. Chemistry is the study of what things are made of and how substances change. Natural history is the study of plants, animals and rocks. Silliman gave his first lectures in 1804.

On December 14, 1807, a meteorite fell at Weston, Connecticut. A meteorite is a rock from space that falls to the ground. Silliman and James Kingsley wrote down what was known about the fall. They also ran chemical tests to learn what the meteorite was made of. It was the first meteorite fall in the Americas that scientists recorded and studied in this way.

In 1818 Silliman founded the *American Journal of Science*. A scientific journal is a magazine in which scientists publish their research. His was the first one in the country that lasted. For decades people called it "Silliman's Journal."

Joseph Henry, magnets and credit

Joseph Henry discovered self-induction and published it in July 1832, in Silliman's journal. When the electric current in a coil of wire changes, the coil makes its own push of electricity against that change. That effect is self-induction.

Henry was a teacher at the Albany Academy, a school in Albany, New York. His best years of research there ran from 1826 to 1832. He built the strongest electromagnets of his day. An electromagnet is a magnet made by sending electricity through a coil of wire.

Henry also saw a related effect, called electromagnetic induction. It is the making of an electric current with a magnet. Michael Faraday in London published his discovery of it first, in 1831. Henry had found it on his own but published later. Faraday keeps the credit for that discovery, and Henry has the credit for self-induction. Scientists measure the strength of self-induction in a coil with a unit called the henry, named after him.

Samuel Morton's skulls

Samuel George Morton was a Philadelphia doctor who collected human skulls and used them to rank the races of people. He lived from 1799 to 1851. He was a member of the Academy of Natural Sciences of Philadelphia, a society of scientists. In 1830 he prepared a lecture on how skulls differ. In the early 1830s he began to collect them. When he died in 1851, he owned 867 human skulls.

He got the skulls through 138 contacts: scientists, traders, military men and missionaries, people sent by churches to spread their religion. Army surgeons at far-off posts were his most useful suppliers. Some of his collectors robbed graves. About a dozen skulls came from a potter's field in Philadelphia, a burial ground for poor people. Poor Black Philadelphians were buried there.

Morton worked as a doctor at the city's almshouse, a public home for poor people. In those same years he himself got the remains of at least 14 Philadelphians, Black and white. Remains are what is left of a dead body, such as the bones. A 2021 report on these remains by Paul Wolff Mitchell, a researcher for a University of Pennsylvania project, does not name who dug up their bodies. In 2021 reporters at WHYY, a Philadelphia news station, wrote that the Philadelphia skulls were likely bought from grave robbers.

In 1840 a doctor in Havana, José Rodríguez Cisneros, dug up the graves of enslaved Africans in Cuba and shipped their skulls to Morton. He wrote that he had got 50 skulls. Other records count 51 or 55. More skulls came from battlefields and from gallows, the frames on which people were hanged. Many of the skulls were those of Native Americans.

Morton filled each skull with peppercorns, and later with lead shot, which means tiny balls of lead. Then he poured them out and measured how much the skull had held. He believed that a bigger skull meant a more intelligent person. He ranked the races by the average size of their skulls, with white Europeans at the top.

His book *Crania Americana*, Latin for "American skulls," came out in 1839. It made him famous in other countries. The Penn Museum's own account states that Morton is sometimes called the "father of scientific racism." Scientific racism means using the look of science to claim that some races are better than others.

Two of Morton's followers, the doctor Josiah Nott and George Gliddon, used his work to defend slavery. In 1854 they published a book in Morton's honor called *Types of Mankind*. Nott argued in it that Black people were a separate species, a separate kind of living thing, naturally and forever below white people. His aim was to show that freeing enslaved people would be a disaster for both races. Nott wrote to protect his clients, who were slaveholders.

Scholars still argue about how carefully Morton measured. In 1978, and again in a 1981 book, Stephen Jay Gould of Harvard wrote that Morton's numbers were biased. That means his mistakes leaned toward the answer he wanted. In 2011 six scholars led by Jason E. Lewis measured 308 of the 670 skulls Morton had published. They found his errors small and random. A 2016 paper argued against parts of their work. The argument is only about whether Morton measured carelessly. His main idea, that skull size ranks the intelligence or worth of groups of people, is false.

Today the Penn Museum, at the University of Pennsylvania, holds Morton's skulls. Museum staff took them off a classroom display in 2020. On April 12, 2021, the museum's director, Christopher Woods, apologized for "the unethical possession of human remains in the Morton Collection." Unethical means wrong. He announced a plan to return the remains. In January 2024, on the order of a Philadelphia court, museum staff buried the skulls of 19 Black Philadelphians from the collection at Eden Cemetery in Collingdale, Pennsylvania. It is one of the oldest Black burial grounds near Philadelphia. A group called the Black Philadelphians Descendant Community Group objected. Its members said that the Black community, not the museum, should decide what happened to the remains.

James Smithson

Who: An English chemist who left his fortune to the United States to found the Smithsonian Institution. He never set foot in the country.

When and where: Died in Genoa, Italy, on June 27, 1829. The Smithsonian was founded in Washington on August 10, 1846.

James Smithson paid for the Smithsonian Institution, even though he never set foot in the United States. He was an English chemist. He died in Genoa, Italy, on June 27, 1829.

His will left his money to his nephew. It also stated a condition. If the nephew died without heirs, meaning children or other family to inherit the money, it was to go to the United States. The will said the money was "to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase & diffusion of knowledge." An establishment here means a place set up for a purpose, and diffusion means spreading. Smithson never explained why he left his fortune to a country he had never seen, and nobody knows the reason.

The nephew died without heirs in 1835. In September 1838, more than 100,000 gold coins called sovereigns reached the mint in Philadelphia, where the country's coins are made. Workers there turned them into American coins worth more than $500,000. Members of Congress then argued for eight years about what to do with the money. On August 10, 1846, President James K. Polk signed a law to set up the Smithsonian.

Joseph Henry

Who: A teacher at the Albany Academy who discovered self-induction and became the first Secretary, or head, of the Smithsonian Institution.

When and where: Albany, New York, for his research of 1826 to 1832. Princeton from 1832. Washington from 1846.

Joseph Henry was the first Secretary, or head, of the Smithsonian Institution. On December 3, 1846, he won seven of the twelve votes cast by the Smithsonian's Board of Regents, the group that runs it. He held the job for 32 years, until he died in 1878.

Before that he had taught at the Albany Academy, where he discovered self-induction. In 1832 he became a professor at Princeton.

At the Smithsonian, from 1849, Henry ran the Smithsonian Meteorological Project. Meteorology is the science of weather. About 150 volunteers wrote down the weather where they lived. They sent their reports by mail, and by telegraph at no charge. A telegraph sent messages along a wire as bursts of electricity. Henry used the reports to build the first weather maps of the whole country.

A decade later, about 600 observers were sending reports. The project ran from 1849 to 1870. This project led to the National Weather Service, the weather agency of the United States government today.

Charting the winds at sea

Matthew Fontaine Maury made charts of the winds and currents at sea from thousands of old ships' logs. A log is the daily record a ship's crew keeps of its position, the wind and the sea. A current is a stream of moving water inside the ocean. A chart is a map for sailors.

From 1842 Maury ran the Navy's Depot of Charts and Instruments, where old logs were stored. He went through thousands of them for facts about winds and currents. In 1847 he issued the first Wind and Current Chart of the North Atlantic. He then collected logs from ship captains around the world, all kept in the same format. Captains who used his charts cut their sailing times.

In April 1861 Virginia's leaders took the state out of the United States. Maury then resigned from the US Navy and joined the Confederacy. The Confederacy was the group of Southern states that broke away from the United States and fought against it in the Civil War. Before the war, Maury had wanted slavery to spread into the American West and also into Cuba and Brazil.

Maria Mitchell

Who: A librarian and astronomer on Nantucket who found a comet in 1847. She was the first American and the first woman to win the King of Denmark's gold medal for finding a comet.
When and where: Nantucket, Massachusetts. She found the comet on October 1, 1847.

On October 1, 1847, Maria Mitchell found a comet that no chart of the sky showed. A comet is a frozen body that travels around the sun. She was on the roof of the Pacific National Bank building on Nantucket, an island off Massachusetts. Her father worked at the bank. She was sweeping the sky with a small telescope, moving it slowly across the stars. The comet is known as "Miss Mitchell's Comet."

The King of Denmark offered a gold medal for each new comet found with a telescope. Mitchell won it. She was the first American and the first woman to receive it. An Italian astronomer named de Vico saw the same comet two days after she did.

> In 1836 she had become the first librarian of the Nantucket Atheneum, a library on the island. For the 20 years she held that job, Mitchell read in the library by day. At night she and her father watched the sky from the roof of the bank, where he was in charge.
>
> In 1848 Mitchell became the first woman elected to the American Academy of Arts and Sciences, a society of scholars.

1850 to 1900

Louis Agassiz, the most famous scientist in America, used his fame to argue that the races of people were created separately. In 1850 he had seven enslaved people in South Carolina photographed, with their clothes taken off, as "evidence" for that claim. From 1868, officials of an Army museum in Washington asked Army doctors to send them the skulls of Native Americans. Scientists there measured the skulls to rank the races. Agassiz also attacked Charles Darwin's book *On the Origin of Species*, and Asa Gray, a botanist, or plant scientist, defended it.

In 1879 Albert Michelson measured the speed of light to within about 0.05 percent of the value used today. Josiah Willard Gibbs of Yale founded the science of energy in chemical changes with a paper published in 1876 and 1878. Williamina Fleming, first hired as a maid, sorted more than 10,000 stars at Harvard's observatory.

The argument over Darwin's book

Charles Darwin's book *On the Origin of Species* came out in London in November 1859. In it, Darwin argued that species were not each created separately. A species is one kind of living thing. He wrote that species change over time. He called the way they change natural selection. A trait is a feature of a living thing, such as its color or size. Some living things have a trait that helps them survive and have young where they live. They have more young, and the young are likely to have the trait too. In time, the trait spreads through the group. Copies of the book reached Harvard quickly, and two American scientists there took opposite sides.

Asa Gray, a botanist, defended Darwin's theory. Gray had arranged for Darwin's book to be published in America. Louis Agassiz was a zoologist, a scientist who studies animals, and the most famous scientist in America. He attacked the book. He insisted that every species had been created separately.

The two men argued it out at the American Academy of Arts and Sciences in early 1860. Agassiz opened his attack there on January 10, 1860. Gray also defended Darwin in essays in the *Atlantic Monthly*, a magazine. In 1876 he collected them in a book called *Darwiniana*. In it he argued that a person could accept science and keep a religious faith at the same time.

Agassiz and the fifteen photographs

Louis Agassiz used his standing as America's most famous scientist to push a racist idea called polygenism. Polygenism is the false claim that the races of people were created separately. In the winter of 1850, Agassiz hired a photographer named Joseph T. Zealy to photograph enslaved people in South Carolina as "evidence" for it.

On a tour of plantations, Agassiz looked among the enslaved people for ones who had been born in Africa. A plantation is a large farm. Agassiz thought that people born in Africa were racially "pure."

Zealy made 15 daguerreotypes. A daguerreotype is an early kind of photograph made on a polished metal plate. The pictures show seven people: Renty Taylor, his daughter Delia, Alfred, Drana, Fassena, Jack and Jem. Agassiz had examined them himself. He left instructions with Robert W. Gibbes, a doctor in Columbia, South Carolina, to collect photographs as evidence. Gibbes arranged for Zealy to photograph the people Agassiz had examined.

In 1976 Elinor Reichlin found the daguerreotypes again at Harvard's Peabody Museum. They are the earliest known photographs of enslaved people in America. In 1977 Reichlin wrote that each person had been posed naked. News reports in 2025 said that Renty and Delia were posed with no shirts on and photographed from several angles. Reichlin's account does not make clear whether Gibbes or Zealy did the posing.

B. F. Taylor enslaved Renty on his plantation, called Edgehill. Delia was Renty's daughter, born in America to parents from Africa. Jack worked in Taylor's fields as a driver, an enslaved man put in charge of other enslaved workers. F. W. Green of Columbia enslaved Jem. Reichlin's account does not name who enslaved Alfred, Drana and Fassena.

Tamara Lanier sued Harvard over the pictures in 2019. She identifies Renty as her great-great-great-grandfather. In 2022 the judges of the Supreme Judicial Court of Massachusetts, the state's highest court, let her claim for emotional distress go forward. Emotional distress means harm to a person's mind and feelings. On May 28, 2025, Lanier and Harvard's lawyers settled the case, and Harvard's leaders agreed to give up the images. In December 2025 Harvard's

leaders handed the pictures over from the Peabody Museum to the International African American Museum in Charleston, South Carolina. Museum staff there unveiled them to the public on March 11, 2026.

Skulls for the Army Medical Museum

From the 1860s, Army doctors and other collectors sent the skulls of Native Americans to the US Army Medical Museum in Washington. Collectors took many of them from graves and battlefields. Scientists at the museum measured the skulls to rank the races.

The museum got the remains of a Dakota man killed in May 1864. Near an Army post in rural Minnesota, militiamen shot him twice. Militiamen are part-time citizen soldiers, and these were fighting against the Native people there. One bullet shattered his skull. The other went through his mouth or neck. Soldiers dragged his body to a nearby fort, where settlers beat it. Someone cut off his scalp, the skin and hair of the top of the head, and carried it away to keep. Someone buried the body in a shallow grave. A few months later, his skeleton was dug up again. The historian Samuel Redman, who told this man's story in 2016, does not name the militiamen, the settlers or the person who dug him up. He was about 25 to 35 years old. Nobody recorded his name. Alfred Muller, an Army doctor with the title of acting assistant surgeon, examined the man's remains and sent them to the Army Medical Museum. They ended up at the Smithsonian.

In 1867 officials in the Army's Surgeon General's Office, which ran the Army's doctors, sent out a letter called Circular No. 2. In it they asked Army medical officers to collect skulls, along with Native weapons, clothing, tools, food and medicine. From 1868, officials at the Army Medical Museum asked Army doctors in "Indian country," the lands where Native nations lived, to send them Native American skulls.

The museum's scientists did craniometry, which means measuring skulls. Craniometry was part of a false "racial science." People who did it used the measurements to sort humans into races. Then they ranked the races by how intelligent they believed each one was. George A. Otis, the museum's curator, collected and measured hundreds of the skulls. A curator is the person in charge of a museum's collection.

Redman's history of these collections tells how the collectors got the skulls. They dug some out of graves, sometimes months after the burial, and emptied whole cemeteries. Others came from battlefields, from people who had just been killed there. Redman's account does not say who did the killing. Some skulls arrived at the museum without anyone asking for them.

One of the collectors was B. E. Fryer, the Army surgeon at Fort Harker in Kansas. In late January 1869, US soldiers and Kansas settlers attacked a party of Pawnee men at a farm near Mulberry Creek, in Kansas. James Riding In, a Pawnee historian, calls it a massacre. The Pawnee said the soldiers fired first, and Army officers said the Pawnee did. Two soldiers were wounded. The soldiers and settlers killed eight or nine Pawnee men. Settlers captured one of the Pawnee men and killed him, and the reason given was that he was "trying to escape." Five men escaped and hid their dead friends' bodies from the soldiers. Three of those five later died of exposure, which means from cold out in the open. So as many as twelve Pawnee men may have died because of the attack.

On January 30, Fryer sent a civilian to cut off the dead men's heads. Over the next weeks, Fryer or men he sent searched for the hidden bodies. On March 11, 1869, Fryer shipped 26 Native skulls to Washington, and six of them were Pawnee. He wrote to Otis that two of the skulls were damaged because soldiers "shot into the bodies and heads several times after the fight." From 1868 to 1872 Fryer sent Otis the remains of at least 42 people. They were Cheyenne, Wichita, Caddo, Osage, Kansa and people of other nations. Riding In told what Fryer did in a 1992 article, quoting Fryer's letter to Otis.

By about 1900 the museum's collection held about 3,000 skulls. In 1898 and again in 1904, Army officials moved the Native remains to the Smithsonian's national museum. The only ones kept back were those of interest for the study of surgery. One record counts 2,000 skulls in the transfer.

Colleges and farm research in every state

The Morrill Act became law on July 2, 1862. Under it, members of Congress gave each state 30,000 acres of public land for each of its senators and representatives. The states sold the land and used the money to start colleges that taught farming and the skills of machines and building. These are called land-grant colleges. The land had been taken from Native nations. The reporters Robert Lee and Tristan Ahtone counted about 10.7 million acres of this land. US officials had taken it from nearly 250 Native nations, bands and communities, in more than 160 land deals backed by violence. For all of it the United States paid less than $400,000. Through them, students in every state could study science.

Under the Hatch Act of 1887, members of Congress set aside federal money for an agricultural experiment station in every state. An agricultural experiment station is a place where scientists run tests to improve farming. Scientists at the stations did research for the public in every state, including places far from the old college towns.

Maria Mitchell's eclipse trip, 1878

In 1878 Maria Mitchell led a team of women about 2,000 miles by train to Denver to watch a total solar eclipse. In a total solar eclipse, the moon blocks all of the sun's light for a short time. The eclipse took place on July 29, 1878. Her team was made up of students and graduates of Vassar College, a college for women. The women ran the trip themselves, and reporters for newspapers across the country followed it.

Mitchell had become a professor at Vassar in 1865. She was the first American woman to be a professor of astronomy.

Josiah Willard Gibbs

Who: A Yale physicist whose long paper of 1876 and 1878 founded chemical thermodynamics, the science of energy in chemical changes.

When and where: Yale, in New Haven, Connecticut. Professor from 1871.

Josiah Willard Gibbs founded chemical thermodynamics. Thermodynamics is the science of heat and energy. Chemical thermodynamics uses its rules to explain what happens to energy when substances change.

He published this work in two parts, in 1876 and 1878. It was called *On the Equilibrium of Heterogeneous Substances*. Equilibrium means a steady balance. Heterogeneous substances are mixtures of different materials. The work came out in the *Transactions of the Connecticut Academy*, a journal that was little known. It was also very hard to follow.

Scientists in Europe took notice of Gibbs's work before scientists in America did. In 1873 Gibbs had published shorter papers that described a curved surface in mathematics. In 1874 the Scottish physicist James Clerk Maxwell, a scientist who studied matter and energy, built a model of that surface with his own hands. He shaped it in clay, made copies in plaster and mailed one to Gibbs in New Haven.

Gibbs had earned the first American doctorate in engineering, at Yale in 1863. A doctorate is the highest degree a university gives. From 1871 he was Yale's professor of mathematical physics. For his first nine years in that job he received no pay, and he lived on money he had inherited. In 1880 leaders of Johns Hopkins University offered him a job. Yale's leaders then began to pay him so that he would stay.

In 1901 he received the Copley Medal, at that time the top science honor in the world.

Albert Michelson

Who: An immigrant from Prussia, raised in mining towns in the West, who measured the speed of light to within about 0.05 percent of today's value.

When and where: Annapolis, Maryland, in 1879. Cleveland, Ohio, in 1887.

In 1879, at Annapolis in Maryland, Albert Michelson measured the speed of light. His result came within about 0.05 percent of the value scientists use today. That is an error of about 1 part in 2,000. He measured 299,864 kilometers per second, in air. Some books print his figure as 299,910.

Michelson was born on December 19, 1852, in Strelno, a town in Prussia. Prussia was a German kingdom, and the town is now Strzelno, in Poland. His parents brought him to the United States in 1855, when he was 2. He grew up in mining towns in California and Nevada. He graduated from the US Naval Academy at Annapolis.

From April to July 1887, in Cleveland, Ohio, Michelson and the chemist Edward Morley ran the test now called the Michelson-Morley experiment. Scientists then thought that light traveled as waves through an unseen substance they called the ether. Michelson and Morley found no trace of the ether. A result like this, where the test finds nothing, is called a null result. Their null result was an early clue for the theory of relativity. Albert Einstein put forward that theory, a new account of space, time and light, in 1905.

In 1907 Michelson became the first American to win a Nobel Prize in science.

Williamina Fleming

Who: An immigrant from Scotland, hired as a maid in the house of the Harvard College Observatory's director, who went on to classify more than 10,000 stars.

When and where: Harvard College Observatory, from about 1879.

Williamina Fleming sorted more than 10,000 stars by type for the Draper Catalogue, a list of stars published in 1890. She was an immigrant from Scotland. In about 1879 she took a job as a maid in the house of Edward Pickering, the director of the Harvard College Observatory. An observatory is a building for studying the sky. In 1881 she moved onto the observatory's staff.

She was one of the observatory's "computers." At that time a computer was a person whose job was to do calculations and measurements. Fleming studied photographic plates, which are glass sheets that hold photographs of the night sky. On a plate from

> 1888 she spotted the Horsehead Nebula. A nebula is a cloud of gas and dust in space.
>
> Fleming discovered 59 nebulae, more than 310 variable stars and 10 novae. A variable star is a star whose brightness changes. A nova is a star that suddenly grows much brighter for a time. In 1899 she became Curator of Astronomical Photographs, the person in charge of the observatory's photographs of the sky.
>
> Harvard's time capsule of 1900, called the Chest of 1900, holds an entry by Fleming. A time capsule is a box of papers sealed to be opened in the future. Her entry records that she earned $1,500 a year, while men in similar jobs earned $2,500. She wrote: "Does he ever think that I have a home to keep and a family to take care of as well as the men?"

1900 to 1950

Between 1900 and 1950, American scientists measured distances across the universe and ran the first controlled nuclear chain reaction. Edwin Hubble showed in 1929 that the galaxies are moving apart. On December 2, 1942, Enrico Fermi's team in Chicago ran the chain reaction. Albert Einstein, Fermi and Emilio Segrè all came to American labs from Europe in the 1930s. Fermi and Segrè made their homes in America after Italy's ruler, Benito Mussolini, put laws against Jews into force in 1938.

In the same years, some American scientists used people as research material without asking them. From 1910 to 1939, the staff of the Eugenics Record Office in New York collected family records to claim that poverty and behavior are inherited. At the Smithsonian, Aleš Hrdlička collected human brains and bones to rank the races. From 1945 to 1947, doctors working for the Manhattan Project, the secret program that built the atomic bomb, injected 18 hospital patients with plutonium to learn where it goes in the human body.

The charge of an electron and the place of a gene

Robert Millikan measured the electric charge of a single electron in experiments with drops of oil, from 1909 to 1913. An electron is one of the tiny particles inside every atom, and it carries electricity. Millikan showed that electric charge comes in exact, equal pieces. He won the Nobel Prize in Physics in 1923. The Nobel Prizes are awards first given in 1901 under the will of Alfred Nobel, a Swedish inventor. Each year they go to people for work in physics, chemistry, medicine, writing and peace, and later also economics.

In 1910 Thomas Hunt Morgan found a fruit fly with white eyes in his lab at Columbia University in New York. People called the lab the "fly room." After that fly, Morgan and his team spent 17 years working in the fly room. Morgan and his team proved that genes sit in a line along the chromosomes. A gene is a piece of the instructions, passed from parents to children, that shapes a living thing. A chromosome is a thread inside a cell that carries genes.

Morgan won the Nobel Prize in Physiology or Medicine in 1933. Physiology is the study of how living bodies work. It was the first Nobel Prize for genetics, the study of how living things pass on their traits.

Frank Chapman and the first Christmas Bird Count

Who: An ornithologist, a scientist who studies birds, at the American Museum of Natural History. He proposed counting birds at Christmas instead of shooting them.

When and where: Across North America, from Toronto to Pacific Grove, California, on December 25, 1900.

On Christmas Day in 1900, Frank M. Chapman replaced a Christmas hunt with a count of birds. Hunters had a Christmas custom called the "side hunt." In a side hunt, they shot at every bird and animal they could reach.

Chapman worked at the American Museum of Natural History in New York. He had founded a bird magazine called *Bird-Lore* and was its editor. He proposed that people count the birds instead of shooting them.

On December 25, 1900, 27 bird-watchers ran 25 separate counts. The counts stretched from Toronto in Canada to Pacific Grove in California. Together the volunteers counted about 18,500 birds of 90 species. A species is one kind of living thing.

The count has run every winter since 1900. It is one of the longest-running citizen-science records in the world. Citizen science is research done by ordinary volunteers.

Robert Goddard

Who: A physics teacher at Clark University who built and flew the first rocket that burned liquid fuel. The New York Times mocked his rocket science in an editorial in 1920 and printed a correction in 1969.

When and where: Worcester and Auburn, Massachusetts. The first flight was on March 16, 1926.

> On March 16, 1926, at Auburn, Massachusetts, Robert Goddard launched the first rocket that ran on liquid fuel. It rose 41 feet, flew for 2.5 seconds and came down in a farm field 184 feet away.
>
> Goddard grew up in Worcester, Massachusetts. In 1914 he began teaching physics at Clark University in Worcester. He later ran its physics department, and he became a full professor in 1934. In all he spent 29 years in Clark's physics department.
>
> His paper *A Method of Reaching Extreme Altitudes* came out from the Smithsonian Institution in January 1920. Extreme altitudes are very great heights. On January 13, 1920, the editors of the New York Times answered it with an editorial, an article giving the newspaper's own opinion. Its title was "A Severe Strain on Credulity." Credulity means a willingness to believe things.
>
> In the editorial, the editors mocked Goddard for thinking that a rocket could push itself forward in a vacuum. A vacuum is a space with no air in it, like outer space. They wrote that he lacked "the knowledge ladled out daily in high schools."
>
> On July 17, 1969, the three Apollo 11 astronauts were on their way to the Moon. That day the Times editors printed a correction. It read: "...it is now definitely established that a rocket can function in a vacuum as well as in an atmosphere. The Times regrets the error."

Henrietta Leavitt's rule for measuring space

Henrietta Swan Leavitt found a way to measure how far away stars are. She was a computer, a person hired to do calculations and measurements, at the Harvard College Observatory. An observatory is a building for studying the sky. Leavitt was one of more than 100 women hired as computers at the observatory to study photographs of the stars. She was paid 30 cents an hour, five cents more than most of the others. She had been deaf since an illness in her twenties.

Leavitt studied a kind of variable star called a Cepheid. A Cepheid grows brighter and dimmer over and over, in a steady rhythm. In 1912 she published a paper on 25 Cepheids in the Small Magellanic Cloud, a patch of stars in the southern sky. She showed that the time a Cepheid takes for one blink tells how bright it truly is.

Astronomers compare that true brightness with how bright the star looks from Earth. The dimmer it looks compared with its true brightness, the farther away it is. With Leavitt's rule, Cepheids became markers for measuring distance across the universe. Her rule is called the

period-luminosity law. The period is the time of one blink, and luminosity means true brightness.

Leavitt died on December 12, 1921. In 1925 a Swedish mathematician who did not know she had died wrote to begin nominating her for a Nobel Prize.

Edwin Hubble

Who: An astronomer who showed that there are galaxies far outside our own and that the universe is expanding.

When and where: Mount Wilson Observatory, California, from 1923 to 1929.

Edwin Hubble showed that the universe is expanding. In 1929 he published his finding that the farther away a galaxy is, the faster it is moving away from us. A galaxy is a huge group of billions of stars. Our own galaxy is the Milky Way.

Hubble worked with the Hooker telescope at Mount Wilson, which has a main mirror 100 inches across. On the night of October 4 to 5, 1923, he found a Cepheid star on a photograph of the Andromeda "nebula," a faint cloudy patch in the sky. The photograph was on a photographic plate, a glass sheet that holds a photograph of the sky. Hubble marked the plate "VAR!" for variable star.

Using Leavitt's law, Hubble worked out how far away the star was. His answer was about 900,000 light-years. A light-year is the distance light travels in one year. At that distance, Andromeda lay far outside the Milky Way, so it had to be a separate galaxy. He announced the result at a meeting of the American Astronomical Society on January 1, 1925.

For his 1929 paper, published in March, Hubble used measurements of the galaxies' light made by Milton Humason. Georges Lemaître, a Belgian scientist, had already worked out and published the expansion of the universe in 1927. His paper appeared in a journal that few people read. In 2018 the members of the International Astronomical Union, the world society of astronomers, renamed Hubble's law the Hubble-Lemaître law.

Aleš Hrdlička's brain collection

Aleš Hrdlička collected human brains and bones for the Smithsonian to try to prove that the races differ in their bodies. From 1903 into the early 1940s he ran the physical anthropology division of the Smithsonian's National Museum of Natural History in Washington. Physical

anthropology is the study of human bodies and bones. Hrdlička believed that white people were superior to other races. Scientists have since shown his theories about the races' bodies to be false.

In 1903 Hrdlička began what he himself called the "racial brain collection." Reporters at the Washington Post, a newspaper, looked into his collecting and published what they found in August 2023. They reported that the museum held at least 255 brains, and that Hrdlička or people working at his direction collected most of them.

Collectors took most of the remains without the consent of the dead people or their families. Consent means agreeing to something after being told what it is. Many of these people had died in hospitals, were poor, or had no relatives nearby to claim and bury them. Collectors also dug up burial grounds. Hrdlička and a small team dug up the remains of about 1,000 people in Alaska and shipped them to the Smithsonian. In the 1930s they dug them from the Uyak site on Kodiak Island. The people of Larsen Bay are Alutiiq. They asked the Smithsonian for their dead in 1987. In September 1991 museum staff sent the remains back to Larsen Bay. It was one of the first returns of Native American remains in the country.

The Post's reporters also found that in 2023 the museum held more than 30,700 human remains. More than 19,000 of them, about 62 percent, were collected while Hrdlička led the division.

The Eugenics Record Office

From 1910 to 1939, the staff of the Eugenics Record Office at Cold Spring Harbor, New York, collected family records. They used the records to argue that some people should not have children. Eugenics was the claim that a country should decide which of its people may have children, and stop the rest. The men who ran the office presented it as the science of heredity. Heredity is the passing of traits from parents to children.

The biologist Charles B. Davenport directed a research station at Cold Spring Harbor. The station belonged to the Carnegie Institution of Washington, a private group that paid for scientific research. In 1910 Davenport persuaded Mary Harriman, the widow of a railroad owner, to give $10,000. She bought an 80-acre farm next to the station and built an office on it. The Eugenics Record Office opened there in 1910, with Harry H. Laughlin in charge.

Staff at the office ran summer courses that trained field workers. Photographs of the courses survive from 1913 to 1922. The field workers went door to door and filled out forms of questions about families. By 1924 the office's files held 750,000 index cards, along with family trees and reports. Davenport, Laughlin and their workers traced traits through families, such

as blindness and musical ability. They also traced what they called "feeblemindedness," their label for people they judged to be of low intelligence. They treated poverty and behavior as traits that parents pass to their children.

Laughlin used the office's records to push for laws to keep immigrants out and to sterilize people labeled "defective." To sterilize a person is to operate on the body so that the person can never have a child. In a woman, for example, a doctor cut out a piece of each of the two tubes that carry eggs to the womb. It cannot be undone.

Scientists who studied heredity, among them Thomas Hunt Morgan, Raymond Pearl and Herbert Jennings, pointed out flaws in eugenics research. They showed that the eugenicists' experiments were badly designed and that the eugenicists used the new science of genes too simply. They also showed that the eugenicists' work was racist and unfair to poor people. In 1935 leaders of the Carnegie Institution gathered a panel of scientists to judge the office's work. The panel found that almost none of it had any scientific worth.

In the 1930s Americans also learned what Nazi Germany's leaders were doing with eugenics. Under a German law of July 14, 1933, judges and doctors sat on special courts, each made up of a judge and two doctors. By 1945 the judges and doctors on these courts had forced about 400,000 people to be sterilized. Doctors usually cut the tubes that carry sperm in men, and tied or cut the tubes that carry eggs to the womb in women. The forced operations killed hundreds of people, most of them women. In 1939 Vannevar Bush, the president of the Carnegie Institution, cut off the office's money, and it closed in December 1939. Its records went to the University of Minnesota in 1948. Staff at Cold Spring Harbor Laboratory now publish this history on the laboratory's archive website, under the heading "Good genes, bad science."

Albert Einstein

Who: A physicist who moved to America in 1933, the year the Nazis took control of Germany. He became a US citizen in 1940.

When and where: Princeton, New Jersey, from October 1933.

Albert Einstein arrived in the United States on October 17, 1933. Earlier that year the Nazis had taken control of Germany. He joined the new Institute for Advanced Study in Princeton, New Jersey, as one of its first professors.

Einstein had done his most famous physics, the theory of relativity, in Europe between 1905 and 1915. Relativity explains how space, time and gravity are tied together.

On August 2, 1939, Einstein signed a letter to President Franklin Roosevelt. The physicist Leo Szilard wrote it, with Edward Teller and Eugene Wigner. The letter stated that Germany might build atomic bombs. Historians at the Atomic Heritage Foundation, a group that records the history of the bomb, trace the start of the Manhattan Project back to this letter. The Manhattan Project was the secret American program to build an atomic bomb during World War II.

On October 1, 1940, Einstein became a citizen of the United States. He also kept his Swiss citizenship.

In May 1946 the leaders of Lincoln University, a Black university in Pennsylvania, gave Einstein an honorary degree. An honorary degree is a degree a college gives to honor a person's life and work. At Lincoln he called racism "a disease of white people." He said, "I do not intend to be quiet about it."

Emilio Segrè

Who: An Italian physicist who lost his job at home in 1938 under Mussolini's laws against Jews, stayed at Berkeley, and won a Nobel Prize.

When and where: Berkeley, California, from the summer of 1938.

In the summer of 1938, Emilio Segrè was visiting Ernest Lawrence's Radiation Laboratory at the University of California, Berkeley. That year Benito Mussolini, who ruled Italy, put antisemitic racial laws into force. Antisemitic means hostile to Jews. Italian officials used those laws to take away his job as a professor in Palermo, Italy.

Segrè stayed in America. Lawrence gave him a job as a research assistant, at low pay.

Segrè later helped discover the elements technetium and astatine, and plutonium-239, one form of plutonium. With Owen Chamberlain he discovered the antiproton. A proton is a tiny particle with a positive electric charge, found in the center of every atom. An antiproton matches a proton but has a negative charge. Segrè and Chamberlain shared the Nobel Prize in Physics in 1959.

Splitting the atom, and the big laboratories

In December 1938 two chemists in Berlin, Otto Hahn and Fritz Strassmann, discovered nuclear fission. Fission is the splitting of the center of an atom, called the nucleus, into two pieces. The split gives off energy. In January 1939 Lise Meitner and her nephew Otto Frisch explained

what the chemists' results meant. Meitner was a Jewish refugee living in Sweden. A refugee is a person who flees their home country to be safe. In 1944 the Nobel judges gave the prize for the discovery to Hahn alone and left Meitner out.

News of fission reached America in January 1939. On December 2, 1942, Enrico Fermi's team of 49 people ran the first controlled nuclear chain reaction. In a chain reaction, each atom that splits sets off more atoms splitting. The team's reactor, a machine built to run a chain reaction, was called Chicago Pile-1. It stood under the west stands of Stagg Field, an unused football field at the University of Chicago. The reaction kept itself going for 28 minutes and made about half a watt of power. Controlled means the team could keep it steady and stop it.

Fermi was an Italian physicist. He won the Nobel Prize in 1938. He sailed straight from the ceremony in Stockholm to New York. His wife, Laura, was Jewish, and Mussolini had just put his new laws against Jews into force.

Chicago Pile-1 belonged to the Manhattan Project. The project's leaders set up three large laboratories: the Metallurgical Laboratory in Chicago, Clinton Laboratories at Oak Ridge in Tennessee, and Los Alamos in New Mexico. They were the start of the national laboratories, the government's big science labs. In August 1945 American bomber crews dropped the project's two atomic bombs on the Japanese cities of Hiroshima and Nagasaki. The Radiation Effects Research Foundation is a research group that Japan and the United States run together. Its researchers estimate that within two to four months the bombs killed 90,000 to 166,000 people in Hiroshima and 60,000 to 80,000 in Nagasaki. The exact numbers are not known, and a US study in 1946 gave lower counts.

An older lab came before these, the Radiation Laboratory at the University of California, Berkeley. Ernest Lawrence built it around his cyclotrons. A cyclotron is a machine that speeds tiny particles around in a circle and smashes them into atoms. From 1931 the lab was housed in a converted campus building. It became a separate laboratory on July 1, 1936. In 1939 Lawrence won the first Nobel Prize at Berkeley. After the war, American scientists built their labs on its plan of big machines run by big teams.

Glenn Seaborg redrew the periodic table, the chart of all the chemical elements. He pulled a row of heavy elements, the actinides, out of the main table and set it as its own row at the bottom. With his layout, chemists could predict how elements that nobody had made yet would behave.

Plutonium injected into 18 patients

Between April 1945 and July 1947, doctors working for the Manhattan Project injected 18 hospital patients with plutonium. To inject is to push a substance into the body through a needle. Plutonium is a radioactive metal that scientists made during the war and used in atomic bombs. A radioactive metal gives off radiation, which is invisible energy that can damage or kill the cells of the body.

Once plutonium is in the blood, it collects in the bones, the liver and the spleen, an organ that cleans the blood. There it keeps giving off radiation that kills cells. When a person breathes it in, it scars the lungs and can cause cancer.

The doctors wanted to know where plutonium goes in a human body and how fast the body gets rid of it in urine. Workers on the bomb could take some in by accident. The doctors wanted a way to judge how much a worker had taken in. Four men led the program. They were Wright Langham of Los Alamos, Joseph Hamilton of the University of California in San Francisco and Berkeley, Hymer Friedell of Oak Ridge, and Stafford Warren, the head of the project's medical section.

The doctors injected one patient at Oak Ridge, three in Chicago, 11 in Rochester, New York, and three at the University of California hospital in San Francisco. Doctors in the program also injected six people with uranium, five with polonium and at least one with americium, which are also radioactive metals. In all they injected about 30 civilians, people who were not in the armed forces.

Ebb Cade, a 53-year-old Black cement mixer, was hurt in a car accident at Oak Ridge on March 24, 1945. On April 10, 1945, a doctor injected him with 4.7 micrograms of plutonium. A microgram is one millionth of a gram. Dr. Joseph Howland, an Army doctor, later said he gave the injection only after his boss, Hymer Friedell, ordered him to in writing. Howland also said that Cade never gave his consent, which means he never agreed to it. Friedell later said he gave no such order and that another doctor, Dwight Clark, gave the injection. On January 15, 1994, President Bill Clinton set up a federal committee to look into these experiments. Its members could not tell which man was right. Doctors did not set Cade's broken arm and leg until April 15, five days after the injection, when they also took samples of his bone. Someone pulled out 15 of his teeth, and they were tested for plutonium. The committee's report does not name who pulled them. Its members could not find out whether the teeth were pulled mainly because they were decayed or for the test. He died of heart failure on April 13, 1953.

Doctors at the San Francisco hospital told Albert Stevens, a 58-year-old house painter, that he had stomach cancer that would kill him. They injected him with plutonium on May 14, 1945, as part of Joseph Hamilton's program. The federal committee's report does not identify the doctor who gave the injection. When surgeons operated, they found a harmless ulcer, a sore in the stomach, and no cancer. The doctors told him only about "a new substance." Members of the federal committee later found that he was almost certainly never told it was plutonium. He died of heart failure in 1966, 21 years later.

One patient came from Australia. In April 1946 officials of the Red Cross and the US Army arranged for Simeon Shaw, a 4-year-old boy with bone cancer, and his mother to fly on an Army plane to San Francisco. Within days, doctors at the university hospital injected him with a liquid that held plutonium and two other metals, yttrium and cerium, under Joseph Hamilton's direction. His medical file holds a consent form for an operation. A witness signed it a week after the injection, stating that his mother agreed. The committee found that the form probably covered a bone test done that week, not the injection itself. Surgeons cut out a piece of his bone tumor to see how much of the metals it had taken up. He went home to Australia about a month after the injection, and nobody followed up on him. He died in January 1947.

Eda Schultz Charlton, 49, entered Strong Memorial Hospital in Rochester on November 2, 1945. Three weeks later doctors in the hospital's research ward, run by Dr. Samuel Bassett, injected her with 4.9 micrograms of plutonium. No doctor had ever found that she was dying of any illness. She lived until 1983.

Elmer Allen was a Black railroad porter from Italy, Texas. A porter carried passengers' bags on the trains. He was 36, and his doctors believed he had bone cancer. On July 18, 1947, doctors at the University of California hospital injected him with plutonium. The researchers never expected the injection to help him. Soon afterward, a surgeon cut off his left leg at the middle of the thigh. A test of his tumor showed a slow-growing bone cancer called chondrosarcoma. Two doctors signed a note saying the experiment had been explained to him and that he agreed. The committee's members found it unclear whether he was told the injection was not meant to help him. According to later newspaper reporting, he died in 1991 without ever learning what had been done to him. In 1995 his daughter, Elmerine Whitfield Bell, told the committee: "We contend that my father was not an informed participant in the plutonium experiment."

Trinity and the people downwind

On July 16, 1945, Manhattan Project scientists exploded the first atomic bomb at a test site called Trinity, in New Mexico. The project's leaders decided not to move the people who lived nearby. According to the National Park Service, they worried that moving people would make them suspicious or cause panic. The nearest ranchers lived 13 miles from the site. Tens of thousands of people lived within 50 miles.

General Leslie Groves, the Army officer in charge of the project, wanted the test kept secret above all. Under his rules, nobody was to be protected unless people had already been badly hurt. When the project doctor James Nolan brought him safety plans, Groves asked him, "What's the matter with you, are you a Hearst propagandist?" William Randolph Hearst owned a chain of newspapers known for stories written to shock and excite readers. A propagandist spreads one side's story. The scientists Joseph Hirschfelder and John Magee warned of "the definite danger of dust containing active material." Robert Oppenheimer was the director of the Los Alamos lab. He approved a plan to move people only after they had taken in 60 to 100 roentgens of radiation. A roentgen is a unit for measuring radiation. Nobody was moved.

Fallout is radioactive dust that falls back to the ground after a nuclear explosion. The fallout from Trinity spread over an area about 250 miles long and 200 miles wide. It fell heaviest on Chupadera Mesa, a flat-topped highland 30 miles away. It fell across Lincoln, Socorro, Otero and Sierra counties. People there ate vegetables and drank water that had fallout in them. The Ratliff family, who lived near a place called Hot Canyon, took in about 47 roentgens in two weeks. The allowed amount was 1.4. Nobody warned them.

After the test, Groves put out a statement to the press. It said that an ammunition dump had exploded and that nobody had been hurt. On July 21, 1945, Stafford Warren, the project's chief medical officer, reported to Groves in writing. He wrote that the dust "was potentially a very serious hazard over a band almost 30 miles wide extending almost 90 miles northeast of the site." He advised that future tests take place in an area "with a radius of at least 150 miles without population," meaning with nobody living within 150 miles.

Nobody knows how many people the Trinity fallout made sick or killed, because no government official ever counted them. The National Park Service states that the exposure is "linked to cancer, stillbirth, and birth defects." A stillbirth is a baby born dead. A birth defect is a problem in a baby's body that begins before it is born.

The physics inside the transistor, 1947

On December 16, 1947, John Bardeen and Walter Brattain made a solid crystal amplify an electrical signal at Bell Labs, the research lab of the telephone company. To amplify a signal is to make it stronger. Their device was the first transistor, called the point-contact transistor. A transistor is a small solid part that can make an electrical signal stronger.

Bardeen and Brattain worked in William Shockley's group. Bardeen worked out the physics of how electrons behave at the surface of the crystal. He used quantum mechanics, the branch of physics that describes very tiny particles. Shockley then designed a second kind, the junction transistor. On June 30, 1948, Bell Labs staff showed the transistor to the public at a press conference in New York City. The three men shared the Nobel Prize in Physics in 1956.

Barbara McClintock

Who: A scientist who studied the chromosomes of corn and discovered that genes can move from one place to another.

When and where: Cold Spring Harbor, New York. Her key experiments began in 1944.

Barbara McClintock discovered that some genes move from one place to another on the chromosomes. This is called transposition. She found it in maize, which is corn, in experiments she began in 1944. She called the moving pieces "controlling elements."

McClintock earned a PhD, the highest university degree, at Cornell University in 1927. She studied the chromosomes of corn under the microscope. She came to Cold Spring Harbor in 1941 or 1942. The Eugenics Record Office there had closed in December 1939.

She first described the moving genes in 1948. In 1950 she published a paper called *The Origin and Behavior of Mutable Loci in Maize*. Mutable loci are places on a chromosome that can change. In 1951 she presented the work at a meeting of scientists at Cold Spring Harbor.

Other scientists respected her as an expert on chromosomes. For decades, though, few of them took up her idea of moving genes. In the 1960s and 1970s, molecular biologists, who study the molecules inside cells, reached the same finding. In 1983 she won the Nobel Prize in Physiology or Medicine. She was the first woman to win that prize without sharing it.

1950 to 2000

In 1951 Dr. Lawrence Wharton Jr. of Johns Hopkins Hospital cut cells from the tumor of Henrietta Lacks, a Black woman with cancer in Baltimore, without her knowledge. Scientists grew her cells for decades and used them to study polio, cancer and the AIDS virus. In 1953 James Watson and Francis Crick worked out the shape of DNA, the molecule that carries genes. By about 1970 most geologists, the scientists who study the Earth's rocks, agreed that the continents move.

In 1993 a reporter named Eileen Welsome made the plutonium injections of the 1940s public. Members of a federal committee then found nearly 4,000 radiation experiments on people, and in 1995 President Bill Clinton apologized. Under laws passed in 1989 and 1990, museum staff had to begin returning the Native American dead that scientists had collected.

Henrietta Lacks and the HeLa cells

In 1951 a doctor at Johns Hopkins Hospital cut cells from the tumor of Henrietta Lacks without her knowledge or consent, which means nobody told her and nobody asked her permission. Her cells became the first human cells that kept living and dividing in a lab with no end.

Henrietta Lacks was a Black woman, born on August 1, 1920. In 1941 she and her husband moved to Baltimore, Maryland. They had five young children. In 1951 she went to Johns Hopkins Hospital because she was bleeding from her vagina. Dr. Howard Jones, a gynecologist, found a malignant tumor on her cervix. A gynecologist is a doctor who treats the parts of a woman's body that carry and deliver babies. Malignant means cancerous. The cervix is the narrow lower end of the womb. Doctors treated her cancer with radium, the usual treatment at the time. Radium is a radioactive metal.

During the treatment she was asleep under anesthesia, a medicine that puts a patient into a deep sleep so they feel no pain. While she was asleep, Dr. Lawrence Wharton Jr. cut samples from her tumor and from healthy tissue of her cervix. They went to the laboratory of George Gey, a cell biologist at Johns Hopkins.

Most human cells died in a lab dish. Hers kept dividing, about once every 20 to 24 hours. Scientists named the cells HeLa, from the first two letters of her first and last names. Henrietta Lacks died at Johns Hopkins on October 4, 1951. She was 31.

Scientists used HeLa cells to study the polio vaccine, leukemia, the AIDS virus, cancer, and the effects of zero gravity in space. The polio vaccine is the shot that protects people from polio. Leukemia is a cancer of the blood. Her family did not learn that her cells were being used in

research until the 1970s.

The shape of DNA, and who got the credit

In 1953 James Watson and Francis Crick worked out the shape of DNA, using Rosalind Franklin's X-ray pictures without her knowledge. DNA is the molecule inside cells that carries genes. A molecule is a group of atoms joined together. Watson was a 24-year-old American, and Crick was British. They worked at Cambridge University in England. At Caltech in California, Linus Pauling and his team were racing for the same answer.

On April 25, 1953, Watson and Crick published the structure in the journal *Nature*. DNA is a double helix: two long strands wound around each other in a spiral.

They depended on the work of Rosalind Franklin at King's College London. Franklin took pictures of DNA with X-rays, a kind of invisible light that passes through many things. In early 1953 Maurice Wilkins, who worked at King's College, showed Watson her picture called "Photo 51." He did it without her knowledge. Accounts differ on whether this was in late January or in February. Her data also reached Watson and Crick in a report for the Medical Research Council, a British government group that paid for research. Max Perutz passed it to them. Franklin's own paper came out in the same issue of *Nature*.

Franklin died in 1958, at 37. In 1962 the Nobel Prize went to Watson, Crick and Wilkins. Nobel rules do not allow a prize to go to a person who has died.

Watson later made racist statements about the intelligence of people in Africa. In 2007 the *Sunday Times Magazine* of London quoted him saying he was "inherently gloomy about the prospect of Africa" because "all our social policies are based on the fact that their intelligence is the same as ours." In the same sentence he went on: "where all the testing says not really." The trustees of Cold Spring Harbor Laboratory in New York, the people who govern it, removed him from all his management jobs there. They also ended his post as the lab's chancellor, one of its top leaders.

In a PBS film shown on January 2, 2019, *American Masters: Decoding Watson*, he was asked whether his views had changed. He said, "No, not at all." The leaders of Cold Spring Harbor Laboratory, where the Eugenics Record Office had run from 1910 to 1939, called his views "unsubstantiated and reckless" and "reprehensible, unsupported by science." Unsubstantiated means not backed by proof, and reprehensible means deserving strong blame. They took away his honorary titles.

The floor of the ocean, and moving continents

By about 1970, most geologists agreed that the continents move. Geologists are scientists who study the Earth and its rocks. The idea that the continents move is called plate tectonics. The Earth's outer shell is broken into huge pieces, called plates, that slowly shift.

Marie Tharp's maps of the ocean floor recorded evidence for it. In 1957 Tharp and Bruce Heezen published a map of the floor of the Atlantic Ocean, the *Physiographic Diagram of the Atlantic Ocean*. In 1962 Harry Hess published a paper called "History of Ocean Basins." In it he proposed seafloor spreading, the idea that new ocean floor forms along the undersea mountain ranges and spreads outward. In 1977 Tharp and Heezen published a painted map of the ocean floor of the whole world.

Marie Tharp

Who: A geologist and mapmaker who mapped the ocean floor and found the rift valley along the Mid-Atlantic Ridge. Women were kept off the research ships, so she drew her maps on land.

When and where: Lamont Geological Observatory, Columbia University, from 1948.

In 1952 and 1953, Marie Tharp found a valley running down the middle of the Mid-Atlantic Ridge, a long chain of mountains under the Atlantic Ocean. It was a rift valley, a valley that forms where the Earth's crust is pulling apart. The crust is the Earth's rocky outer layer. Her work partner, Bruce Heezen, at first dismissed her finding as "girl talk."

Tharp began work at Columbia University's Lamont Geological Observatory in 1948. She could not go out on the research ships. According to Smithsonian Magazine, Navy rules kept her off the ships that Maurice Ewing and her other colleagues hired. She first sailed on one in 1968. She made her maps from soundings taken on the ships. A sounding is a measurement of how deep the water is. Tharp turned the depth numbers into drawings of the shape of the sea floor.

The rift valley she found became part of the evidence that the sea floor spreads apart. Staff at the Library of Congress later named her one of the great mapmakers of the 20th century.

Measuring the air on Mauna Loa

Charles David Keeling of the Scripps Institution of Oceanography began measuring the carbon dioxide in the air on Mauna Loa, a volcano in Hawaii, in March 1958. Carbon dioxide is one of the gases in the air. It is a greenhouse gas, a gas that takes in heat and gives it off again. The

amount in the air is rising mostly because people burn coal, oil and other fossil fuels for energy. His first reading was 313 parts per million. That means 313 molecules of carbon dioxide in every million molecules of air. The average in the early part of that year was about 315.

The measurements have run without a break since 1958. The line they make on a graph is called the Keeling Curve. It rises in a saw-tooth pattern, with small ups and downs inside a steady climb. By 2026 it had passed 430 parts per million. Climate scientists use the Keeling Curve as the base measurement for their work.

The afterglow of the Big Bang, and the parts of a proton

Arno Penzias and Robert Wilson found the leftover glow of the Big Bang, the hot beginning of the universe, in 1964 and 1965. They worked at Bell Labs in Holmdel, New Jersey, with a large antenna shaped like a horn. An antenna is a device that picks up radio waves. They picked up a faint hiss of microwaves, a kind of radio wave, and could not get rid of it. They even cleared out pigeons that had nested in the antenna, along with their droppings.

Physicists at Princeton identified the hiss. It was the cosmic microwave background, the cooled light left over from the early universe. Penzias and Wilson won the Nobel Prize in 1978.

In 1964 Murray Gell-Mann proposed tiny particles that he named quarks. He won the Nobel Prize in 1969. In 1968 Jerome Friedman, Henry Kendall and Richard Taylor ran experiments at MIT and at SLAC, a particle lab in California. They found point-like pieces inside the proton. The three won the Nobel Prize in 1990.

Darleane Hoffman

Who: A nuclear chemist who found plutonium in nature and whose group did chemistry on single atoms of the heaviest elements.

When and where: Los Alamos, New Mexico, and from 1984 Berkeley, California. She reported the plutonium find in 1971.

Darleane Hoffman showed in 1971 that plutonium-244, one form of plutonium, occurs in nature. Scientists had believed that all plutonium was made by people. Hoffman was a leader of a chemistry division at Los Alamos National Laboratory. She found tiny traces of plutonium-244 in rock from the Mountain Pass mine in California. In 1984 she moved to Lawrence Berkeley National Laboratory and the University of California, Berkeley. She died in 2025, at 98.

> Hoffman's group did chemistry on single atoms of the heaviest elements. The periodic table arranges the elements in patterns, and elements in the same column behave alike. Her group tested those patterns one atom at a time, to find where the heaviest elements stop following them.

What the Moon rocks and the space probes taught

Six Apollo crews landed on the Moon between 1969 and 1972. They brought back 382 kilograms, or 842 pounds, of Moon rock and soil, in 2,200 samples. Scientists at NASA's Johnson Space Center, part of the government's space agency, keep the samples and are still opening and studying them. Scientists used the rocks to work out the history of the Moon and the ages of surfaces across the solar system.

In 1976 Viking 1 and Viking 2 became the first spacecraft to land on Mars and work there. Each carried tests for life in the Martian soil. The results did not agree. One test, called Labeled Release, gave a result that looked like life. Another found no organic matter, the carbon-based material that living things are made of. Most scientists now think chemicals in the soil called perchlorates caused the first result. Gilbert Levin, who led the Labeled Release test, argued to the end of his life that it had found life. Nobody has settled the question.

Voyager 1 and Voyager 2 were launched in 1977. Pictures from the two probes showed volcanoes on Io, a moon of Jupiter. They also showed a cracked shell of ice on Europa, another moon of Jupiter, and the thick air around Titan, a moon of Saturn. The Voyager flights reached Uranus in 1986 and Neptune in 1989. Both probes are now in interstellar space, the space between the stars.

In the fall of 1980, Carl Sagan's television series *Cosmos* began on PBS, the public television network. In 2020 Charles Apple of *The Spokesman-Review*, a newspaper in Washington state, wrote that it was the most-watched PBS series until Ken Burns's *The Civil War* in 1990. The news site Space Daily reported that about 500 million people around the world have seen it.

> #### Linda Morabito
>
> **Who:** A navigation engineer at NASA's Jet Propulsion Laboratory who found the first active volcano ever seen beyond Earth.
>
> **When and where:** Jet Propulsion Laboratory, Pasadena, California, on March 9, 1979.
>
> **Movie:** *The Farthest* (2017)

On March 9, 1979, Linda Morabito found the first active volcano ever seen beyond Earth. It was on Io, a moon of Jupiter. An active volcano is one that is erupting, or throwing out gas and melted rock.

Morabito was a navigation engineer for the Voyager 1 probe. A navigation engineer works out where a spacecraft is and where it is heading. She was processing a routine navigation picture of Io. At the edge of the moon she noticed a faint plume, a cloud shooting up from the surface. It was 270 kilometers high, about 170 miles. The plume came from an erupting volcano.

Morabito later wrote her own history of the discovery. She appears in *The Farthest*, a 2017 documentary film about the Voyager missions, and tells the story there.

Richard Feynman

Who: A physicist who rebuilt the theory of light and matter, drew the diagrams that physicists still use, and explained hard ideas simply.

When and where: Los Alamos during World War II. Later Caltech, in Pasadena, California. He died in 1988.

Movie: *The Fantastic Mr Feynman* (2013)

Richard Feynman rebuilt quantum electrodynamics, the theory of how light and electrically charged matter act on each other. He shared the Nobel Prize in Physics in 1965 with Julian Schwinger and Sin-Itiro Tomonaga. He also invented Feynman diagrams, simple drawings that show how particles act on each other. Physicists everywhere use them now.

During World War II Feynman worked at Los Alamos. Later he became known for explaining hard ideas plainly, in his lectures at Caltech and in his 1985 book *Surely You're Joking*.

In 1986 the space shuttle Challenger broke apart soon after launch, and all seven people aboard died. They were Francis R. Scobee, Michael J. Smith, Ellison S. Onizuka, Judith A. Resnik, Ronald E. McNair, Christa McAuliffe and Gregory B. Jarvis. Hot gas had leaked through a joint in one of the shuttle's booster rockets. The air at launch was 36 degrees Fahrenheit, 15 degrees colder than at any earlier shuttle launch. Feynman sat on the commission, a group of experts, that looked into the disaster. On February 11, 1986, at a

> hearing shown on television, he dropped a piece of O-ring rubber into ice water. An O-ring is a rubber ring that seals a joint. The cold rubber lost its spring. In about one minute he showed how launching in cold weather had caused the failure.
>
> Feynman died in 1988. The BBC documentary *The Fantastic Mr Feynman* (2013) includes interviews with him, his family and his colleagues.

The national labs, a late Nobel and the genome

During the Cold War, the national laboratories had big machines and big teams, paid for with government money. The Cold War was the long rivalry between the United States and the Soviet Union after World War II. The main labs were Lawrence Berkeley, Lawrence Livermore, Argonne, Los Alamos and Oak Ridge. Scientists at these labs and in the Soviet Union raced each other to make new elements.

In October 1983 Barbara McClintock won the Nobel Prize in Physiology or Medicine for her discovery of moving genes. She was the first woman to win that prize without sharing it. The prize came 39 years after she began the experiments.

On October 1, 1990, officials of the National Institutes of Health and the Department of Energy launched the Human Genome Project. A genome is the complete set of DNA in a living thing. The project's goal was to read all the DNA in a human genome, in order. Its planners gave it 15 years and about $3 billion.

Two laws to return the dead

Under two laws passed in 1989 and 1990, museum staff had to begin returning the Native American dead they held. Scientists had collected many of those remains. From 1868 Army doctors sent the skulls of Native Americans to the Army Medical Museum in Washington, where scientists measured them to rank the races. In the 1930s Aleš Hrdlička and a small team dug the remains of about 1,000 people out of burial grounds in Alaska for the Smithsonian.

The National Museum of the American Indian Act became law on November 28, 1989. It requires Smithsonian staff to list the Native human remains the Smithsonian holds and to return them when asked.

The Native American Graves Protection and Repatriation Act, called NAGPRA, became law on November 16, 1990. Repatriation means sending something back to where it came from. Under NAGPRA, staff at museums and government agencies that take federal money must list the

Native American human remains and sacred objects they hold. They must return them to descendants and to Native nations. Native nations campaigned for these laws.

The radiation experiments made public

The reporter Eileen Welsome made the plutonium injections public in November 1993. Her three-part series in the *Albuquerque Tribune*, called "The Plutonium Experiment," began on November 15, 1993. It named the patients who had been injected. She won the Pulitzer Prize for National Reporting in 1994, a top award for American journalism.

In 1993 Energy Secretary Hazel O'Leary opened her department's records. On January 15, 1994, President Bill Clinton set up the Advisory Committee on Human Radiation Experiments to investigate.

The committee's members reported in 1995. Its members found "nearly 4,000 human radiation experiments sponsored by the federal government between 1944 and 1974." They also found "several hundred intentional releases of radiation into the environment for research purposes." That means radiation let out into the air, land or water on purpose, for research. They found "little evidence of rules or practices of consent except in research with healthy subjects." In the 1940s and 1950s it was routine for doctors to use patients in research without the patients knowing. About the plutonium injections, the committee's members wrote: "In no case was there any expectation that these patient-subjects would benefit medically from the injections."

Some of these experiments were done on children. The Fernald School was a state school in Massachusetts for children with disabilities. Researchers from MIT worked there with the school's senior staff. In 1946 they gave radioactive iron to 17 boys who lived at the school. From 1950 to 1953 they gave radioactive calcium to 57 boys, in a special breakfast. The boys belonged to the school's "science club," whose members got extra milk and trips. One MIT researcher, Robert S. Harris, wrote that three boys who objected could be "induced to change their minds." A 1949 letter from the school's head to parents described a special diet and blood tests and did not mention radiation.

From 1953 to 1957, doctors at Massachusetts General Hospital in Boston injected 11 patients with uranium.

From 1963 to 1973, two doctors aimed X-rays at the testicles of 131 prisoners in Oregon and Washington. The testicles are the organs that make sperm. The doctors wanted to learn how radiation affects the making of sperm, and the men could get no health benefit from it. Carl Heller did this to 67 men at the Oregon State Prison, and his former student C. Alvin Paulsen

ran the study in Washington. The men had to agree to a vasectomy at the end, an operation that cuts the tubes that carry sperm so a man can no longer father children. In Heller's study most men also had small pieces cut out of their testicles for testing five or more times, and were paid $25 each time.

Researchers at Vanderbilt University and the Tennessee state health department studied nutrition in pregnancy from 1946 to 1949. The women were poor patients at a clinic for pregnant women. Paul Hahn led the part of the study in which researchers gave about 819 of them a drink with a dose of radioactive iron at their second visit to the clinic. In 1994 Emma Craft and other women from the study sued Vanderbilt in federal court. They said the researchers called the drink a "cocktail" or a "vitamin drink" and never told them it was radioactive, and that no one gave them a chance to say no. The women had been pregnant when they drank it, and the children they had been carrying joined them in the lawsuit. The women also said that Vanderbilt researchers ran a follow-up study in the 1960s and found "a disproportionately high incidence of cancer" in the children, meaning more cancer than expected. They said nobody told them they had been exposed or what the study found. Vanderbilt officials denied doing wrong. In 1998 university officials settled the case by paying the women $10 million.

On October 3, 1995, at the White House, Clinton said: "the United States of America offers a sincere apology to those of our citizens who were subjected to these experiments, to their families, and to their communities."

In November 1996 O'Leary announced payments of $4.8 million to the families of 12 people injected in the 1940s. Eleven had been injected with plutonium and one with uranium. Each family was to receive $400,000. Eleven of the 12 had died. One woman was still alive, living in upstate New York.

2000 to Today

In 2003 scientists announced that they had read nearly all of the human genome, and in 2022 they read all of it. In 2012 scientists found the Higgs boson. In 2015 they detected gravitational waves for the first time. The biggest experiments now have thousands of scientists. About 3,000 people worked on ATLAS, one of the two experiments that found the Higgs boson in 2012.

Some of the people who were used for science, and their families, have also won apologies, rules and payments. In 2013 the Lacks family reached an agreement on how scientists may use the genome of Henrietta Lacks's cells. In 2023 the head of the Smithsonian apologized for how people collecting for it had taken human remains, many of them dug from graves and most taken without consent. In July 2025 people who lived downwind of the Trinity test became able to claim federal payments.

The genome, finished twice

Scientists announced a working draft of the human genome in June 2000. In April 2003 the International Human Genome Sequencing Consortium, the teams of scientists doing the work, announced that the genome was essentially complete. They had read about 92 percent of it, with fewer than 400 gaps left. They timed the announcement to the 50th anniversary of the 1953 paper on the shape of DNA.

On March 31, 2022, another group of scientists, the Telomere-to-Telomere consortium, published the first complete human genome with no gaps.

The National Human Genome Research Institute, the government's genome research agency, has published what the work cost. The Human Genome Project cost the United States about $2.7 billion. That money paid for mapping the genome and for building new tools, as well as for reading it. In 2006, reading one person's genome to a high-quality draft cost about $14 million. By the middle of 2015 it cost just over $4,000, and by late 2015 it cost less than $1,500.

James Watson died in November 2025, at 97. With Francis Crick, he had worked out the shape of DNA in 1953, using Rosalind Franklin's X-ray pictures without her knowledge. In 2019 he had said that his racist views about the intelligence of Africans had not changed, and the leaders of Cold Spring Harbor Laboratory took away his honorary titles.

The Higgs boson, and the collider that members of Congress cancelled

On July 4, 2012, scientists at CERN, the European physics laboratory in Geneva, Switzerland, announced that they had found the Higgs boson. The Higgs boson is a particle tied to how other particles get their mass. Mass is the amount of matter in an object. Two experiments found it, called ATLAS and CMS. Both used the Large Hadron Collider, a machine that smashes tiny particles together at very high speed. According to the US Department of Energy, about 1,700 American scientists worked on these experiments through two American labs, Fermilab and Brookhaven.

American physicists had begun building a collider of their own, the Superconducting Super Collider, near Waxahachie, Texas. It was planned as a ring 54 miles around. In October 1993 members of Congress cancelled it. By then $2 billion had been spent and more than 14 miles of tunnel had been dug. The Large Hadron Collider, the machine the Higgs experiments used, was built in Europe instead.

Monica Dunford

Who: An American physicist who worked on the ATLAS experiment at CERN. She was one of six physicists a film crew followed through the search for the Higgs boson.

When and where: CERN, in Geneva, Switzerland, up to the Higgs announcement on July 4, 2012.

Movie: *Particle Fever* (2013)

Monica Dunford is an American experimental physicist, a scientist who runs experiments and measurements. At the time of the Higgs search she was a postdoc on the ATLAS experiment at CERN. A postdoc is a scientist who has just finished a PhD and does research for a few years before taking a permanent job.

About 3,000 people worked on ATLAS. The documentary film *Particle Fever* (2013) follows six physicists, Dunford among them, from the start-up of the Large Hadron Collider to the announcement of the Higgs boson on July 4, 2012. Mark Levinson directed the film, and the physicist David Kaplan produced it. The film records Dunford's working days as one scientist among the 3,000 on a single experiment.

Jennifer Doudna

Who: A biochemist at the University of California, Berkeley, who with Emmanuelle Charpentier made CRISPR-Cas9 into a tool for cutting DNA at a chosen spot.

When and where: UC Berkeley. The key paper came out on June 28, 2012.

Movie: *Human Nature* (2019)

On June 28, 2012, Jennifer Doudna and Emmanuelle Charpentier published a paper in the journal *Science* about CRISPR-Cas9. CRISPR-Cas9 is a tool that scientists can program to cut DNA at a spot they choose. Cutting DNA at a chosen spot lets scientists change genes. A biochemist is a scientist who studies the chemistry inside living things.

In 2020 Doudna and Charpentier won the Nobel Prize in Chemistry. It was the first science Nobel Prize shared by two women with nobody else.

Human Nature (2019) is a documentary film about CRISPR. Doudna is one of the main people interviewed in it.

Rainer Weiss

Who: An MIT physicist, who came to America as a child refugee from Nazi Germany, and who worked out the idea for the detectors that first picked up gravitational waves.

When and where: MIT, and the LIGO detectors at Hanford, Washington, and Livingston, Louisiana. The detection came on September 14, 2015.

On September 14, 2015, the two LIGO detectors picked up gravitational waves for the first time. Gravitational waves are ripples in space and time. These came from two black holes that crashed into each other 1.3 billion light-years away. A black hole is a place in space where gravity is so strong that not even light can get out. Rainer Weiss worked out the idea for the detectors in 1972.

Weiss was born in Berlin in 1932. His family fled the Nazis through Prague and reached New York in January 1939. He became a professor at MIT, the Massachusetts Institute of Technology.

His kind of detector is called a laser interferometer. It uses laser beams to measure very small changes in distance. The LIGO detectors were paid for by the National Science Foundation, the government agency that pays for science research. LIGO scientists announced the discovery on February 11, 2016, a century after Einstein predicted the waves. In 2017 Weiss shared the Nobel Prize in Physics with Barry Barish and Kip Thorne.

The Webb telescope

The James Webb Space Telescope was launched on December 25, 2021. NASA released its first science images on July 11 and 12, 2022. Scientists using the telescope have found galaxies from the first few hundred million years of the universe, earlier than any galaxies found before.

In 2022 scientists using the telescope made the first clear detection of carbon dioxide in the air of a planet around another star. The planet is called WASP-39b. A planet that circles a star other than our Sun is called an exoplanet.

Computers that predict the shapes of proteins

Scientists at DeepMind, a British lab, showed in 2020 that their program AlphaFold2 could predict the shape of a protein well enough for practical use. A protein is a molecule that does work inside living cells, and its shape sets what it can do. AlphaFold2 is an example of artificial intelligence, or AI: computer software that learns patterns from huge amounts of data. According to the European Molecular Biology Laboratory, free public databases held more than 200 million predicted protein shapes by 2026.

In 2023 staff at the science journal *Nature* surveyed more than 1,600 researchers around the world. Reporting the results, Richard Van Noorden and Jeffrey Perkel wrote that AI tools were becoming more common in science. Many of the researchers expected AI tools to become a central part of their work soon.

In 2024 the Nobel Prize in Chemistry was split in two. Half went to David Baker, an American at the University of Washington, for using computers to design new proteins. The other half went to Demis Hassabis and John Jumper of DeepMind in Britain.

Heavy elements, made by many countries

Scientists from several countries now work together to make the heaviest elements. Teams from Dubna in Russia and from Lawrence Livermore and Oak Ridge in the United States have worked on the same experiments. Scientists on joint panels of two international science groups, IUPAC and IUPAP, judge who made each new element. On December 30, 2015, officials of IUPAC announced that they recognized the discoveries of elements 113, 115, 117 and 118. That filled the seventh row of the periodic table. RIKEN, a science institute in Japan, got credit for 113. Teams from Dubna and Livermore got credit for 115, 117 and 118, with Oak Ridge also credited for 115 and 117. The names came on November 28, 2016: nihonium, moscovium, tennessine, named for Tennessee, and oganesson.

In 2024 scientists at Berkeley made livermorium, element 116, by firing a beam of titanium at a target. With that result, the Berkeley team prepared to try for element 120. The physicists are looking for what they call the "island of stability," a group of superheavy elements that they predict would last longer before breaking apart.

The Lacks family and the HeLa genome

European researchers published the genome of the HeLa cells in March 2013. They did it without the consent of Henrietta Lacks's family. Between April and July 2013, Francis Collins, the director of the National Institutes of Health, met with members of the Lacks family three

times.

On August 7, 2013, NIH officials announced the NIH-Lacks Family Agreement. Under it, scientists must apply to NIH to use the full genome data of HeLa cells. A working group that includes members of the Lacks family reviews the requests.

In 2021 the Lacks estate sued Thermo Fisher Scientific, a company that sold about a dozen products made with HeLa cells. An estate is the property a dead person leaves behind, managed for the heirs. The lawyers Ben Crump and Chris Seeger represented the estate. The lawsuit stated that the company "made staggering profits by using the HeLa cell line." It added that this happened "all while Ms. Lacks' Estate and family haven't seen a dime."

According to news reports in STAT and Smithsonian Magazine, the two sides announced a settlement on August 1, 2023. That day would have been Henrietta Lacks's 103rd birthday. They kept the terms of the settlement secret.

Apologies, and the dead still held

Lonnie G. Bunch III, the Secretary, or head, of the Smithsonian, apologized in August 2023 for how people collecting for the Smithsonian had taken many of its human remains. He spoke after the Washington Post published its investigation of Aleš Hrdlička's collecting.

Two years earlier, on April 12, 2021, Christopher Woods, the director of the Penn Museum at the University of Pennsylvania, had apologized for "the unethical possession of human remains in the Morton Collection." Samuel Morton was a Philadelphia doctor of the 1800s who collected human skulls to rank the races. In January 2024, on the order of a Philadelphia court, Penn Museum staff buried the skulls of 19 Black Philadelphians from his collection at Eden Cemetery in Collingdale, Pennsylvania. A group called the Black Philadelphians Descendant Community Group objected that the Black community, not the museum, should decide what happened to the remains.

Reporters at ProPublica, a news organization, counted the Native American remains still held, using federal NAGPRA reports. As of January 6, 2025, staff at about 650 museums, universities and agencies had reported holding more than 210,000 Native American remains. They had not yet made 90,831 of them, or 42 percent, available for return. The Ohio History Connection held the most, 7,936. The Illinois State Museum held 5,801, and Harvard University held 5,431. The University of California, Berkeley held 4,794, and Indiana University held 4,503. The Smithsonian is not on that list, because it reports under the 1989 law instead of NAGPRA. Writers at Retrospect Journal reported in March 2025 a different count, made in September 2024: 126,299 of 216,804 remains returned.

On January 12, 2024, a revised NAGPRA rule took effect. Officials of the Interior Department had announced it on December 6, 2023. Under the rule, staff at museums and federal agencies must get the free, prior and informed consent of direct descendants, Native nations or Native Hawaiian organizations. They need it before they display human remains or sacred and cultural objects, let others see them, or do research on them. Free, prior and informed consent means a yes given freely and beforehand, by people who have been told everything about the request. In January 2024, according to The Art Newspaper, staff at the Field Museum in Chicago covered display cases in two of its halls.

Payment for the Trinity downwinders, 2025

Downwinders are people who lived where the wind carried fallout from nuclear bomb tests. Members of Congress passed the Radiation Exposure Compensation Act in 1990. Compensation means payment for harm. The law included people who lived downwind of the Nevada Test Site, where the United States tested nuclear bombs from 1951 to 1957. It did not include the Trinity downwinders in New Mexico.

Tina Cordova of the Tularosa Basin Downwinders Consortium led the campaign to add them. In July 2025, 80 years after the Trinity test, President Donald Trump signed a budget bill that added New Mexico's downwinders to the law. The bill also added uranium workers who entered the industry after 1971. Each person who qualifies can receive $100,000 in one payment. According to KUNM, a New Mexico public radio station, New Mexicans can apply until December 31, 2027.

Chapter 10: Energy

Before 1500

Before 1500, the people who lived here did their work with the strength of their own bodies and with fire. Wood was the fuel. People burned it to heat their homes, to cook and to see after dark.

North of Mexico there were no horses, oxen or mules. People carried and dragged loads with their own muscle, and they moved heavy goods by canoe. Dogs were the only animals that hauled loads. On the Plains, dogs dragged a travois, which is two long poles tied together at one end so that they form a narrow V. The load rode on the poles, and their far ends dragged along the ground.

Fire set on purpose

Native people lit fires on purpose, on regular cycles. Today this is called cultural burning. It means lighting small fires and keeping them under control. The fires help the plants and animals that people use for food, clothing and ceremonies. People burned land to clear space for crops and for travel, and they used fire to hunt game.

In the eastern part of the continent, oak and chestnut trees fill many forests. According to the National Park Service, those forests grew that way because people burned them on purpose to get certain nut crops.

In what is now northern California, Karuk and Yurok people burned their hazel shrubs so that the shrubs would grow new stems. Weavers used those stems to make baskets. Karuk and Yurok people still do these burns. In 2021, a team of four researchers published a study of the burns done today, and the US Forest Service lists it among its research papers. Burning every three to five years gave the best stems. In the first season after a fire, the shrubs grew 13 times as many basket stems.

For most of the 1900s, the federal officials in charge of forests tried to put out wildfires. They wanted to protect water supplies, towns and timber for sale. Under the rules those officials made, Native people could do far fewer burns. Writers for The Nature Conservancy reported in

2020 that Native people who burn in the old way still face punishment. Their report does not say who punishes them. In 2013, Yurok people worked with California's state fire department on a small burn on Yurok land. In May 2014, organizers with the Cultural Fire Management Council held the first Yurok training event for this kind of burning.

The 1500s

In the 1500s, Spanish explorers and soldiers brought horses here. A horse could drag a travois farther and faster than a dog could, and it could carry more weight. Most people living here still did their work with muscle, fire and wood for the whole century.

In 1598, at the very end of the century, Spanish colonists in New Mexico built water mills. A history of the state's mills, printed in a Santa Fe newspaper, states that they were the first mills powered by water in what is now the United States.

Horses come ashore

In May 1539, Hernando de Soto landed near what is now Tampa Bay, Florida, with 11 ships. He brought about 250 horses, 1,000 soldiers on foot, many dogs and a herd of pigs. In April 1540 he reached Hymahi, a small Native village where two rivers meet. Writers for the National Park Service say the rivers must have been the Congaree and the Wateree, in what is now South Carolina. De Soto took all of the village's food. He burned at least one of the people who lived there to death while questioning that person about a town called Cofitachequi.

In 1540, Francisco Vázquez de Coronado led a large party north from Mexico into the Southwest. He had more than 300 armed Europeans and at least 1,200 Native people who marched on the Spanish side. Many dozens of servants and enslaved people went too. The Spanish brought horses with them. Coronado's party went as far as what is now Kansas and returned in 1542.

The first water mills, 1598

In 1598, Juan de Oñate led Spanish colonists north into what is now New Mexico. That year they founded a town called San Juan de los Caballeros on the Rio Grande. The land there belonged to the Tewa, one of the Pueblo nations. Pueblo is a Spanish word that means town or village. The Spanish gave that name to the Native peoples of the Southwest who lived in towns built of stone and of adobe, which is brick made of mud and dried in the sun. Early in 1599 the

colonists moved to a new capital, San Gabriel. They built it at a pueblo town near Ohkay Owingeh, a Tewa town. Writers for the National Park Service call that site abandoned. They do not say whether Tewa people had been made to leave it.

According to a history of New Mexico's mills in the *Santa Fe New Mexican* newspaper, Oñate's colonists built their first water mills in 1598. These were small tub mills. In a tub mill, the water wheel lies flat in the stream. The moving water spins the wheel, and the wheel turns the millstone directly. The millstone grinds grain into flour. The colonists hauled their millstones north on the Camino Real, which means the Royal Road. It ran about 1,600 miles north from Mexico City.

The 1600s

English colonists built their first windmills and water mills in the 1600s. For the first time in these colonies, wind turned a mill, and falling water turned mills that ground grain and sawed logs. All other work still took muscle, and colonists burned wood in open fireplaces to heat their homes and cook.

Two other kinds of energy came into use in these years. Native people rode horses and fed them corn. Along the coast, colonists began to hunt whales for oil to burn in their lamps.

The first wind and water mills

In 1621 George Yeardley, the governor of the Virginia colony, had a windmill built at Flowerdew Hundred, on the James River. It is the first windmill recorded in English America. Members of the colony's council, its group of leaders, wrote to the Virginia Company of London, the company in charge of the colony. Their letter records Yeardley's "good example" of building a windmill. Archaeologists, scientists who dig up the past, later dug at the spot. They found a round pit five feet across with iron hoops and brackets still in place. They took it to be the remains of Yeardley's windmill.

Flowerdew Hundred was land of the Weyanock, a Native nation whose language belonged to the Algonquian family of languages. Yeardley brought 15 men from England in 1619 to grow tobacco there. That same year, the crews of two armed ships, the *White Lion* and the *Treasurer*, attacked a Portuguese ship carrying 350 enslaved Africans. They seized 50 to 60 of the captives. In late August 1619 the *White Lion* brought its share to Point Comfort, Virginia. Yeardley and a merchant named Abraham Peirsey bought them in exchange for food. At least 11 of these Africans were taken to Flowerdew Hundred, Yeardley's land. The archaeologists'

account of Flowerdew does not say who moved them there. A count of the colony's people taken in 1624 and 1625 records seven Africans at Flowerdew as laborers. It gives no names for them.

Records from 1621 also list a gristmill near Jamestown, the first recorded in the English colonies. A gristmill is a mill that grinds grain.

In 1634, three English carpenters built a sawmill and a gristmill run by water at Newichawannock, in what is now South Berwick, Maine. These mills were among the first water mills in New England.

William Chadbourne

Who: An English carpenter, one of three men that Captain John Mason sent through his Laconia Company to build a sawmill and a gristmill at Newichawannock.

When and where: What is now South Berwick, Maine, from July 1634.

William Chadbourne was one of the carpenters who built some of the first water mills in New England. In July 1634 he, James Wall and John Goddard arrived from England on a ship called the *Pied Cow*. They worked under a contract with the Laconia Company of Captain John Mason. Under the contract, they were to build a sawmill and a gristmill on the Asbenbedick River, also called the Little Newichawannock.

A sawmill uses the power of water to cut logs into boards. In a letter of May 1631, Thomas Eyre wrote that a model of a sawmill had been sent to Newichawannock on the *Pied Cow*. The carpenters sailed on the same ship in 1634. Chadbourne and his partners built the sawmill in a rocky gorge. The spot is below the Great Works bridge on Brattle Street in South Berwick today.

Writers for the Old Berwick Historical Society say the sawmill is "thought to be the first" mill in America with an overshot wheel. On an overshot wheel, water pours onto the top of the wheel. The weight of the water turns it. People in other towns of the region say that their town had the first sawmill.

The river's name, Newichawannock, is an Abenaki word. Abenaki people lived there. Between 1616 and 1618, before the carpenters came, diseases brought by Europeans, such as measles or smallpox, killed seven out of every ten of them. The Old Berwick Historical Society's histories of the mills do not say that Mason's men asked the Abenaki for permission to build. A leader named Rowls survived the diseases. In 1650 he sold his village land, Quamphegan, to a man named Thomas Spencer for five pounds.

> Mason died in 1638. After that, the mills fell apart. People stole the mills' materials, and one of the mills later burned. The society's timeline of the mills does not name who stole them. In 1652 James Wall made a sworn statement in a lawsuit about where the 1634 mills had stood. A sworn statement is one a person makes after promising, under the law, to tell the truth.

Wood for every fire

Wood was the main fuel in colonial homes. People measured firewood in cords. A cord is a stack of wood 4 feet high, 4 feet wide and 8 feet long. Estimates of how much wood one colonial household burned in a year run from about 15 cords to as many as 40. The low figure, 15 cords, comes from one New England estimate of the 1600s. The high figures, 30 to 40 cords, are for a home that heated and cooked with open fireplaces. An open fireplace sent most of its heat up the chimney, so a family had to burn a great deal of wood to stay warm.

Horses in Native hands

Native people had horses earlier than the old account said. For a long time, the usual account said that Native people got their horses after the Pueblo Revolt of 1680. In that revolt, in August 1680, Pueblo people led by Po'pay, a Tewa religious leader, rose against the Spanish colonists in New Mexico and drove them out. Perhaps 1,500 or more horses came into Native hands at one time.

In 2023 a team of scientists published a study in the journal *Science* showing that Native people had horses earlier than that. The team included Lakota, Comanche and Pawnee scholars. They studied the bones of horses found in what are now Wyoming, Kansas and New Mexico. The bones showed that Native people were riding horses, putting bridles on them and feeding them corn by the early 1600s. That was decades before the Pueblo Revolt.

Oil from whales

English colonists on Long Island and in New England began killing whales close to shore for their oil in the 1600s. From about 1690, whale oil was one of the main fuels that Americans burned in their lamps, and it stayed one for about 150 years.

1700 to 1750

From 1700 to 1750, colonial iron furnaces burned charcoal, a fuel made from wood. An iron furnace is a tall oven where fire melts iron out of rock. At the Baltimore Iron Works in Maryland, enslaved people and convicts shipped from Britain hauled charcoal to the furnace around the clock. Lamps burned whale oil. Families who could pay the most bought candles made from a waxy oil in the head of the sperm whale. In 1741 Benjamin Franklin designed an iron stove meant to heat a room with less wood.

Charcoal for iron

Iron furnaces burned charcoal as their fuel. Charcoal is wood that has been heated with too little air for it to burn away. The heat drives off the water and gases in the wood. What is left is nearly pure carbon, and it burns hotter than wood. The men who made charcoal were called colliers.

In 1731, five planters started the Baltimore Iron Works on the Patapsco River in Maryland. Dr. Charles Carroll, a surgeon, gave 2,200 acres of land and ran the works at first. His cousins Charles Carroll and Daniel Carroll, along with Daniel Dulany and Benjamin Tasker, put in money and enslaved workers. In the 1600s, the land around the Patapsco lay within the hunting grounds of the Susquehannock nation. The Susquehannock had their villages farther north, along the Susquehanna River.

The Baltimore Iron Works opened with 89 workers. Forty-two of them were enslaved. Many of the workers were enslaved people or transported convicts. A transported convict was a person found guilty of a crime in Britain and sent to the colonies to be sold into years of forced work. Judges in English courts gave that sentence. Merchants shipped the convicts across the ocean, and merchants and ship captains sold them in the colonies, some of them to iron makers. Their forced work lasted 7 to 14 years. The workers hauled cartloads of charcoal, oyster shells and iron ore, the rock that iron comes from, to the top of the furnace in 12-hour shifts. The work went on around the clock, six or seven days a week.

The owners did not give the workers enough food. Some workers ran away, and others worked slowly on purpose. In a good year the partners made a profit equal to 55 percent of the money they had put in. By 1785 an advertisement for the Baltimore Iron Works listed "more than 200 Negroes," which means more than 200 enslaved Black people. Negro was a word used then for a Black person.

The surviving records of these early furnaces list the owners. They do not list the men who made the charcoal.

Light after dark

The brightest light in the colonies came from spermaceti. Spermaceti is a waxy oil found in the head of the sperm whale. Candle makers turned it into candles that burned brighter and cleaner than any others and cost the most. Writers at the New Bedford Whaling Museum call spermaceti "the most valuable product of the Yankee whaling industry." Yankee meant someone from New England.

A stove to save wood

In 1741 Benjamin Franklin designed what he called the Pennsylvania fireplace. It was a stove made of cast iron, which is iron poured into a mold while it is melted. Franklin meant it to give more heat and less smoke from less wood than an open fireplace. Few people bought it at first. David Rittenhouse later improved the design, and after that it sold better.

1750 to 1800

In 1755, at a copper mine in New Jersey, a steam engine began pumping water out of the mine. It was the first steam engine in America. A fire under a boiler, a closed tank of water, made the steam that ran it.

One iron furnace in Pennsylvania, Hopewell, burned charcoal made from about an acre of forest every day it ran. At Catoctin Furnace in Maryland, enslaved Black workers and some free Black workers cut the wood, made the charcoal and hauled it to the furnace. After dark, spermaceti candles still gave the brightest light.

The first steam engine in America

In 1748, water flooded the copper mine of John Schuyler at Second River, now North Arlington, New Jersey, and the mine had to shut down. Schuyler paid an English engine maker, Jonathan Hornblower, 1,000 pounds to send him a "fire engine" and mechanics to set it up. People at the time called this kind of steam engine a fire engine. Josiah Hornblower used that name in a letter of 1768. The parts arrived in New York in September 1753 on a ship called the

Irene, after twelve weeks at sea. Jonathan's son Josiah came with them. The parts were taken to Newark, New Jersey, and put together there. By early 1755 the engine was pumping water out of the mine.

The engine was a kind invented in England by Thomas Newcomen. The fire under the boiler turned the water into steam. The steam flowed into a cylinder, a tall round tube. Inside the cylinder, the steam filled the space under a piston, a heavy disk that could slide up and down. Then a jet of cold water sprayed into the cylinder. The cold turned the steam back into water, which left almost nothing under the piston. The weight of the air above pushed the piston down.

The piston was joined to one end of a beam that rocked up and down like a seesaw. The other end of the beam lifted long pump rods that hung down the mine shaft, and the pumps raised the water. Then the weight of the pump rods pulled the piston back up, and the engine started again. Engines of this kind were about two stories high. Their power was about ten horsepower. A horsepower is a unit of power based on the work one horse can do.

Josiah Hornblower

Who: An English engine builder who came with the first steam engine in America and later ran it, at the Schuyler copper mine.

When and where: Second River, now North Arlington, New Jersey. Engine at work from 1755. Born 1729, died 1809.

Josiah Hornblower was the young English engineer who came with the first steam engine in America, and later he ran it himself. He was born in 1729, the son of Jonathan Hornblower, an English engine maker. In 1753, when he was about 24, he sailed from London to New York with the parts of the engine. By early 1755 the engine had been put together and was pumping water out of John Schuyler's copper mine at Second River, now North Arlington, New Jersey.

For the next twenty years the engine worked only part of the time. In 1761 Hornblower and a partner, John Stearndall, leased the mine from the Schuyler family. They paid one seventh of the ore they dug as rent.

In March 1762 the building around the engine caught fire and burned to the ground. A report in the *New York Mercury* of March 22 states that the engine works had cost nearly ten thousand pounds. People at the time guessed that a careless workman had left a candle burning. By 1767 the engine was working again. Richard McCormick, a historian who wrote the history of the engine, does not say who repaired it or when.

> Late in 1767, Hornblower had to stop the engine because he had run out of fuel. He got more fuel, put the old pumps back in, made all the repairs needed and started it again in April 1768. Soon the vein, the band of ore running through the rock, dipped deep. He tried to follow it with hand pumps, but they could not keep the water out. His partners had also not sent money they owed him. On a Monday in July 1768, he stopped the mine and let all the workers go. At about eight o'clock that same evening, the engine house caught fire. It burned to ruins in a few minutes while a crowd of people tried to save it. Hornblower wrote that a man had gone into the engine house two hours before to light his pipe. The man said he could not find any fire there to light it with. A report in the *Pennsylvania Chronicle* states that the fire was "supposed to be by Design," because no one knew of any fire being used there lately. That means people thought someone set it on purpose.
>
> Mining at Schuyler's stopped in 1773. Hornblower stayed in New Jersey for the rest of his life, and he died there in 1809. Accounts of what became of the engine differ. One says it was broken up around 1800. Another says it was repaired in 1793 and pumped water into the 1800s. Half of its cylinder is now in the Smithsonian Institution.

Charcoal by the acre

Mark Bird built Hopewell Furnace on French Creek, in Berks County, Pennsylvania, in 1771. The land around it had belonged to the Lenni Lenape. After the colony's founder, William Penn, left Pennsylvania in 1701, his agent James Logan handled Penn's land deals. Under Logan, land deals with the Lenni Lenape were often dishonest, and some were frauds, deals built on lies. By about 1750, nearly all Native people had been driven out of the lower Delaware and Susquehanna river valleys. Most moved west to the Allegheny, Monongahela and Ohio river valleys. The history of Hopewell written for the National Park Service does not name the people who drove them out.

When Hopewell's furnace was in blast, which means lit and making iron, it burned up to 800 bushels of charcoal a day. A bushel is a measure for dry goods such as grain or charcoal. To make that much charcoal, workers cut about an acre of forest every day. In a year the furnace used 5,000 to 7,000 cords of wood, from more than 200 acres of woodland. The owners held between 4,000 and 8,000 acres of forest to keep the furnace supplied. Woodcutters, using only axes, cut an average of two cords a day each.

How a collier made charcoal

A collier made charcoal in a pile called a pit, built on flat, cleared ground. He drove a pole 18 feet long into the middle of that ground. The pole was green, which means freshly cut. Around the pole he built a chimney with three corners. Then he stacked about 30 cords of wood around it in three layers and covered the whole pile with leaves and dust.

To light the pit, he shoveled red-hot coals from his cooking fire down the chimney. The wood inside smoldered, burning slowly with very little air. The collier watched it day and night. He walked on top of the pit to find soft spots, where air was getting in, and he filled them. After 10 days to two weeks, the wood had turned into charcoal. One pit made about 1,100 bushels, enough to run the furnace for a day and a half.

Who made the charcoal

In 1780, Mark Bird enslaved 18 people: 10 men, 4 women, 3 boys and 1 girl. No one else in Berks County enslaved as many people that year. That same year, Pennsylvania lawmakers passed a law to end slavery in stages. Under it, mainly children born after the law passed could become free. The last record of slavery at Hopewell is from 1821, when Matthew Brooke freed one person he enslaved. Hopewell's owners hired free Black workers only for jobs that took little training. They worked as woodcutters, laborers and teamsters, who drove wagons. According to the National Park Service, no record from Hopewell's 112 years shows a Black worker in a skilled job or as a manager.

Catoctin Furnace, in Maryland, was making iron by 1776. Four brothers named James, Baker, Roger and Thomas Johnson built it. The Johnson family enslaved more than 80 people there. One of them was a skilled man recorded only as Collier Sam. The Catoctin Furnace Historical Society's history gives only his name and his trade. Over the life of the furnace, at least 271 enslaved African Americans worked at Catoctin, along with an unknown number of free African Americans. They mined ore, cut wood, made charcoal, drove wagons and worked the forge, the shop where iron was heated and hammered into shape. Woodcutters cut, hauled and stacked the wood for the colliers, and other workers carried the finished charcoal to the furnace.

1800 to 1850

Between 1800 and 1850, Americans began to heat their homes with coal dug out of the ground. In 1808 a tavern keeper in Pennsylvania showed that hard coal from northeastern Pennsylvania could heat a home. Boats, first on the rivers and then on canals, carried that coal to the cities. In 1817 the first public gas street lamp in the country was lit in Baltimore, with gas made from coal and sent through pipes.

The American whaling fleet reached its largest size in 1846, with 735 ships. Whale oil cost too much for most families, and most homes burned cheaper fuels.

Stone coal

Northeastern Pennsylvania has a hard kind of coal called anthracite. People then called it stone coal. Two brothers named Gore, who were blacksmiths, had burned it in their forges since 1769. A forge is a blacksmith's fire for heating metal. For use at home, though, most people thought anthracite was too difficult to burn.

Jesse Fell ran a tavern in Wilkes-Barre, Pennsylvania. He had believed for some time that a big enough pile of anthracite would keep burning once it was lit. He built a grate shaped like the letter L out of "Small Iron rods." A grate is a rack that holds fuel up off the floor of a fireplace, so air can flow in underneath. On February 11, 1808, Fell set his grate in the fireplace of the tavern's main room and lit the coal. He later wrote that "on first lighting" he "found it to burn excellently well."

Fell had shown that anthracite could heat a home. After that, the anthracite business grew. In 1818 a company called Lehigh Navigation was formed. Anthracite floated down the Lehigh River to Philadelphia in boats called arks. Later, boats on canals carried the coal into the cities. From the 1820s to the 1840s, people put stoves and furnaces made to burn anthracite into homes and other buildings.

Gaslight

Heating coal makes a gas that burns. The gas is a mix of gases that can burn, among them hydrogen and a gas called carbon monoxide. In 1816 Rembrandt Peale, who ran a museum on Holliday Street in Baltimore, lit a room of his museum with gas made from coal.

On June 17, 1816, the Gas Light Company of Baltimore received its charter, a legal paper that allowed the company to form. It was the first gas company in the United States. Gas makers stored the gas in large tanks called gasometers and sent it through pipes. On February 7, 1817,

the company's first public gas street lamp, the first in the country, was lit at Market and Lemon Streets in Baltimore.

By 1850 about 50 American cities and towns had gas works, plants that made gas. Gaslight was expensive, and most Americans could not pay for it. It lit streets, shops and the homes of richer families in the larger cities.

Whale oil, and who could pay for it

In 1846 the American whaling fleet counted 735 ships, the most in any year. Other counts put the peak of the whaling business as late as 1852. There were about 900 whaling ships in the whole world, so most of them were American. New Bedford, Massachusetts, was the leading whaling port. At its peak, more than 400 whaling ships sailed from there.

Whale oil cost $1.30 to $2.50 a gallon, and most families burned cheaper fuels. Tallow candles were made of animal fat. Lard oil, made from pig fat, cost about 90 cents a gallon, and camphene cost about 50 cents. Camphene was one part turpentine, a liquid made from pine trees, mixed with four parts alcohol and a little camphor, which was added for its smell. Its fumes caught fire easily, and camphene lamps could start sudden fires.

Oil from sperm whales lit the homes of richer families. It also lit lighthouses and public halls.

Nelson Cole Haley

Who: A New Bedford boy who ran off to sea at twelve, became a harpooner on a whaling ship, and later wrote a book about his four-year voyage.

When and where: At sea aboard the whaling ship *Charles W. Morgan*, 1849 to 1853. Born 1832, died 1900.

Nelson Cole Haley hunted whales for the oil that Americans burned in their lamps. He was born in 1832 and grew up in New Bedford, Massachusetts. His father died when he was a boy. In 1844, when he was twelve, he ran off to sea to become a whaleman, even though his mother did not want him to go.

In 1849, when he was seventeen, Haley became a harpooner on the whaling ship *Charles W. Morgan*. A harpooner threw the harpoon, a heavy iron spear, into the whale from a boat that the crew rowed out from the ship. Haley called the harpoon an iron. He later wrote about one chase: "I raised the iron, and with all the force I was capable of, I sent it to the socket into the vast mass of blubber and meat that was now only a foot or two clear

> of the boat." Blubber is the thick layer of fat under a whale's skin. He drove a second harpoon in beside the first. Then the second mate, one of the ship's officers, killed the whale with a lance, a long spear with a sharp blade.
>
> The crew rowed the dead whale back to the ship. The next morning, men stood on the dead whale and peeled off strips of blubber, and the crew hoisted the strips on board. On deck, the crew cut the blubber into chunks they called bibles. They boiled the chunks in two big metal pots set on the try-works, a brick furnace built on the ship's deck. The heat melted the fat into oil, and the crew poured the oil into barrels below deck. For fuel under the pots, they burned the crisp bits of blubber left over from the boiling.
>
> Haley's voyage lasted four years, from 1849 to 1853. Whaling ships of that time stayed at sea three to five years on a voyage. Haley wrote a book about the voyage, called *Whale Hunt*. The Mystic Seaport Museum first published it in 1948, almost fifty years after he died.
>
> The *Charles W. Morgan* was built in New Bedford in 1841. It made 37 voyages between 1841 and 1921, with sailors from fifty countries. The ship is kept today at the Mystic Seaport Museum. It is the last wooden whaling ship left in the world.

1850 to 1900

Kerosene made from oil went into American lamps between 1850 and 1900, and some Americans began to buy electricity. In 1859 Edwin Drake's crew drilled a well in Pennsylvania that reached oil, and refiners made the oil into kerosene. In 1882 Thomas Edison's workers began sending electric current through wires to paying customers from a station in New York City.

Coal became the country's main fuel in these years. According to the US Energy Information Administration, coal supplied 9 percent of the energy Americans used in 1850 and 27 percent by 1870. Around 1885, Americans began to burn more energy from coal than from wood, for the first time. In 1869, 110 people died in a fire at the Avondale coal mine in Pennsylvania. Smoke and gas filled the mine, and 108 men and boys underground died because they could not breathe. Two men who went down to rescue them also died.

Drake's well, 1859

Edwin Drake's crew struck oil 69.5 feet down near Titusville, Pennsylvania, on August 27, 1859. It was the first well in the United States drilled on purpose to find oil and sell it. Writers at the American Oil & Gas Historical Society date the start of the American oil business to that day.

Drake worked for the Seneca Oil Company of New Haven, Connecticut. The owners wanted oil to make kerosene, a cheap fuel for lamps. The driller, William Smith, known as Uncle Billy, cut through rock and shale, a soft rock made of hardened mud, at about three feet a day. A steam engine of six horsepower drove the drill. A horsepower is a unit of power based on the work one horse can do.

Edwin Drake

Who: The man the Seneca Oil Company hired to drill for oil. His 1859 well started the American oil business.

When and where: Titusville, Pennsylvania, 1859. Died November 1880 in Bethlehem, Pennsylvania.

Movie: *Born in Freedom: The Story of Colonel Drake* (1954). A 30-minute drama in color, with actors playing the people, paid for by the oil industry's American Petroleum Institute, with Vincent Price as Drake.

Edwin Drake drilled the first American well made to find oil. He lost his money afterward and spent his last years ill.

People called him Colonel Drake, but he never held that rank. An investor named James Townsend made up the title. He addressed letters to "Colonel E. L. Drake" to impress the people of Titusville.

Water from Oil Creek kept seeping into the hole, and the sides kept caving in. Drake had a pipe driven down to the rock, and then the drill worked inside the pipe. This drive pipe kept the water and loose ground out. On August 27, 1859, the drill reached oil at 69.5 feet.

Drake never patented the drive pipe. A patent is a government paper that gives an inventor the only right to make and sell an invention for a set number of years. In the late 1860s his friends raised about $4,000 for him. In 1873, people of Titusville won him a pension of $1,500 a year from the state of Pennsylvania. A pension is money paid every year to someone who no longer works. Drake died in November 1880 in Bethlehem, Pennsylvania.

> The film about him, *Born in Freedom*, first played in Titusville on March 29, 1954.

Kerosene in the lamp

In the 1860s, American families switched to kerosene for their lamps. Refiners made it from oil. They heated the oil until parts of it boiled off as vapor, then cooled the vapor back into separate liquids. Kerosene sold for about 50 cents a gallon.

Whaling was already shrinking before kerosene came. The whaling fleet was largest in 1846, and whalers caught fewer whales through the 1850s. Whale oil cost $1.30 to $2.50 a gallon, and mainly richer families burned it. Most families burned camphene and lard oil.

During the Civil War, members of Congress passed the Internal Revenue Act to pay for the Union Army. That was the army of the Northern states. Under that law, alcohol was taxed at up to $2.08 a gallon from 1862 to 1864. The lawmakers meant to tax alcohol that people drank. They did not leave camphene out of the law, and camphene was about three quarters alcohol. Before the tax, camphene and kerosene each sold for about 50 cents a gallon. At the top rate, the tax on the alcohol in one gallon of camphene came to more than a dollar. Kerosene was taxed at 10 cents a gallon. People stopped buying camphene, and families switched to kerosene.

A common saying holds that kerosene saved the whales. Writers at the University of Houston's engineering college and at the website environmentalhistory.org call that claim a myth. Whaling had been shrinking for more than ten years, and the fuel that kerosene replaced in most homes was camphene.

Pearl Street, 1882

On September 4, 1882, Thomas Edison's workers started the first permanent central power station in the United States. A central power station makes electricity in one place and sends it out through wires to many buildings. It stood at 257 Pearl Street in Manhattan, in New York City.

The station ran on coal. Four boilers burned coal to make steam. The steam ran engines, and the engines turned six dynamos. A dynamo is a machine that turns motion into electric current. Wires carried the current to a district of about a quarter of a square mile around the station.

On the first day, the station served 85 customers, who had about 400 lamps among them. Within a year it served 513 customers with about 10,000 lamps. When the station started, Edison was standing in the office of the banker J. Pierpont Morgan, at the bank of Drexel,

Morgan and Company. The station ran until January 2, 1890. In those years it went dark only once, for three hours.

Thomas Edison

Who: The inventor whose workers built the first permanent central power station in the United States. He built his system on direct current.

When and where: Pearl Street, Manhattan, New York City, from September 4, 1882.

Thomas Edison built his Pearl Street power system to run on direct current, called DC. Direct current flows in one direction only, like the current from a battery. The Pearl Street station sent DC out at a low voltage. Voltage is the force that pushes electric current through a wire.

Low-voltage direct current loses a lot of its energy in the wires as it travels. So the Pearl Street station could serve only about a quarter of a square mile around it. The voltage of direct current could not easily be raised or lowered.

George Westinghouse sold a different kind of current, alternating current, called AC, which flows back and forth. Edison and his supporters said AC was deadly. In 1888 a salesman named Harold Brown killed dogs with AC at Edison's laboratory to show that it was dangerous. Edison also secretly paid a salesman named Brown to use AC in the first electric chair, a chair built to kill a person with electricity.

The current war

Alternating current, called AC, flows back and forth, changing direction many times each second. In the United States today it changes direction 60 times a second. A machine called a transformer can easily raise or lower the voltage of AC. Direct current could not easily be changed that way.

In May 1888 Nikola Tesla received patents for motors that ran on alternating current. In July 1888 George Westinghouse paid for the right to use Tesla's motors. He paid $60,000 in cash and in stock, which means shares in the ownership of a company, plus $2.50 for each horsepower that the motors produced.

Edison and his supporters attacked AC as deadly. Harold Brown, an electricity salesman, ran tests in 1888 at Edison's laboratory in West Orange, New Jersey. He killed dogs with alternating current to show that it was dangerous. The dogs were strays, bought from boys in

the neighborhood for 25 cents each. Edison's supporters used the word "Westinghoused" to mean killed by electricity.

In 1888 New York lawmakers replaced hanging with death by electricity. Governor David B. Hill had proposed the change. New York State officials hired Harold Brown to build the first electric chair, and Edison secretly paid Brown to use alternating current in it. An electric chair kills a person by sending a strong electric current through the body.

The first man put to death in the electric chair was William Kemmler, of Buffalo, New York. Kemmler killed Matilda Ziegler, who lived with him as his wife, in their apartment in Buffalo. He struck her more than 25 times on the head, neck and shoulders with a hatchet. At his trial in a Buffalo court in May 1889, he was found guilty of murder and sentenced to die by electricity in Auburn State prison. His lawyer, W. Bourke Cockran, argued that death by electricity was a cruel and unusual punishment. The New York State Constitution forbids punishments of that kind. The judges of the New York Court of Appeals said it was unusual but not cruel. The justices of the US Supreme Court refused to change that decision.

On August 6, 1890, at Auburn prison in New York, prison officials put Kemmler in Brown's chair and sent a current through him for 17 seconds. A doctor said he was dead, but then Kemmler groaned and began to breathe again. The officials turned the current back on, and this time it took between one and four minutes to kill him. During the execution his fist clenched so hard that blood ran from his palm, and the back of his coat briefly caught fire. The room filled with the smell of burning flesh. Several witnesses fainted. Newspaper writers called the execution "a disgrace to civilization." Westinghouse said, "It has been a brutal affair. They could have done better with an ax."

In 1893 Westinghouse's company offered to light the World's Columbian Exposition, the world's fair in Chicago, for $399,000. General Electric offered to do it for $554,000. Westinghouse got the job, and in May 1893 his company's AC system lit about 100,000 electric lamps at the fair. Later his company also won the job of building three generators for the Adams power plant at Niagara Falls. A generator is a machine that turns motion into electric current. On August 26, 1895, the Adams plant sent out its first alternating current, to factories in the town of Niagara Falls. In November 1896 alternating current from Niagara Falls lit Buffalo, New York.

> **George Westinghouse and Nikola Tesla**
>
> **Who:** The businessman whose company sold alternating-current systems, and the inventor whose AC motors he paid to use.

When and where: 1888 to 1896. The Chicago world's fair, 1893. Niagara Falls and Buffalo, New York, 1895 and 1896.

Movie: *The Current War* (2017). A Hollywood drama, not a documentary. Benedict Cumberbatch plays Edison, Michael Shannon plays Westinghouse and Nicholas Hoult plays Tesla. Tom Holland plays Samuel Insull, Edison's private secretary. Alfonso Gomez-Rejon directed it. It first showed at the Toronto International Film Festival on September 9, 2017, and opened widely in 2019.

George Westinghouse's company won the jobs that brought alternating current to the Chicago world's fair and to Niagara Falls. Its AC motors came from Nikola Tesla, who received patents for them in May 1888. In July 1888 Westinghouse bought the right to use those patents for $60,000 in cash and stock, plus a payment of $2.50 for every horsepower the motors produced.

Edison's supporters called AC deadly and used the word "Westinghoused" to mean killed by electricity. In 1893 Westinghouse's company offered to do the Chicago world's fair job for $155,000 less than General Electric, and it lit the fair with alternating current. Two years later, on August 26, 1895, the Adams plant at Niagara Falls, with generators built by Westinghouse's company, began making AC power. In November 1896 the current from Niagara reached Buffalo.

What coal cost the miners

A fire at the Avondale mine, near Wilkes-Barre, Pennsylvania, killed 110 people on September 6, 1869. The Steuben Coal Company owned the mine. Mine operators then kept small fires burning at the bottom of their shafts, the deep holes that lead down into a mine. A fire like this, called a ventilating furnace, made a draft that moved fresh air through the mine.

Sparks from the ventilating furnace set fire to the wooden timbers in the shaft. The flames spread up to the breaker, the wooden building where coal was broken and sorted. The breaker stood right over the shaft, and the shaft was the only way into or out of the mine. The men who ran the Steuben Coal Company had the mine and its breaker built that way. The fire filled the mine with smoke and gas, and 108 men and boys underground died because they could not breathe. Five of the dead were boys between 12 and 17 years old. Two men who went down to rescue the miners also died.

In 1870 Pennsylvania lawmakers passed a mine law. It required every mine to have more than one way out. It also forbade using one single passage both to bring fresh air in and to let bad air out.

From charcoal to coal

Hopewell Furnace in Pennsylvania burned charcoal from about 1771 until it closed in 1883. According to the National Park Service, charcoal furnaces had fallen out of use by then. Iron makers had built new ironworks that burned anthracite, the hard coal, in their place. For more than a hundred years, workers at Hopewell had cut the forest around it for charcoal. Mark Bird, who built the furnace, enslaved some of the people who worked at Hopewell in its early decades. In 1780 he enslaved 10 men, 4 women, 3 boys and 1 girl. The last record of slavery at Hopewell is from 1821.

Lafayette Houck

Who: A collier, or charcoal maker, at Hopewell Furnace. He came from a family of colliers, was one of Hopewell's last colliers, and later taught the National Park Service how the work was done.

When and where: Hopewell Furnace, Berks County, Pennsylvania, in the later 1800s. He showed how to make charcoal in 1936.

Lafayette Houck was one of the last colliers at Hopewell Furnace. His family's work there began in 1818, when Henry Houck worked at Hopewell as a master collier, a collier in charge of the pits and of the helpers who worked them. In winter Henry also repaired wooden wagon wheels or chopped wood to sell.

A collier's pit was a big pile of wood, stacked around a pole and covered with leaves and dust. The collier lit it, and the wood smoldered, burning slowly with very little air. In 10 days to two weeks the wood turned into charcoal. A Hopewell collier lived in a rough hut near his pits from May to October, with one or two helpers. Together they tended up to eight or nine smoldering pits at once. They watched the pits day and night. The watch did not stop from the moment a pit was lit until a teamster, a man who drove a wagon, hauled away the last load of charcoal. In the 1830s the furnace's owners paid about 20 colliers, and each one tended eight or nine pits.

Hopewell closed in 1883. In the 1930s the federal government bought the land. In 1936 Houck and his son, William, showed workers of the Civilian Conservation Corps, a government jobs program, how a collier lived and worked. Houck taught the National Park Service how charcoal was made. He also told them what he remembered about life at the furnace.

> His age is uncertain. One National Park Service page lists his life as 1846 to 1939. Another states that he was 82 years old in 1936, which would mean he was born around 1854. The Park Service pages do not give his pay or the years he began and stopped work as a collier.

1900 to 1950

By 1950, electric wires reached almost every American home. The census is the government's count of the people and their homes, taken every ten years. In 1890 about 8 in 100 households had electricity. By 1950, 94 in 100 did, according to a 2008 study by Emanuela Cardia that used census figures. Most farms got their wires only after 1935.

Coal still heated most homes. The 1940 census found that more than half of American homes were heated mainly with coal, and about a quarter with wood.

In 1901 a single well in Texas began to pour out an estimated 100,000 barrels of oil a day. In World War II, most of the oil burned by the Allies, the countries fighting Germany, Italy and Japan, came from the United States.

Spindletop, 1901

On January 10, 1901, a well on Spindletop hill, about 3 miles south of Beaumont, Texas, struck oil 1,139 feet down. Oil shot more than 100 feet into the air. The well poured out an estimated 100,000 barrels a day until workers capped it nine days later, on January 19. In the whole year of 1900, all of Texas had produced 836,000 barrels. At the estimated rate, the Spindletop well poured out about 900,000 barrels in its nine days, more than that whole year's total.

Anthony F. Lucas led the drilling. According to the Texas State Historical Association, he was the leading American expert on salt domes, large masses of salt buried deep underground. The well stood on a piece of land known as the McFaddin-Wiess and Kyle land. Several oil companies started at Spindletop or grew large there. Among them were the Texas Company, later called Texaco, and Gulf Oil.

What coal cost the miners, 1900 to 1950

Coal miners died at work by the thousands in the early 1900s. Officials of the federal Mine Safety and Health Administration keep a count for every year. Federal means belonging to the national government. In 1900, 1,489 coal miners died in accidents at work. The worst year was

1907, when 3,242 died. In 1930, 2,063 died, and in 1950, 643. From 1900 through 2025, the yearly counts add up to about 105,000 coal miners who died in accidents. The counts do not include miners who died of disease from their work.

On December 6, 1907, explosions in mines No. 6 and No. 8 at Monongah, West Virginia, killed 362 men by the official count. It is the worst mine disaster in American history. Later estimates run above 500. The explosion destroyed the system that kept track of which miners were underground, so no one could make a full count. Some of the dead were boys as young as eight. Mine companies of the time hired more workers than they listed, and their lists left out many of the children who worked underground. The dead included immigrants from Italy, Poland and Hungary, and Black workers. About 1,000 children lost a father.

Accounts differ about which company owned the mines. One names the Fairmont Coal Company, and another names the Consolidation Coal Company. The Fairmont company's president, C. W. Watson, said the explosion "could only have been caused by the careless use of a mining lamp." Experts at the time disagreed about the cause. Some blamed torn electrical wires, and others blamed lamps.

Clio, a history website run from Marshall University, states that a loaded coal car broke loose near the top of a trestle, a raised track, and ran back into mine No. 6. The histories of the disaster by Clio and by the West Virginia Mine Wars Museum do not name anyone charged with a crime. After Monongah, members of Congress, the lawmakers who make the nation's laws, created the federal Bureau of Mines.

In 1914 Colorado National Guard soldiers killed striking coal miners and their families at Ludlow, Colorado. The National Guard is a state's own force of part-time soldiers. The strike had begun in 1913. That year the coal miners of southern Colorado went on strike, which means they stopped work to demand changes. The coal they mined supplied Colorado's steel mill and its railroads. Most of them worked for the Colorado Fuel and Iron Company, and its main owner was John D. Rockefeller Jr.

The miners wanted the company's owners to obey Colorado's mining laws. They also wanted the owners to accept their union, the United Mine Workers. A union is a group that workers form so they can bargain with owners together. The strikers and their families lived in tent camps. Governor Elias M. Ammons sent the Colorado National Guard, and the mine owners agreed to pay for it.

On April 20, 1914, fighting broke out at the tent camp at Ludlow. No one knows who fired the first shot. Guardsmen burned the tents. At least 19 people were killed: one guardsman, five miners, and thirteen women and children. The women and children had hidden in a pit under a tent. Fumes from the burning filled the pit, and they died because they could not breathe.

Guardsmen killed three strike leaders who were under a flag of truce, a white flag that asks for a pause in fighting. They shot the strike leader Louis Tikas, a Greek American, three times in the back.

In the days after, miners attacked mines across the region and killed mine bosses and guards. No one knows how many people died in those days, but more died than at Ludlow. President Woodrow Wilson sent the US Army on April 28. The strike ended in December 1914, and the miners won none of the union's goals.

Samuel Insull

Who: Thomas Edison's private secretary, who later built a group of more than 85 electric companies that served millions of people. It collapsed in 1932.

When and where: Chicago, 1892 to 1932. Died in Paris in 1938.

Samuel Insull built a chain of electric companies that served millions of people, and the chain collapsed in 1932. He had worked for Thomas Edison as his private secretary. In 1892 Insull took over the Chicago Edison company, and he built it into Commonwealth Edison.

Insull tied together more than 85 companies through holding companies. A holding company is a company that owns shares, or pieces of ownership, of other companies. Insull's companies owned shares in one another, and they had borrowed much of the money behind them. Many small investors bought shares in his companies.

In 1932, during the Great Depression, Insull's companies failed, and investors lost millions of dollars. Insull fled to Europe. In October 1932 a grand jury in Chicago charged him with crimes. A grand jury is a group of citizens who decide whether there is enough proof for a trial. He moved to Greece, and officials there refused to send him back. In 1934, after US officials pressed them, Greek officials told him to leave. Officials of Turkey arrested him, and US State Department officers brought him back to the United States to stand trial.

> He was tried three times: for fraud, which means cheating people by lying, for embezzlement, and for breaking federal bankruptcy law. Embezzlement means stealing money that other people trusted you to handle. Bankruptcy law sets the rules for what happens when a person or a company cannot pay its debts. He was found not guilty all three times.
>
> In 1932 Franklin Roosevelt, running for president, named Insull in a campaign speech. In 1935 members of Congress passed the Public Utility Holding Company Act. They wrote it to stop anyone from building another chain of electric companies like Insull's.

Rivers into power, and who lost their homes

From 1933 to 1945, federal officials had large dams built to make electricity. In the Tennessee Valley alone, they made an estimated 82,000 people leave their homes to do it. A hydroelectric dam holds back a river. Water rushing down through the dam turns machines that make electricity.

On May 18, 1933, President Franklin Roosevelt signed the law that created the Tennessee Valley Authority, or TVA. The TVA was a federal corporation, a company owned by the national government. Its board and staff ran it, and TVA officials had dams built in the Tennessee Valley. Before the TVA, about 3 in 100 families in the valley had electricity. Work on the first TVA dam, Norris Dam, began in October 1933.

From 1933 to 1945, TVA officials bought or took about 1.3 million acres from their owners. They made those 82,000 people leave to make room for 16 hydroelectric dams. For Norris Dam alone, TVA officials made more than 3,000 families leave. TVA lawyer John Snyder described how the land was taken: "a price is set and we buy at that price or we condemn." To condemn land is to take it by law without the owner's agreement, at a price the government sets. TVA's own economists estimated that condemning land got it for about 60 percent of what a private buyer would pay. Wayne Moore's 1995 history of the TVA land-taking does not name one official who made these choices. The TVA's board and staff made them together.

On October 9, 1936, the first generator at Hoover Dam began sending electricity over 266 miles of wire to Los Angeles. Some records date the start to October 26, 1936, the day that generator reached full operation.

Officials of the federal Bureau of Reclamation had Grand Coulee Dam built on the Columbia River, and it was finished in 1941. The dam stands 550 feet high, and its builders gave it no fish ladders. A fish ladder is a set of rising pools that lets salmon swim upstream past a dam. The

dam ended the runs of salmon and of steelhead, a trout that swims to the sea and back, in the whole upper Columbia Basin. The lake behind the dam flooded Kettle Falls, where Native people had fished for salmon for about 9,000 years. The catch there had averaged about 644,500 fish a year. Native people also lost thousands of acres of low, flat land beside the river where they grew food. They lost their way to the places where they gathered roots and berries.

In June 1940, as the dam neared completion, the Colville Confederated Tribes held a three-day Ceremony of Tears to mourn the loss of the fishery at Kettle Falls. Between 8,000 and 10,000 people came, from the Spokane, Yakima, Nez Perce, Coeur d'Alene and other nations.

Osage oil

Some of the oil Americans burned in the 1920s came from under the Osage Nation's land in Oklahoma. Under the Osage Allotment Act of 1906, the Osage kept the rights to the oil and minerals under their land, owned in common. Each Osage person with a share, called a headright, received part of the oil money. Under a law passed in 1921, local judges put many Osage adults' money under the control of white guardians, people the judges chose to handle it.

From about 1920 to 1925, husbands, guardians and others killed Osage headright holders to inherit their shares of the oil money. William Hale, a cattleman, ordered the murders of one family so that his nephew, Ernest Burkhart, could inherit their headrights. Burkhart was married to Mollie Burkhart. Federal agents later proved that Hale ordered the murders.

In May 1921 Kelsie Morrison shot Mollie's sister Anna Brown. He later admitted that he killed her at Hale's request. Their mother, Lizzie Q. Kyle, died in July 1921, and poison was suspected. The accounts of the Oklahoma Historical Society and the FBI do not say whether she was poisoned, or by whom. A cowboy named John Ramsey admitted that Hale hired him to kill their cousin Henry Roan. Roan was shot. Those two accounts do not say who fired the shot. On March 10, 1923, a bomb blew up the home of Mollie's sister Rita Smith. It killed Rita, her husband, Bill Smith, and Nettie Brookshire, who worked for them. Ramsey confessed that he took part in those murders. He named Hale as the leader, along with two other men, Henry Grammar and Asa Kirby.

Burkhart admitted his guilt in June 1926 and got life in prison. Morrison got life in November 1926. Hale got life in January 1929, and Ramsey got life that November. Hale and Ramsey went to the federal prison at Leavenworth.

The counts of the dead differ. Writers for the Oklahoma Historical Society count about 24 violent or suspicious deaths, and the FBI's history of the case says at least two dozen. The Osage Nation counts more than 60 murders and suspicious deaths.

The night the lights came on

In 1935 fewer than 11 farms in 100 had electricity from a central power station. Most farms got their wires after federal officials began lending money to farmers' cooperatives to build power lines.

On May 11, 1935, President Roosevelt signed Executive Order 7037, which created the Rural Electrification Administration, or REA. An executive order is a rule that a president issues on his own authority, without a vote of Congress. On May 20, 1936, Roosevelt signed the Rural Electrification Act. Under that law, REA officials made long-term, low-cost loans to cooperatives owned by farmers. A cooperative is a business owned by the people who use it. The farmers' cooperatives used the loans to build power lines. About half of American farms had electricity by 1945, about 9 in 10 by 1950, and about 97 in 100 by 1960.

In 1930 a Tennessee farmer, whose name was not recorded, said: "The greatest thing on earth is to have the love of God in your heart, and the next greatest thing is to have electricity in your house." David Nye records the words in his book *Electrifying America*. In 1984 the national association of electric cooperatives named its history of the program *The Next Greatest Thing*.

In the 1930s and 1940s, Louisan Mamer, who worked for the REA teaching farm families to use electricity in their homes, toured farm towns with a traveling show called the electric circus. She showed families electric appliances and how to cook with electricity.

In the Texas Hill Country, power first ran through the lines of the Pedernales Electric Cooperative on October 27, 1939. The cooperative had 1,800 miles of line and 422 first customers. Families coming home that night saw their farmhouses lit for the first time.

Pearl Yates

Who: A high school English teacher in the countryside of western North Carolina. Electricity reached her area in July 1939, and she told about it in an interview in 1984.

When and where: Haywood County, North Carolina, 1939.

Pearl Yates walked from room to room with her small children when the electric lights came on in her home. "We'd stop and look and they were so pretty and we'd go look at another room and another room," she said. The power reached her part of Haywood County, North Carolina, in July 1939.

Before then, she cooked on a wood stove. Washing clothes took a whole day, in a large pot. Officials of the power company, Carolina Power and Light, would not run lines into the countryside where the Yates family lived. So people there formed a cooperative. Many

> neighbors did not trust it at first, because outsiders ran it and members had to pay money up front. Organizers went from door to door and signed many of them up.
>
> On May 29, 1984, Bonnie Bishop interviewed Pearl Yates and her husband, Oral Yates. Oral Yates had worked as a teacher and for the railroad, and he had served as a state representative and a state senator, a lawmaker for North Carolina. The interview was part of a set recorded for the 50th anniversary of the REA. It is kept in the Southern Oral History Program at the University of North Carolina.

Oil for a world war

The Allies used about 7 billion barrels of oil in World War II, and about 6 billion of those barrels came from the United States. Writers at the American Oil & Gas Historical Society give these figures.

Tanker ships carried oil from Texas along the coast, and German submarines were sinking them. So workers built two pipelines on land. The Big Inch, a pipe 24 inches wide, ran from East Texas to Illinois and on to the East. It was finished in August 1943. Together with a second line, the Little Big Inch, it carried more than 350 million barrels of oil east before the war in Europe ended.

1950 to 2000

Nuclear power plants began making electricity in the United States in the 1950s. In 1957 the first full-scale American plant built only for civilian power began sending electricity into a power company's lines in Pennsylvania. In 1979 a reactor at Three Mile Island, also in Pennsylvania, partly melted. After that, American power companies stopped ordering new reactors.

Americans kept burning more oil and natural gas after World War II, according to the US Energy Information Administration. In October 1973 officials of the Arab members of OPEC, a group of countries that sell oil, cut off oil sales to the United States. Drivers waited in long lines for gasoline. Members of Congress then passed new energy laws and set up a federal Department of Energy, which opened in 1977.

Electricity from the atom

A nuclear power plant makes electricity from uranium, a heavy metal dug out of the ground as ore, which is rock that holds a metal. The fuel sits in the core, the center of the plant's reactor. A reactor is the machine where the atoms are split. Inside it, atoms of uranium split in two, and each split gives off a large amount of energy as heat. This splitting is called fission. The heat boils water into steam. The steam spins the blades of a turbine, a wheel with many blades. The turbine turns a generator, a machine that turns motion into electric current.

A test reactor in Idaho called EBR-1 made the first usable electricity ever produced from nuclear energy, on December 20, 1951. It lit four 200-watt light bulbs. On July 17, 1955, the town of Arco, Idaho, about 1,200 people, ran on electricity from a nearby reactor called BORAX III for about an hour. Arco was the first town lit only by nuclear power.

On December 8, 1953, President Eisenhower gave a speech called "Atoms for Peace" to the General Assembly of the United Nations. Work on a nuclear power plant at Shippingport, Pennsylvania, began in 1954. On December 18, 1957, the plant sent its first electricity into the lines of Duquesne Light, a power company. On December 23 it reached its full power of 60,000 kilowatts. A kilowatt is 1,000 watts. At 200 watts a bulb, 60,000 kilowatts could light 300,000 bulbs like the ones EBR-1 lit.

Shippingport was the first full-scale nuclear power plant in the United States built only to make electricity for civilian use, meaning not for the military. It was not the first to make nuclear electricity. EBR-1 and smaller American reactors came before it, and so did reactors built for more than one purpose. A British plant, Calder Hall, began sending power in 1956.

Garrison Dam and the Three Affiliated Tribes

In 1947 members of Congress paid for Garrison Dam on the Missouri River in North Dakota. The dam was part of the Pick-Sloan Plan of the Army Corps of Engineers, the part of the Army that builds dams and waterways. Under that plan, the dams were to stop floods and make electricity. The Army Corps was in charge of Garrison Dam, and it was finished in 1953. Its lake flooded the farmland along the river on the Fort Berthold Reservation. The reservation is the home of the Mandan, Hidatsa and Arikara, called the Three Affiliated Tribes.

The lake behind the dam, Lake Sakakawea, covered the river bottomlands where the tribes farmed. Bottomlands are the low, flat lands beside a river. Counts of the flooded land run from 153,000 to about 155,000 acres. Farms, homes, schools, a hospital, businesses, churches,

cemeteries, roads and whole towns went under the water. The drowned towns included Elbowoods, Sanish and Van Hook. By 1954 the Elbowoods school building stood under 50 feet of water.

Under the federal act for taking the tribes' land, about 300 families had to leave their homes before the lake covered them. By one count, that was more than 90 percent of the tribes' people. In 1948, at the signing of the contract for the tribes' land, tribal chairman George Gillette spoke about the Treaty of Fort Laramie. A treaty is a signed agreement between nations, and the tribes had made this one with the United States. Gillette said: "The truth is, as everyone knows, our Treaty of Fort Laramie ... and our constitution are being torn to shreds by this contract." In 1950, 525 of the tribes' 991 adults voted to accept the terms of the government's act for taking the land.

Black lung and the 1969 law

An explosion at the Consol No. 9 coal mine in Farmington, West Virginia, killed 78 miners on November 20, 1968. Members of Congress then passed the Federal Coal Mine Health and Safety Act of 1969, which became law on March 30, 1970. Under it, federal inspectors had to check every underground coal mine four times a year and every surface mine twice a year. Inspectors could close a mine where they found a danger to life. Under the law, miners with black lung disease could also get federal payments.

Black lung is a group of lung diseases caused by breathing coal mine dust. The body's defending cells try to break down the grains of dust and cannot. The cells burst and release chemicals that damage the lung. Over the years, scar tissue and hard lumps form in the lungs. Miners cough up dark, inky phlegm, the thick slime that comes up from the lungs. In the worst form, large masses of scar tissue fill the lungs, and the miner gasps for every breath. According to US Department of Labor figures reported in *Smithsonian* magazine in 2017, more than 76,000 miners had died of black lung since 1968.

Officials of the Mine Safety and Health Administration count the coal miners who died in accidents at work each year. They counted 311 in 1968, 203 in 1969, 260 in 1970, 133 in 1980 and 38 in 2000. In 2014 the count was 16, the lowest ever recorded.

1973: the gasoline runs short

In October 1973 officials of the Arab members of OPEC, a group of countries that sell oil, announced an embargo on oil sales to the United States. An embargo is an order that stops trade. They acted because US officials were sending military supplies to Israel in the Yom

Kippur War. That war began on October 6, 1973, when Egypt and Syria attacked Israel's forces. The embargo lasted until March 1974. In about six months, the price of a barrel of oil rose from about $2.90 to $11.65, about four times as much.

Gas stations ran out of gasoline, and drivers waited in long lines. Officials in many states let drivers buy gas only on certain days, by license plate number. Cars with odd numbers could buy on odd-numbered days, and cars with even numbers on even-numbered days. Members of Congress set a national speed limit of 55 miles an hour, and it became law in January 1974. A US Department of Energy report gives the average price of gasoline as 39 cents a gallon in 1973 and 53 cents in 1974.

More energy laws followed. On December 22, 1975, the Energy Policy and Conservation Act became law. Under it, federal officials set up the Strategic Petroleum Reserve, a store of crude oil kept for emergencies. Crude oil is oil just as it comes out of the ground. The law also contained the first fuel-economy standards for cars, rules for how far a car must go on a gallon of gas. New cars had to average 27.5 miles per gallon by 1985, about twice what they got then. The federal Department of Energy opened on October 1, 1977.

David Falconer

Who: A photographer for the Environmental Protection Agency's DOCUMERICA project. He photographed Oregon's gasoline shortage and wrote captions for his pictures.

When and where: Oregon, October 1973 to May 1974.

David Falconer photographed the gasoline shortage in Oregon and wrote down what he saw. He worked for Project DOCUMERICA. Officials of the Environmental Protection Agency started the project in 1972 to photograph environmental problems around the country. About 120 photographers took part. The National Archives keeps Falconer's pictures and captions.

At Sutherlin, on Interstate 5, he photographed closed pumps in October 1973. His caption states, "By midday gasoline was becoming unavailable along interstate highways." That month in Lincoln City, gas stations closed early and stayed closed on weekends, and "No Gas Today" signs went up.

He took more pictures in Portland. In December 1973 he photographed a man who had run out of gas and was standing in line with a gas can. The man's name was not recorded. By February 1974, drivers there with even-numbered license plates lined up for gas on even-numbered days, Monday through Friday. Anyone could try on Saturday if gas was

> left, and all Portland stations closed on Sundays. Falconer wrote that Oregon was the first state to use this odd-even plan. In May 1974, after the embargo had ended, he photographed a sign at a downtown Portland station saying its gas for the day was sold out.

Three Mile Island, 1979

The Unit 2 reactor at the Three Mile Island power plant in Pennsylvania partly melted down on March 28, 1979. It was the worst accident in American history at a nuclear power plant that sold its electricity. In a meltdown, the reactor's fuel gets so hot that it melts.

General Public Utilities ran the reactor. A small fault in the cooling system came first. Then a relief valve, a valve that opens to let out pressure, stuck open and let cooling water escape. The operators had no gauge that showed the valve was open. They believed the system held too much water, so they cut back the water flowing into it. The core lost its water and overheated. At least 45 percent of the core melted.

On March 30, Governor Dick Thornburgh advised pregnant women and preschool children living within 5 miles to leave. He told people within 10 miles to stay indoors. Officials gave out messages that conflicted with each other. About 140,000 people left on their own.

A small amount of radiation escaped. The average dose to people within 10 miles was 0.08 millisieverts, and no one got more than 1 millisievert. A millisievert is a unit that measures how much radiation a body takes in. Scientists at the Nuclear Regulatory Commission, and more than 12 health studies since 1981, found no health effects they could detect. No deaths are linked to the accident.

Where the uranium came from

Miners dug uranium on Navajo land for the federal government and later for power plants. Federal officials did not warn uranium miners about radon, a gas from the uranium that caused lung cancer. From 1944 to 1986, miners dug nearly 30 million tons of uranium ore from Navajo land, according to the Environmental Protection Agency. About 10,000 people worked in uranium, and about a quarter of them were Navajo. Until 1966 the federal Atomic Energy Commission was the only buyer. After that, uranium was also sold to fuel power plants.

Uranium gives off radon, a radioactive gas. Something radioactive gives off energy that can damage the cells of the body. Navajo miners say that no one taught them about the dangers of uranium mining. They say no one gave them protective gear or fresh air in the mines. In 1995 a

federal committee, the Advisory Committee on Human Radiation Experiments, reported that "at least several hundred" uranium miners had died of lung cancer from breathing radon. The committee found that federal officials did not require the mine owners to pump fresh air into the mines. They also did not warn the miners.

On July 16, 1979, four months after Three Mile Island, a dam owned by the United Nuclear Corporation, holding radioactive waste, broke. It stood near Church Rock, New Mexico. About 94 million gallons of radioactive liquid and 1,100 tons of solid waste poured down the Rio Puerco, past about 1,700 Navajo people. A 2013 study estimated that the spill released 46 curies of radiation. It estimated 13 curies for Three Mile Island. A curie is a unit that measures radioactivity. A New Mexico state agency called the effects "quite limited." Governor Bruce King turned down the Navajo Nation's request for a federal disaster declaration.

Panels on the White House roof

President Carter held a ceremony for 32 new solar panels on the roof of the West Wing of the White House on June 20, 1979. The panels used sunlight to heat water. They were in use for about seven years. In 1986, while President Reagan was in office, workers took the panels down to repair the roof, and no one put them back.

In 1991 some of the panels went to Unity College in Maine. Workers there put 16 of them back up to heat water for the cafeteria. In 2009 one panel went to the Smithsonian's National Museum of American History. Others are at the Carter Library and at a solar museum in Dezhou, China.

2000 to Today

Since 2000, Americans have changed the fuels they burn to make electricity. In 2016, for the first time over a full year, natural gas made more American electricity than coal, according to the US Energy Information Administration, or EIA. Drillers got more and more of that gas by fracking, which cracks rock deep underground to free the gas inside. Wind and solar power made a record share of the country's electricity in 2025, about 17 to 18 percent, by EIA figures.

In 2019 Americans produced more energy than they used, for the first time since 1957. In February 2021 a winter storm shut down power plants across Texas, and more than 4.5 million households lost power. In 2023 a new nuclear reactor began running in Georgia. It was the first new American reactor to start since 2016.

Fracking

After drillers began fracking shale, a rock made of hardened mud, American wells produced more natural gas and then more crude oil than the wells of any other country. Fracking is short for hydraulic fracturing. Drillers pump water, sand and chemicals down a well at high pressure. The pressure cracks the rock, and the sand holds the cracks open so that gas or oil can flow out. Many of these wells turn and run sideways through the rock for thousands of feet. That is called horizontal drilling.

In the early 1980s, George Mitchell's company, Mitchell Energy, began working a layer of shale in Texas called the Barnett Shale. Mitchell and his company spent about twenty years trying to get gas out of it. In the late 1990s an engineer, Nick Steinsberger, used a cheaper way of fracking called slickwater fracturing. It cut the cost enough that selling the shale gas made money. In the 2000s drillers joined fracking with horizontal drilling.

American wells produced about 5 billion cubic feet of shale gas a day in 2007 and about 80 billion cubic feet a day in 2023, according to the EIA. In 2011 American wells became the world's largest producers of natural gas. In 2018 they passed Russia's wells to become the world's largest producers of crude oil, the EIA reports. In 2025 American wells pumped a record 13.6 million barrels of crude oil a day, by EIA figures published in 2026.

People disagree about fracking. Supporters say it brought cheaper energy and jobs. They add that natural gas burns cleaner than coal, and power companies have replaced coal-burning plants with gas-burning ones.

Critics worry that fracking fluid can pollute groundwater and that methane, the main gas in natural gas, leaks from wells and pipes. Earthquakes are a third concern. Drillers pump wastewater from oil and gas wells deep underground. In 2017, scientists at the US Geological Survey wrote that the sharp rise in Oklahoma's earthquakes is widely seen as the result of that deep pumping of waste fluids. On September 3, 2016, an earthquake near Pawnee, Oklahoma, measured magnitude 5.8, the largest ever recorded in the state. Magnitude is a number that states the size of an earthquake.

Mine deaths, black lung and a pipeline

An explosion of gas and coal dust killed 29 miners at the Upper Big Branch mine in Montcoal, West Virginia, on April 5, 2010. It was the worst mine disaster in the United States in 40 years. Performance Coal Company, part of Massey Energy, ran the mine. The report on the explosion by the federal Mine Safety and Health Administration identifies Massey's "corporate culture"

as the root cause. A company's culture is the set of habits and ways of working inside it. Officials of the Mine Safety and Health Administration issued 369 citations and orders, which are written notices of broken safety rules, with fines of $10.8 million.

In December 2015 Massey's former chief executive, Don Blankenship, was convicted of conspiring, or planning with others, to break federal mine safety laws. It was a misdemeanor, a less serious crime than a felony. On April 6, 2016, Judge Irene Berger gave him the longest sentence the law allowed. He got one year in prison and a $250,000 fine. After prison came a year of supervised release, when a court officer checks on him. He was not convicted of causing the miners' deaths.

Black lung came back among coal miners in the 2000s. In 2016 researchers at NIOSH, the federal agency that studies workers' health, found 60 cases of the worst form of the disease in 20 months at one small clinic in Kentucky. Reporters at National Public Radio found 962 cases of advanced black lung in the 2010s. That was more than double the 441 cases NIOSH had recorded in the 40 years before. *Smithsonian Magazine* reported both counts in 2017.

In 2016 members of the Standing Rock Sioux Tribe opposed the Dakota Access oil pipeline where it crosses under Lake Oahe. The lake is the tribe's water supply, upstream of its reservation. Protest camps began in April 2016. On December 4, 2016, Army Corps of Engineers officials denied the easement for the crossing. An easement is permission to cross land, here federal land under the lake. On January 24, 2017, President Trump ordered the Army Corps to review and approve the easement quickly. Army Corps officials approved it on February 8, 2017, and oil moved through the pipeline later that year. The tribe's lawsuits continued.

Natural gas, wind and solar, 2016 to 2025

Natural gas made 34 percent of American electricity in 2016 and passed coal for a full year for the first time, according to the EIA. In 2025, by EIA figures, natural gas made about 41 percent of the country's electricity, nuclear power about 18 percent and coal about 17 percent. Wind made about 11 percent, solar about 7 and hydropower about 6.

Wind, solar, flowing water and other sources that do not run out are called renewable energy. In 2025 all renewable sources together made about 24 percent of American electricity. Wind and solar together made about 17 to 18 percent, a record. The EIA's yearly report puts wind and solar at about 17 percent. Its rounded shares for wind (11 percent) and solar (7 percent) add up to 18.

Analysts at the federal Bureau of Labor Statistics have projected jobs for 2024 to 2034. They expect wind turbine service technicians to be the fastest-growing job in the country, up 49.9 percent. Solar panel installers come second, up 42.1 percent. The two jobs together are projected to add fewer than 20,000 jobs.

Americans also began buying cars that run partly or fully on electricity. A hybrid car has both a gasoline engine and an electric motor. A battery electric car runs on electricity alone. According to the EIA, about 20 percent of the new cars, SUVs and pickups sold in 2024 were hybrids or electric. In 2025 the share rose to about 22 percent. But 2025 was also the first year that sales of battery electric cars fell. Federal tax credits for buyers of these cars, money taken off the buyer's tax bill, ended on September 30, 2025. In each of the months left in 2025, battery electric cars made up less than 6 percent of sales.

The Texas grid fails, 2021

In February 2021, during a winter storm named Uri, Texas power plants of every kind broke down in the cold. Some gas, coal, nuclear and wind plants stopped working. More than 4.5 million households, about 10 million people, lost power, some of them for days. Reports on the failure by federal energy regulators and by researchers at the University of Texas give these figures, and so do news reports.

The Electric Reliability Council of Texas, called ERCOT, runs the Texas power grid. A grid is the network of power plants and wires that serves an area. ERCOT's operators cut off power to customers to keep the whole grid from failing. They cut 20,000 megawatts, the largest cutoff of its kind in American history. A megawatt is a million watts. ERCOT officials later said the grid came within 4 minutes and 37 seconds of a total collapse.

In 2022 Texas state health officials counted 246 deaths from the storm. Some researchers argue that the official count is much too low. Reporters at BuzzFeed News, for example, studied how many more people died that month than usual. Damage estimates run above $195 billion.

Cristian Pavón Pineda

Who: An 11-year-old sixth grader who died in his family's mobile home during the Texas blackout.

When and where: Conroe, Texas, February 16, 2021.

Cristian Pavón Pineda was 11 years old when he died in his family's mobile home in Conroe, Texas, on February 16, 2021. The home had been without power since the Sunday before, and the temperature there fell to about 10 degrees. Al Día News reported that he

had seen snow for the first time the day before he died.

The family of five slept in one room to keep warm. Cristian shared a bed with his younger brother. His aunt, Jaliza Yera, told a TV station that he went to bed in "a shirt, a sweater, two pairs of pants, socks on." His stepfather put another blanket over him. In the morning his family could not wake him.

Early reports, and his family's lawsuit, said he died of hypothermia. Hypothermia means the body's temperature has fallen too low to keep a person alive. An autopsy is an examination of a body to find the cause of death. An autopsy on February 18, 2021, found that he died of carbon monoxide poisoning, Conroe police said in May 2021. Carbon monoxide is a gas with no color or smell that comes from burning fuel. When a person breathes it in, it stops the blood from carrying oxygen. Published reports do not say where the gas in the home came from.

Across Texas, more than 30 people had died in the storm by February 21, Al Día News reported. Many of them died of carbon monoxide poisoning after using cars or generators to keep warm.

On February 22, 2021, his mother, Maria Elisa Pineda Guzman, sued ERCOT and Entergy Texas, the power company, for more than $100 million. Her lawyer was Tony Buzbee. Officials had called the power cuts temporary rolling outages, meaning planned cuts that move from area to area. The suit states that ERCOT and Entergy Texas did not give his family good enough information about how long the outages would last. "Accurate information might have saved Cristian Pineda's young life," the suit states. In a statement, ERCOT officials called his death a "tragedy" and said they were "confident that our grid operators made the right choice to avoid a state-wide blackout." Published reports do not say how the lawsuit ended.

New and restarted reactors

Two new nuclear reactors at the Vogtle plant in Georgia began running in 2023 and 2024. Unit 3 began selling power on July 31, 2023, and Unit 4 on April 29, 2024, according to the EIA. Unit 3 was the first new reactor to start in the United States since Watts Bar Unit 2 in Tennessee, owned by the TVA, began running in 2016. Work on Watts Bar 2 had begun in 1973. Workers stopped building it in 1985 and started again in 2007. So the two Vogtle reactors were the first American reactors begun after the 1970s to start running.

The owners of two closed plants plan to run them again. Holtec International owns the Palisades plant in Michigan, which shut down in May 2022. The company got a $1.52 billion federal loan to restart it. Holtec missed its targets of 2025 and early 2026. Workers began loading fuel into the reactor in late August 2026. On August 30 a fuel assembly, a tall bundle of fuel rods, tilted while it was being loaded, and the loading was paused. Officials of the Nuclear Regulatory Commission, the federal agency that oversees nuclear plants, began a review, and their first results showed no radiation had escaped and no workers were harmed. As of late September 2026, Holtec had given no date for the restart, a Michigan TV station reported.

Three Mile Island Unit 1 is the reactor that did not melt down in 1979. It closed in 2019. Its owner, Constellation Energy, renamed it the Christopher M. Crane Clean Energy Center and plans to run it again. Constellation signed a 20-year agreement to sell its power to Microsoft. Members of the Nuclear Regulatory Commission are expected to decide in May 2027 whether to give Constellation an operating license, which is permission to run the reactor. The news outlet WITF reported that date in July 2026.

What energy independence means

Americans produced more energy than they used in 2019, for the first time since 1957, according to the EIA. Americans produced 101.0 quadrillion Btu of energy that year and used 100.2 quadrillion. A Btu, or British thermal unit, is the heat needed to warm one pound of water by one degree Fahrenheit. A quadrillion is a million billion.

People call this energy independence. It means Americans produce more energy in total than they use. It does not mean Americans stopped buying fuel from other countries. In November 2019 Americans still bought 5.8 million barrels of crude oil a day from other countries and sold 3.0 million barrels a day to them, by EIA figures.

In 2025 Americans sold a record 31 quadrillion Btu of energy to other countries and bought 21 quadrillion Btu from them, the EIA reported in May 2026. Oil and products made from it were 63 percent of the energy sold abroad, and natural gas was 29 percent.

Chapter 11: Transportation

Before 1500

Before 1500, people in North America traveled on foot and by water. No one here used wheeled vehicles, and there were no horses. The horses of the Americas had died out after the ice age. North of Mexico, no large animal was left that could pull a cart.

Without an animal to pull a cart, a wheel had no hauling work to do here. People already moved themselves and their goods over trails and rivers that crossed the whole continent. In Mesoamerica, the region that is now Mexico and Central America, people made toys with wheels. They did not use wheels to haul loads.

The trail network

Native people built and kept up long trails, and many of those trails had names. The Great Trail, also called the Great Path, was a network of footpaths. People who spoke Algonquian and Iroquoian languages used it. These are two families of related languages. The paths linked New England, the middle of the Atlantic coast and the Great Lakes.

The route later called the Natchez Trace started as paths worn by bison walking to salt licks near present-day Nashville. A salt lick is a place where animals lick salt from the ground. Natchez, Choctaw and Chickasaw people followed these paths, widened them and kept them clear. They used them for trade, travel, war and talks with other nations. People have used this route for about 8,000 years.

As early as 6000 BC, people traded seashells and copper between the Great Lakes and the coast of the Gulf of Mexico. They carried the goods along the trails and rivers. The copper was native copper, which means copper found pure in the ground. Many of these trails later became colonial roads, and some of those roads became highways.

Canoes, portages and the travois

On the rivers and lakes, people built dugout canoes and birchbark canoes. A dugout canoe was made from one log. Builders hollowed it out with fire and tools. For thousands of years, dugouts were the main boats of the Southeast and the Eastern Woodlands. The Eastern Woodlands are the forests that covered the eastern part of the continent. Some dugouts found in lakes in Wisconsin are more than 4,000 years old.

In the Northeast and around the Great Lakes, people built canoes from the bark of birch trees. One or two people could carry a birchbark canoe. It floated in shallow water, and its owners repaired it with materials from the forest. Builders made them in sizes from one-person boats up to large canoes that carried freight. Freight means goods being shipped.

Where one river or lake ended, travelers lifted their canoes and carried them over land to the next one. That overland crossing is called a portage. Portages and trails linked the waterways into one network across the continent.

On the Great Plains, dogs were the only animals people used to haul loads. A dog dragged a travois, which was two long poles with the load slung between them. The travois was the usual way to move goods on the Plains before horses came.

The 1500s

In 1540 Spanish soldiers led by Francisco Vázquez de Coronado brought horses north into what is now the southwestern United States. That was almost fifty years after Christopher Columbus carried horses to the Caribbean islands. In 1565 Spanish colonists landed at a Timucua town in Florida and took over the chief's council house. Their settlement, St. Augustine, became a port. Thirty-three years later, colonists led by Juan de Oñate brought 83 wagons and carts north into Pueblo land in New Mexico.

Horses, a port and wagons

Christopher Columbus carried horses to the Caribbean islands on his second voyage, in 1493. From 1540 to 1542, a Spanish commander named Francisco Vázquez de Coronado led a long march north from the west coast of Mexico. His soldiers brought more than a thousand horses. Theirs were the first horses in what is now Arizona. The march went on into New Mexico and the Great Plains.

On September 8, 1565, Pedro Menéndez de Avilés landed at Seloy, a Timucua town in what is now Florida. Seloy was also the name of the town's chief, who answered to a greater chief named Saturiwa. Father Francisco López de Mendoza Grajales was the priest with the Spanish ships. He wrote that the Timucua received the Spanish well and gave them a large house belonging to their chief, on the riverbank. It was the chief's council house. A council house is a building where leaders meet. The Spanish took it over. Two Spanish captains, Patiño and San Vicente, then had a ditch, a moat and a wall of earth built around the house. It became the first Spanish fort there.

Accounts differ on how many people came with Menéndez. One count is about 1,500 soldiers and colonists. Another is 800 colonists, including 24 women and an unknown number of enslaved Africans.

St. Augustine is the oldest European town and port on the mainland of the United States. People have lived there without a break since 1565. Spanish ships sailing between Spain and the Caribbean stopped there for supplies and for protection.

In January 1598, Juan de Oñate led a Spanish colony north from Santa Bárbara, in northern New Spain. New Spain was the Spanish colony that included Mexico. About 400 men came, about 130 of them with families. They brought 83 wagons and carts and more than 7,000 farm animals. In late April the long line of wagons, people and animals reached the Rio Grande near El Paso del Norte.

The land the colony moved into was the homeland of the Pueblo peoples. On April 30, 1598, Oñate claimed New Mexico for Spain in a ceremony the Spanish called La Toma, which means "the taking." In July 1598 Oñate set up the colony's headquarters at San Juan Pueblo, called Ohkay Owingeh, on the upper Rio Grande. The route the wagons followed became El Camino Real de Tierra Adentro, Spanish for "the royal road of the interior." It ran from Mexico City to northern New Mexico.

The 1600s

In the English colonies of the 1600s, colonists moved most of their goods by water. They used canoes, small open boats called shallops, and ships that sailed along the coast from one colony to another. In 1631 the leaders of the Massachusetts colony licensed a ferry across Boston's harbor. In 1673 a rider on horseback began carrying mail from New York to Boston, along paths that Native people had made long before.

The Boston Post Road

In January 1673 the first post rider left New York for Boston. A post rider was a man on horseback who carried letters. Francis Lovelace, the governor of New York, pushed for the route along with John Winthrop Jr. of Connecticut. The rider went by way of New Haven, Hartford, Springfield and Worcester. The trip was about 250 miles and took about two weeks. The path that he and later riders used grew into the Boston Post Road.

Much of that road followed Native paths. The lower part followed the Pequot Path, which Narragansett and Pequot people had traveled for hundreds of years. It ran about 69 miles near the shore, from Providence to New London, Connecticut. The English colonist Roger Williams walked it in 1636. Along 20 miles of the path he saw about a dozen Narragansett villages. He wrote: "It is admirable to see what paths their naked hardened feet have made in the wilderness in the most stony and rockie places." Admirable meant worth wondering at. English settlers kept using the Pequot Path until it became the lower part of the Boston Post Road.

The upper part of the road followed the Old Connecticut Path and the Bay Path. These were Native trails from Massachusetts Bay to the Connecticut River. In the early 1630s, Nipmuc people carried corn along them to Massachusetts Bay. There they traded it for copper, iron goods and wool cloth. In 1636 Thomas Hooker led the members of his church along the same path to found the town of Hartford.

Edward Converse

Who: A Puritan settler and church deacon who ran the first ferry between Charlestown and Boston.

When and where: Boston harbor, licensed June 14, 1631. Lived 1589 to 1663.

Edward Converse ran a ferry across the harbor between Charlestown and Boston. The members of the Massachusetts Court of Assistants, the colony's ruling council, licensed it, and their written record still exists. On June 14, 1631, they wrote that "Edw: Converse hath vndertaken to sett vpp a fferry betwixte Charlton & Boston." That is how people spelled English then. In today's English, the record states that Converse had taken on the job of setting up a ferry between Charlestown and Boston.

The court's members also set his fares. He could charge two pence to carry one passenger. When two or more crossed together, each paid one penny. A penny was a small English coin, and pence is the word for more than one. The license was a charter, which is written permission from a government. A history page from the West End Museum in Boston states that Converse started the ferry in 1630, the first ferry on that crossing. At the time it

was the only way across the river there, and Converse ran it for about ten years. The history page of Boston's transit agency, the MBTA, names a different "first." It states that Thomas Williams opened the first chartered transit service in the United States in 1631, with his own ferry to Charlestown.

Converse was a Puritan, one of the English Christians who started the Massachusetts colony on land where Native people already lived. He was also a deacon, a church officer who helps the minister. In 1639 the Charlestown ferry earned 50 pounds in English money. In 1640 the colony's leaders gave the ferry's earnings to Harvard College.

1700 to 1750

Between 1700 and 1750, the first stage lines in the English colonies began carrying passengers between towns. Wagon builders in Pennsylvania made the Conestoga wagon to haul freight to Philadelphia. In 1706 New Jersey officials gave a man named Hugh Huddy the right to run a stage line for passengers. On her ride from Boston to New York in 1704, Sarah Kemble Knight crossed rivers by canoe in the dark.

The Conestoga wagon

The Conestoga wagon was a large freight wagon from Lancaster County, Pennsylvania. The oldest record of its name is from December 31, 1717. That day James Logan, who had been William Penn's secretary, wrote in his account book that he had bought a "Conestogoe Waggon."

German and Swiss wagon builders along the Conestoga River worked out the design. The bed of the wagon curved down toward the middle, so the load settled toward the center. A white cloth cover stretched over hoops above the bed. Teams of four to six horses pulled it. Drivers used Conestogas to haul loads more than 60 miles to Philadelphia. People in the East used it as their main freight wagon well into the age of railroads.

The wagon took its name from the Conestoga River and from the Conestoga people who lived in Lancaster County. In December 1763, a mob of men from Paxton township, a district of Pennsylvania, killed the last of the Conestoga people. These men are known as the Paxton Boys. Accounts give the date as December 14 or December 15, 1763. On that day a group of

these men attacked Conestoga Manor, a Conestoga settlement under the protection of Pennsylvania's colonial government. One account counts 57 men in the group. They killed the six people at home there: three men, two women and a boy.

Lancaster officials locked the Conestoga survivors in the county workhouse to protect them. A workhouse was a locked building where people who broke small laws were held and made to work. On December 27 the mob broke in and killed them, men, women and children. Accounts count 14 or 16 people killed that day. About 20 Conestoga people were killed in the two attacks. In 1764 Benjamin Franklin wrote that no witnesses could ever be found to speak against the men, and no one was ever put on trial for the killings.

Stage lines, log roads and the Great Wagon Road

A stage line carried passengers in a wagon or coach along a fixed route between towns. In 1706 New Jersey officials gave Hugh Huddy a patent, a legal right, to run a stage line between Burlington and Perth Amboy. From 1732 coaches ran between New York and Philadelphia, though not on a fixed schedule. New lines opened from Trenton to New Brunswick in 1738 and from Bordentown to New York in 1740. By 1756 several regular coach services ran between New York and Philadelphia, and the trip took about three days.

Where a road crossed swampy ground, builders laid logs side by side across it. This was called a corduroy road, after a cloth with raised ribs.

The Great Wagon Road ran from Philadelphia down the Shenandoah Valley of Virginia toward Augusta, Georgia. Accounts give its length as about 730 miles or almost 800 miles, depending on where the count ends. Colonists used it heavily from the 1720s on.

South of Lancaster and York, in Pennsylvania, the road roughly followed a route that Europeans called the Great Warriors' Path. Native people had made that path to travel through the Shenandoah Valley, and they still valued it. In June 1744, leaders of the Six Nations of the Iroquois met officials of Pennsylvania, Virginia and Maryland in the town of Lancaster. The Six Nations were six Native nations joined in one league. The two sides made a treaty there, a written agreement between nations, called the Treaty of Lancaster. In it the Iroquois leaders gave up their use of the path. They also gave up their claims to land in the Shenandoah Valley. The two sides later disagreed about how much land the treaty covered. Virginia's leaders claimed land as far as the Ohio River and beyond it. The Iroquois said they had given up much less.

Virginia's lawmakers passed road laws in 1632 and 1657 and added to them in 1661. Under those laws, colonists built and repaired the roads themselves. Each year the members of each county court chose an overseer of the highways, a man put in charge of the roads. He was usually given all the "Labouring Male Titheables" who lived on or near the road. "Titheables" is an old spelling of tithables, the people counted for a tax on each person. They included all free men 16 and older and all enslaved people 16 and older, women as well as men. The road orders required the working men among them to bring their own tools, wagons and teams of animals. Each had to work six days a year on the roads. The surviving road orders do not say how many of these men were enslaved.

Sarah Kemble Knight

Who: A Boston businesswoman who rode from Boston to New York and wrote down what the road was like.

When and where: October 1704, by road from Boston to New Haven and on to New York. Her journal was published in 1825.

Sarah Kemble Knight kept a journal of a ride from Boston to New Haven and on to New York in October 1704. She was a businesswoman in Boston. She traveled with post riders, the men who carried the mail, and she hired guides from one town to the next.

Her journal is an eyewitness record of the road itself. She crossed some rivers by canoe in the dark and others at fords. A ford is a shallow place where people and horses can cross a river. She wrote down which bridges she was afraid to cross. The journal was published in 1825, more than a hundred years after her ride.

1750 to 1800

In 1792, people in and around Philadelphia and Lancaster put their money into a company. The company paid for a road and charged travelers a fee to use it. Their Philadelphia and Lancaster Turnpike, finished in the mid-1790s, was the first long-distance road of this kind in the country. On the Delaware River, John Fitch ran steamboats. In 1790 his boat carried paying passengers on a schedule, seventeen years before Robert Fulton's steamboat on the Hudson.

The first turnpike

A turnpike is a road whose owners charge a fee, called a toll, to use it. Travelers paid the toll at gates along the road. The Philadelphia and Lancaster Turnpike Company got its charter in 1792, and work on the road began that year. People in and around Lancaster and Philadelphia bought 1,000 shares of the company's stock at $300 each. A share of stock is a piece of ownership in a company. A Philadelphia merchant, William Bingham, led the company.

The road ran 62 miles between Philadelphia and Lancaster. It mostly followed the older Philadelphia-Lancaster Road, which was the first stretch of the Great Wagon Road. The road had a surface of broken stone and gravel. Accounts differ on when it opened. Some say it was in use in 1794, and most say 1795. The records name the people who bought shares and the company's president. They do not say who broke the stone or how many men did the work.

The Lancaster Turnpike was the country's first long-distance engineered toll road. Engineered means it was planned and built to a design, with a prepared surface. The historian Charlene Mires writes that after the Lancaster Turnpike succeeded, people built many more toll roads. By the 1830s the country had almost 12,000 miles of turnpikes.

Steam on the Delaware

On August 22, 1787, John Fitch tested a steamboat on the Delaware River. Delegates to the Constitutional Convention watched. These were the men meeting in Philadelphia that summer to write the Constitution of the United States. A steam engine on Fitch's boat worked rows of oars that pushed the boat through the water.

In the summer of 1790, Fitch's boat, the *Experiment*, carried passengers on a schedule. The boat ran on the Delaware between Philadelphia and towns such as Trenton, Burlington and Bordentown, in New Jersey, and also to Wilmington, carrying up to about 30 passengers at a time. Fitch's was the first steamboat service anywhere in the world to carry paying passengers on a schedule.

John Fitch

Who: The builder of a working steamboat in 1787 and of the first steamboat service anywhere to carry paying passengers on a schedule.

When and where: The Delaware River, 1787 to 1790. Died 1798.

Fitch's steamboat service of 1790 did not last. His business failed because too few people bought tickets, the machinery broke down, and the people who had put money into his boats stopped paying for them.

> Robert Fulton built the first steamboat business that lasted. Fulton's steamboat began running on the Hudson River in 1807, nine years after Fitch died.

1800 to 1850

Steamboats, canals and railroads cut the time and the cost of moving people and goods in the first half of the 1800s. In 1807 Robert Fulton's steamboat went from New York City to Albany in 32 hours. A sailing boat took about four days. After the Erie Canal opened in 1825, hauling a ton of goods from Buffalo to New York City cost under $10, against about $100 by wagon.

American-born laborers and Irish immigrants dug the Erie Canal. In the South, enslaved Black men dug most of the Dismal Swamp Canal, and enslaved people built most of the railroads. Owners rented the men out to the builders and kept their pay. The men running Southern railroad companies also bought enslaved people outright.

Steamboats on the rivers

On August 17, 1807, Robert Fulton's North River Steamboat left New York City for Albany, 150 miles up the Hudson River. It arrived 32 hours later. Sailing boats called sloops took about four days to make the same trip. Fulton's boat began carrying passengers on a regular schedule right away. People later called it the *Clermont*.

Many later accounts say that people who doubted the boat called it "Fulton's Folly." A folly is a foolish project. Few records from 1807 show anyone using that name. It comes from stories told afterward.

Within a few years, steamboats were running on the Ohio and Mississippi Rivers. In 1814, 21 steamboats arrived at New Orleans. In 1846, 2,770 arrived. In the 1810s steamboats covered about 50 miles a day, and by the 1820s about 100.

Much of what the boats carried was cotton. Farms in the state of Mississippi grew 20 million pounds of cotton in 1820 and 535 million pounds in 1860. Before the Civil War, more than half of all the cotton grown in the United States passed through New Orleans. Enslaved people grew and picked that cotton, forced to work by the people who held them in slavery.

A steamboat's boiler is the tank where water is heated into steam under pressure. Steamboat boilers on the Mississippi and the rivers that flow into it exploded again and again in these years. Those explosions killed thousands of people.

Robert Fulton

Who: The man who made the steamboat a business that lasted.
When and where: The Hudson River in New York, from August 17, 1807.

Robert Fulton made the steamboat into a business that kept running. John Fitch had carried paying passengers by steamboat 17 years earlier, in 1790, but his service failed.

Fulton's partner was Robert Livingston, who paid for the work. Livingston held a monopoly on steamboats in New York. A monopoly is a legal right to be the only seller of something.

Fulton and Livingston paid for a second boat, the *New Orleans*, built at Pittsburgh. It left Pittsburgh on October 20, 1811. It traveled more than 1,800 miles down the Ohio and Mississippi Rivers and reached New Orleans on January 10, 1812. It was the first steamboat on the western rivers.

The National Road

The National Road was the first highway in the United States built entirely with money from the federal government, the national government in Washington. Members of Congress approved it in 1806, while Thomas Jefferson was president. Work began at Cumberland, Maryland, in 1811. The road reached Wheeling, on the Ohio River, in 1818. By the 1830s it went on to Vandalia, Illinois, where the federal money stopped.

West of Cumberland, the road followed an older path. A Delaware chief named Nemacolin and a colonist named Thomas Cresap marked and cleared it in 1749 or 1750. Their path ran between the Potomac and Monongahela Rivers. It went from where Cumberland now stands to the mouth of Redstone Creek, where Brownsville, Pennsylvania, is today. George Washington used it on his first trip to the west. General Edward Braddock's army used it in the French and Indian War. It was called Braddock's Road until the National Road was built on the same route.

Irish laborers built sections of the National Road. They were paid six dollars a month.

The Erie Canal

A canal is a waterway that people dig so boats can travel where no river runs. Workers dug the Erie Canal from 1817 to 1825. It ran 363 miles, from Albany on the Hudson River to Buffalo on Lake Erie. It opened on October 26, 1825, and cost about $7.1 million. While it was being dug,

people who mocked it called it "Clinton's Ditch" after DeWitt Clinton, who pushed for it. The tolls that boats paid to use the canal paid back the cost of building it in about nine years.

Moving goods by canal cost far less than moving them by wagon. Hauling a ton from Buffalo to New York City cost about $100 by wagon. By canal it cost under $10. Some accounts put the cost by canal at about $6 a ton.

The boys who drove the mules that pulled the canal boats were called hoggees. Many of them were about 10 years old. A hoggee walked 18 to 20 miles a day, six hours on and six hours off. He earned about $8 to $10 a month, and many hoggees were cheated out of their pay. Columns on the canal boys in the Lockport *Union-Sun & Journal*, a newspaper in a canal town, tell of the cheating but do not name the men who did it.

Who dug the canals, and whose land they crossed

American-born workers and Irish immigrants dug the Erie Canal. In 1818 between 2,000 and 3,000 laborers were working on it, with a horse for every second man. Ads in Ireland that called for workers promised wages of 8, 10 or 12 dollars a month, with meat three times a day and liquor. Many men worked for 75 cents to $1.50 a day, and less as more workers arrived. They got no pay on rainy days, but they still had to pay for their lodging.

Some contractors, the men who ran sections of the work, started fights among the workers to get out of paying them. At Rochester, a contractor named William Brittin brought about 30 convicts, people serving prison sentences, from Auburn State Prison to work. Many escaped, and Irish workers took their places.

In 1819 the canal crews reached the Montezuma Marshes, wet ground full of mosquitoes. The mosquitoes spread malaria, a disease that brings high fevers and chills again and again. The canal commissioners, the state officials in charge of the canal, reported that about 1,000 workers fell sick between the middle of July and October 1, 1819. Many died. No one kept a count of the dead.

The Erie Canal ran through the homelands of the Oneida, Onondaga, Cayuga and Seneca nations. The Oneida Indian Nation's history of the canal states that the Oneida lost the land for it through a series of 27 treaties. The other side in those treaties was the State of New York, and the Oneida Nation describes all 27 as illegal. From 1858 to 1871 New York State officials took parts of the Seneca Oil Spring Reservation for a canal reservoir, a lake made to store water. A reservation is land set aside for a Native nation.

In the South, owners rented out enslaved men to dig canals, and the owners kept the men's pay. Enslaved men dug most of the Dismal Swamp Canal, which runs 22 miles from Deep Creek, Virginia, to South Mills, North Carolina. They dug it from 1793 to 1805. Before the canal, George Washington and his brother John Augustine Washington ran a business called the Dismal Swamp Company. Through it they bought 54 enslaved men, women and children to dig ditches and cut timber in the swamp.

DeWitt Clinton

Who: The New York governor who pushed the Erie Canal through while people mocked it.

When and where: New York State, 1811 to 1825.

DeWitt Clinton pushed for the Erie Canal while critics called it "Clinton's Ditch" and "Clinton's Folly." In 1811 he was the mayor of New York City and a new canal commissioner, one of the state officials in charge of planning the canal. The canal was planned to run through the land of the Iroquois, six Native nations joined in one league and also called the Six Nations. That year, in a speech to the New-York Historical Society, Clinton predicted that "before the passing away of the present generation, not a single Iroquois will be seen in this state." His prediction was wrong. Today more people of the Six Nations live in New York than lived there at the end of the American Revolution.

As governor, Clinton rode on the first boat to travel the whole length of the canal in 1825. The boat was named the *Seneca Chief*. At the opening, Clinton poured water from Lake Erie into New York harbor. People called this the "wedding of the waters."

James Garfield, canal boy

Who: A 16-year-old who worked on an Ohio canal boat. He later became president of the United States.

When and where: The Ohio and Erie Canal, 1848, on the boat *Evening Star*.

In 1848, when he was 16, James Garfield ran away to work on a canal boat called the *Evening Star*. The boat carried freight, which means goods being shipped, on the Ohio and Erie Canal. For about six weeks he helped haul coal, copper ore and wood.

Garfield could not swim. One night he fell overboard. He later caught malaria and went home. Writers of biographies for his campaign for president claimed he fell into the canal fourteen times. That number comes from those later stories and not from the record of his time on the boat.

Moses Grandy

Who: An enslaved man who ran boats through the Dismal Swamp canals, bought his own freedom three times, and described the men who dug the canals.

When and where: Camden County, North Carolina, and the canals to Norfolk, Virginia, from the early 1800s. His narrative was published in London in 1843.

Moses Grandy was born into slavery in Camden County, North Carolina, around 1786. His owners hired him out each year to other men. He worked canal boats that carried shingles, boards and other freight through the Dismal Swamp canals to Norfolk.

Grandy paid for his own freedom three times. First he paid $600 to his owner, James Grandy. James Grandy kept the money and sold him to a man named Trewitt. Over two and a half years, Moses Grandy earned $600 more and paid it to Trewitt. Then Trewitt's business failed, and a man named Mews claimed Grandy to cover Trewitt's debt. Grandy's next owner, a Mr. Sawyer, put him to work in the fields. A captain from Deep Creek, Edward Minner, lent Grandy the third price, $650, and Sawyer set him free. Grandy paid Minner back over three years.

While Grandy worked on the canal, his wife's owner sold her. A group of enslaved people passed along the road beside the canal, and she called out to him. The man who had bought her, Mr. Rogerson, pulled out a pistol. He said he would shoot Grandy if he came near the wagon. Grandy wrote: "I have never seen or heard of her from that day to this."

Grandy also described the enslaved men who dug the canals. They worked "up to the middle or much deeper in mud and water, cutting away roots and baling out mud." Baling out means scooping out. They slept in open huts, still covered in mud, with no bedding. Once a month their owners came to collect the men's pay.

An overseer named Wiley M'Pherson gave every man the same amount of digging each day. An overseer was the man in charge of the workers. When men had not finished the day before, M'Pherson tied them up and flogged them. Flogging means whipping a person's bare back until the skin splits. Then he had "pork or beef brine," the salt water

> used to keep meat, put "on their bleeding backs, to increase the pain." He left men tied all day with their feet barely touching the ground, while flies and mosquitoes settled on the cuts.
>
> Grandy wrote: "I have seen him flog slaves with his own hands, till their entrails were visible." Entrails are the organs inside the body. Grandy went on: "I have seen the sufferers dead when they were taken down. He never was called to account in any way for it."
>
> Grandy later married again. He lived in Boston, sawed wood, worked in coal yards, loaded and unloaded ships, and went on more voyages. He saved enough to buy his second wife out of slavery in Virginia, and she joined him in Boston. He raised $450 to buy his son's freedom. His daughters in New Orleans paid for their own freedom, $1,200 for each of them. His book was sold to raise money for his relatives who were still enslaved.

The first railroads

The Baltimore and Ohio Railroad was the first railroad in the United States to carry both passengers and freight on a schedule for anyone who paid. Its builders laid the first stone on July 4, 1828. Its first 13 miles of track, from Baltimore to Ellicott's Mills, opened in 1830.

In a well-known story, Peter Cooper's steam engine, the *Tom Thumb*, raced a horse pulling a railroad car on August 28, 1830. In the story, the engine lost when a belt on it slipped. The story comes from a talk that John H. B. Latrobe gave in 1868, 38 years later. No record from 1830 shows that the race took place. The Baltimore and Ohio Railroad Museum's page on the *Tom Thumb* describes the race as a legend.

On August 9, 1831, a locomotive named the *DeWitt Clinton* pulled the first steam passenger train in New York State. A locomotive is the engine that pulls a train. The train ran 16 miles from Albany to Schenectady in about an hour, on the Mohawk and Hudson line.

City transit began in these years too. From 1827, Abraham Brower ran a horse-drawn coach called an omnibus on the streets of New York City. On November 14, 1832, the *John Mason*, a horse-drawn car that rolled on rails, began carrying passengers in lower Manhattan for the New York and Harlem Railroad. It was the first street railway in the country.

In the South, enslaved people built most of the railroads. As early as 1841, the men running Southern railroad companies bought hundreds of enslaved men between the ages of 16 and 35. In the 1850s they bought or rented enslaved workers in groups of hundreds. The historian Theodore Kornweibel Jr. found enslaved workers on 85 of the 113 railroads in the Confederate

states. These were the Southern states that later fought the United States in the Civil War. In 1860 Southern railroad companies owned about 15,000 enslaved people, and women and children were among them. In 1855 the president of the Mississippi Central Railroad told the people who owned shares in the company that "the slave is preferable to free labor, and far better adapted to the construction of railways in the south." Free labor meant workers who were not enslaved.

1850 to 1900

Railroad track spread across the United States in the second half of the 1800s. In 1850 the country had about 9,000 miles of railroad track. By 1900 it had more than 190,000 miles. Counts for 1900 run from about 193,000 to 215,000, depending on whether side tracks are counted.

In 1869 the first railroad across the country cut the trip from one coast to the other from about four months to about a week. Central Pacific managers hired about 10,000 to 12,000 Chinese workers to build the western part of the line. The tracks of the two companies that built it crossed the lands of the Cheyenne, Lakota, Arapaho, Shoshone and Paiute nations. Streetcars were passenger cars that ran on rails laid in city streets. By the end of the century, the companies that ran them were switching from horse-drawn cars to electric ones, and many Americans, women among them, were riding bicycles.

The railroad across the continent

Two companies built the first railroad across the country. Union Pacific crews built west from Omaha, Nebraska, while Central Pacific crews built east from Sacramento, California. The two lines met at Promontory Summit, Utah, on May 10, 1869. A golden spike marked the place where they joined.

Members of Congress voted to give the two companies land and loans. On July 1, 1862, President Abraham Lincoln signed the Pacific Railroad Act. Under it, each company got 6,400 acres of public land for every mile of track it built. Each company also got up to $48,000 in government bonds for every mile. A bond is a kind of loan. The top rate of $48,000 was for miles built through mountains.

The act also said: "The United States shall extinguish as rapidly as may be the Indian titles to all lands falling under the operation of this act." To extinguish a title means to end someone's ownership of land. With those words, the lawmakers directed federal officials to end Native

nations' ownership of the land along the railroad as fast as they could. From 1850 to 1871, members of Congress voted to give railroads about 130 million acres of federal land. Some counts run as high as 175 million acres. State lawmakers gave railroads about 51 million acres more.

Whose land the railroad crossed

While the two lines were built, the companies' builders and US officials took land from many Native nations and drove people from their homes. Among those nations were the Cheyenne, Lakota (also called Sioux), Arapaho, Shoshone and Paiute. Historians at the Utah Division of State History count 15 Native homelands that the track crossed.

The Lakota, Arapaho and Cheyenne hunted bison, also called buffalo, for food, shelter and trade. As the railroad moved west, soldiers, railroad workers and travelers hunted the bison too. National Park Service writers state that the bison fell from tens of millions in the early 1800s until they had almost died out.

Some Paiute people worked for the Central Pacific. Union Pacific managers and US officials hired hundreds of Pawnee, who guarded the work crews alongside the US Army. On January 13, 1865, four army units of Pawnee soldiers, called companies, joined the Army under Major Frank J. North.

On November 29, 1864, at Sand Creek in Colorado, US soldiers on horseback led by Colonel John Chivington attacked a camp of Cheyenne and Arapaho people. The camp flew a US flag and a white flag. The soldiers killed between about 150 and about 230 people, most of them women and children. The people killed were not armed. PBS writers give the count of 150. Britannica and the National Park Service give about 230.

Cheyenne, Arapaho and Lakota fighters struck back for Sand Creek. On January 7, 1865, they burned the town of Julesburg, Colorado. They also cut the telegraph line, the wire that carried messages by electric signals. Two and a half years later, on August 27, 1867, at Plum Creek, Nebraska, Cheyenne men pulled up railroad track, wrecked a work train and killed its crew. One man survived.

The Chinese workers

Central Pacific managers hired about 10,000 to 12,000 Chinese workers from 1865 to 1869. Most came from Guangdong, a province in southern China. The Chinese workers were paid about $35 a month, and they had to buy their own food and housing. White workers got about $42 a month, plus housing.

The Central Pacific's managers kept no record of the Chinese workers who died, so no one knows how many there were. Avalanches, masses of snow sliding down the mountains, killed workers in the winter of 1866 to 1867. There were 44 storms that winter. In one, snow carried away the camp at Strong's Canyon. Blasts of black powder and nitroglycerin, both explosives used to cut through rock, killed others. Smallpox, a disease that spreads from person to person, killed more in 1868 and 1869.

On June 30, 1870, writers at two Sacramento newspapers printed guesses of the dead. The writer at the *Sacramento Union* reported "about fifty." The writer at the *Sacramento Reporter* told of "the accumulated bones of perhaps 1,200," about 20,000 pounds of bones being shipped home to China. Researchers on the online forum of the Central Pacific Railroad Photographic History Museum estimate 100 to 150 dead. Other estimates run to hundreds or thousands.

On June 25, 1867, Chinese workers in the Sierra Nevada mountains went on strike, which means they stopped work to demand better terms. Estimates of how many struck run from 2,000 to 5,000. They asked for $40 a month instead of $35, for workdays of no more than ten hours, and for shorter shifts in the cramped tunnels. The construction boss, Charles Crocker, and his foreman, the man who ran the work crews, James Harvey Strobridge, cut off food and supplies to the Chinese camps. After a week with little food, Crocker told the strikers that men who went back at once would only be fined. Men who stayed out would lose all their pay for June. Most men, weak from lack of food, went back. The men who refused faced a group of armed white men, and work started again. Crocker gave the strikers no raise, though pay for experienced men later rose a little, according to the Library of Congress. It was the largest strike by workers in the country up to that time.

On April 28, 1869, crews laid 10 miles and 56 feet of track in one day. Eight Irish workers carried the rails, and several thousand Chinese workers did the rest of the work. Twelve days later, at Promontory Summit, eight Chinese workers laid the last track joining the two lines. Three of them, Ging Cui, Wong Fook and Lee Shao, rode on a float at the celebration of the railroad's 50th anniversary on May 10, 1919.

> ### Hung Wah
>
> **Who:** The leading Chinese headman on the Central Pacific.
>
> **When and where:** The Central Pacific Railroad, from January 1864.

Hung Wah is one of the few Chinese railroad workers whose names appear in the records. The company's payroll, its list of the people it paid, usually named only headmen, the men who led the Chinese work gangs. So the names of most of the thousands of Chinese laborers are not in the records.

Hung Wah first appears on the Central Pacific's payroll in January 1864. With another headman, Ah Toy, he supervised the railroad's first Chinese crew, about 23 men. He became the leading Chinese headman on the line, over hundreds of Chinese workers and at times thousands. He handled the workers' pay and their living arrangements, and he dealt with the company for them.

Cornelius Vanderbilt

Who: A ferryman who moved his money from steamboats into railroads and left the largest American fortune of his time.

When and where: New York, 1810 to 1877.

Cornelius Vanderbilt began as a ferryman and died in 1877 with about $100 million, the largest American fortune of his time. In 1810, at 16, he began carrying freight and passengers between Staten Island and Manhattan. His boat was a periauger, a shallow sailboat with two masts. Accounts of how he got the boat differ. One says he borrowed $100 from his mother and named the boat *Swiftsure*. The first account of his life, printed in 1853, says the boat was his father's and he kept half the profit. The website Biography.com describes the story of the young ferryman as a legend. Other boat captains called him "the Commodore," at first as a joke. A commodore is a navy officer who commands a group of ships.

Vanderbilt owned steamboats and moved his money into railroads in the early 1860s. In 1867 he took control of the New York Central Railroad. On November 1, 1869, he joined it with his Hudson River Railroad. In 1871 he opened Grand Central Depot, a train station in Manhattan.

Mark Twain, steamboat pilot

Who: Samuel Clemens, who steered steamboats on the Mississippi River before he wrote books as Mark Twain.

When and where: The Mississippi River. He got his pilot's license on April 9, 1859.

> **Movie:** *Mark Twain* (2001), a documentary by Ken Burns about his whole life. PBS showed it in January 2002.
>
> Samuel Clemens was a licensed steamboat pilot on the Mississippi River. A pilot is the person who steers a boat. He got his license on April 9, 1859, when he was 23. He piloted boats until 1861, when the Civil War began and traffic on the river stopped.
>
> He took his pen name from a call used on the river. A leadsman was the crew member who measured the depth of the water and called it out to the pilot. "Mark twain" meant two fathoms. A fathom is six feet, so two fathoms is twelve feet of water. In 1883 he published *Life on the Mississippi*, a book about his years as a pilot.

Clocks, sleeping cars and danger on the railroads

On November 18, 1883, railroad managers in the United States and Canada began using standard time zones. A time zone is a region where all clocks show the same time. Before then, each railroad company ran its trains by its own clocks. William F. Allen, the editor of the *Traveler's Official Railway Guide*, a book of train schedules, drew up the plan. On the day of the switch, railroad workers reset every railroad clock to the new time, even clocks that had already passed noon. In those places noon came twice, so people called it "the day of two noons." Members of Congress did not vote time zones into law until the Standard Time Act of March 19, 1918.

In 1865 George Pullman built the *Pioneer*, his first sleeping car built for luxury. It had upper beds that folded away and seats that pulled out. His company, the Pullman Palace Car Company, began in 1867.

Railroad work was dangerous. In 1889, about 8.5 of every 1,000 American trainmen, the workers who ran the trains, were killed on the job. That was twice the rate for trainmen in Britain. That year 1.73 of every 1,000 trainmen were killed while coupling, the job of joining railroad cars together. With the old link-and-pin coupler, a brakeman, the crew member who set the brakes and joined the cars, had to stand between two moving cars to join them. Mangled hands were known as "the badge of the experienced worker."

Safer equipment existed for years before lawmakers required railroad owners to use it. In 1873 Eli Janney got a patent, the legal right to be the only one to make and sell an invention, for an automatic coupler. It joined cars without a worker standing between them. George Westinghouse's air brake existed from 1869. In it, a pump on the locomotive pushed air through hoses to every car. When the engineer opened a valve, the air set the brakes on all the

cars at once. In 1893 members of Congress passed the Safety Appliance Act. It required automatic couplers and air brakes on trains that crossed state lines, starting in 1900. Accidents while coupling cars fell from about 11,000 in 1892 to about 2,000 in 1902, while the number of railroad workers grew.

Separate cars by race

Train crews and lawmakers decided where Black passengers could sit. In 1884 Ida B. Wells had a first-class ticket on a train in Tennessee. The train crew ordered her into the car for Black passengers. She refused, and they forced her off the train. She sued the railroad and won $500 in a Tennessee court. In 1887 the judges of the Tennessee Supreme Court threw out that decision.

On June 10, 1890, Louisiana lawmakers passed the Separate Car Act. It required railroads to provide "equal but separate" cars for Black and white passengers. A passenger who broke it could be fined $25 or jailed for 20 days. Homer Plessy, a shoemaker in New Orleans, offered to test the law. To test it, he would break it on purpose so that judges would have to decide whether the law was allowed. On June 7, 1892, he bought a ticket on the East Louisiana Railroad and sat in the car for white passengers. The railroad's officials agreed to the test, because separate cars cost the company money. A private detective hired by the group planning the test, the Citizens' Committee, arrested him. Judge John H. Ferguson ruled against Plessy. On May 18, 1896, the justices of the US Supreme Court ruled against him too, 7 to 1, in *Plessy v. Ferguson*. With that ruling, the justices allowed states to keep separating Black and white passengers by law. Nearly sixty years later, in 1954, the justices of the Supreme Court threw out that ruling's reasoning in *Brown v. Board of Education*.

Electric streetcars and bicycles

Electric streetcars replaced horse-drawn ones in American cities between 1888 and 1902. Electric streetcars ran earlier in East Cleveland in 1884, in Baltimore in 1885 and in Montgomery, Alabama, in 1886. The Dictionary of American History describes the system that Frank Sprague built in Richmond, Virginia, in 1888 as the first successful one. By 1891, about 200 streetcar systems had switched to electricity or planned to. Street railway track grew from about 8,000 miles in 1890 to 22,500 miles in 1902. In those same years, the share of streetcar service pulled by animals fell from 75 percent to 1 percent. The last horse-drawn streetcar in paid service in New York City ran on July 26, 1917.

In the 1890s cycling became a craze, something that very many people took up at the same time. Riders used the safety bicycle, which had two wheels of the same size, a chain drive and air-filled tires. Women rode as well as men. On February 2, 1896, Susan B. Anthony told the reporter Nellie Bly in the *New York World* that bicycling "has done more to emancipate women than anything else in the world." To emancipate means to set free. She said: "I stand and rejoice every time I see a woman ride by on a wheel."

Frank Sprague

Who: The engineer whose streetcar system in Richmond showed that electric streetcars could work in a city.

When and where: Richmond, Virginia. Regular service began February 2, 1888.

Frank Sprague built the Richmond Union Passenger Railway, which began regular electric streetcar service on February 2, 1888. It started with 10 cars. By May 1888 it had about 12 miles of track and 23 cars. Other electric streetcars had run before, in East Cleveland, Baltimore and Montgomery. Richmond's was the first large system that worked well. Within about two years, about 110 electric railways had been built or ordered using Sprague's equipment. Members of the Institute of Electrical and Electronics Engineers, a society of engineers, have named his Richmond railway a milestone in the history of engineering.

1900 to 1950

By 1927 Ford's workers had built 15 million Model T cars, and airplanes were carrying mail and paying passengers on schedules. The Model T first went on sale in 1908 for $825. The first airline to fly on a schedule began in 1914, across Tampa Bay in Florida.

Trains moved about 43.7 million members of the armed forces in World War II, from 1941 to 1945. In Virginia, bus drivers had the power of police officers to make Black passengers sit apart from white passengers, and to arrest riders who refused.

The Model T and the new roads

The Ford Model T went on sale on October 1, 1908, at $825. Its price fell to $260 by 1925. On May 26, 1927, the 15 millionth Model T left the factory, and that was the last day Ford made the car.

In 1913 a group of private backers, among them Carl Fisher and Henry Joy, laid out the Lincoln Highway. It was the first named road for cars across the whole country, from Times Square in New York City to San Francisco. After 1926 highway officials made parts of it into sections of numbered routes.

On November 11, 1926, state and federal highway officials gave the main highways of the United States numbers. Route 66 got its number that day. It ran 2,448 miles, from Chicago to Santa Monica, California. People called it the "Main Street of America." It was fully paved only by the late 1930s.

In 1913 car crashes killed about 4,100 to 4,200 people in the United States. In 1937 they killed about 37,800 to 39,600, which was about 30 of every 100,000 Americans. The counts differ because the National Safety Council, a private safety group, and the federal officials who kept the national tables counted deaths in different ways.

The Wright brothers

Who: Orville and Wilbur Wright, the brothers who flew their powered airplane four times in one day.

When and where: Near Kill Devil Hills, North Carolina, December 17, 1903.

On December 17, 1903, Orville and Wilbur Wright made four flights in a powered airplane near Kill Devil Hills, North Carolina. Orville flew first. He stayed in the air for 12 seconds and went 120 feet. Wilbur made the fourth and last flight of the day, 852 feet in 59 seconds. Five people watched. One of them, John T. Daniels, took the photograph. He belonged to a lifesaving station, a crew that rescued people from wrecked ships.

About ten years after those flights, an airplane in Florida was carrying paying passengers on a schedule.

Airplanes start carrying mail and passengers

The St. Petersburg-Tampa Airboat Line in Florida was the first airline in the world to fly on a schedule. Its first flight left on January 1, 1914. The pilot, Tony Jannus, flew a Benoist flying boat, a plane that takes off from and lands on water. The trip across Tampa Bay took about 23 minutes, low over the water. Abram C. Pheil, a former mayor of St. Petersburg, paid $400 at an auction for the first round-trip ticket. The airline ran for about four months.

Airplanes began carrying mail on a regular route on May 15, 1918. The route ran 218 miles, from Washington to Philadelphia to New York. Army pilots flew it first, and Post Office pilots took over in August 1918. In 1925 members of Congress passed the Kelly Act. Under it, private companies flew the airmail on contract. The airline companies grew out of those mail contracts.

On May 20 and 21, 1927, Charles Lindbergh, an airmail pilot, flew the *Spirit of St. Louis* alone and without stopping from New York to Paris. He covered about 3,600 miles in 33 hours and 30 minutes. Airline passengers in the United States rose from 5,782 in 1926 to 173,405 in 1928. Applications for pilot licenses tripled in 1927.

The Douglas DC-3 airliner first flew passengers in 1936. An airliner is a large plane built to carry passengers. It carried 21 or more passengers at up to 207 miles an hour. Van der Linden is a curator at the Smithsonian's National Air and Space Museum. In van der Linden's words, the DC-3 is "widely considered to be the first airliner capable of making money just by carrying passengers." By 1939 DC-3s carried about 90 percent of the world's airline travel.

Jack Knight

Who: An airmail pilot who flew through the night and a snowstorm to finish a test that kept the airmail going.

When and where: North Platte, Nebraska, to Chicago, the night of February 22 to 23, 1921.

In February 1921 Post Office officials ran a test to show that airplanes could carry mail across the country faster than trains. Pilots flew the mail in a relay, day and night, each pilot handing it to the next. Jack Knight flew his part, from North Platte, Nebraska, to Omaha.

At Omaha the next pilot refused to take off in the storm. Knight flew on to Chicago himself, at night, through snow and fog, over ground he had never flown before. The mail crossed the country, 2,629 miles, in 33 hours and 20 minutes. After the test, members of Congress voted money to keep the airmail flying.

The sleeping-car porters

Pullman Company managers hired Black men as the porters who served passengers in the company's sleeping cars. After the Civil War, George Pullman looked for men who had been enslaved to hire as his porters. By the early 1900s the Pullman Company was the largest single employer of Black men in the United States.

Porters often had to work at least 400 hours a month to earn a full month's pay. A porter who worked every day of a 30-day month would still need more than 13 hours a day to reach 400. Their pay was among the lowest of all the workers on the train. Company managers built tips from passengers into the porters' pay, which saved the company money. To earn those tips, porters had to do whatever passengers asked.

Passengers called porters "George," whatever their real names were, after George Pullman. Calling an enslaved person by the owner's name was a practice from slavery. Some passengers called the porters "boy." The porters formed a union, a group of workers who bargain together with their employer. In 1937 the union's leaders won a contract that limited the porters' work to 240 hours a month.

The porters of Miles of Smiles

Who: C. L. Dellums, E. D. Nixon and six other retired Pullman porters, with Rosina Tucker, a porter's wife, who described the porters' work in their own words.

When and where: Pullman sleeping cars across the country, from the 1910s to the 1940s. Filmed in 1982.

Movie: *Miles of Smiles, Years of Struggle* (1982), a documentary by Jack Santino and Paul Wagner, made from the porters' own accounts.

In 1982 eight retired Pullman porters told the filmmakers Jack Santino and Paul Wagner what their job had been like. Rosina Tucker, a porter's wife who worked to build the porters' union, tells the story in the film. The porters describe the smile the company required them to wear for passengers. They talk about living on tips, working through the night without sleep, and being called "George" instead of their own names.

Two of the men in the film are C. L. Dellums and E. D. Nixon. Pullman managers fired Dellums in October 1927 for organizing porters into a union. Nixon later called the meeting for the bus boycott in Montgomery, Alabama.

Trains and Jeeps in World War II

From December 1941 to August 1945, trains carried about 43.7 million members of the armed forces. That was more than 97 percent of all the troops moved in organized groups. About 100,000 members of the armed forces rode troop trains on an average day. Half of all Pullman sleeping cars were in use carrying troops.

The Jeep was a small army car. About 640,000 were built in the war. About 363,000 of them were the Willys MB, and about 280,000 were the Ford GPW.

Separate seats on the buses

In Virginia, the law required buses to seat Black and white passengers apart. The same law made bus drivers "special policemen." A driver could decide a passenger's race, order the passenger to another seat, throw the passenger off the bus and make an arrest. Refusing a driver was a crime with a fine of $5 to $25. Greyhound's own rules stated that the company had "full control and discretion as to the seating of passengers." Discretion means the power to decide.

In August 1932, Bessie Nelson and Mamie Kinchlow were thrown off a Greyhound bus in Alexandria, Virginia, and jailed for more than a week. On January 16, 1943, Mildred Turpin and Caroline Johnson, clerks for the Navy Department, were jailed at Clarendon, Virginia. On February 19, 1945, in Johnson City, Tennessee, Tonito Holmes was beaten, removed from a Greyhound bus and fined $14.25. The Encyclopedia Virginia account of these cases does not name the drivers and officers who threw the riders off, jailed them or beat them.

Irene Morgan

Who: A Baltimore war worker who refused to give up her bus seat in Virginia and won her case in the US Supreme Court.

When and where: A Greyhound bus near Saluda, Virginia, July 16, 1944. The Supreme Court decided her case on June 3, 1946.

Irene Morgan, of Baltimore, was 27 and built B-26 bombers in a wartime factory. On July 16, 1944, she had been visiting her mother in Gloucester County, Virginia, and took a Greyhound bus home. She was going back to her husband and to see a doctor. Near Saluda, two white passengers got on the crowded bus. The driver told Morgan and the woman next to her, a Black woman holding a baby, to move to the back seat.

"I refused to move," Morgan said years later. The driver drove the bus to the jail in Saluda. The sheriff showed her a warrant, a paper that allows an arrest. She "just took it and tore it up and just threw it out the window." "So then he put his hands on me," she said, and she kicked him. The sheriff and a deputy forced her off the bus. Her mother paid $500 to get her out of jail.

> On October 18, 1944, Morgan paid a $100 fine for resisting arrest. She would not admit breaking the seating law. She was found guilty of it anyway, and she refused to pay the $10 fine. The Encyclopedia Virginia account of her case does not name the judge. Her lawyer was Spottswood W. Robinson III. The lawyers Thurgood Marshall and William H. Hastie of the NAACP, a civil rights group, joined him. The judges of the Virginia Supreme Court of Appeals ruled against her on June 6, 1945.
>
> On June 3, 1946, the justices of the US Supreme Court ruled for her. Justice Stanley Reed wrote that Virginia's law made travel between states harder, so it could not apply to buses crossing state lines. The ruling covered only trips between states. Reporters at the *Afro-American* newspaper wrote that bus companies' seating rules did not change right away.

1950 to 2000

After 1950, Americans moved people and goods over long distances on three new systems: shipping containers, jet airliners and Interstate highways, the big highways that join the states. In 1956 President Dwight Eisenhower signed the Federal-Aid Highway Act, the law for the Interstate highways. That year a ship called the *Ideal X* carried 58 shipping containers from New Jersey to Texas. The writer Marc Levinson worked out that in 1956 loading a ton of cargo in containers cost about 16 cents. Loading it by hand cost about $5.86. In 1958 Pan Am began flying jet airliners across the Atlantic Ocean, about twice as fast as the older planes.

Highway officials forced the people of more than 475,000 households, more than a million people, out of their homes to make room for federal roads. A household is the people who live in one home, and federal roads are roads paid for by the national government. That number is the US Department of Transportation's estimate, a figure worked out rather than an exact count. Private railroads were losing money on passenger trains, and in 1971 a new company, Amtrak, took over most of them.

The Interstate highways

On June 29, 1956, President Eisenhower signed the Federal-Aid Highway Act. The law allowed for 41,000 miles of new highways, called the Interstate Highway System. It was the largest public works program in the history of the United States up to then. Public works are projects that the government pays for and the public uses, such as roads and bridges. The system is about 48,900 miles long today. In 1990 members of Congress added Eisenhower's name to it.

Interstate highways went around Route 66. Officials of AASHTO, the association of state highway officials, took Route 66 off the list of numbered U.S. highways on June 27, 1985.

Dwight Eisenhower

Who: The president who signed the Interstate highway law, 37 years after he crossed the country in an Army motor convoy.

When and where: The 1919 convoy from Washington, D.C., to San Francisco. The highway law, June 29, 1956.

In 1919 the Army's first convoy of motor vehicles crossed the country. A convoy is a group of vehicles traveling together. It had 81 vehicles and went 3,251 miles, from Washington, D.C., to San Francisco. The trip took 62 days. Its vehicles sank in mud and broke down, and bridges failed under them.

Dwight Eisenhower was a young Army officer, a lieutenant colonel, and he volunteered to go. He wrote a report on the trip. In 1945, at the end of World War II, he saw the autobahns, Germany's highways. After those two experiences, he argued for a system of highways across the United States. As president he signed the law for it on June 29, 1956.

The homes the highways took

The people who planned the Interstates ran many of them through city neighborhoods, and they took the homes that stood in the way. By the US Department of Transportation's estimate, highway officials took the homes of more than 475,000 households, more than a million people, for federal roads. The planning scholar Alan Altshuler made an estimate in those years. He said the new system would push out up to a million people, "a disproportionate number of them Black." Disproportionate means more than their share. The law professor Deborah N. Archer says the neighborhoods chosen "were largely Black and poor."

In Montgomery, Alabama, Interstate 85 ran south of the city in the plans drawn up in 1955. Sam Engelhardt became head of the Alabama State Highway Department in 1959. His business cards read "I Stand for White Supremacy and Segregation." Under Engelhardt, state highway officials chose a final route through Montgomery's only middle-class Black neighborhood. Ralph Abernathy, a minister and civil rights leader, lived there, and Alabama State University stood next to it. An engineering firm had suggested a route through Oak Park. City officials had closed that park rather than let Black people use it.

Highway officials took about 356 homes in the Centennial Hill, Bel Air and Bottoms neighborhoods. They paid owners an average of $3,300 a house. In 1961 Abernathy sent a telegram, a short message sent over electric wires, to President John F. Kennedy. He wrote that the route "will destroy one of the best negro neighborhoods in the south." "Negro" was the common word for Black people in his time. Rebecca Retzlaff, a researcher at Auburn University, told this history in a 2019 study.

In St. Paul, Minnesota, highway officials built Interstate 94 through the Black neighborhood of Rondo from 1956 to 1968. Counts of what was lost differ. One puts it at about 600 families. Another puts it at about 700 homes and 300 businesses.

Jets in the sky

Two airliners left Los Angeles three minutes apart on June 30, 1956. One was TWA Flight 2, and the other was United Air Lines Flight 718. Over the Grand Canyon in Arizona, they flew into each other. The crash killed all 128 people on the two planes. It was the deadliest airplane crash in the world up to that time. The crash was a major reason the Federal Aviation Agency was set up in 1958.

Pan Am flew a Boeing 707 jet from New York to Paris with 111 passengers and 12 crew members on October 26, 1958. It was the first jet service across the Atlantic by an American airline, and the trip took about 8 hours. The older airliners were propeller planes. The 707 flew about twice as fast and carried about twice as many people.

Before 1978 the members of a federal board, the Civil Aeronautics Board, decided which airlines could start or stop flying and what they could charge. President Jimmy Carter signed the Airline Deregulation Act on October 24, 1978. Under that law, the board lost its control of fares and routes. Under the CAB Sunset Act, a part of that law, lawmakers set dates for the board to lose its powers one by one. The board shut down on December 31, 1984. Two economists, Morrison and Winston, studied the change for the Brookings Institution, a research group. Economists study money, prices and trade. Morrison and Winston worked out that fares ended up about 22 percent lower than they would have been under the old rules. Counted in dollars adjusted for rising prices, average fares fell about 40 to 45 percent in the decades after 1978, by government and industry figures.

> **Barbara "Dusty" Roads**
>
> **Who:** An American Airlines stewardess who fought the airline's rule that fired women at age 32 or when they married.

When and where: American Airlines, from 1950. She lived from 1928 to 2023.

Movie: *Fly With Me* (2024), a PBS *American Experience* documentary about flight attendants, directed by Sarah Colt and Helen Dobrowski. Roads appears in it.

Barbara Roads, called Dusty, joined American Airlines as a stewardess in 1950. A stewardess was a woman who served passengers on an airplane. Today the job is called flight attendant. In 1953, American's managers put a rule into a contract that any stewardess hired after November 1953 would be fired at age 32. A stewardess who married was fired too. In a radio interview, Roads gave her view of the reason: "It was cheaper to have someone that'll never get married, never have babies, never get pensions, never get the highest rate of pay."

Roads lobbied members of Congress on her own flights to Washington, D.C. To lobby is to try to talk lawmakers into doing something. In 1963 she held a news conference that made the papers. At news conferences she also asked reporters to pick the 32-year-old stewardesses out of a lineup. Representative Martha Griffiths helped her. In August 1968 the stewardesses came close to a strike, a refusal to work until their demands were met. By Roads's account, American's managers dropped the age rule the day after someone asked Griffiths to press the Equal Employment Opportunity Commission. That is the federal office that handles complaints of unfair treatment at work.

In 1977 Roads helped start the Association of Professional Flight Attendants, a union. She worked for American Airlines for 44 years.

The Freedom Rides

In May 1961 Black and white riders traveled together by bus into the South. They were called Freedom Riders. They were testing a court order that banned separating Black and white travelers in bus stations used for trips between states. On May 4, two groups, John Lewis among them, left Washington, D.C., on a Greyhound bus and a Trailways bus, headed for New Orleans.

On May 14, at Anniston, Alabama, a white mob with clubs and bats attacked the Greyhound. They broke its windows and slashed its tires, then chased the bus until the flat tires stopped it several miles out of town. One of the attackers threw a firebomb, a bomb that starts a fire, through a window. The riders and other passengers barely got out of the flames. E. L. Cowling, a state officer riding the bus in plain clothes, held the attackers back with his gun. The mob

beat the riders while the bus burned, until police arrived. Later that day white men got on the Trailways bus at Anniston and beat the riders on it. Their beating left one rider, Walter Bergman, a white man, with permanent brain damage.

The same day, a crowd met the Trailways bus in Birmingham with pipes, chains and baseball bats. Many in the crowd belonged to the Ku Klux Klan, a group that used violence against Black people and their supporters. Eugene "Bull" Connor, the city official in charge of the police, had told Klan leaders that the police would hold back from the bus station for 15 minutes. He encouraged the Klan to attack the riders. With no police there, Klansmen beat the riders in the waiting room and in a dark hallway. They beat James Peck, a white rider, until he was unconscious, and he needed more than 50 stitches. Walter Bergman was beaten for the second time that day.

On May 20, a white crowd in Montgomery attacked a new group of riders arriving by Greyhound. They beat John Seigenthaler, a Justice Department official, until he was unconscious. Alabama's public safety director, Floyd Mann, had arranged protection for the buses up to Montgomery. Montgomery police did not take over the protection, and Mann went into the fighting himself. Governor John Patterson blamed the riders for the violence.

Justice Department officials asked the Interstate Commerce Commission to act. Its members were federal officials in charge of trade and travel between states. They banned keeping Black and white passengers apart in bus and train stations. The ban was issued on September 22, 1961, and took effect on November 1, 1961. People in many Southern towns kept ignoring it.

Amtrak takes over the passenger trains

Private railroad companies were losing money on their passenger trains. In 1970 members of Congress passed the Rail Passenger Service Act and created a new company called Amtrak. On May 1, 1971, Amtrak began running most of the passenger trains between American cities, which the private railroads gave up.

The shipping container

Before containers, dockworkers loaded cargo onto ships by hand. On April 26, 1956, a ship called the *Ideal X* left Port Newark, New Jersey, carrying 58 metal boxes. Each box was 35 feet long, the size of a truck trailer. These boxes are called shipping containers. The ship reached Houston, Texas, five days later.

Marc Levinson worked out what the change saved in his book *The Box*. In 1956 loading cargo by hand cost about $5.86 a ton. Loading it in containers cost about 16 cents a ton. In the late 1960s, an international standards group set standard sizes for containers, and the same boxes came into use around the world.

> ### Malcom McLean
>
> **Who:** A North Carolina trucking owner who sold his trucking company to start shipping truck-sized boxes by sea.
>
> **When and where:** Port Newark, New Jersey, April 26, 1956.
>
> Malcom McLean sent the *Ideal X* to sea with its 58 containers on April 26, 1956. He had started in 1934 in North Carolina with one used truck and built it into a trucking company. Then he sold the trucking company and put the money into shipping containers by sea.

Deaths in car crashes

Car crashes killed 54,589 people in the United States in 1972. That is the most in any single year, before or since. By 1975 the yearly count had fallen to 44,525.

The minivan

Workers in Windsor, Ontario, in Canada, built the first Dodge Caravan and Plymouth Voyager minivans on November 2, 1983. A minivan is a tall, boxy car with room for a family and its bags. They went on sale as 1984 models.

2000 to Today

Since 2000, Americans have used phones to find their way and to hire rides, and some of them drive electric cars. In 2024 about 8 of every 100 new cars sold were electric, according to Kelley Blue Book. In 2025 about 7 of every 100 bridges in the country were rated in poor condition in federal records, by the count of a road builders' group.

Federal safety officials counted 43,230 deaths in car crashes in 2021. Their early estimate for 2025, published in April 2026, is about 36,640. In 2024 a container ship that had lost power hit a bridge in Baltimore. The bridge fell, and the fall killed six road workers. In 2025 an Army

helicopter and a passenger jet collided near Washington, D.C., and the crash killed all 67 people aboard.

Maps and rides on a phone

GPS, the Global Positioning System, uses signals from satellites to show a GPS device where it is. Until 2000 a setting called Selective Availability made GPS less exact for ordinary users. Federal officials switched the setting off a few minutes after midnight at the end of May 1, 2000. According to the government's GPS website, the error of an ordinary GPS device shrank from about 100 meters to about 20 meters.

People also began hiring rides through apps on their phones. According to Britannica and news reports, Uber began in March 2009 as a company called UberCab. It started its app service in San Francisco on July 5, 2010. In October 2010, after receiving an official order to stop, the company's owners changed its name to Uber. Lyft started its service in June 2012.

In a ride-hailing app, a rider asks for a ride, and a driver using a personal car takes the job. The companies' managers called their drivers independent contractors, meaning people in business for themselves rather than employees. In 2015 a California state hearing officer ruled that one driver, Barbara Ann Berwick, was Uber's employee and that Uber owed her money for the costs of her car.

> #### Barbara Ann Berwick
>
> **Who:** A San Francisco Uber driver who asked the state of California to decide whether she was Uber's employee, and won.
>
> **When and where:** San Francisco, July to September 2014. The decision came on June 3, 2015.
>
> Barbara Ann Berwick drove for Uber in San Francisco, in her own car, for about eight weeks in the summer of 2014. She quit on September 18, 2014. Uber's managers called her an independent contractor, and the company did not pay her back for the costs of her car. She took a claim to the California Labor Commissioner, the state office that handles pay disputes. On March 10, 2015, she argued her case herself at a hearing, a meeting where each side tells its story to an official who decides. Uber sent two lawyers and a product manager, Brian Tolkin.
>
> The hearing officer, Stephanie Barrett, listed the rules Uber's managers set for its drivers. The car could be no more than 10 years old, counted by its model year, and the company had to approve it. Drivers needed $1,000,000 in insurance. They had to keep a rating

> from riders of 4.6 stars or higher, or the company turned off their app. The agreement said riders did not tip. Barrett wrote that Uber was "involved in every aspect of the operation."
>
> On June 3, 2015, Barrett ruled that Berwick was Uber's employee. She ordered Uber to pay Berwick $4,152.20. That was 56 cents a mile for 6,468 miles, plus $256 in bridge tolls and $274.12 in interest, extra money owed for the time she had waited to be paid. Barrett turned down Berwick's claim for unpaid wages, because Berwick agreed that Uber had paid her.
>
> Uber's lawyers asked a court in San Francisco to undo the decision. In a statement, Uber's spokespeople said the ruling applied to Berwick alone. Uber's managers kept treating the company's other drivers as contractors.

The fight over drivers' pay

In November 2020, California voters decided the question for app drivers in their state. They passed Proposition 22, a law put to the voters directly, 58.6 percent to 41.4 percent. The law kept app drivers as contractors. It also set a minimum for their pay: 120 percent of the minimum wage for the time drivers spent working on a ride request, plus 30 cents a mile. Uber, Lyft, DoorDash, Instacart and Postmates paid for the campaign for it, which raised $205.7 million. Ballotpedia tracks state ballot questions from official vote counts and money reports. It lists that as the most money raised for any California ballot question up to then.

On January 12, 2021, four drivers and a union went to court to overturn the law. The drivers were Hector Castellanos, Joseph Delgado, Saori Okawa and Michael Robinson. The union was the Service Employees International Union, a group of workers who bargain together with their employers. On July 25, 2024, the justices of the California Supreme Court ruled that the law could stand.

In Massachusetts, the state's top lawyer, Attorney General Maura Healey, sued Uber and Lyft in 2020. On June 27, 2024, the next attorney general, Andrea Campbell, ended the case with a deal, as WBUR, a Boston public radio station, reported. Leaders of Uber and Lyft agreed that the two companies would pay $175 million. They also agreed that the companies would pay drivers in the state at least $32.50 an hour for time spent driving to a rider or carrying one. The drivers stayed contractors.

Bigger vehicles and electric ones

In 2001, Americans bought more light trucks than cars for the first time. Light trucks are pickups, sport utility vehicles (SUVs) and minivans. They made up 50.8 percent of new vehicle sales that year, against 49.2 percent for cars, according to trade magazines that follow the business. The gap grew wider in the years after.

Tesla delivered its first Model S electric cars to buyers on June 22, 2012, in Fremont, California, according to the company and news reports. The company is named after the inventor Nikola Tesla, who died in 1943. He had no connection to the company.

Americans bought about 1.3 million electric cars in 2024 and almost as many in 2025. Kelley Blue Book and Cox Automotive, car-market research companies, published those counts in January 2026. Electric cars made up 8.1 percent of new car sales in 2024 and 7.8 percent in 2025. Tesla sold nearly half of all the electric cars bought in 2025. A tax credit is money taken off what a buyer owes in taxes. In July 2025 members of Congress passed a budget law, and President Donald Trump signed it on July 4. Under it, the federal tax credits for buying electric cars ended for cars bought after September 30, 2025. In the last three months of 2025, Americans bought 234,000 electric cars, 46 percent fewer than in the three months before.

In September 2017, a company called Bird put electric scooters for rent on the streets of Santa Monica, California. In 2018 another company, Lime, followed, and city officials began trial programs for scooters.

Ports, trains and bridges

In 2021 ships carrying containers backed up outside American ports. On January 9, 2022, staff at the Marine Exchange of Southern California counted a record 109 container ships waiting off the ports of Los Angeles and Long Beach. By October 2022 the line was down to about 4 ships.

In November 2008 California voters approved $9.95 billion in bonds, a kind of loan, for high-speed trains from San Francisco to Anaheim. The state's high-speed rail officials then put the cost of the whole system at $33.6 billion. Workers broke ground in Fresno on January 6, 2015. The first section planned is 171 miles, from Merced to Bakersfield.

In July 2025, US Transportation Secretary Sean Duffy canceled about $4 billion in federal grants, money the national government had promised, for the California line. He said the state's rail agency had "no viable plan," meaning no plan that could work. California officials sued, then dropped the case in December 2025. The project now gets $1 billion a year through

2045 from cap-and-trade, a state program that makes polluters pay for permits to pollute. Associated Press reporters wrote in December 2025 that cost estimates are now above $100 billion. No passenger had ridden a California high-speed train as of 2026.

Researchers at ARTBA, a trade group for companies that build roads, counted the federal bridge records for 2025. The United States had 624,167 bridges, and 41,677 of them were rated in poor condition, about 7 of every 100. Drivers crossed those poor bridges 163 million times a day.

Deaths on the roads and in the air

Car crashes killed 43,230 people in the United States in 2021, the most in recent years. The count then fell four years in a row. In April 2026 officials at the National Highway Traffic Safety Administration published an early estimate of 36,640 deaths in 2025. That is 1.10 deaths for every 100 million miles driven. The only lower rate on record was 1.08, in 2014.

At about 1:30 in the morning on March 26, 2024, the container ship *Dali* was leaving Baltimore for Sri Lanka. It lost power and steering and hit a support of the Francis Scott Key Bridge. The bridge fell into the Patapsco River. The fall killed six men who were filling potholes on the bridge on an overnight shift. They were Dorlian Ronial Castillo Cabrera, Carlos Daniel Hernandez Estrella, Alejandro Hernandez Fuentes, Miguel Angel Luna Gonzalez, Jose Mynor Lopez and Maynor Yassir Suazo Sandoval. They were immigrants from Mexico and Central America. Maryland Governor Wes Moore named them in a statement.

In November 2025, members of the National Transportation Safety Board, the federal board that investigates crashes, reported the cause. A label band had been put on a wire the wrong way. The band kept the wire from going all the way into its connector, so the connection came loose. The loose connection cut the ship's power. The board's press release does not say who put the band on or when. The board's members sent safety advice to several groups, among them the ship's builder, HD Hyundai Heavy Industries of South Korea. On May 12, 2026, federal prosecutors, the government lawyers who bring criminal cases, charged the two Synergy Marine companies that ran the ship with crimes. They also charged the *Dali*'s technical superintendent, the manager in charge of the ship's machinery and upkeep, Radhakrishnan Karthik Nair. The charges include causing the deaths of the six workers. A charge is an accusation, not proof. The law treats the companies and Nair as innocent unless a judge or jury finds them guilty. The same day, Attorney General Anthony Brown, Maryland's top lawyer, announced a $2.25 billion settlement with the ship's owner, Grace Ocean, and with Synergy. A settlement is a deal that ends a legal claim.

On January 29, 2025, an Army Black Hawk helicopter collided with an American Eagle passenger jet that was landing at Reagan National Airport near Washington, D.C. The crash killed all 67 people on the two aircraft, 64 on the jet and three soldiers on the helicopter. It was the deadliest crash of an American passenger airline in more than 20 years. On January 27, 2026, the head of the National Transportation Safety Board, Jennifer Homendy, said: "This was preventable. This was 100% preventable." CNN reported that the board's members blamed Federal Aviation Administration officials for helicopter routes that ran close to the path planes took down to the runway. The board's members also blamed those officials for failing to act on years of reports of near misses.

Chapter 12: Landmarks

Before 1500

The oldest landmarks in the United States were built by Native people, hundreds and even thousands of years before any European arrived. They piled up mounds of earth, and one of them covers more ground than the Great Pyramid in Egypt. In the Southwest they built stone houses with hundreds of rooms and set whole villages under cliffs.

No one wrote down the names of the people who built these places. In the Southwest, the builders' descendants, among them the Pueblo peoples, still live in the same region.

Monks Mound and the mound builders

The largest structure made of earth in North and South America is Monks Mound, at Cahokia in what is now Illinois. A mound is a hill that people build by piling up earth. People built Monks Mound in stages, mostly between about the years 1050 and 1200. It stands about 100 feet tall, and its base covers about 14 acres. The base of the Great Pyramid of Giza, in Egypt, covers about 13 acres. The pyramid is far taller, so the mound beats it only in the ground it covers.

Poverty Point, in Louisiana, is much older. People built it between about 1700 BC and 1100 BC. BC means "before Christ," and it counts years backward from the year 1 of the calendar used today. The builders lived by hunting, fishing and gathering wild food. They raised five mounds and six curved ridges of earth, set one inside another around a wide open space in the middle. It is the largest earthwork of its age north of Mexico. An earthwork is anything people build by moving earth.

UNESCO is an agency of the United Nations, and its World Heritage List names places chosen for their importance to all people. On June 22, 2014, members of UNESCO's World Heritage Committee, meeting in Doha, Qatar, added Poverty Point to that list. It was the 1,001st place on the list and the 22nd in the United States.

Serpent Mound, in Ohio, is a snake shaped out of earth, about a quarter of a mile long. It is the largest snake-shaped mound in the world. Nothing found inside it shows who built it. Archaeologists, scientists who study the past from the things people left behind, have tested it with radiocarbon dating. That method measures the age of material that was once alive. Tests done in 1991 gave a date of about the year 1070, which matches a people archaeologists call the Fort Ancient culture. Tests done in 2014 gave a date of about 300 BC, which matches a people they call the Adena culture. Archaeologists' later work has found evidence for both dates. They now think it possible that people built the mound in one period and rebuilt it in another.

Stone buildings of the Southwest

In Chaco Canyon, in what is now New Mexico, people built large stone buildings called great houses between about 850 and 1150. The largest, Pueblo Bonito, rose four stories high. It held about 600 to 650 rooms, or more. The counts differ because some of them include a guess at how many rooms the upper floors held, and some do not.

At Mesa Verde, in what is now Colorado, people built Cliff Palace between about 1190 and 1280. They set it under an overhang, a place where the rock of the cliff sticks out above like a roof. Cliff Palace has about 150 rooms and 23 kivas. A kiva is a room used for religious ceremonies. It is the largest cliff dwelling in North America.

The builders' descendants are the Pueblo peoples of the Southwest. The National Park Service lists 26 tribes with a special tie to Mesa Verde. Among them are the Hopi Tribe, the 19 Pueblos of New Mexico, including Zuni, Taos and Acoma, and the Navajo Nation. The Ute Mountain Ute, the Southern Ute, the Northern Ute and the Jicarilla Apache are also on the list.

The Hopewell earthworks of Ohio

About 2,000 years ago, Native people in southern Ohio built long walls of earth in the shapes of circles and eight-sided figures. Archaeologists call these people the Hopewell culture. Hopewell is a name archaeologists gave them, and it is not the name of any nation. Written accounts differ on when the building went on. A National Park Service article states that the work took about 400 years, and an article in the Smithsonian's *American Indian* magazine dates it from about the year 1 to about the year 400. A report on WVXU, a public radio station in Cincinnati, states a longer span, from 200 BC to the year 500.

The Octagon Earthworks, in Newark, Ohio, is a large circle of earth joined to an eight-sided wall. An octagon is a shape with eight sides. Together the two walls surround nearly 70 acres. The walls line up with the points where the moon rises, in a pattern that repeats every 18.6

years.

In 1910 the Moundbuilders Country Club began leasing the Octagon and used it as a golf course. To lease land is to rent it. The Ohio Historical Society has owned the land since 1933. It is a group set up under state law, and it is not run to make money. It is now called the Ohio History Connection, and for decades its leaders kept leasing the site to the club.

On September 19, 2023, the members of UNESCO's World Heritage Committee voted to add eight Hopewell earthwork sites to the World Heritage List. The Octagon was one of them.

Glenna Wallace

Who: Chief of the Eastern Shawnee Tribe of Oklahoma from 2006 to 2026, the first woman to be the tribe's chief.

When and where: The Octagon Earthworks, Newark, Ohio, from the late 2000s to 2025.

Glenna Wallace worked for years to get a golf course off the Octagon Earthworks. She was born in about 1939 in Ottawa County, Oklahoma. She taught and worked at Crowder College in Neosho, Missouri, for 38 years. In 2006 the Eastern Shawnee elected her chief. She was the first woman to hold that job.

Her people once lived in western Ohio, near a place called Lewistown, on land they shared with a band of Seneca. On July 20, 1831, the band signed a treaty with James B. Gardiner, a commissioner, or special official, sent by the United States. A treaty is a written agreement between nations. In it the band gave up about 48 square miles of land near Lewistown, plus 8,960 acres of a reservation dating from 1818. A reservation is land set aside for a Native nation. In return Gardiner promised, for the United States, 60,000 acres west of the Mississippi River. Under the treaty, US officials had to move the band there.

In 1832 US officials forced the people out of Ohio. A profile of Wallace by the Ohio History Connection states that they walked about 800 miles. More than 15 percent of them died on the way. No record of the march names the officials who led it. In December 1832 the band received the 60,000 acres Gardiner had promised, as a reservation in what is now Ottawa County, Oklahoma.

Wallace first visited the Octagon Earthworks in the late 2000s. An article in the Smithsonian's *American Indian* magazine gives the year as 2007, and other accounts give 2009. While she was there, a golfer shouted at her, "Out of the way! You don't belong

here!" She decided to get the golf course off the earthworks and to win World Heritage status for them.

Leaders of the Ohio History Connection went to court to end the club's lease. They used eminent domain, a legal power to take property for public use as long as the owner is paid. On December 7, 2022, the judges of the Ohio Supreme Court ruled 5 to 1 that they could do it.

In 2023 the members of the World Heritage Committee met in Riyadh, Saudi Arabia, and voted to add the Hopewell earthworks to the list. Wallace gave the main speech at that meeting. In August 2024 leaders of the club and of the Ohio History Connection agreed to end the court case. They did not make the terms of their deal public. Wallace said, "At last. So many people have worked so long for this to become reality." The club ran the golf course until the end of 2024. The Octagon opened to the public on January 1, 2025. Wallace retired as chief in 2026, after 20 years.

The 1500s

Nothing that Europeans built here in the 1500s still stands. The Spanish built their first forts in Florida of wood and earth. Those forts burned many times, and the Spanish rebuilt them again and again. A mission was a settlement run by Catholic priests, where Native people lived and were taught the Catholic religion. Spanish mission buildings of this century, in Florida and in the Southwest, survive only as remains in the ground that archaeologists dig up. Native mounds and stone buildings of earlier centuries, such as Monks Mound and Cliff Palace, were still standing, and they still stand today.

St. Augustine's founding site

St. Augustine, Florida, began in a Native town. On September 8, 1565, Pedro Menéndez de Avilés landed at Seloy, a town of the Timucua people. The Spanish made their first settlement in Seloy's village. People have lived in St. Augustine without a break ever since. Of all the cities that Europeans founded on the mainland of the United States, it is the oldest that people never left.

In 1586 Francis Drake and his men burned the town. The only landmark left from this century is the place where the Spanish settled. Nothing they built there in the 1500s survives above ground. The stone fort that still stands in St. Augustine, about a mile south of Seloy, was begun

in 1672.

The 1600s

Three buildings from the 1600s are among the oldest buildings put up by Europeans that still stand in the United States. One is a Spanish stone fort in Florida. Another is a chapel in Santa Fe, New Mexico, made of adobe, or sun-dried mud brick. The third is a wooden church building in Massachusetts, called a meetinghouse. Spanish officials forced Native men from their towns to work on the fort in Florida, cutting its stone.

A fort built of shell stone

Spanish officials ordered a stone fort built at St. Augustine after pirates attacked the town. On the night of May 28, 1668, about a hundred English pirates came ashore at midnight and looted St. Augustine. They killed more than 50 Spaniards. The pirates said they would come back and take the town's fort. Queen Mariana of Spain then named Manuel de Cendoya governor of Florida. She sent him to the viceroy of New Spain, the king's highest official in Mexico. There he was to collect 12,000 pesos, which were Spanish coins, to begin a fort of stone.

Workers broke ground on October 2, 1672. Cendoya laid the first foundation stone on November 9. The main work was finished in about 1687, under Governor Juan Cabrera. Governor Laureano de Torres had the last stones set on the fort's water defenses in 1695 or 1696. Two histories written for the National Park Service give different years. Albert Manucy, who wrote the first one in 1942, gives 1696, and a 1993 park handbook gives August 1695. By 1696 the fort had cost close to 100,000 pesos. It is called the Castillo de San Marcos, and it is the oldest masonry fort in the continental United States. Masonry means built of stone or brick.

The fort is made of coquina, a soft stone made of packed seashells. Workers cut the coquina from quarries on Anastasia Island, across the bay from the town. A quarry is a pit where stone is cut out of the ground. The workers cut grooves in the rock with picks and axes, then broke the blocks loose with bars and wedges. The largest blocks were 2 feet thick and 4 feet long. Manucy wrote that six strong men "could hardly lift" one of them. Oxen dragged the blocks to a dock, and rafts carried them across the bay.

The stones are held together with mortar, a paste that hardens. Workers made lime, a white powder, for the mortar by burning oyster shells in kilns, or very hot ovens. By the spring of 1672 they had stored about 7,000 bushels of lime. A bushel is a measure of about 8 gallons. The walls they built are 14 feet thick at the base and about 9 feet thick at the top.

English soldiers attacked the fort twice and failed both times. In November 1702, Governor James Moore of Carolina came with an army, and Colonel Robert Daniel was at his side. Almost 1,500 people crowded into the fort for safety. The siege lasted about two months. A siege is an attack in which an army surrounds a place and tries to force the people inside to give up. The English cannonballs did not shatter the walls. The shell stone crushed inward where each ball hit, so the balls sank into the wall or bounced off.

When a Spanish force arrived to help, the English set fire to their own ships and retreated. As they left, Daniel's troops and their Native allies burned the rest of St. Augustine to the ground. The fort and the people inside it survived. In 1740 General James Oglethorpe of Georgia besieged the fort for 27 days, and he failed too. The fort is now the Castillo de San Marcos National Monument.

Who cut the stone

Spanish officials forced Native men to work on the Castillo. At times up to 300 Native people were working for the Spanish king in St. Augustine, on the fort and in the corn fields. The men came from three nations: the Guale of what is now Georgia, the Timucua of eastern Florida and the Apalache of western Florida. Officials drafted them for labor in their home towns. A draft is an order that forces people to serve. Some of the men had to walk about 200 miles to reach St. Augustine. Manucy wrote that "many of them served unwillingly."

A drafted man had two choices. He could bring his family with him, or he could leave his wife and children in the village to feed themselves. Officials drafted even some chiefs. They kept men working past the end of their terms. One chief was forced to work on the fort for more than three years without once going home. Some governors used Native men as their own servants. Spanish officials had sentenced the Apalache, years before, to work on the forts as a punishment for rebelling.

The Native laborers were paid 1 real a day, plus a daily share of corn. A real was a Spanish silver coin. Manucy counted it as worth 12 and a half cents, and the 1993 park handbook puts it at about 20 cents. Spanish master masons on the same job earned 20 reales a day.

The work needed about 150 laborers, and officials found it hard to get even 100. In the first winter, a sickness the Spanish called El Contagio, "the contagion," spread among the Native laborers. The crew shrank to almost no one. Manucy's history does not count how many men died. The payrolls, the lists of workers and their pay, counted the Guale, Timucua and Apalache men who cut the stone. Manucy's history and the 1993 park handbook were both written from those payrolls. They give the men's nations and numbers, but not their names.

Spanish officials also put convicts to work on the fort. These were men sentenced to work there for a set number of years. One Spaniard caught smuggling English goods got 6 years of labor on the fort. His term would double if he ran away. Enslaved Black people owned by the Spanish king worked there too. In 1687 Spanish officials added eighteen of the king's slaves to the work crew.

That same year, eleven people escaped slavery in Carolina and reached St. Augustine. They were eight men, two women and a nursing baby. Governor Diego de Quiroga y Losada gave them shelter. He had them baptized in the Catholic Church, a ceremony with water that makes a person a member of the church. He hired the men as paid workers, and six of them worked on the Castillo. In 1693 King Charles II of Spain ordered that enslaved people who escaped from the English colonies and became Catholic would be free.

John Collins

Who: An English prisoner who burned lime and ran the stone quarry for the Castillo de San Marcos.

When and where: St. Augustine, Florida, from 1670 for 19 years or more.

John Collins was an English mason, a builder in stone, whom the Spanish held as a prisoner and put to work on the Castillo. In 1670 a ship was sailing for the new English colony at Charleston, in Carolina. It landed by accident at the Spanish mission of Santa Catalina, near the Savannah River. The Spanish there captured two Englishmen from the ship, William Carr and John Rivers. A small boat came from Charleston to get them back, and Joseph Bailey and John Collins carried a message ashore. The Spanish held them too and sent all four men to St. Augustine as prisoners.

Governor Manuel de Cendoya put the prisoners to work on the fort. On the Spanish payroll, Collins's name appears as Juan Calens. According to Manucy's history, Collins could burn more oyster shells into lime in a week than Spanish workmen could in two. The lime went into the mortar that held the coquina blocks together. As a prisoner he was paid 8 reales a day. A master workman was owed 20.

> Collins rose from master of the lime kilns to master of the quarry. Later he ran the dugout boats, the food stores and the convict workers. At last he held the job of pilot, guiding ships between St. Augustine and Charleston. Officials of the Spanish king recognized his work after he had spent 19 years or more in the town. Neither Manucy's history nor the 1993 park handbook says when he was born or died, or whether he ever went home.

The oldest churches

San Miguel Chapel in Santa Fe, New Mexico, is often called the oldest church in the country. Its site and its foundations are that old, but most of the walls standing today date from a rebuilding in 1710. The chapel is built of adobe, bricks made of mud and straw and dried in the sun. It was built around 1620 as a church for the soldiers, servants and laborers of the town's Spanish officials, and it was in use before 1626.

The chapel was partly destroyed in 1680, when the Pueblo people of northern New Mexico rose up against Spanish rule. Spanish officials had been collecting tribute, payments of goods, from the Pueblos. They had also used their power to keep the Pueblo people from practicing their own religion. A religious leader named Popé planned the uprising from Taos. In the uprising, called the Pueblo Revolt, the Pueblo people drove the Spanish out of the region. The Spanish stayed out until 1692, when Diego de Vargas led them back. The histories of the chapel written for the National Park Service and the Historic Santa Fe Foundation do not say who damaged it. In 1710 Governor José Chacón had it rebuilt on the old foundations.

The Old Ship Meetinghouse in Hingham, Massachusetts, was built in 1681. The Puritans, a group of English Protestants who settled in New England, met in buildings like this one for church. It is the only Puritan meetinghouse from the 1600s still standing in the country. It is also the oldest church building in the United States that has been in use without a break. Its roof rests on a frame of heavy timbers, left open to view from inside. The frame reminded the people who worshiped there of the hull, or body, of a ship turned upside down. That is how the building got its name.

1700 to 1750

In the first half of the 1700s, colonists put up public buildings that are still landmarks today. The first lighthouse in what became the United States was lit in 1716, at the mouth of Boston Harbor. Boston's Old North Church went up in 1723. In 1732 builders in Philadelphia began a

statehouse for Pennsylvania, a building where the colony's lawmakers would meet. It is now called Independence Hall. In Texas, Spanish priests ran a mission, a settlement where Native people lived and were taught the Catholic religion. There, at the place later known as the Alamo, the first stone of a stone church was laid in 1744.

The first lighthouse

Boston Light stands on Little Brewster Island, at the entrance to Boston Harbor. A lighthouse is a tower with a bright light at the top that warns ships away from rocks and guides them into harbor. Boston Light was first lit on September 16, 1716. It was the first lighthouse in what became the United States.

British forces blew up the tower in 1776. It was rebuilt in 1783, and the 1783 tower is the one that stands today.

George Worthylake

Who: The first keeper of Boston Light, the first lighthouse in what became the United States.
When and where: Little Brewster Island, Boston Harbor, 1716 to 1718.

George Worthylake became the first keeper of Boston Light in 1716. He was paid £50 a year, 50 British pounds, to keep the light burning from sundown to sunrise. Worthylake lived on the island with his wife Ann and his daughter Ruth. He earned extra money guiding ships in and out of the harbor, and he kept a flock of sheep on Great Brewster Island, next door.

On November 3, 1718, the family had gone into Boston for a church sermon. Just after noon, on the way back to the island, their canoe tipped over. Worthylake, Ann and Ruth all drowned. Shadwell, a man Worthylake enslaved, drowned with them. So did George Cutler, a servant, and John Edge, a friend of the family.

Benjamin Franklin was 12 years old and working for his older brother, a printer in Boston. His brother had him write a ballad about the drowning called "The Lighthouse Tragedy." A ballad is a poem that tells a story and can be sung. Once it was printed, Franklin's brother sent him around the town to sell copies. Franklin later called his own verses "wretched stuff," and no copy survives. A few days after the Worthylakes died, the next keeper, Robert Saunders, drowned too.

A steeple and a statehouse

Old North Church in Boston, also called Christ Church, was built in 1723. It is the oldest church building still standing in Boston. Its steeple, the tall pointed tower on top, was finished in 1740 and is 191 feet high. On April 18, 1775, the church's sexton, or caretaker, Robert Newman, and Captain John Pulling Jr. hung two lanterns in the steeple. The lanterns were a signal, worked out by Paul Revere, that British troops were moving by water.

Work on the Pennsylvania State House in Philadelphia began in 1732 and ended in 1753, 21 years later. Andrew Hamilton designed it with Edmund Woolley, a master carpenter. Workers added its tower from 1750 to 1753. In 1753 a bell was hung in the new tower. Words on the bell read "Proclaim liberty throughout all the land." The building is now called Independence Hall.

The mission church later called the Alamo

Father Antonio de San Buenaventura y Olivares, a Spanish priest, founded Mission San Antonio de Valero in San Antonio, Texas, on May 1, 1718. Soldiers sent by Governor Martín de Alarcón came with him. The people who lived at this mission came from more than a hundred Native groups. Among them were the Payaya, the Pamaya, the Xarame, the Apache and the Karankawa. Diseases brought by Europeans had already killed many Native people in the region. Many came to the San Antonio missions for protection from their enemies and for a steadier supply of food.

As a rule, the Spanish forced no one to come in. Once people had joined a Texas mission, though, priests and soldiers used force to keep them. Soldiers went out to bring back people, and whole groups, who left. In 1739 an epidemic of smallpox and measles struck the mission. An epidemic is an outbreak of a disease that spreads to many people at the same time. In 1745 the mission had 311 residents.

The cornerstone of a stone church was laid on May 8, 1744. A cornerstone is the first stone set at a corner of a new building. That church fell down in the 1750s. Work on the church that stands today began in 1758. The missionaries never finished it. The bell towers and the dome they planned were never built. The records do not say who laid the church's stones.

In 1793 Spanish officials closed the mission and divided its lands among the Native people and other residents who were still there. The old mission church is known today as the Alamo.

1750 to 1800

Enslaved people worked at every stage of building the first buildings of the new national capital. Leaders of the United States began building the capital beside the Potomac River in the 1790s. Its two main buildings were the President's House and the Capitol. The officials in charge rented enslaved men from their owners, and the owners collected the pay. Two houses of the time that are landmarks today, Mount Vernon and Monticello, were also built by enslaved workers.

Raising the capital's buildings

The land chosen for the capital had been home to the Nacotchtank people. In 1608 the English captain John Smith traveled up the Potomac River and found their villages there. European settlers brought diseases that killed many of the Nacotchtank. In colonial times most of their groups joined other Native peoples, and some moved away.

The President's House, later called the White House, was designed by James Hoban, an architect born in Ireland. Its cornerstone was laid on October 13, 1792. A cornerstone is the first stone set at a corner of a new building, often in a ceremony. On September 18, 1793, George Washington laid the cornerstone of the Capitol, the building where Congress meets. Neither building was done by 1800. When John Adams moved into the President's House in November 1800, it was still unfinished. The Capitol had only one wing.

Enslaved men who built the capital

Enslaved people worked at every stage of building the President's House and the Capitol. They quarried sandstone, cut timber, made bricks, sawed boards, did carpentry and hauled loads. On December 2, 1791, the three commissioners in charge of the new District of Columbia bought a sandstone quarry for $6,000. It was on Aquia Creek, in Stafford County, Virginia. A quarry is a pit where stone is cut out of the ground. At the Government Island quarry, forty Black men worked beside free workers.

William C. Allen, a historian in the office of the Architect of the Capitol, studied the Capitol's payrolls for Congress in 2005. His report states that the commissioners rented enslaved men from their owners by the year. They called this "Negro hire." "Negro" was a word of that time for Black people. The Capitol's accounts list 385 payments for it between February 11, 1795, and May 17, 1801. The money went to the owners. At first an owner got $60 a year for each man. A white laborer with no special skills earned $70 a year. In 1797 the commissioners raised the owners' rate to $70. When a man missed work, the commissioners cut his owner's pay.

Two of the commissioners, Gustavus Scott and William Thornton, rented their own slaves to the project. Thornton also designed the Capitol. James Hoban was paid for enslaved men too, and so was the commissioners' treasurer, William Deakins. Other owners who were paid included Middleton Belt, who oversaw the Capitol's laborers, and a land developer named Thomas Law. Many Maryland slaveholders rented out men too, and several of them were women, such as Ann Digges and five women of the Brent family.

The commissioners told the overseers to keep the rented men at work "from sunrise to sunset," six days a week. The commissioners housed the men in huts. They gave them rations, a set share of food and drink, of salt meat and whiskey. Allen found that the commissioners' overseers probably kept the enslaved sawyers, men who sawed logs into boards, at work seven days a week. For work at night, on Sundays and on holidays, the men themselves got small extra wages.

Only a few of the men's names were written down, and only their first names. The payments name Dick and Tom, rented from Ann Digges in 1795. They also name Nace, Gerrard, David, Charles, Harry, Gabe and Sil, rented from the Brent women in April 1795. Allen wrote that "virtually nothing is known of their lives."

In 1793 a man named Jacob ran away from the work, and his owner offered a $6 reward for him. The historian Bob Arnebeck counts at least 200 known enslaved laborers on the Capitol and the President's House together. Richard Baker, the Senate Historian, and Kenneth Kato of the House history office introduced Allen's report. They wrote that no one will ever know how many enslaved people helped to build the Capitol.

Tom, Peter, Ben, Harry, and Daniel

Who: Five enslaved carpenters who helped build the White House. They are known by name from the payroll for May 1795.

When and where: The President's House building site, Washington, May 1795.

Tom, Peter, Ben, Harry and Daniel were enslaved carpenters who worked on the President's House in May 1795. The carpenters' payroll for that month lists them by their first names only. James Hoban, the architect of the building, held four of them in slavery. His assistant, Pierce Purcell, held the fifth.

The payroll records how many days the men worked that month. Peter and Ben each worked 28 days. Daniel worked 25 days, and Harry worked 9. Hoban signed for their wages. The pay went to the men's owners and not to the men. The payroll does not give

their last names.

Landmark houses

Mount Vernon, George Washington's home in Virginia, was built and enlarged by enslaved workers. Monticello, Thomas Jefferson's home in Virginia, was too. Jefferson began building Monticello in 1769 and left it unfinished in 1784. From 1796 to about 1809 he redesigned it and had it rebuilt. Enslaved workers did much of the building and made much of its fine woodwork.

Thomas Jefferson

Who: The owner of Monticello, who designed his own house and worked on the design for the Virginia State Capitol.

When and where: Monticello, Virginia, 1769 to about 1809. The design for the Virginia State Capitol in Richmond, 1785.

Thomas Jefferson designed his own house at Monticello, and with a French draftsman, a man who drew building plans, he made the design for the Virginia State Capitol. The house at Monticello was under construction from 1769 to about 1809, a span of 40 years. The people he enslaved did much of the building.

In 1785 the Directors of Public Buildings of Virginia asked Jefferson for a design for a new state capitol in Richmond. Jefferson was then the United States minister to France, which means he represented the country to the French government. A French draftsman, Charles-Louis Clérisseau, persuaded him to model the outside of the building on the Maison Carrée. That is an ancient Roman temple in the city of Nîmes, in France. Clérisseau drew the final plans. A plaster model reached Richmond late in 1786 to guide the workmen, and Samuel Dobie built the capitol.

The Virginia General Assembly is the state's group of lawmakers. Its history of the building states that the capitol "introduced the Classical Revival temple style to the modern world." Classical Revival buildings copy the look of the temples of ancient Greece and Rome. The same history states that the capitol "has inspired countless public buildings for over 200 years."

At Monticello, the fine woodwork of the rebuilt rooms was made by enslaved craftsmen. One of them was John Hemmings, a joiner, or maker of fine woodwork.

1800 to 1850

Between 1800 and 1850, Americans began building monuments to the Revolution and to George Washington. A monument is something built to help people remember a person or an event. Two of them were tall stone pillars: the Bunker Hill Monument near Boston and the Washington Monument in the capital. The people raising both ran out of money and had to stop building. Workers finished the Bunker Hill Monument in 1842. Work on the Washington Monument stopped in 1854 at about 150 feet, and the stump stood unfinished for 25 years.

Two obelisks

Both monuments are obelisks. An obelisk is a tall stone pillar with four sides that narrows toward a pointed top.

The Bunker Hill Monument marks the Battle of Bunker Hill, fought on June 17, 1775. It stands on Breed's Hill in Charlestown, Massachusetts. In 1823 a group of leading citizens of the Boston area formed the Bunker Hill Monument Association to build it.

A cornerstone is the first stone set at a corner of a new building, often in a ceremony. Daniel Webster and the Marquis de Lafayette, a French general, led the ceremony that laid this one on June 17, 1825. That day was the 50th anniversary of the battle. About 40 men who had fought in the battle came, along with about 190 other men who had fought in the Revolutionary War.

The association bought a granite quarry, a pit where stone is cut out of the ground, in Quincy, Massachusetts. Horses pulled the granite blocks three miles to the Neponset River on a railway. A National Park Service article describes it as the first horse-drawn railway built to carry goods as a business. Ships then carried the blocks to Charlestown.

In December 1828, after 19 months of work, the association's money ran out and the work stopped. To pay off its debts, the association sold 10 acres of the old battlefield in 1839. Sarah Josepha Hale organized a Ladies' Fair at Quincy Market in Boston in 1840. The money taken in at the fair came to more than $30,000, about a quarter of the monument's cost. Workers finished the 221-foot granite obelisk in July 1842. It was dedicated, or opened with a public ceremony, on June 17, 1843, with President John Tyler there.

The Washington Monument was begun in the capital on July 4, 1848. About 20,000 people watched members of the Washington National Monument Society lay the cornerstone. By 1854 the society's money was gone, and work stopped at about 150 feet.

That same year, in March 1854, members of the Know-Nothing movement stole a block of marble meant for the monument. Pope Pius IX, the head of the Catholic Church, had given it. The Know-Nothings were people in a political movement who were against Catholics. By the usual account, the thieves threw the stone into the Potomac River. It was never found. From 1855 to 1858 Know-Nothings took control of the monument society. The stump of the monument stood unfinished until 1879.

From 1847 to 1855, workers in Washington put up the Smithsonian Institution Building, built of red sandstone. The architect James Renwick Jr. designed it. Its cornerstone was laid on May 1, 1847. People call it the Castle.

> ### John Hemmings
>
> **Who:** An enslaved joiner who made the fine woodwork of Monticello's rebuilt rooms.
>
> **When and where:** Monticello and Poplar Forest, Virginia. Born 1776, died 1833.
>
> John Hemmings was a joiner, a woodworker who makes the fine wooden parts inside a house, such as doors, trim and furniture. Thomas Jefferson held him in slavery at Monticello, Jefferson's home in Virginia. Hemmings was born in 1776. From the age of 17 he trained under white joiners whom Jefferson hired.
>
> When Jefferson rebuilt Monticello, Hemmings made the fine woodwork of the remodeled rooms and much of the furniture. Hemmings also led the woodwork at Poplar Forest, Jefferson's other house in Virginia.
>
> Jefferson enslaved more than 600 people during his life. In his will he freed five of them. Hemmings was one of the five, and he became free in 1826. Jefferson also left him the tools of the joiner's shop. Hemmings died in 1833.

1850 to 1900

When workers finished the Washington Monument in 1884, it was the tallest structure in the world, at 555 feet. In the same half century, workers raised a bronze statue onto the new dome of the Capitol. Others hung the Brooklyn Bridge from cables and set up the Statue of Liberty in New York Harbor. At least 21 workers died building the Brooklyn Bridge. As St. Louis grew, between 1850 and 1904, almost all of the Native mounds that had stood there for centuries were dug away.

The Statue of Freedom

On December 2, 1863, workers set the last section of a bronze statue called Freedom on top of the new dome of the Capitol. From 1860 to 1862 the statue was cast at the foundry of Clark Mills, a sculptor who had taught himself. A foundry is a workshop where metal is melted and poured into molds. One of the men who cast it was Philip Reid, whom Mills held in slavery.

Philip Reid

Who: An enslaved foundry worker who helped cast the Statue of Freedom for the dome of the Capitol, and who was free by the day it was raised.

When and where: Clark Mills' foundry, Washington, 1860 to 1863.

Philip Reid worked out how to take apart the plaster model of the Statue of Freedom so it could be cast in bronze. He was born in slavery in Charleston, South Carolina, in about 1820. Clark Mills bought him there. Mills said he paid $1,200 for Reid "because of his evident talent for the business."

An Italian sculptor on the job refused to show how to take the model apart unless he got a raise in pay. Reid worked out how to separate the sections himself, using a pulley and tackle, a set of ropes and wheels for lifting heavy loads.

Reid earned $1.25 a day, but he kept only Sunday's pay. Mills collected the pay for the other six days of each week. On April 16, 1862, President Abraham Lincoln signed the District of Columbia Compensated Emancipation Act. Emancipation means setting enslaved people free, and compensated means paid. Counts of the people it freed in the capital differ. The government of the District of Columbia gives 3,100. The US Senate's history office gives 2,989, the number freed through the more than 930 requests that the officials in charge approved in the months after the law passed. Owners who had stayed loyal to the Union, the side of the United States government in the Civil War, could be paid up to $300 for each person. Reid received his freedom that day. When the last section of Freedom was set on the dome in December 1863, Reid was a free man. He later signed his name Philip Reed.

The Brooklyn Bridge

The Brooklyn Bridge, in New York, opened on May 24, 1883. It is a suspension bridge, which means its roadway hangs from cables strung between tall towers. At least 21 workers died building it, and the counts differ. The historian David McCullough counted 21 deaths. C. C.

Martin, an assistant engineer on the bridge, told the *Brooklyn Eagle* newspaper that 27 men died in accidents. E. F. Farrington, the master mechanic, the head mechanic on the job, said the number could be as high as 40. Most of the dead were immigrants.

The towers stand on caissons. A caisson is a huge box, open at the bottom, sunk to the bottom of the river. Men worked inside it, digging out the riverbed in air pumped in under pressure to keep the water out. When men came up out of that air too quickly, bubbles of gas formed in their blood. The bubbles caused great pain in the joints. They could leave a man paralyzed, unable to move parts of his body, or kill him. This illness is called caisson disease, or the bends.

Dr. Andrew Smith, the bridge company's doctor, gave it the name caisson disease. Between January 25 and May 31, 1872, he treated 110 cases among the roughly 600 men who worked in the air under pressure. Three of them died of it.

Caisson disease killed John Myers on April 22, 1872, Patrick McKay eight days later, and Daniel Reardon within the month. After those deaths, Washington Roebling, the chief engineer, stopped digging the New York caisson any deeper.

Other workers died too. John French and Thomas Douglas died before the caisson deaths, and Neil Mullen died in 1877. In 1878 a strand of cable snapped at the Manhattan end and threw Thomas Blake and Harry Supple, two men from Newfoundland, to their deaths. Caisson disease also crippled many workers who lived.

John, Washington, and Emily Roebling

Who: The man who designed the Brooklyn Bridge, the son who took charge of building it, and the son's wife, who carried his instructions to the engineers for 11 years.

When and where: New York, 1869 to 1883.

Movie: *Brooklyn Bridge* (1981), Ken Burns' first documentary, narrated by David McCullough. It was nominated for the Academy Award for Best Documentary Feature. It is about the bridge and the Roeblings.

John A. Roebling designed the Brooklyn Bridge, but he died before building began. In June 1869 he was measuring the site for a tower when a ferry crushed his foot against the posts that held up the dock. Doctors told him the foot should be cut off. He refused and allowed only a water treatment, with cold water dripped steadily onto the wound. His crushed toes were cut off, and tetanus set in. Tetanus is an infection from a wound that makes the muscles tighten and lock. He died on July 22, 1869.

> His son, Washington Roebling, took over as chief engineer. He went down into the caissons with the workers and got caisson disease. He collapsed in 1872 and was left partly paralyzed. For the next ten years he directed the work from a room in Brooklyn Heights, watching the bridge through a telescope.
>
> His wife, Emily Warren Roebling, carried his instructions to the engineers for 11 years. She studied cable construction, the forces on a bridge and the mathematics of bridge building. That let her pass on his orders correctly and answer the engineers' questions. Trustees are people chosen to look after a project or a group's money. When the bridge's trustees tried to remove her husband, she defended him before them. Some writers today call her the bridge's "effective chief engineer," meaning she did much of that job in practice. Washington kept the title and made the engineering decisions from his sickroom. Emily was the person the engineers dealt with every day.
>
> When the bridge opened in 1883, Emily Roebling was the first person to cross it by carriage. She carried a live rooster as a sign of victory.

The Washington Monument, finished

In 1876 members of Congress voted to have the federal government take over the unfinished Washington Monument. In 1879 Army engineers led by Lieutenant Colonel Thomas Lincoln Casey started work again. The workers finished the monument on December 6, 1884. On its point they placed a cast aluminum tip that weighed 100 ounces. Aluminum then cost about a dollar an ounce, roughly a day's wage for a laborer, and the whole tip cost $225.

The monument was dedicated on February 21, 1885. At 555 feet, it was the tallest structure in the world until the Eiffel Tower was built in Paris in 1889. About 150 feet up, the color of the marble changes. The stone laid after 1879 came from different beds of rock in the quarries than the stone laid from 1848 to 1854. The line shows where the work stopped for 25 years.

Building the Statue of Liberty

People in France gave the money for the Statue of Liberty, and Americans had to raise the money for its pedestal, the tall stone base it stands on. Édouard de Laboulaye proposed the statue in 1865. The sculptor Frédéric Auguste Bartholdi designed it.

The statue's finished arm and torch were shown at the Centennial Exhibition, a big fair in Philadelphia in 1876. Centennial means a 100th birthday, and the fair marked 100 years since 1776. From 1877 to 1882 the arm stood in Madison Square Park in New York to draw gifts of

money for the pedestal. The engineer Gustave Eiffel joined the work in 1879 and designed the iron frame inside the statue. The statue's copper skin is 3/32 of an inch thick. In the words of the National Park Service, that is "about the thickness of two pennies placed together." The copper hangs on the iron frame.

The architect Richard Morris Hunt designed the pedestal, which was built from 1884 to 1886. Money for it came in slowly until 1885. That year Joseph Pulitzer, who published the *New York World* newspaper, ran a campaign in its pages. More than $100,000 came from about 120,000 donors. Most gave less than a dollar, and many of the gifts were coins from schoolchildren. Every donor's name was printed in the paper.

President Grover Cleveland led the dedication ceremony on October 28, 1886. The statue is 151 feet tall. With its pedestal it stands about 305 feet high.

Frédéric Auguste Bartholdi

Who: The French sculptor who designed the Statue of Liberty.
When and where: Paris, 1870 to 1885. New York Harbor, dedicated October 28, 1886.

Frédéric Auguste Bartholdi worked on the Statue of Liberty for more than 15 years, from 1870 to 1886. He was born in 1834 in Colmar, in the Alsace region of France, and he died in 1904.

In 1871 Bartholdi traveled to the United States. In a little under three months he chose Bedloe's Island in New York Harbor as the site and met many of the leading people in America. He and Laboulaye set up committees in both countries to raise money.

The statue's skin was made of thin copper sheets shaped by hammering, a method called repoussé. The arm and torch were finished in 1876, and the head and shoulders in 1878. That year the head and shoulders were shown at the Paris Universal Exposition, a world's fair. The whole statue was put together in Paris between 1881 and 1884.

Then it was taken apart again. The French ship Isère carried it across the Atlantic Ocean in 350 pieces packed in 214 crates. It arrived on June 17, 1885. Bartholdi came back to New York with a group sent from France for the dedication in 1886.

Mounds dug away for fill

St. Louis, Missouri, was once called the Mound City. It was built among about 40 mounds, hills of earth that Native people built between about the years 600 and 1300. As the city grew, people dug away most of them. One group of 25 mounds stood along the north riverfront. By the 1850s all of them were gone except part of the largest, Big Mound.

Big Mound stood about 30 to 34 feet high. In 1869 it was dug away completely, and its earth was sold to the North Missouri Railroad to build up the beds for its tracks. The workers who removed it found 32 burials, the graves of people, in two chambers inside it. No surviving record says what became of the bones. An archaeologist is a scientist who studies the past from the things people left behind, and no archaeologist is known to have recorded the digging. The history of the mounds written for the Landmarks Association of St. Louis does not name the men who dug the mound out or the person who sold its earth.

Before the World's Fair of 1904 in Forest Park, two more groups of mounds along the River des Peres were destroyed, 16 mounds in all. That same history does not name who destroyed them.

One mound is left in St. Louis, Sugarloaf Mound, on the south side of the city. In 1928 someone built a house on top of it. The Osage Nation, a Native American nation, bought that house and about a third of the mound in 2009 and tore the house down in 2017. In 2025 the Osage Nation, working with an arts group called Counterpublic, got the rest of the mound back. The Osage Nation's announcement describes Sugarloaf Mound as a sacred Osage site.

The largest private house

George W. Vanderbilt had Biltmore House built in Asheville, North Carolina, between 1889 and 1895. It has 250 rooms and covers about 179,000 square feet. It is still the largest privately owned house in the United States. Vanderbilt opened it to his family on Christmas Eve, 1895.

1900 to 1950

Many large structures in the country went up between 1913 and 1941. Among them were the Lincoln Memorial, Mount Rushmore, the Empire State Building, the Golden Gate Bridge and Hoover Dam. Workers died building three of them. Five died on the Empire State Building and 11 on the Golden Gate Bridge. At Hoover Dam the official count is 96. It does not include 42 more deaths that were listed as pneumonia. Mount Rushmore was carved into a mountain in the Black Hills of South Dakota. Members of Congress took that land from the Sioux in 1877, breaking a treaty, a written agreement between nations.

The Woolworth Building

Frank W. Woolworth paid the whole $13.5 million cost of the Woolworth Building in New York himself, in cash. Workers finished it in 1913. At 792 feet, it was then the tallest building in the world. Woolworth had made his fortune from stores that sold goods for five and ten cents.

The Lincoln Memorial

At the opening of the Lincoln Memorial in Washington in 1922, a white Marine ordered Black guests into a roped-off section, apart from white guests. William Howard Taft, who led the group in charge of the memorial, told the only Black speaker to cut his speech. The memorial honors Abraham Lincoln. Work began on February 12, 1914, Lincoln's 105th birthday. Joseph Blackburn broke the ground. He was a member of the Lincoln Memorial Commission, the group in charge of the building. He had also been an officer in the Confederate army, the army of the Southern states that fought to keep slavery in the Civil War. The architect Henry Bacon designed the building. The sculptor Daniel Chester French made the seated statue of Lincoln inside.

About 50,000 people came to the dedication on May 30, 1922. The crowd was segregated, which means Black people and white people were kept apart. A Smithsonian magazine account says the Marine sent the Black guests to their section "abrasively," which means roughly and rudely. Twenty-one of them left in protest.

Robert Russa Moton was the only Black speaker. A week before, on May 23, William Howard Taft sent him a telegram, a message sent by wire. Taft was the Chief Justice, the head of the US Supreme Court, and he was also the president of the Lincoln Memorial Commission. He wrote, "Shall have to ask you to cut five hundred words." Taft added, "I am sure you wish to avoid any insinuation of attempt to make the occasion one for propaganda." An insinuation is a hint. Propaganda means messages made to push people toward one side. Moton made the cuts. One passage he removed said that the work Lincoln died for was "still unfinished."

In 1939 Marian Anderson, a famous African American singer, sang from the memorial's steps after the Daughters of the American Revolution refused to let her sing in Constitution Hall. The group owned the hall, in Washington, and its rule allowed only white performers there. Eleanor Roosevelt, the president's wife, quit the group in protest. Harold Ickes, the Secretary of the Interior, got President Franklin D. Roosevelt's approval for a concert at the memorial. On Easter Sunday, April 9, 1939, Anderson sang from its steps to about 75,000 people of all races.

Mount Rushmore and the Black Hills

Mount Rushmore is carved on land that US officials promised to the Sioux in a treaty and that members of Congress later took. The Lakota, one of the Sioux peoples, call the mountain Tunkasila Sakpe, the Six Grandfathers. It stands in the Black Hills of South Dakota.

In the Fort Laramie Treaty of 1868, US officials set aside a large reservation for the Sioux, and the Black Hills were part of it. The treaty says the land was "for the absolute and undisturbed use and occupation" of the Sioux. It also says no part of it could be given up unless three-fourths of the adult Sioux men signed.

On July 2, 1874, Lieutenant Colonel George Armstrong Custer led close to 1,000 soldiers and teamsters, men who drove wagons, into the Black Hills. Lieutenant General Philip Sheridan had sent them. By the middle of August they had found gold. In August 1876, members of Congress passed a law saying no more money would be spent on food for the Sioux until they gave up the Black Hills. Under it, officials would give the Sioux no more food rations. The Sioux then depended on those rations to eat.

In September 1876 a group of officials led by George Manypenny brought the Sioux a paper that was already written. It gave up the Black Hills. Only about one in ten of the adult Sioux men signed it, far fewer than the three-fourths the treaty required. On February 28, 1877, members of Congress made that paper a law anyway. With it they took the Black Hills.

In 1980 the judges of the US Supreme Court, who are called justices, decided the case *United States v. Sioux Nation*. Justice Harry Blackmun wrote for the court that the taking had broken the treaty. The justices agreed with an earlier award of $17.1 million for the land, plus interest, extra money of 5 percent for every year since 1877. In 1980 the total came to between about $102 million and $106 million.

The Sioux nations have never taken the money. They say the Black Hills were never for sale. The money sits in a federal account held by the US Interior Department, and officials keep its balance sealed. Published estimates put it at more than $1 billion. Frank Star Comes Out, president of the Oglala Sioux Tribe, has said, "We will never sell out our holy lands, the Black Hills, to the United States for monetary compensation."

Workers carved the mountain from October 4, 1927, to October 31, 1941. According to the National Park Service, nearly 400 men and women worked there, among them drillers and blacksmiths. They did about 90 percent of the carving with dynamite. In all, they removed about 450,000 tons of rock. Then drillers made rows of holes close together, a method called honeycombing, and smoothed the faces with hand tools. Workers were lowered down the 500-

foot face on steel cables, sitting in bosun chairs, which are seats hung from a cable. No worker died in the 14 years of carving. Today the memorial's staff consult with 21 Native nations connected to the site.

Gutzon Borglum

Who: The sculptor who designed Mount Rushmore. Before that, he carved a Confederate memorial at Stone Mountain, Georgia, a project the Ku Klux Klan helped pay for.

When and where: Stone Mountain, Georgia, from 1923. The Black Hills of South Dakota, 1927 to 1941.

Before he carved Mount Rushmore, Gutzon Borglum went to meetings of the Ku Klux Klan and took a deep part in Klan politics, according to reports in the Washington Post and Smithsonian magazine. No record proves he was a member. Confederate veterans had started the first Klan in Pulaski, Tennessee, in December 1865. Its members whipped, burned the homes of and murdered freed Black people and the people who helped them. Federal officials put that Klan down in the early 1870s.

On Thanksgiving night in 1915, William J. Simmons and 16 other men climbed Stone Mountain in Georgia. They burned a cross there and announced that the Klan was born again. Members of the new Klan preached white supremacy, the belief that white people should rule over everyone else. They were also against Catholics and Jews, and they wanted fewer immigrants let into the country.

At Stone Mountain, Borglum designed a carving of three Confederate leaders on horseback, Robert E. Lee, Stonewall Jackson and Jefferson Davis. Klan money helped pay for it. Work began in 1923, and Borglum unveiled the head of Lee in 1924.

Borglum quarreled with the businessmen who ran the Stone Mountain project, and they fired him. He then destroyed his models to protect his design. That made the directors angry. A warrant, a court paper ordering his arrest, was issued, and he fled Georgia.

In 1927 Borglum began Mount Rushmore. He directed the carving from then until he died in 1941. He died in Chicago on March 6, 1941, after surgery, a few days before his 74th birthday. His son, Lincoln Borglum, finished the work that year.

Nick Clifford

Who: The youngest worker on Mount Rushmore, and the last of its carvers to die.

> **When and where:** Mount Rushmore, South Dakota, 1938 to 1940. Died in 2019, at 98.
>
> Donald "Nick" Clifford was 17 when he was hired at Mount Rushmore in 1938. He was the youngest worker on the job. The Borglums hired him partly because they wanted him for the crew's baseball team, where he pitched.
>
> Clifford earned 55 cents an hour. He ran the winch, a machine that winds a cable. The cable carried men up the face of the mountain. He also drilled holes for the dynamite. He worked there until 1940.
>
> Clifford was the last of the carvers to die. He died on November 23, 2019, at the age of 98.

The Empire State Building and the Mohawk ironworkers

Builders took about 410 days to put up the Empire State Building in New York, from the first steel to the opening on May 1, 1931. Up to 3,400 workers were on the job each day. During the fastest stretch the steel frame rose about four and a half floors a week. The building has 102 stories and stands 1,250 feet tall, or 1,454 feet to the tip of today's antenna. It was the tallest building in the world until 1970, when the steel frame of the World Trade Center's North Tower rose higher.

Five workers died building it. That is the official count. A story that hundreds died is false. The photographer Lewis Hine took pictures of the men working on the steel for his book *Men at Work*.

Some of the riveting crews were Mohawk ironworkers from Kahnawake, a Mohawk community in Canada. The Mohawk are a Native nation. Riveters joined steel beams with rivets, hot metal pins that lock the beams together. Ironworkers put up the steel frames of buildings and bridges. Kahnawake men had done this work since the 1880s.

Kahnawake ironworkers had died on an earlier job, in 1907. On August 29 of that year, the south half of the Quebec Bridge fell while it was being built across the St. Lawrence River in Canada. James H. Marsh, writing in the Canadian Encyclopedia, gives 75 workers killed. Eve Cable, writing in *The Eastern Door*, the Kahnawake newspaper, gives 76. Thirty-three of the dead were Kahnawake men. A Royal Commission, a group set up to find the cause, blamed two engineers. Theodore Cooper was the consulting engineer, an expert brought in to oversee the design. He had made mistakes in the design and had lengthened the bridge to save money. John Deans, the chief engineer, kept the crews working after Cooper warned of danger.

After 1907, the women of Kahnawake made sure that the men of one family did not all work on the same job at the same time. *The Eastern Door* gives the rule this way: "If a lady had seven sons, they're not all going to the same job." Crosses made from the bridge's steel stand in the village cemetery. In 2007 a monument went up with a picture of each man who was killed and a 40-foot steel model of the bridge.

The Golden Gate Bridge

Eleven workers died building the Golden Gate Bridge in San Francisco, which opened in May 1937. On May 27, the first day, about 200,000 people walked across it. One died in October 1936. Ten died on February 17, 1937, when a falling work platform tore through the safety net under the bridge.

Joseph Strauss was the chief engineer. Charles Ellis, the engineer who worked out how the bridge's structure would hold its weight, did the detailed design and thousands of calculations from 1929 to 1931. Strauss fired Ellis before building began, and Ellis got no public credit for decades. In a 2007 report, officials of the Golden Gate Bridge District gave Ellis the main credit for the design.

> #### Joseph Strauss
>
> **Who:** The chief engineer of the Golden Gate Bridge, who hung a safety net under the bridge while it was built.
>
> **When and where:** The Golden Gate Bridge, which opened in May 1937.
>
> Joseph Strauss required hard hats on the Golden Gate Bridge job. He also spent about $130,000 on a safety net that hung under the bridge while it was built. It was the first large safety net used on an American bridge job.
>
> The net caught 19 men who fell. They called themselves the Halfway to Hell Club.

> #### Al Zampa
>
> **Who:** An ironworker who fell from the Golden Gate Bridge and lived. A bridge in California is named for him.
>
> **When and where:** The Golden Gate Bridge, October 19, 1936. From Crockett, California.
>
> Alfred Zampa was an ironworker from Crockett, California. On October 19, 1936, he slipped on wet steel and fell into the safety net. He was near the shore, where the net sagged down onto the rocks, and he broke four bones in his back.

> Zampa spent twelve weeks in the hospital and two years in a back brace. Then he went back to ironwork. He was one of the first members of the Halfway to Hell Club and later its unofficial spokesman, the man who spoke for the club without holding any title.
>
> In 2003 California lawmakers named the new bridge over the Carquinez Strait the Alfred Zampa Memorial Bridge.

Hoover Dam

By the official count, 96 men died building Hoover Dam. The count comes from the Bureau of Reclamation, the federal agency that runs the dam. It covers deaths from falls, rock slides, machinery and drowning. It leaves out deaths from heat, heart trouble and pneumonia, a sickness of the lungs. The exact number of deaths is not known.

The main builder was a company called Six Companies Inc. The records list 42 more workers who died of pneumonia. Workers said these men really died of carbon monoxide poisoning. They said officials of Six Companies listed the deaths as pneumonia so the company would not have to pay compensation claims. Those are payments owed when a worker is hurt or killed on the job. Carbon monoxide is a gas with no color or smell that comes from burning fuel. When a person breathes it in, it stops the blood from carrying oxygen. The workers blamed the gasoline-powered vehicles running inside the diversion tunnels, which were dug to carry the river around the building site. The tunnels often reached 140 degrees Fahrenheit and filled with thick exhaust. In nearby Boulder City, no one who did not work on the dam was recorded as dying of pneumonia in those years.

The first deaths on the official list came in 1922, during the surveys for the dam. On December 20 of that year J. G. Tierney drowned, and Harold Connelly also died that year. The last death on the list came 13 years to the day after Tierney's. On December 20, 1935, his son, Patrick Tierney, an electrician's helper, fell from one of the dam's intake towers, the towers that take in water.

A story says that men are buried inside the dam's concrete. It is false. Workers poured the dam as many separate blocks, in shallow layers, with crews standing over each pour. A body could not have been left inside. President Franklin D. Roosevelt dedicated the dam on September 30, 1935. Its generators began making electricity in 1936.

1950 to 2000

The Vietnam Veterans Memorial, dedicated in Washington in 1982, is a black stone wall set into the ground. The names of more than 58,000 Americans who died in the Vietnam War are cut into it. Earlier, in the 1960s and 1970s, builders put up a steel arch in St. Louis and two towers in New York, one of which was for a few years the tallest building in the world. While the arch was going up, Black workers were kept out of the building trades unions and so off the job, Justice Department lawyers later charged in court. Two men climbed the arch in protest. Workers also restored older landmarks, including the Statue of Liberty and Ellis Island.

The Space Needle

Builders put up the Space Needle in Seattle in about 400 days for a world's fair called the Century 21 Exposition. It opened on April 21, 1962, the first day of the fair. The tower is 605 feet tall, with a restaurant on top that turns around.

The Gateway Arch

The Gateway Arch in St. Louis is 630 feet tall and 630 feet wide, and its outside is stainless steel. The architect Eero Saarinen won the contest to design it, and the winner was announced in February 1948. Saarinen died in 1961, before building began. Workers built the arch from February 12, 1963, to October 28, 1965. Insurers had predicted 13 deaths, and no worker died.

Black workers were kept out of the construction jobs on the arch, a federal monument. Unions are groups that workers join to bargain together for jobs and pay. In St. Louis, the building trades unions, the unions of carpenters, plumbers, ironworkers and other builders, had almost all white members. Justice Department lawyers later charged in court that the leaders and members of these unions kept Black men out of the unions and so out of the jobs.

On July 14, 1964, Percy Green and Richard Daly climbed a 125-foot construction ladder on the unfinished north leg of the arch. The two men were activists, people who campaign for a cause, and they climbed to protest. An article by the Gateway Arch Park Foundation states that they stayed up for 6 hours. A St. Louis Public Radio report by Kavahn Mansouri and Elaine Cha states that Green was up there for more than four hours. Police arrested both men. Green later helped start the Action Committee to Improve Opportunities for Negroes, called ACTION, a St. Louis group that worked for fair hiring. "Negroes" was a word of that time for Black people.

In 1966 two Black plumbers, Elijah Smith and Oliver Parker, were hired to work on bathrooms in the arch's visitor center. White union workers walked off the job to protest the hiring of the two Black plumbers. Lawyers in the US Justice Department then sued the St. Louis Building and Construction Trades Council and five of its unions. They sued under Title VII of the Civil Rights Act of 1964. Title VII is the part of that law that forbids employers and unions to treat workers unfairly because of their race, color, religion, sex or national origin. It was the department's first lawsuit under Title VII charging a "pattern or practice," which means unfair treatment by race as a regular habit. Officials of the St. Louis building trades unions signed an agreement to end "all practices that were discriminatory," meaning every rule and habit that kept Black workers out.

Harold McComber

Who: A Mohawk ironworker from Kahnawake who built skyscrapers in New York.

When and where: Manhattan and Kahnawake, filmed in 1965.

Movie: *High Steel* (1965), a documentary by the National Film Board of Canada, directed by Don Owen. It is about McComber's working life.

Harold McComber was a Mohawk ironworker from Kahnawake. Like many Kahnawake men, he worked on the steel frames of skyscrapers in Manhattan. In 1965 the director Don Owen made a documentary film about his working life, called *High Steel*. The National Film Board of Canada produced it.

The World Trade Center

The architect Minoru Yamasaki designed the two towers of the World Trade Center in New York, each 110 stories tall. The ribbon-cutting was on April 4, 1973. The North Tower stood 1,368 feet. Its steel frame had passed the height of the Empire State Building in 1970, which made it the tallest building in the world. It kept that title until May 1973, about a month after the ribbon-cutting, when the steel frame of the Sears Tower in Chicago rose higher.

Philippe Petit

Who: A French high-wire walker who walked on a cable between the two towers of the World Trade Center.

When and where: New York, August 7, 1974.

Movie: *Man on Wire* (2008), directed by James Marsh. It won the Academy Award for Best Documentary Feature and is about the walk.

On August 7, 1974, Philippe Petit walked on a wire strung between the tops of the Twin Towers, about 1,350 feet above the ground. He and his friends had smuggled a cable up to the roofs and strung it from one tower to the other. Petit crossed eight times in 45 minutes.

Afterward police arrested him. The charges against him were dropped. In return, he put on a show for children in Central Park.

The Vietnam Veterans Memorial

Two long walls of polished black granite, set into the ground of the National Mall in Washington, form the Vietnam Veterans Memorial. The names of more than 58,000 Americans who died in the Vietnam War are cut into the stone, in the order they died. It was dedicated on November 13, 1982, and it became the most visited memorial in Washington.

Critics attacked the design before it was built. One veteran called it "a black gash of shame." Another critic said that burying the dead "in a black stone sarcophagus," a stone coffin, "is like spitting on their graves." Opponents of the design included Patrick Buchanan and Congressman Henry Hyde. The members of the US Commission of Fine Arts, a federal board that reviews designs in Washington, kept the wall. They also added a statue of three soldiers by Frederick Hart nearby, in 1984. Hart's design had won third place in the contest for the memorial.

Maya Lin

Who: The 21-year-old college student whose design won the contest for the Vietnam Veterans Memorial.

When and where: Yale University and Washington, 1981 to 1982.

Movie: *Maya Lin: A Strong Clear Vision* (1994). It won the Academy Award for Best Documentary Feature and is about Lin.

Maya Lin was a 21-year-old architecture student at Yale University when she won the contest to design the Vietnam Veterans Memorial. She had first drawn the design for a class. She was born in Ohio, where her parents were professors. They had escaped from mainland China as young adults.

The contest was the biggest design competition held in the United States up to then. The judges looked at the entries without knowing who had made them. They chose entry number 1026 over 1,420 others. In May 1981 officials came to Lin's college room to tell

> her she had won the $20,000 first prize.
>
> People who attacked the wall used Lin's age and her Chinese family background as reasons to change the design or drop it. At the dedication in 1982, no one spoke her name.

Restoring the old landmarks

From 1984 to 1986, workers restored the Statue of Liberty for its 100th birthday. They took down its original 1886 torch in 1984. It is now in the statue's museum. In its place they put a copy made of copper and covered in gold leaf, thin sheets of gold. The statue was dedicated again on July 4, 1986.

Ellis Island, in New York Harbor, was where federal officials checked arriving immigrants. On May 11, 1965, President Lyndon B. Johnson signed Proclamation 3656, a formal order from the president, which made Ellis Island part of the Statue of Liberty National Monument. Ellis Island's main building had opened in 1900. Workers restored it, and in 1990 it opened as a museum of immigration.

On the West Coast, from 1910, US officials held immigrants in barracks on Angel Island, in San Francisco Bay. Chinese immigrants held there had carved more than 200 poems into the barracks walls, and in 1970 the poems were found again. After that, people campaigned to save the barracks. In 1997 Angel Island Immigration Station became a National Historic Landmark.

2000 to Today

Since 2000, Americans have built memorials to people who were killed or enslaved: the victims of the September 11 attacks, the Black Americans murdered by lynch mobs, and the people held in slavery. In the same years, officials and work crews took down, moved or renamed hundreds of memorials to the Confederacy, the Southern states that fought to keep slavery in the Civil War. These memorials include statues and place names. In April 2025 researchers at the Southern Poverty Law Center, a group that campaigns for civil rights, counted 415 Confederate memorials removed, moved or renamed since 2015. By their count, 2,086 were still standing. In 2025 federal officials began putting some of the removed monuments back.

Ground Zero rebuilt

The National September 11 Memorial in New York stands where the Twin Towers stood. On September 11, 2001, hijackers took over four airliners. They crashed two of them into the North Tower and the South Tower, and fires from the crashes made both towers collapse. They crashed a third into the Pentagon, the headquarters of the US military, near Washington. The fourth, Flight 93, also crashed. The hijackers killed 2,977 people, not counting the 19 hijackers themselves, according to the 9/11 Memorial and Museum. Of those, 2,753 were killed in New York, 184 at the Pentagon and 40 on Flight 93.

The memorial opened on September 11, 2011, ten years after the attacks. It has two pools set into the footprints of the two towers. Each pool covers nearly an acre. Water falls 30 feet into each pool and then drops another 20 feet. Around the edges, bronze panels carry the names of 2,983 people. They are the people killed on September 11, 2001, and the six people killed in an earlier bombing of the towers in 1993.

The design, called *Reflecting Absence*, won a contest in 2004 against 5,201 entries from 63 countries. The museum under the memorial opened on May 21, 2014. On November 3, 2014, One World Trade Center opened nearby. It stands 1,776 feet to the tip of its spire. The height was chosen to match 1776, the year of the Declaration of Independence.

Michael Arad

Who: The architect who designed the National September 11 Memorial.

When and where: New York. He won the design contest in 2004, and the memorial opened in 2011.

Michael Arad was 34 years old and working as an architect for a New York City government agency when he entered the contest for the memorial. In his first sketches, he pictured two empty spaces cut into the surface of the Hudson River. His finished design put two pools where the towers had stood.

Arad worked with the landscape architect Peter Walker, who plans outdoor spaces such as parks. In 2004 the contest judges chose their entry from 5,201.

New memorials in Washington

In Washington, new memorials were built for Black Americans, among them the enslaved workers who helped build the Capitol. On February 28, 2012, members of Congress unveiled a marker in Emancipation Hall, the great hall of the Capitol Visitor Center. Emancipation means

freeing people from slavery. The marker is a block of Aquia Creek sandstone taken from the Capitol's East Front, which was built from 1824 to 1826. Its plaque says the stone "was quarried by laborers, including enslaved African Americans, and commemorates their important role in building the Capitol." Quarried means cut out of the ground.

The Martin Luther King, Jr. Memorial was dedicated on October 16, 2011. It was the first memorial to an African American in the area of the National Mall. At its center is a 30-foot carving called the Stone of Hope.

The National Museum of African American History and Culture opened on September 24, 2016, beside the Washington Monument. It is part of the Smithsonian. The architect David Adjaye led its design. He based the building's outside, a bronze-colored shape in three levels called the corona, on the art of the Yoruba. The Yoruba are an African people. The pattern of its metal screen copies ironwork made by enslaved and free Black craftsmen in the South.

Memorials to lynching and slavery

The National Memorial for Peace and Justice, in Montgomery, Alabama, is a memorial to Black people who were lynched. Lynching is a killing by a mob, without a trial. The lawyer Bryan Stevenson founded the Equal Justice Initiative (EJI), a legal group that does not make a profit. EJI built the memorial and opened it on April 26, 2018, with a museum called the Legacy Museum.

The memorial holds 805 steel blocks, each six feet tall, hanging from above. Each one stands for a county in the United States where EJI researchers found a record of a lynching. In their study *Lynching in America*, EJI researchers counted almost 4,400 lynchings of Black people from 1877 to 1950. A copy of each county's block stands at the site. EJI offers each copy to groups in that county to set up at home. A team called MASS Design Group designed the memorial, and it cost about $20 million, paid by private foundations.

In March 2024 EJI opened the Freedom Monument Sculpture Park nearby, on 17 acres with nearly 50 sculptures. Its National Monument to Freedom lists more than 122,000 last names taken from the 1870 census, the government's count of everyone in the country that year. Nearly five million Black people took those names. The 1870 census was the first time people who had been enslaved could claim a last name that the government would recognize. The monument stands 43 feet tall and 155 feet long, and EJI dedicated it on Juneteenth, June 19, 2024. Juneteenth marks June 19, 1865, the day Major General Gordon Granger of the US Army reached Galveston, Texas, with the news that enslaved African Americans were free.

Confederate monuments coming down and going back up

In 2018 researchers at the Southern Poverty Law Center (SPLC) reported that members of the United Daughters of the Confederacy had put up hundreds of Confederate statues at courthouses and other public places since the Civil War. The SPLC researchers found two main periods of building. The first began around 1900, while lawmakers in Southern states were passing Jim Crow laws. Lawmakers wrote these laws to force Black and white people apart and to take away Black people's rights. The second ran from the early 1950s through the 1960s, when segregationists, people who wanted to keep the races apart, fought the civil rights movement.

Hundreds of these memorials came down or were renamed after people were killed in three places: Charleston, Charlottesville and Minneapolis. On June 17, 2015, a 21-year-old white man named Dylann Roof sat in on a Bible study at the Emanuel African Methodist Episcopal Church in Charleston, South Carolina. After about an hour he opened fire and killed nine Black worshippers. Roof had posted pictures of himself with Confederate flags on his website, and he had written racist views there. On December 15, 2016, a federal jury found Roof guilty of all 33 federal charges against him. On January 10, 2017, the federal court sentenced him to death.

In Charlottesville, Virginia, Paul Goodloe McIntire paid for a statue of the Confederate general Robert E. Lee, and it was dedicated in 1924. On February 6, 2017, the members of the city council voted 3 to 2 to remove it. White supremacists then organized a rally called Unite the Right around the statue. On August 12, 2017, James Alex Fields Jr. drove his car into a crowd of people protesting against the rally. He killed Heather Heyer, a 32-year-old paralegal, a worker who helps lawyers, and injured many others. Counts of the injured run from 19 to 29. In December 2018 a Virginia jury found Fields guilty of first-degree murder, the most serious kind of murder, done on purpose. In 2019 he pleaded guilty to 29 federal hate crimes, crimes against people chosen because of their race, religion or a similar trait, and a federal judge sentenced him to life in prison.

City workers took the Charlottesville statue down on July 10, 2021. City officials gave it to the Jefferson School African American Heritage Center. In October 2023 the staff of the center's Swords into Plowshares project had the statue melted down at a foundry, a workshop where metal is melted and poured into molds.

On May 25, 2020, Minneapolis police officer Derek Chauvin murdered George Floyd by kneeling on his neck, back and shoulder for about ten minutes. In 2021 a jury convicted Chauvin of murder. Protests followed Floyd's death. SPLC researchers counted at least 168 Confederate symbols removed in 2020 alone. In June 2020 Virginia Governor Ralph Northam

ordered the removal of Richmond's Lee statue, a 12-ton monument put up in 1890. The judges of the Supreme Court of Virginia then refused to block the removal in two lawsuits. ABC News reporters Meredith Deliso and Emily Shapiro wrote that a crew led by Devon Henry, who owned the construction company doing the work, took the statue down on September 8, 2021.

In April 2025 SPLC researchers counted 2,086 Confederate memorials still standing in public places. In their count, memorials include place names and other symbols as well as monuments such as statues, and 685 of the 2,086 were monuments. Rivka Maizlish of the SPLC called the memorials "the results of a mass propaganda campaign."

In 2025 federal officials began putting some monuments back. In June 2020, protesters had pulled down a statue of the Confederate general Albert Pike in Washington and set it on fire. In October 2025 National Park Service workers put it back up. They cited a historic preservation law. They also cited an executive order, a written command from the president, that President Donald Trump had signed on restoring removed monuments.

The Confederate Memorial at Arlington National Cemetery was put up in 1914 by the United Daughters of the Confederacy. The sculptor, Moses Ezekiel, had fought for the Confederacy. The memorial shows "an enslaved man following his owner to war." It also shows an enslaved woman as a "mammy," holding a white officer's child. The "mammy" was a made-up picture of an enslaved Black woman who cared for a white family's children and seemed happy in slavery. The picture hid the truth that enslavers separated these women from their own children. A commission set up by Congress found that the memorial showed "highly sanitized depictions of slavery." That means pictures of slavery with the cruelty cleaned out. On that commission's advice, the memorial was taken down in December 2023. The *Stars and Stripes* report on it does not say who did the work. In August 2025 Defense Secretary Pete Hegseth announced that it would return in 2027. The newspaper *Stars and Stripes* reported that the repairs would cost about $10 million.

Exhibits about slavery at the President's House

In 2026, National Park Service workers took down an exhibit about slavery in Philadelphia, and a federal judge ordered it put back. The President's House site marks where George Washington lived while he was president. Its exhibit panels described the lives of nine people Washington held in slavery there. The workers removed the panels in January 2026, following President Trump's executive order called "Restoring Truth and Sanity to American History." Lawyers for the City of Philadelphia sued. On February 16, 2026, US District Judge Cynthia Rufe ordered the panels restored while the case went on, and workers began putting them back

three days later. Lawyers for the federal government appealed, which means they asked a higher court to change the ruling. By July 2026, judges of the Third Circuit Court of Appeals had agreed that officials of the Trump administration had the power to replace the exhibit.

Old landmarks, new names and owners

Sugarloaf Mound, on the south side of St. Louis, is the only Native mound left in that city. Native people built about 40 mounds there between about the years 600 and 1300. As the city grew, people dug away all the others. In 1869 workers dug away Big Mound, the largest, and its earth was sold to a railroad to build up the beds for its tracks. Inside it the workers found 32 burials, the graves of people, in two chambers. No surviving record says what became of the bones. In 1928 someone built a house on top of Sugarloaf Mound. The Osage Nation bought that house and about a third of the mound in 2009, and tore the house down in 2017. In 2025, working with an arts group called Counterpublic, the Osage Nation got the last two pieces of the property transferred to it. Afterward Andrea Hunter, the Osage Nation's Historic Preservation Officer, said, "It has been a long 17-year journey, and I am thrilled to finally see the entire mound come under Osage Nation control." She said her office must now "remove all the structures from the properties and stabilize the mound." Osage leaders plan to build a center there to teach visitors about the mound.

In 2009 workers finished restoring the barracks of the Angel Island Immigration Station in California. On February 22, 2018, President Donald Trump signed a law that gave the Jefferson National Expansion Memorial in St. Louis, the grounds of the Gateway Arch, a new name, Gateway Arch National Park. It is the smallest national park in the country.

Chapter 13: The Elements

Before 1500

Native miners near Lake Superior were digging and shaping copper at least 9,500 years ago. A 2021 study places them among the first coppersmiths in the world. A coppersmith is a person who makes things out of copper. All the land that later became the United States was Native land before 1500, and no miner or metalworker from these thousands of years is known by name.

Copper is one of the chemical elements. Everything is made of tiny pieces called atoms, far too small to see. An element is a substance made of only one kind of atom. Copper, iron, gold and silver are all elements. Nobody anywhere on Earth yet knew what a chemical element was. People here mined copper, gathered salt and colored earth, and chose hard stone for tools. In some regions they also worked iron that had fallen from space. They turned these materials into tools, beads, ornaments and paint.

Copper from Lake Superior

Copper that lies in the ground as pure metal is called native copper. The Lake Superior country, in what are now Michigan, Wisconsin and Minnesota, has veins of it running through the rock. Native miners dug out this copper and hammered it into spear points, knives, fishhooks and ornaments. They also made awls, which are thin, pointed tools for punching holes.

In 2021 a team led by the geologist David Pompeani published new dates for this copper work in a journal called *Radiocarbon*. A journal is a magazine where scientists publish their studies. A geologist is a scientist who studies rocks and the Earth. Radiocarbon dating is a way to measure the age of things that were once alive, such as wood or bone. The team used 53 radiocarbon dates. They found that the copper work began at least 9,500 years ago, which is about 3,500 years earlier than scientists had thought. The work was busiest between about 7,000 and 5,000 years ago.

The oldest known copper work in the Middle East is a pendant about 8,700 years old. A pendant is an ornament that hangs from a cord. So the Lake Superior copper work is as old as the earliest known copper work in the Middle East, or older. Writers at the journal *Science* reported the 2021 study under the headline "Ancient Native Americans were among the world's first coppersmiths."

Traders carried Lake Superior copper hundreds of miles along Native trade routes. On the same routes they also carried turquoise, shells and obsidian. Turquoise is a blue-green stone. Obsidian is a natural glass that forms from the lava of volcanoes.

Iron from space

Before 1500, the only iron metal that people here could work came from meteorites. A meteorite is a piece of rock or metal from space that has fallen to Earth. Nobody here got iron out of rock by smelting yet. Smelting means heating rock until the metal inside it melts out.

In 1945, archaeologists dug 22 iron beads out of Hopewell burial mounds near Havana, Illinois. Archaeologists are scientists who dig up and study the things people left behind long ago. Hopewell is the name for a Native way of life in the woodlands of eastern North America from about 2,000 to 1,600 years ago. A burial mound is a hill of earth that people built over the graves of their dead. People made the beads about 2,000 years ago. In 2017, Timothy McCoy of the Smithsonian and four other scientists published a study of the beads in the *Journal of Archaeological Science*. They found that the iron came from the Anoka meteorite, an iron meteorite from Minnesota.

That means people had carried or traded the metal several hundred miles before anyone made it into beads. The beadmakers shaped the iron by hammering it. They used the same hammering skills that people used on copper.

Gold, silver, ochre, salt and stone

In some regions, metalworkers made ornaments of gold and silver. Red and yellow ochre, a colored earth, went into paint. The color of ochre comes from iron oxides. An iron oxide is a compound of iron and oxygen. A compound is a substance made of two or more elements joined together.

People gathered salt and traded it. Salt is a compound of two elements, sodium and chlorine. They made tools of flint and chert, two hard stones. Both are made of compounds that contain the element silicon.

The 1500s

In the 1500s, Spanish expeditions came looking for gold and silver. An expedition is a long journey made by a group of people for a purpose. The Spaniards found no cities of gold in the lands that later became the United States. The land was still Native land from coast to coast. People here worked the same copper, gold and meteorite iron as before. Spaniards brought some metal of their own into their few outposts, the small forts and settlements they built.

Spanish gold hunters, 1539 to 1543

Hernando de Soto led a Spanish expedition across the Southeast from 1539 to 1543. Francisco Vázquez de Coronado led another across the Southwest from 1540 to 1542. Both men were following stories of cities full of gold. Neither man found one.

In the same century, Spaniards found large amounts of silver in Mexico and South America, not in the future United States. Nobody here or anywhere else yet had a science of elements. In Europe, the modern idea of an element had not been written down. People there who studied what things are made of still worked by alchemy, the older practice that came before chemistry. Alchemists tried to turn ordinary metals, such as lead, into gold by heating them and trying to make them purer. They kept most of their methods secret.

The 1600s

English colonists built ironworks in Virginia and Massachusetts in the 1600s. An ironworks is a place where workers make iron out of ore, which is rock that contains a metal. Fighters of the Powhatan, a union of Native towns in eastern Virginia, destroyed the Virginia works in 1622. Building at Saugus, in Massachusetts, began in 1646, and the works there ran until about 1670. Scottish prisoners of war did forced labor at Saugus. People in Europe, Asia and Africa had already been smelting iron for thousands of years.

Falling Creek, 1619 to 1622

In 1619, English colonists began building an ironworks on Falling Creek, near present-day Richmond. They built it for the Virginia Company, the English business that King James I had allowed in 1606 to start a colony in Virginia. By March 1622 the furnace was ready to make iron, or close to it.

Opechancanough was the head chief of the Powhatan, a union of Native towns and nations in eastern Virginia. The English colony stood on Powhatan land. English colonists had been moving farther up the James River and settling more of that land. From 1618, Virginia Company officials gave land to new colonists, who planted it in tobacco. By 1620 colonists were taking the land they wanted from the Powhatan without asking or paying, according to the historian Betty Wood. Company officials, George Thorpe most of all, also pressed the Powhatan to send their children to live among the English. The English wanted to school the children and make them Christian.

Opechancanough planned attacks on many parts of the colony to drive the English out for good. On March 22, 1622, Powhatan fighters destroyed the ironworks at Falling Creek and killed twenty-seven people there. The colonists never managed to rebuild the works.

Hammersmith at Saugus

In 1646 Richard Leader began building an ironworks on the Saugus River near Boston. He worked for the Company of Undertakers of the Iron Works in New England. In the 1600s, an undertaker meant a person who took on a business project. People called the works Hammersmith. Its furnace was running by the next year.

Hammersmith was the first ironworks in North America where every stage of the work happened on one site. A blast furnace is a tall furnace with air blown into its fire, which makes it hot enough to melt iron out of ore. The iron that came out of it was called pig iron. A forge is a workshop where workers heat iron and hammer it. At the Saugus forge, workers hammered pig iron into wrought iron, a tougher iron that bends instead of breaking. The rolling and slitting mill had rollers that pressed the iron flat and blades that cut it into strips. The strips were the raw material for nails, tools and horseshoes. Seven waterwheels powered the machines.

The ore was bog iron. Workers collected it from swamps and ponds. The works ran until about 1668 to 1670. The site is now Saugus Iron Works National Historic Site.

Scottish prisoners at Saugus

Scottish prisoners of war did forced labor at Saugus. English soldiers under Oliver Cromwell took these Scottish soldiers prisoner at the Battle of Dunbar in 1650 and the Battle of Worcester in 1651. About 400 prisoners from the two battles reached New England in all, according to the National Park Service. The prisoners had no choice about going or about the work.

English soldiers led by Oliver Cromwell won the Battle of Dunbar in September 1650. Cromwell let more than 5,000 of the Scottish prisoners go. He marched about 3,900 of the fittest south to the English city of Durham. On the march their English captors gave the Scots no food and no shelter. The captors killed some of the prisoners for refusing to keep walking. At Durham the English locked the prisoners in the city's cathedral, a large church that was not in use at the time.

A group of English leaders called the Council of State decided to send most of the prisoners to the colonies. In November 1650 they ordered Sir Arthur Haselrig, the governor at Newcastle, to hand over 150 Dunbar prisoners. The prisoners went to agents of John Becx and Joshua Foote. Becx and Foote were two of the main investors in the Company of Undertakers, which had built the Saugus works. The prisoners sailed from England on a ship called the *Unity* and reached Boston in December 1650. The records do not show how many died on the voyage.

The men running the Company of Undertakers kept 62 of the prisoners for the ironworks, according to the historian Marsha Hamilton. They sent 36 to Saugus and 17 to a Boston warehouse run by William Aubrey, a manager for the company. Hamilton does not say where the other nine of the 62 went. The company's men sold the rest of the prisoners to farmers, merchants and other mills.

The men running the company forced many of the Scots to work five to seven years under indentures at the Saugus ironworks. An indenture was a written agreement that bound a person to work for a master for a set number of years. These men had no say in theirs. They had to work to pay back the cost of their voyage, food, shelter, care and clothing. National Park Service staff give the term at Saugus as seven years. There, most of the Scots cut wood, made charcoal or did heavy work that needed no special skill. The charcoal makers were called colliers. Other prisoners did hard and dangerous forced labor elsewhere in Massachusetts and in New Hampshire and Maine, for the farmers, merchants and mill owners who bought them.

Meanwhile in Europe

Chemistry is the science of what substances are made of and how they change. In Europe in the 1600s, chemists began to separate their work from alchemy. Robert Boyle published his book *The Sceptical Chymist* in 1661, and the book is one sign of that split. Every element discovery of this century happened in Europe. Phosphorus was found in the city of Hamburg in 1669.

1700 to 1750

By about 1750, colonists were shipping raw iron from their own furnaces to Britain. Raw iron meant iron not yet made into finished goods. Colonists had built ironworks in New England, Pennsylvania, Maryland, Virginia and New Jersey. The owners of many ironworks forced enslaved people to do much of the labor. Nobody discovered an element anywhere in the Americas in these years, and element science still happened only in Europe.

Enslaved and indentured ironworkers

Owners held enslaved people as property and forced them to work without pay. Five rich Maryland planters, owners of large farms called plantations, founded the Baltimore Iron Works in 1731. They were Dr. Charles Carroll, his cousins Charles and Daniel Carroll, Daniel Dulany and Benjamin Tasker. The partners put up money and supplied enslaved workers. The works opened with 89 workers, and 42 of them were enslaved, according to the staff of the Mount Clare Museum House in Baltimore.

Workers at the Baltimore furnace hauled cartloads of charcoal, oyster shells and iron ore to its top in 12-hour shifts. The furnace ran day and night, six or seven days a week. Many of the workers were enslaved people. Others were convicts, people found guilty of crimes in Britain and shipped across the ocean as punishment. The owners did not give the workers enough food, according to the museum. Some enslaved and convict workers ran away, and others worked slowly or carelessly on purpose.

British investors set up the Principio Company in Maryland in 1719. Its Principio Furnace began with workers who were mostly indentured servants from Britain. By the middle of the 1700s, more of the workers there were enslaved African Americans, many of them in skilled jobs. Principio's owners gave their enslaved and indentured workers mostly corn and salt pork to eat. Some of these workers tried to escape. Historians at the University of Maryland and the Maryland Historical Trust surveyed the state's old industries. They wrote that escape attempts were "not uncommon."

The Iron Act of 1750

Parliament was the lawmaking body of Great Britain. In 1750 its members passed the Iron Act. They wrote it to encourage colonists to keep making raw iron and sending it to Britain. Raw iron meant pig iron and bar iron, which is iron hammered into bars. The act also stated that colonists could not build new mills to make finished ironware, meaning iron goods ready for use. The members of Parliament wanted that business kept in Britain.

Colonists ignored the ban. After 1750 they built more than sixty new ironworks, about twenty of them in Pennsylvania. By the American Revolution, colonists made more iron than people in England and Wales did. By a common ranking, the colonies were third in the world for iron.

Other elements turned up in colonial homes every day. Lead went into gunshot and into pewter, a gray metal made mostly of tin and used for plates, bowls, mugs and spoons. Kettles and buttons were made of copper or of brass, a metal made partly of copper. Silver and gold arrived in the colonies as Spanish coins.

1750 to 1800

Between 1750 and 1800, chemists in Europe turned chemistry into a modern science. Among them were the Swedish chemist Carl Wilhelm Scheele and the French chemist Antoine Lavoisier. They worked out what an element is and found new ones. Nobody in the United States discovered an element in these years. Americans used elements in their coins and dug ores out of the ground.

Joseph Priestley collected the gas oxygen on its own in England in 1774 and moved to Pennsylvania twenty years later. In Maryland, owners of iron furnaces held hundreds of Black people in slavery. In North Carolina in 1799, a 12-year-old boy found the first gold in the United States that an expert confirmed was real.

Three elements in the new coins

A mint is a place where workers make coins. Lawmakers in Congress passed the Coinage Act, and it became law on April 2, 1792. Under it, government officials set up the United States Mint. The act also stated that the new country's coins would be made of three elements. Gold went into coins called eagles, silver into dollars and smaller coins, and copper into cents.

Enslaved ironworkers in Maryland

After the Revolution, Maryland officials took a one-fifth share of the Baltimore Iron Works from Daniel Dulany, a Loyalist. A Loyalist was a colonist who sided with Britain in the war. In 1785 they offered the share for sale in a newspaper advertisement, in the *Maryland Gazette*. The advertisement listed more than 200 enslaved Black people at the works, according to the Mount Clare Museum House. Their owners made them work without pay.

Four brothers, Thomas, James, Baker and Roger Johnson, built Catoctin Furnace in Maryland. It was making iron by 1776. Thomas Johnson later became the first governor of the state of Maryland. In 1803 Baker Johnson became the only owner. A Johnson owner enslaved more than 80 people at the furnace, according to the Catoctin Furnace Historical Society, which names him only as "Johnson." The society names some of the enslaved men, among them Collier Sam, Waggoner's Henry and Harvey. A collier made charcoal, and a waggoner drove wagons.

At least 271 enslaved people and an unknown number of free African Americans worked at Catoctin, according to a 2023 study in the journal *Science*. They mined ore, made charcoal, worked the forge, filled the furnace, drove wagons and cut wood. Others worked in the owners' houses and fields. The furnace had a cemetery for its African American workers, with burials from 1774. Between about 1825 and 1850, the owners switched to paid workers, most of them white.

On August 4, 2023, a team of scientists published a study in the journal *Science*. Three of them planned and led the work. They were David Reich of Harvard Medical School, Douglas Owsley of the Smithsonian and Joanna Mountain of the company 23andMe. They studied the DNA of 27 people buried in the Catoctin cemetery. DNA is the material inside the body's cells that parents pass down to their children. The team linked the 27 people to nearly 42,000 living relatives.

Joseph Priestley

Who: The English chemist credited with discovering oxygen, who spent his last ten years as an immigrant in Pennsylvania.

When and where: Isolated oxygen on August 1, 1774, in England. Moved to America in 1794. Lived in Northumberland, Pennsylvania, until his death on February 6, 1804.

On August 1, 1774, Joseph Priestley heated a substance called mercuric oxide with a burning lens. Mercuric oxide is a compound of the element mercury and oxygen. A burning lens is a glass lens that bends sunlight to one hot point. Priestley isolated a gas from the mercuric oxide, which means he collected it apart from everything else. The gas was later named oxygen.

Carl Wilhelm Scheele, in Sweden, had found the same gas earlier than Priestley did. Scheele published his work later. The French chemist Antoine Lavoisier gave oxygen its name.

Priestley invented carbonated water in Leeds in 1767. Carbonated water is water with bubbles of gas in it. In 1770 he gave rubber its English name, because he found it was good for rubbing out pencil marks.

Priestley was also a minister, a leader of a church. He preached outside the official Church of England, and many people in Birmingham, England, turned against him for his views on religion. In 1791 a mob there burned his home and his laboratory. In 1794 he left England for Pennsylvania and settled in Northumberland, where his house was finished in 1798. There he built what was then the best chemistry laboratory in the United States and identified the gas carbon monoxide. The University of Pennsylvania offered him a job as a professor, and he turned it down. Priestley died in Northumberland in 1804.

American chemists met at his house in 1874, one hundred years after he isolated oxygen. That meeting was a step toward the founding of the American Chemical Society in 1876. The house is now a National Historic Landmark.

Conrad Reed

Who: A 12-year-old farm boy who found the first gold in the United States that an expert confirmed was real.

When and where: 1799, Little Meadow Creek, Cabarrus County, North Carolina.

In 1799 Conrad Reed pulled a heavy yellow rock out of Little Meadow Creek. The creek ran through the farm of his father, John Reed, in Cabarrus County, North Carolina. The rock was a gold nugget that weighed 17 pounds. A nugget is a lump of metal found in the ground.

The family did not know the rock was gold. They used it to hold a door open for about three years. In 1802 a jeweler identified it as gold. The jeweler bought it from John Reed for $3.50, about a week's wages. It was worth about $3,600 at the time.

Conrad's find was the first gold found in the United States that an expert checked and showed was real. After the find, people in North Carolina began the first gold mining in the United States.

1800 to 1850

Between 1800 and 1850, miners rushed to dig gold in the South and copper in the North. The Georgia gold lay under Cherokee land, and the Michigan copper lay under Ojibwe land. Georgia lawmakers gave the Cherokee land away by lottery, a drawing of names by chance. In 1842 a United States official signed a treaty, a written agreement between nations, under which Ojibwe bands gave up the copper country. The bands were groups within the Ojibwe nation.

A mineral rush happens when thousands of people hurry to a place where someone has found a valuable metal. Everything is made of tiny pieces called atoms, and an element is a substance made of only one kind of atom, such as gold or copper. Nobody in the United States discovered a new element in these years. In Europe, chemists such as Humphry Davy and Jöns Jacob Berzelius found one element after another.

Gold on Cherokee land

In 1799 Conrad Reed, a 12-year-old boy, found a 17-pound lump of gold in a creek on his family's farm in North Carolina. After that, more people dug for gold on the Reed farm and along the creeks near it. That mining grew from 1803. Miners in North Carolina dug more gold than miners in any other state until the California gold rush of 1849.

The first printed report of gold in Georgia appeared in the *Georgia Journal*, a newspaper, on August 1, 1829. The gold was in the Cherokee Nation, the homeland of the Cherokee people. By the spring of 1830, about 4,000 miners had crowded onto Cherokee land to dig. The gold town of Dahlonega takes its name from the Cherokee word for "golden."

Georgia's lawmakers met as the Georgia General Assembly. On December 24, 1831, they passed a law. Under it, they divided "the original Cherokee Indian territory" into lots and gave it away by lottery. In a lottery, names are drawn by chance. In the Gold Lottery, winners received lots of 40 acres in the gold country for a fee of $10 a lot. The drawings ran from October 22, 1832, to May 1, 1833. Single men aged 18 or older who were United States citizens, widows and married men could enter if they had lived in Georgia for three years. Families of orphans could enter too. The lawmakers barred anyone who had mined gold in the Cherokee territory since June 1, 1830. They also barred anyone who lived in the Cherokee territory, so the Cherokee who lived there could not enter. The lots went to white Georgians.

In 1838 President Martin Van Buren sent General Winfield Scott to force the remaining Cherokee off their land and west of the Mississippi River. Scott commanded about 7,000 soldiers and members of state militias, which were part-time armies run by the states. These

troops forced the Cherokee into stockades, which are pens fenced with tall wooden posts. In June 1838 a missionary wrote that the Cherokee "have been dragged from their houses." In Georgia, he wrote, "multitudes were allowed no time to take any thing with them except the clothes they had on."

Scott's soldiers forced more than 16,000 Cherokee to leave for the west in 1838 and 1839. This forced journey is called the Trail of Tears. Over 4,000 Cherokee died of cold, hunger and disease along the way, by the usual count. National Park Service staff count more than a thousand deaths on the trip itself and perhaps several thousand more from the results of the removal. The demographer Russell Thornton, a scientist who studies the size of populations, puts the Cherokee losses at about 8,000 or more.

Copper on Ojibwe land

Douglass Houghton was the state geologist of Michigan, a scientist the state paid to study its rocks. In 1840 he published a report on the copper of Michigan's Upper Peninsula. The Keweenaw Peninsula there has veins of pure native copper. Veins are long, thin bands of metal running through rock, and native copper is copper that lies in the ground as pure metal. Native miners had worked those same veins for thousands of years.

The land belonged to Ojibwe bands. On October 4, 1842, a United States commissioner named Robert Stuart signed the Treaty of La Pointe with Ojibwe bands. A commissioner is an official sent to make an agreement. Under the treaty, the Ojibwe bands gave up land along the south shore of Lake Superior. That land included the Keweenaw copper country.

The treaty states that the Ojibwe would receive $12,500 a year in coins and $10,500 a year in goods for 25 years. It also states that $75,000 would go toward debts the Ojibwe owed to traders. The Ojibwe kept the right to hunt on the land "until required to remove by the President of the United States." That meant they could hunt there only until the President ordered them to leave.

The treaty never uses the word copper, but people came to call it the Copper Treaty. According to the Bad River Band of Ojibwe and the Lac Courte Oreilles Ojibwa College, United States officials wanted the copper.

In 1843, United States government officials opened an office at Copper Harbor to handle land with metal in it. Thousands of prospectors poured into the Upper Peninsula from that year on. A prospector is a person who searches the ground for metal. That rush was the nation's first great copper rush. The Keweenaw stayed the country's biggest source of copper into the 1880s.

The Ontonagon Boulder

The Ontonagon Boulder is a single lump of pure copper that weighs 3,708 pounds. It lay in the Ontonagon River country near Lake Superior. The Ojibwe had known the boulder for a long time, and they held it sacred. The Keweenaw Bay Indian Community, made up of the L'Anse and Ontonagon bands of Lake Superior Ojibwe, states that people made offerings at it.

Julius Eldred was a merchant from Detroit. In the summer of 1841 he made a deal for the boulder with Okandikan, a leader of the Ontonagon band of Ojibwe. Eldred agreed to pay $45 right away and $105 more if he managed to move it. In 1843 Eldred hauled the sacred boulder away. Walter Cunningham was an agent of the United States government in charge of the lands with metal in them. Before Eldred could leave Copper Harbor, Cunningham made him hand the boulder over to the government in Washington. Later, the members of Congress paid Eldred money to make up for his loss.

The boulder sat in a yard of the War Department until 1860. The War Department was the part of the United States government that ran the army. In 1860 the boulder was moved to the Smithsonian, the national museum in Washington, D.C., and put on display.

In 1991, the Keweenaw Bay Indian Community formally asked the Smithsonian to return the boulder. In 2000 Smithsonian officials refused. They said the boulder did not fit the meaning of a sacred object under the law on returning Native objects. The boulder stayed at the Smithsonian.

Lead at Galena

Miners also dug lead in these years, in Missouri and in the Galena district of Illinois and Wisconsin. Galena is a lead ore, a rock that contains lead. The town of Galena, Illinois, is named for that ore.

1850 to 1900

In 1886 Charles Martin Hall, a 22-year-old in Oberlin, Ohio, found a cheap way to make aluminum. By the middle of the 1890s, the price of aluminum had fallen from about $12 a pound to less than $1. Scientists abroad already knew aluminum as an element. What Hall found was a process, a series of steps for making the metal.

Gold miners in California used mercury and released about 13 million pounds of it at their mines and into rivers. Hatmakers in Danbury, Connecticut, breathed mercury at work and were poisoned by it. Miners took gold from the Black Hills, land that belonged to the Sioux. In 1877 the members of Congress voted to take the Black Hills from the Sioux.

Mercury in the rivers and the hat shops

Mercury is an element. It is a metal that stays liquid at room temperature, and people also call it quicksilver. Gold miners used mercury to catch the fine bits of gold in the gravel they dug. They lost mercury into the rivers.

The United States Geological Survey is the government office that studies the country's rocks and water. Its scientists found that California mines produced more than 220 million pounds of mercury between 1850 and 1981. The mercury came from mines in the Coast Range, a line of mountains along the California coast. About 26 million pounds of it went into California's gold mining. Placer miners wash gold out of sand and gravel in streams. They released about 10 million pounds of mercury. About 80 to 90 percent of that 10 million pounds was released in the Sierra Nevada mountains. Miners at hardrock mines, which are dug into solid rock, released about 3 million pounds more.

By 2005, California officials had warned people about eating fish from about 20 lakes, rivers and other waters, because of mercury. The Geological Survey's scientists list the ways this mercury reaches people: in fish they eat, in mud they handle and in vapor they breathe. A vapor is a gas that rises off a liquid or a solid. The form of mercury that builds up most easily in living bodies, fish included, is called methylmercury. It is also the form most poisonous to people. Fish in the Bear and Yuba river areas carry enough mercury to put people's health at risk, the scientists found. They give no count of people poisoned by the gold miners' mercury.

People in Danbury, Connecticut, had made hats since 1780. To make felt, a thick cloth of pressed fur, they soaked fur in a liquid that contained mercury nitrate, a compound of mercury. A compound is a substance made of two or more elements joined together. The fur then matted together into felt. This step was called carroting. As they worked, the hatters breathed in the mercury as vapor and as dust.

The hatters' mercury poisoning first appeared in medical writing in 1860. People called it the Danbury shakes. The poisoned hatters had tremors, which are shaking movements a person cannot stop. Their skin itched, burned or peeled. Some lost their hair and teeth. They sweated,

swelled up, felt dizzy and got confused. The mercury slurred their speech and made them stumble, and people mistook the shaking hatters for drunks. In bad cases, hatters had hallucinations, which means they saw or heard things that were not there.

The members of Connecticut's State Board of Health watched the mercury's effects in Danbury's hat factories in the 1880s and 1890s. They did not act, because the carroting was not harming people outside the factories. The historian Shirley Wajda, who wrote the history of the Danbury shakes for Connecticut Humanities, names no factory owner and gives no count of hatters poisoned before 1900.

Silver, copper and a table from Russia

In 1859, miners found the Comstock Lode at Virginia City, Nevada. A lode is a long, rich band of ore inside rock. The Comstock was the richest find of silver ore ever made in North America. Its ore held gold as well as silver, and miners rushed there too.

In 1869, Dmitri Mendeleev published his periodic table of the elements in Russia. The periodic table is a chart that arranges the elements in order, with elements that act alike grouped together. Mendeleev used his table to predict elements that nobody had found yet. Every element that Americans discovered later went into Mendeleev's table.

Electric lights and the telephone spread through American cities in these years. Both ran on copper wire. The copper came from Michigan, and later from Butte, Montana.

Gold from the Black Hills

The Black Hills, in what is now South Dakota, belonged to the Sioux. The Fort Laramie Treaty of 1868 was an agreement between the United States and the Sioux. It states that the Black Hills were set apart for the "absolute and undisturbed use and occupation" of the Sioux.

In 1874, the Army officer George A. Custer, a lieutenant colonel, led an expedition into the Black Hills. An expedition is a long journey made by a group of people for a purpose. Miners went along with Custer's soldiers. The men of the expedition confirmed that there was gold. In August 1874 they sent the news out, and miners poured in. In late 1875, President Ulysses S. Grant ordered the Army to stop keeping the miners out of the Black Hills, the land the 1868 treaty had set apart for the Sioux. By 1876, about 11,000 prospectors were at Custer City.

In August 1876 the members of Congress voted to stop paying for food for the Sioux unless the Sioux gave up the Black Hills and their hunting grounds outside the reservation. The members of Congress asked the President to choose a commission, a group of officials given a special job. George Manypenny led the commission to the Sioux that September. He and the other

commissioners brought an agreement written in advance. They told the Sioux that the United States no longer had to feed them, and they showed the agreement only to chiefs and leading men. Only about 10 percent of adult Sioux men signed it. The 1868 treaty required three-fourths of them to sign. The members of Congress made it law anyway in 1877.

On June 30, 1980, in a case called *United States v. Sioux Nation of Indians*, the justices of the Supreme Court ruled that the 1877 law was a taking. In law, a taking happens when a government takes property and must pay its owner. The justices awarded the Sioux $17.1 million plus interest from 1877. Interest here meant extra money for every year the Sioux had waited to be paid. The total came to about $106 million in all. The Sioux refused the money. Taking it would have meant giving up their claim to the land. By 2022, the money they refused had grown to about $2 billion, according to South Dakota Public Broadcasting.

An aluminum tip for the Washington Monument

In 1884, workers finished the Washington Monument with a pyramid of aluminum on its top. Aluminum was rare then. In 1884 it cost about $1 an ounce, the same price as silver. That comes to about $16 a pound. Other price records for the early 1880s give a lower figure, about $12 a pound.

An engineer is a person who plans and builds large works such as bridges and buildings. Colonel Thomas Lincoln Casey of the Army Corps of Engineers, the Army's group of engineers, was the engineer in charge of finishing the monument. He talked over the metal for the tip with William Frishmuth, who owned a foundry in Philadelphia. A foundry is a factory where workers melt metal and pour it into molds. Frishmuth chose aluminum, and Casey agreed. Aluminum matched the color of the monument's granite and would not stain. It also polished well and could be engraved.

Frishmuth cast a pyramid that weighed 100 ounces. It was the largest piece of aluminum anyone had yet cast. He first asked $75 for it and then sent a bill for $256.10. An assistant of Casey's named Davis bargained him down to $225.

Before the tip went up, Frishmuth showed it at the Tiffany's store in New York without permission. The tip sat on the floor, so visitors could step over the top of the Washington Monument. Workers set it in place on December 6, 1884.

> #### Charles Martin Hall and Julia Brainerd Hall
>
> **Who:** A 22-year-old Ohio college graduate who invented the cheap way to make aluminum, and his older sister, a chemist whose notes helped win the fight over his patent.

> **When and where:** February 23, 1886, in the family woodshed in Oberlin, Ohio.
>
> On February 23, 1886, Charles Martin Hall made beads of aluminum metal in his family's woodshed in Oberlin, Ohio. Hall was 22 and had just finished at Oberlin College. With batteries he had made himself, he melted a substance called cryolite and dissolved aluminum oxide in it. Aluminum oxide is a compound of aluminum and oxygen. When Hall ran electricity through the melted mix, aluminum metal came out.
>
> His older sister, Julia Brainerd Hall, had studied chemistry at Oberlin College. She helped with the experiments, watched them and wrote them down. A patent is a government paper that gives an inventor the sole right to make and sell an invention for a set number of years. When Hall later had to fight for his patent, Julia's notes helped him win.
>
> In France, Paul Héroult found the same process in the same year, working on his own. Both men were born in 1863, and both died in 1914. The method is called the Hall-Héroult process. Aluminum makers around the world still use it.
>
> Aluminum cost about $12 a pound in the early 1880s. In 1888 the investors who backed Hall formed the Pittsburgh Reduction Company to make aluminum his way. After aluminum makers began to use Hall's process, the price fell to about $2 a pound. By 1893 it was about 78 cents a pound. The company's owners renamed it the Aluminum Company of America, or Alcoa, in 1907. Aluminum became cheap enough for kitchen foil and pots and pans.

Helium, almost found in America

Around 1890, William Hillebrand, a chemist at the United States Geological Survey, got a gas out of uranium ore. The gas did not join with other substances. Hillebrand recorded it as nitrogen and missed the chance to find helium.

In 1895, William Ramsay in London followed up on Hillebrand's paper. Ramsay got a gas out of cleveite, a uranium mineral, and examined it with a spectroscope, an instrument that splits light into its colors. He saw a yellow line that belongs to helium. Scientists had seen helium's line in the light of the sun since 1868. Nobody had found helium on Earth before. The credit for finding helium on Earth goes to Ramsay.

1900 to 1950

In 1937, people made an element for the first time, using material from a machine at Berkeley, California. An element is a substance made of only one kind of atom, and atoms are the tiny pieces that everything is made of. By the end of 1949, teams working in the United States had made or found seven more elements. They were astatine, neptunium, plutonium, curium, americium, promethium and berkelium.

In the same fifty years, the elements Americans dug up and used poisoned people who worked with them. Supervisors told women who painted watch dials to shape their brushes with their lips. The women swallowed radium, and many of them died of radium poisoning. At the plants that made a lead additive for gasoline, at least 15 workers died of lead poisoning in the 1920s. Arsenic from a copper smelter in Montana killed farm animals. From 1941, Navajo and other Native miners dug uranium. Navajo miners later reported that no one had told them of its dangers.

The gas well that put out the fire

Helium is an element, a gas that does not burn. In May 1903, a drilling company struck a roaring gas well on William Greenwell's farm near Dexter, Kansas. The people of Dexter planned a celebration. They pushed a burning bale of hay toward the gas to light a giant flame, and the gas put the fire out. Local people made fun of it as "wind gas."

Erasmus Haworth was a Kansas geologist, a scientist who studies rocks and the Earth. He carried samples of the gas to the University of Kansas. There the chemists Hamilton P. Cady and David F. McFarland tested it. On December 7, 1905, they showed that the gas was 1.84 percent helium. Scientists had thought helium was rare on Earth. Cady and McFarland found large amounts of it in the natural gas under the Great Plains.

Airships flew in World War I, and helium became valuable to armies because it does not burn. In 1925 the members of Congress passed the Helium Act. Under it, federal workers, meaning people who worked for the national government, began producing helium and storing it underground in the Bush Dome of the Cliffside gas field, near Amarillo, Texas. That store became the Federal Helium Reserve. For decades it held nearly all of the world's supply of helium.

Under a 1927 law, no one could sell American helium to other countries. For that reason, the German airship *Hindenburg* flew on hydrogen, a gas that burns. On May 6, 1937, the *Hindenburg* caught fire and burned at Lakehurst, New Jersey. After the fire, President

Franklin D. Roosevelt considered selling helium to Germany. In 1938 Hitler took over Austria and made it part of Germany. Harold Ickes then refused to sell. Ickes was the Secretary of the Interior, the head of the federal department in charge of public lands.

Radium on the watch dials

Radium is an element that Marie and Pierre Curie found in France in 1898. Radium is radioactive, which means its atoms break apart on their own and give off radiation. Radiation is energy that shoots out of an atom as it breaks apart. Some of it travels as tiny, fast particles that can damage the living cells of a body. The kind that radium gives off is called alpha radiation.

In the early 1900s, workers at American companies mixed radium into paint so that watch numbers glowed in the dark. Other sellers put radium into tonics, drinks they claimed would make people healthy.

Two doctors, Sabin Albin von Sochocky and George S. Willis, founded the Radium Luminous Materials Corporation in New Jersey in 1914. After World War I, the company was reorganized and renamed the U.S. Radium Corporation, with a plant in Orange, New Jersey. At its biggest, the company employed as many as 250 young women, some only 15 years old. Its treasurer, the officer in charge of its money, Arthur Roeder, replaced von Sochocky as president in January 1921. Howard Barker was the vice president and chief physicist.

In Ottawa, Illinois, the Radium Dial Company ran another dial-painting plant. It belonged to the Standard Chemical Company of Pittsburgh, and Joseph Kelly was its president.

The National Institute of Standards and Technology is a federal science laboratory. A history it published states that more than 3,000 girls and young women painted radium dials across the country in the 1910s and 1920s. Northern Public Radio gives about 4,000. The two counts differ, and neither comes with a list of the painters.

The Radium Girls

Who: Young women, some of them teenagers, who painted glowing radium numbers on watch and instrument dials and were poisoned by the paint.

When and where: The U.S. Radium Corporation in Orange, New Jersey, from 1917, and the Radium Dial Company in Ottawa, Illinois, into the 1930s.

From 1917, young women at the U.S. Radium Corporation plant in Orange, New Jersey, painted watch numbers with radium paint. To shape each brush to a fine tip, they drew it between their lips. This was called lip-pointing, and the method went by the words "lip, dip, paint." Each time a painter lip-pointed, she swallowed a little radium. The women went home glowing, and some people called them ghost girls.

Their supervisors told them to lip-point and said the paint was safe. Von Sochocky, one of the company's founders, grew worried about lip-pointing and told the painters to stop. The supervisors contradicted him, according to Northern Public Radio. Arthur Roeder was the company's president from January 1921, and he still signed papers for the company in 1926. Lip-pointing at the company went on until after 1926. No surviving record names the New Jersey supervisors.

Radium belongs to the same chemical family as calcium, the mineral in bones and teeth. So the painters' bodies took the swallowed radium into their bones and teeth, the way they take in calcium. There the radium kept giving off radiation from inside the body. Radiation damaged the bone marrow, the soft center of the bones that makes blood cells, until the marrow stopped making them. Doctors call this aplastic anemia. The jawbone died and broke down, which doctors call necrosis of the jaw. Some women got bone cancer.

A history published by the National Institute of Standards and Technology states that the radiation "had eaten away their bones from the inside out." Some women's spines collapsed, and they had to wear braces. Their jawbones shattered under light pressure. When doctors examined dial painters' bodies after death, they found 99 percent of the radioactivity in the skeleton.

Grace Fryer began painting dials at the Orange plant on April 10, 1917, and worked there until 1920. Amelia Maggia, called Mollie, painted dials at the company until she died in 1922. In 1924 a dentist, Theodor Blum, found damage to Grace Fryer's jawbone of a kind he had never seen.

Edwin Leman, a chemist at the company, died of aplastic anemia on June 5, 1925. Sarah Maillefer, a dial painter, died on June 18, 1925. Harrison Martland was the medical examiner of Essex County, New Jersey, the doctor who looks into sudden and suspicious deaths there. He examined Leman's body. Martland gave the jaw disease the name "radium jaw."

In May 1927 the lawyer Raymond Berry sued the company for five women. They were Grace Fryer, Katherine Schaub, Quinta Maggia Macdonald, Albina Maggia Larice and Edna Hussman. Mollie Maggia's body was dug up on October 25, 1927. It held 48.4 micrograms of radium. A microgram is one millionth of a gram. Her body held 500 times the amount later set as the limit for a human body.

Company officials first offered each woman $10,000, with her medical and legal costs taken out of it. The women refused. In June 1928 they accepted $10,000 each, a pension of $600 a year and their medical bills. A committee of three doctors had to approve the bills. A pension is money paid every year for the rest of a person's life. Some accounts give the amount each woman got as $15,000. A federal judge, William Clark, arranged the deal on June 4, and the agreement was signed on June 8. The company's officials admitted no blame, and Berry took 10 percent. Von Sochocky, one of the two doctors who founded the company, died of radium poisoning on November 14, 1928. Grace Fryer died in 1933.

In Illinois, the Radium Dial Company advertised for painters in Ottawa in September 1922. The advertisement named a Miss Murray as the person young women should apply to. Catherine Wolfe, who later married and took the name Donohue, described how Miss Murray taught them to point the brushes between their teeth. Supervisors at Radium Dial told the women the paint was safe, and even healthy. They kept the women lip-pointing. From 1925, Radium Dial's managers hired doctors to examine the painters. The doctors told one painter, Peg Looney, that she was very healthy. Nobody told her that she had tested positive for radiation, her niece said later.

Catherine Wolfe Donohue painted dials there and began to feel sick in 1925. Radium Dial's managers fired her in 1931. In her own words, "my limping was causing much talk." She lost half her body weight, and parts of her jaw fell out.

The lawyer Leonard J. Grossman took Catherine Donohue's case for no pay. The case went before the Illinois Industrial Commission, a state board that decided claims by workers hurt on the job. At a hearing on February 10, 1938, she brought a box of pieces of bone that she said had come from her jaw. When the judge asked her doctor about her chances of living, she collapsed. Several men carried her from the room. She weighed 71 pounds. The hearing moved to her home. On April 5, 1938, the hearing officer ruled that her work at Radium Dial had made her sick. The officer awarded her $5,661, which included a pension of $277 a year for life. On July 6, 1938, the members of the Illinois Industrial Commission threw out the company's appeal and added $730.

> Catherine Donohue died on July 27, 1938, at the age of 35. According to NPR Illinois, she weighed less than 60 pounds when she died. Grossman said hers was the eleventh death among women who had done that work at the plant. Northern Public Radio later counted fifteen Ottawa workers dead of radium. Radium Dial's lawyers appealed all the way to the United States Supreme Court and lost, and the case ended in October 1938. Because Radium Dial had left Illinois, the Ottawa women together collected only $10,000.
>
> Joseph Kelly lost his post as Radium Dial's president in 1934. He opened a new dial company, Luminous Processes, a few blocks away and hired many of the same workers. That plant ran until 1976. That year, officials of the Nuclear Regulatory Commission, a federal agency, found radiation there 1,666 times the allowed level.

Radium sold as medicine

William J. A. Bailey owned Bailey Radium Laboratories in East Orange, New Jersey. He sold Radithor, which was radium dissolved in water. Bailey had falsely claimed degrees from Harvard and from Vienna. In 1927 he had pleaded guilty to practicing medicine without the right to do it. His company sold more than 400,000 bottles of Radithor at $1 each.

Eben Byers was a rich Pittsburgh businessman. In 1927 he hurt his arm at a party on a train after the Harvard-Yale football game, and he began drinking Radithor to heal it. Accounts of how much he drank differ. The Museum of Radiation and Radioactivity at Oak Ridge Associated Universities says he averaged three bottles a day for about two years from December 1927. Other accounts give about 1,400 bottles in all. He stopped in 1930, when his teeth began falling out.

The radium destroyed his bones. A government investigator reported that his whole upper jaw except two front teeth, and most of his lower jaw, had been removed. The rest of his bones were slowly breaking down, and holes were forming in his skull. Byers gave testimony to the Federal Trade Commission, the federal office that acts against companies that cheat or mislead buyers. On December 19, 1931, the commission's officials ordered Bailey to stop claiming that Radithor was harmless or that it healed people. Byers died months later, in 1932, at the age of 51.

Lead in gasoline and paint

Lead is a soft, heavy metal and an element. Lead poisoning is the harm lead does to the body once a person swallows it or breathes it in. The National Institute for Occupational Safety and Health (NIOSH) is the federal office that studies dangers at work. Its list of what large doses of

lead do includes paralysis, which means a person cannot move part of the body. The list also includes madness, gout (painful, swollen joints), colic (sharp pains in the belly) and death.

Thomas Midgley Jr., a researcher at General Motors (GM), found that adding tetraethyl lead to gasoline stopped engine "knock." Tetraethyl lead is a liquid made of lead joined with other chemicals. Knock is a pinging sound in an engine that runs on gasoline. Charles Kettering ran GM's research. In August 1924, GM and Standard Oil of New Jersey formed the Ethyl Gasoline Corporation to sell tetraethyl lead. The DuPont company made it.

The workers who made tetraethyl lead died of lead poisoning, and the counts of the dead differ. Bill Kovarik counted them in a 2005 article in a journal about workers' health. Standard Oil ran the Bayway refinery in Elizabeth, New Jersey, a plant that turned oil into gasoline and other products. Seven men died there in October 1924, and 33 went to the hospital. Between September 1923 and the fall of 1924, ten more workers died at a DuPont plant in Deepwater, New Jersey. At GM's laboratory in Dayton, Ohio, at least two died, and 40 went to the hospital. Kovarik's numbers add up to at least 19 dead. Other accounts give five dead at Bayway and 35 in the hospital. In 2021, NIOSH counted 15 worker deaths from making tetraethyl lead in the 1920s.

Kovarik describes how the work poisoned the men. The tanks that held the chemicals were not closed off from the workers, who had to open them between steps. Workers squeezed half-melted lead through metal grates with shovels and with their boots. At Bayway, poisoned men had to be held down and tied into straitjackets, coats that pin a person's arms to the body. Kovarik's account does not say who restrained them. Their bodies were black and blue from muscle spasms they could not stop. They saw things that were not there, such as flying insects, and some could suddenly turn violent or want to kill themselves. Workers called tetraethyl lead "loony gas."

Frank Mann was the Bayway plant supervisor in 1924. He said, "These men probably went insane because they worked too hard." A month before the deaths, in September 1924, engineers from DuPont had visited Bayway and called its safety measures "grossly inadequate." Joseph G. Leslie, a Bayway worker poisoned there, was kept in a mental hospital for 40 years. Only his wife, Gertrude, and later his son knew he was alive. Everyone else believed he had died. Kovarik does not say who sent Leslie to the hospital or who spread the story that he was dead. Kovarik names no manager of the Deepwater plant or the Dayton laboratory apart from Midgley and Kettering.

On October 30, 1924, Midgley held a press conference. He poured tetraethyl lead on his hands and breathed its vapor for about 60 seconds, to show it was safe. A few months earlier, lead had made him seriously ill. At the same event he acknowledged the two deaths in Dayton. He also said more than 50 workers were "under observation" for lead poisoning.

The Surgeon General is the head of the Public Health Service, the federal office in charge of the nation's health. On May 20, 1925, Surgeon General Hugh Cumming brought more than 100 people from industry and from public health to a meeting in Washington. Frank Howard of Standard Oil said the industry could not give up "what has come to the industry like a gift from heaven." Yandell Henderson studied how the body works at Yale. He called tetraethyl lead "one of the most dangerous things in the country today." Alice Hamilton of Harvard told Kettering there were "thousands of things better than lead."

In 1926 the members of a Surgeon General's committee reported "no good grounds" for a ban and asked for more study. The Ethyl company paid Robert Kehoe of the University of Cincinnati to study lead. Kehoe set out the industry's "safe level" theory, the claim that lead below a certain amount did no harm. That claim stayed the industry's position for decades.

Painters also used paint that contained lead. NIOSH states that between 1925 and 1927, more painters died of lead poisoning than workers in all other jobs combined. The International Labour Organization is a world body that sets rules for workplaces. In November 1921, delegates at its conference in Geneva agreed on a treaty that banned lead paint for the insides of buildings. The ban took effect in 1923 in the countries that accepted it. The United States did not belong to the organization until 1934, and it was still outside the ban in 2017.

Mercury in Danbury's hat shops

The hatters of Danbury, Connecticut, the workers who made hats there, kept breathing mercury at work after 1900. They used it to turn fur into felt, the thick cloth of pressed fur that hats were made of. In 1913 Connecticut lawmakers added mercury poisoning to the state's workmen's compensation law. Under a law of that kind, employers pay workers who are hurt or made sick by their jobs.

In 1922, Alice Hamilton examined 100 Danbury hatters and found 43 with mercury poisoning. Some shook so hard from tremors that they could not feed themselves. The union hatters kept demanding investigations. A union is a group of workers who join together to bargain with their employers. Grace Mailhouse Burnham, who had set up the Workers' Health Bureau, found a way to make felt without mercury in the Soviet Union. She could not get the hat manufacturers to agree to use it. Government researchers made a full study only in 1937. They

found many hatters poisoned by mercury. They also found that drinking and smoking had not caused the hatters' symptoms, as some manufacturers and insurance companies had claimed in court. The historian Shirley Wajda's account of the Danbury shakes names no factory owner.

Officials of the Public Health Service then worked out an agreement with the hatters' unions and the hat manufacturers in the 26 states that made hats. Under it, hat shops stopped using mercury. On December 1, 1941, Connecticut Governor Robert A. Hurley announced his state's ban. He said "it was possible to manufacture good fur felt hats without making physical wrecks out of hundreds of workers." The hat shops used hydrogen peroxide in place of mercury. Mercury is still in Danbury's soil and in the mud of the Still River.

Arsenic smoke in Montana

Arsenic is an element and a strong poison. A smelter is a plant where workers melt ore, rock that contains a metal, to get the metal out of it. In 1902 the Anaconda Copper Mining Company started its Washoe smelter at Anaconda, Montana, about 25 miles from the copper mines of Butte. When the smelter melted copper ore, arsenic went up its smokestack with the smoke. Farmers nearby reported livestock dying in the smelter's first year.

In 1904 farmers in the Deer Lodge Valley formed an association to sue the company. The case was *Bliss v. Anaconda Copper Mining Co*. Fred J. Bliss filed it in 1905. His 320-acre farm lay about five miles from the smelter. In 1909 the judges of a federal appeals court found that arsenic had poisoned the farmers' livestock and crops. The judges still refused to close the smelter.

The company's officers then bought out many of the farmers. From the rest they bought "smoke easements." An easement is a legal right to use land that someone else owns. A smoke easement gave the company the right to send its smoke over a farm. The 1909 court ruling and the EPA's history of the site do not name the officers who ran the smelter or chose the buyouts. Neither counts the people harmed by the arsenic.

Uranium from Navajo land

Uranium is a heavy metal element. Its atoms break apart slowly and give off radiation. From 1941, Native American miners, among them Navajo, Pueblo and Hopi people, worked in uranium and vanadium mines in the Southwest. Vanadium is another metal element. In 1943 the Vanadium Corporation of America began mining uranium in secret on Navajo land.

The Environmental Protection Agency (EPA) is the federal office whose staff work to protect the country's air, water and land. EPA staff report that from 1944 to 1986, miners working for mining companies dug nearly 30 million tons of uranium ore out of Navajo land. They mined under leases with the Navajo Nation. A lease is an agreement to use land for a set time in return for payment.

A false first, and the machine at Berkeley

In 1931 the physicist Fred Allison of Alabama Polytechnic, now Auburn University, announced two new elements. He called element 85 "alabamine" and element 87 "virginium." He said he had found them with a machine he used in his lab. Scientists at other labs tried his method and could not get the same results. They showed that the signals Allison saw came from his equipment, not from any element. Scientists stopped accepting his claims. A Berkeley team made the real element 85 in 1940.

Ernest Lawrence built his first cyclotron at Berkeley, California, in 1930 and 1931. A cyclotron is a machine that whirls tiny charged particles in a spiral up to high speed. When the fast particles hit a target, they can turn atoms of one element into atoms of another. With his machines, Berkeley's Radiation Laboratory became the source of most of the new elements made in the United States.

Ernest Lawrence

Who: The physicist who invented the cyclotron, the machine behind most of the elements discovered in the United States.

When and where: Berkeley, California, from the 1930s to the 1950s. He won the Nobel Prize in Physics in 1939 and died in 1958.

After his first cyclotron of 1930 and 1931, Ernest O. Lawrence and his teams built larger ones. The 60-inch cyclotron of 1939 had a magnet that weighed 220 tons. The Radiation Laboratory at Berkeley became an independent laboratory in 1936.

Lawrence won the Nobel Prize in Physics in 1939. The Nobel Prize is an international award given each year for work in science and other fields.

Lawrence's machines made the material for several new elements. A metal sheet from his 37-inch cyclotron held the technetium that Segrè and Perrier found. Teams used his 60-inch cyclotron to make astatine and plutonium in 1940. Lawrence died in 1958. Element 103, lawrencium, carries his name.

Elements made by people

The periodic table is a chart that lists the elements in order, with elements that act alike grouped together. Dmitri Mendeleev published his periodic table in Russia in 1869. His table had a gap at element 43, below manganese. Early in 1937, Lawrence mailed a thin sheet of a metal called molybdenum to Emilio Segrè in Palermo, Sicily. The sheet had been part of the 37-inch cyclotron. Segrè and the mineralogist Carlo Perrier, a scientist who studies minerals, took a few billionths of a gram of element 43 out of it. They named it technetium, from a Greek word meaning "artificial." Technetium was the first element made by people. Italian scientists did the chemistry, and the material came from an American machine.

Dale R. Corson, Kenneth R. MacKenzie and Segrè made element 85 at Berkeley in 1940. They struck the element bismuth with alpha particles in the 60-inch cyclotron. Element 85 was the element Allison had called "alabamine." In 1947 its makers named it astatine, from a Greek word for "unstable."

Also in 1940, Edwin McMillan and Philip Abelson found element 93 in uranium that had been struck in the cyclotron. It was the first element heavier than uranium. Uranium was named for the planet Uranus, so they named element 93 neptunium, for Neptune, the next planet out.

On December 14, 1940, Glenn Seaborg, McMillan, Joseph W. Kennedy and Arthur C. Wahl made element 94 in the 60-inch cyclotron. On the night of February 23 and 24, 1941, they proved by chemistry that it was a new element. They did it in Room 307 of Gilman Hall at Berkeley, which is now a National Historic Landmark. They named the element plutonium, for the planet Pluto. Seaborg chose the symbol Pu instead of "Pl" as a joke, because "pee-yoo" is what people say about a bad smell. The members of the naming committee accepted it. Government officials kept the work secret from the start. During World War II, American scientists used plutonium and uranium to build atomic bombs.

Seaborg's circle made element 96 in the summer of 1944, with Ralph A. James and Albert Ghiorso on the team. They named it curium, for Marie and Pierre Curie. Element 95 came next, in 1944 and 1945, with Leon O. Morgan also on the team. It was named americium, for the Americas. Much of this work took place at the Metallurgical Laboratory, a secret wartime lab in Chicago.

On November 11, 1945, Seaborg was a guest on a children's radio show called *Quiz Kids*. A boy asked him whether any new elements had turned up during the war. Seaborg said yes, elements 95 and 96. He told the boy five days before he planned to announce them to the American Chemical Society, a national group of chemists.

Jacob A. Marinsky, Lawrence E. Glendenin and Charles D. Coryell found element 61 in 1945 at Clinton Laboratories in Oak Ridge, Tennessee. The lab is now Oak Ridge National Laboratory. They found the element in the leftovers of uranium atoms that had been split. Grace Mary Coryell, Charles Coryell's wife, suggested the name promethium. It honors Prometheus, who stole fire from the gods in Greek stories. The team announced the element in 1947. Promethium is still the only element ever discovered in Tennessee.

In December 1949, Stanley G. Thompson, Ghiorso and Seaborg made element 97 at Berkeley. They struck americium with alpha particles in the 60-inch cyclotron. They named it berkelium, for Berkeley.

Emilio Segrè

Who: An Italian physicist who stayed in the United States after Benito Mussolini and his officials barred Jews like him from university jobs in Italy, and who helped find two elements.

When and where: Palermo, Sicily, and Berkeley, California, from 1937 into the 1940s. He lived in the United States from 1938 and died in 1989.

Emilio Segrè worked with Carlo Perrier in Palermo in 1937. From the metal sheet that Ernest Lawrence mailed them, they identified technetium, the first element made by people.

In the summer of 1938, Segrè was visiting Berkeley. While he was there, he learned that Benito Mussolini and his officials in Italy had issued new racial laws against Jews. Under them, Italian officials took university jobs away from Jews, and Segrè was Jewish. He stayed in the United States and became an American citizen.

At Berkeley, Segrè helped make astatine in 1940. With Glenn Seaborg, he showed in 1941 that atoms of plutonium-239 could be split. He won the Nobel Prize in Physics in 1959 for his work on the antiproton. The antiproton is a tiny particle with the opposite electric charge of the proton, one of the particles in the center of every atom.

Glenn Seaborg

Who: The chemist whose teams found plutonium and nine more elements, and the first person to see an element named for him while he was alive.

When and where: Berkeley, California, and wartime Chicago, from 1940 to 1974. He died in 1999.

> Glenn T. Seaborg led the team that made plutonium in December 1940 and proved it was a new element in February 1941. In all, he helped discover ten elements, numbers 94 through 102 and number 106. One of the ten, nobelium, was later credited to scientists at Dubna in the Soviet Union.
>
> In 1951, Seaborg shared the Nobel Prize in Chemistry with Edwin McMillan for their work on the elements heavier than uranium. From 1961 to 1971, he was chairman of the Atomic Energy Commission, the federal agency in charge of atomic energy.
>
> In 1997 element 106 was named seaborgium, after him. Seaborg joked that a letter addressed only in element names would reach him: Seaborgium, Lawrencium, Berkelium, Californium, Americium. That stood for Seaborg, at the Lawrence laboratory, in the city of Berkeley, in California, in America.

1950 to 2000

Scientists at Berkeley and other American labs made or claimed elements 98 through 106 from 1950 to 1974. Scientists at Dubna, a lab in the Soviet Union, claimed several of the same elements. The two sides argued for decades over who had found them first. In 1992 and 1993, the members of an international panel gave some credit to Berkeley, some to Dubna, and split the rest.

In the same years, uranium mining on Navajo land reached its peak. Miners breathed radioactive gas underground, and most small mines had no fresh air blown in until the 1960s or later. Government researchers and mine owners did not tell the miners the danger. Hundreds of miners died of lung disease and cancer. Scientists also showed that lead was harming children's brains. Between 1971 and 1996, federal officials limited and then banned lead in house paint and in gasoline for cars.

Elements from Berkeley and from a bomb test

Early in 1950, Kenneth Street Jr., Stanley G. Thompson, Albert Ghiorso and Glenn Seaborg made element 98 at Berkeley. They struck curium with helium particles. They announced the element on March 17, 1950, and named it californium, for the state and its university.

Elements 99 and 100 turned up in the dust of a hydrogen bomb test called Ivy Mike. The test took place at Enewetak Atoll in the Pacific Ocean on November 1, 1952. A hydrogen bomb is a bomb far more powerful than the first atomic bombs. An atoll is a ring of small coral islands.

The Ivy Mike blast wiped out one of the atoll's islands, Elugelab, turning it to vapor. Drone planes with no one aboard flew through the mushroom cloud, carrying filter papers to catch the dust. Workers then shipped tons of coral from the blast site to Berkeley. In the dust and coral, Ghiorso and teams from Berkeley, Argonne and Los Alamos found two new elements. In the blast, uranium atoms had soaked up huge numbers of neutrons. A neutron is one of the tiny particles in the center of an atom.

Government officials classified the discoveries, which means they kept them secret. The scientists published them on August 1, 1955, with the names einsteinium and fermium. By then both of the men they honored had died. Enrico Fermi died in November 1954, and Einstein died in April 1955. Neither man was told that an element would carry his name.

Seventeen atoms, one at a time

In 1955 a Berkeley team made element 101 from about a billion atoms of einsteinium. That was all the einsteinium that existed. The team was Ghiorso, Bernard G. Harvey, Gregory R. Choppin, Thompson and Seaborg. They struck the einsteinium with particles, and the new atoms flew off onto a gold foil. Ghiorso had worked out this way of catching atoms. The team dissolved the foil and rushed it through the chemistry.

They made 17 atoms of element 101 in all. It was the first element identified one atom at a time. In the scientists' own telling, Ghiorso wired the detector to the building's fire alarm, so the bell rang for each new atom. He forgot to disconnect it, and the alarm later emptied the building late at night.

The team named element 101 mendelevium, for Dmitri Mendeleev, the Russian who made the periodic table. That was during the Cold War, the long contest between the United States and the Soviet Union. Seaborg asked the United States government for approval before he used a Russian's name. A French chemist later told Ghiorso that the name did more for American and Soviet relations than most diplomacy. Diplomacy is the work of officials who handle dealings between countries.

The fight over elements 102 to 106

Scientists in three countries worked on element 102. In 1957 a team in Stockholm, Sweden, claimed it and named it nobelium, for Alfred Nobel. The Swedish team then took back its claim. Berkeley scientists claimed the element in 1958. Scientists at Dubna did experiments on it in 1966.

The International Union of Pure and Applied Chemistry (IUPAC) is the world organization of chemists that approves element names. A joint panel of chemists and physicists, called the Transfermium Working Group, studied who had found what. Transfermium means the elements after fermium, element 100. Its report came out in 1992 and 1993. The panel's members credited Dubna with element 102. IUPAC's officials kept the Swedish name nobelium anyway, because scientists had used it for more than 30 years.

Ghiorso, Torbjørn Sikkeland, Almon E. Larsh and Robert M. Latimer made element 103 at Berkeley in 1961. Dubna scientists did important work on it from 1965 to 1967. The Working Group's members split the credit between the two labs. The element kept the name lawrencium, for Ernest Lawrence.

Dubna scientists claimed element 104 in 1964, and Berkeley scientists claimed it in 1969. For element 105, the Dubna claim came in 1968 and the Berkeley claim in 1970. Each side gave the elements its own names and argued for them in science journals for decades. The Working Group's members split the credit for both. They credited Berkeley alone with element 106, made there in 1974.

In 1994 IUPAC's officials proposed a rule against naming elements for living people. Under that rule, IUPAC's officials could not have approved the Berkeley name, seaborgium. In 1997 they approved the final names. Element 104 was named rutherfordium, after the scientist Ernest Rutherford, and element 105 dubnium, after the town of Dubna. Element 106 became seaborgium. Glenn Seaborg was the first person to see an element named for him while he was alive. He kept a periodic table with seaborgium on it until he died in 1999.

Albert Ghiorso

Who: The builder of instruments who helped discover more elements than anyone else in history, without ever earning a doctorate.

When and where: Berkeley, California, from 1944 to 1974, with work into the 1990s. He died in 2010.

Albert Ghiorso helped discover 12 elements, americium through seaborgium, numbers 95 to 106. Guinness World Records lists that as the most elements discovered or co-discovered by one person. He never earned a doctorate, the highest university degree.

Ghiorso built the tools the element hunters needed, among them the detectors. He worked out the method of catching new atoms on a foil, which his team used to find mendelevium in 1955. He also ran the HILAC, a machine at Berkeley that sped up particles to make new

elements. In the stories his colleagues told, he wired the mendelevium counter to a fire alarm. Another of their stories has him driving fresh, radioactive samples across the lab in a Volkswagen car.

Darleane Hoffman

Who: A nuclear chemist who proved that plutonium, an element people had made in labs, also occurs in nature.

When and where: Los Alamos, New Mexico, from 1953, and Berkeley, California, from 1984. She died in 2025, at the age of 98.

Darleane C. Hoffman was a nuclear chemist, a chemist who studies atoms that break apart and give off radiation. She began work at Los Alamos in 1953. In 1971 she found traces of plutonium-244 in ancient rock from the Mountain Pass mine in California. Plutonium had been known only as an element made in labs. Her find showed that tiny amounts of it also occur naturally on Earth.

Hoffman showed that atoms of fermium-257 could split in two on their own. She was the first woman to lead a science division at Los Alamos. From 1984 she led work at Berkeley on the chemistry of the heaviest elements, studying them one atom at a time.

She won the National Medal of Science in 1997. In 2000 she won the Priestley Medal of the American Chemical Society, named for Joseph Priestley. She was the second woman ever to receive it.

Elements at home

Many home smoke detectors hold a speck of americium-241, about a third of a millionth of a gram. The americium gives off alpha particles inside a small chamber. The particles let a tiny electric current run through the air in the chamber. Smoke that drifts in disturbs the current, and the alarm goes off.

Silicon is an element that was discovered in Sweden in 1824. Computer chips are made of it, and Silicon Valley takes its name from the element in the chips made there.

By 1996 the federal helium program owed $1.4 billion. That year the members of Congress passed the Helium Privatization Act and ordered the Federal Helium Reserve sold.

Uranium miners on Navajo land

The Atomic Energy Commission (AEC) was the federal agency in charge of atomic energy. EPA staff state that the AEC was the only buyer until 1966 and kept buying ore until 1970. Doug Brugge and Rob Goble, writing in the *American Journal of Public Health* in 2002, say the government was the only buyer from World War II until 1971.

About 10,000 people worked in uranium mining in all, and about a quarter of them were Navajo. The mining peaked in the middle of the 1950s, with about 750 mines working. The companies named in the records include the Vanadium Corporation of America, Kerr-McGee, the United Nuclear Corporation and Hydro Resources Inc.

When uranium atoms break apart, they turn into radon, a radioactive gas. Radon atoms then break apart into radioactive specks called radon daughters. Miners breathed them in. Brugge and Goble explain that the daughters stay in the lungs next to delicate cells and hit those cells with strong doses of radiation. The harm named in the records is lung cancer and lung fibrosis. Lung fibrosis is scarring that makes the lungs stiff, so that breathing gets harder.

Navajo miners report that no one told them about the dangers of uranium mining, and that they got no protective equipment and no ventilation. Ventilation means the fans and shafts that blow fresh air into a mine and push radon out. Scientists already knew about the danger from uranium mines in Europe. Brugge and Goble found that few protections reached American miners before 1962, and they came slowly after that.

Members of a federal panel, the Advisory Committee on Human Radiation Experiments, traced who made these choices in their 1995 report. In 1948 Merril Eisenbud, a safety expert in the AEC's New York office, urged the AEC to write safety rules into its contracts to buy ore. Officials of two AEC divisions, Biology and Medicine and Raw Materials, rejected his advice. They said the law gave the AEC no power over safety in the mines.

From 1950, Public Health Service workers led by Duncan Holaday and Victor Archer followed the miners to measure their cancer risk. The researchers tracked 3,415 miners, and 779 of them were Native American. Brugge and Goble found that the researchers did not tell the miners about the risks they were studying. At first the researchers left the minority miners out of the results. The researchers said they wanted "a homogeneous population," which means a group of people who are all alike.

Duncan Holaday later testified in court that the researchers made a spoken agreement with the mine owners not to tell the miners what they found. The researchers made that deal so the owners would let them into the mines.

Staff of the AEC and of the Public Health Service met on January 25, 1951. The staff at that meeting believed the radon in the mines was at levels that would cause cancer. They agreed that ventilation could lower it, but they called it "unrealistic" to set a limit the mine owners had to meet.

Wilhelm Hueper, a cancer researcher at the National Cancer Institute, warned about radon. In 1952 Shields Warren of the AEC asked the institute's director to stop Hueper from giving his lung cancer figures in a speech to the Colorado Medical Society. Hueper's figures showed lung cancer in 40 to 75 percent of the radioactive ore miners in Europe. The director ordered Hueper to cut them, and Hueper did not give the speech. Warren then asked that Hueper be fired. Hueper kept his job, but Victor Archer later said Hueper was forbidden to travel west of the Mississippi River for his research. The 1995 committee report that gives Archer's account does not say who gave that order.

Public Health Service officials urged the mining companies to ventilate. Some large mines got ventilation in the 1950s and 1960s, but most small mines got none until the 1960s or later. The first federal radon limit for these mines came in 1967, from Secretary of Labor Willard Wirtz. The committee's members found that the mine owners, the state governments and the federal government all had a duty to ventilate the mines after 1951.

In 1984, in a case called *Begay v. United States*, a federal judge found that Public Health Service officials, working under the Surgeon General, decided not to warn the miners because they feared many would quit. The judge still ruled that the miners could not sue the United States government. In the ruling, the judge wrote that the miners' situation "cries for redress," meaning that it called out to be put right, and called it a "tragedy of the nuclear age."

No surviving record gives a full count of the Navajo miners who died. Linda M. Richards, writing in 2013 for *Distillations*, the magazine of the Science History Institute, reported that by the early 1980s, "hundreds of Indian miners had died from lung diseases and cancers." Brugge and Goble cite a study from 2000 that found 94 deaths from lung cancer among Navajo people from 1969 to 1993. Of those 94, 63 had been uranium miners. The members of the 1995 federal committee reported that by 1990, 410 of the 4,100 miners in the Public Health Service study had died of lung cancer. About 75 such deaths would have been expected in a group that size.

Harris Charley was a Navajo uranium miner. His records show he breathed 1,192 "working level months" of radon, a unit that measures how much radon a miner breathed over time. He died of lung fibrosis in 1986. His son, Perry H. Charley, became an environmental scientist. Perry Charley worked with Stewart Udall, a former Secretary of the Interior, to investigate the

miners' illnesses. In 1996 he helped start the Uranium Education Program at Diné College. Diné is the Navajo people's own name for themselves. Navajo organizers, among them Harry Tome, Perry Charley and Phil Harrison, pushed for help for the miners from the 1960s on.

On October 5, 1990, the members of Congress passed the Radiation Exposure Compensation Act. President George H. W. Bush signed it on October 15, 1990. Under it, a uranium worker made sick by radiation on the job could claim one payment of $100,000, if the worker met the law's rules.

The spill at Church Rock

On July 16, 1979, an earthen dam broke near Church Rock, New Mexico. The United Nuclear Corporation owned the dam, which held waste from its uranium mill. A mill is a plant that takes uranium out of the crushed rock. Tailings are the ground-up rock left behind after the uranium is taken out.

Accounts of the spill give different amounts. Richards gives 1,000 tons of radioactive tailings and 93 million gallons of acid, radioactive water. New Mexico's Environmental Improvement Division, the state office that checked for pollution, gives 1,100 tons and 94 million gallons. The waste ran at least 80 miles down the Rio Puerco, a river that flows past the homes of about 1,700 Navajo people.

A curie is a unit that measures radioactivity. The Church Rock spill released 46 curies of radiation. The accident at the Three Mile Island nuclear power plant, four months earlier, released 13. The U.S. Geological Survey called Church Rock "the largest accidental radioactive release in the United States." The Environmental Improvement Division's own report reached a different view. Its authors concluded that the spill's effects "on people and the environment were quite limited." They wrote that the water pumped out of the mines into the Puerco River might be a greater long-term danger.

Within a few hours, officials of the Environmental Improvement Division began testing the river. They ordered United Nuclear to stop sending waste to the broken pond. United Nuclear stopped milling for about three months. No official declared an emergency or ordered anyone to leave. New Mexico's governor, Bruce King, turned down the Navajo Nation's request to have the area declared a federal disaster area, according to news accounts. The state's report on the spill names no United Nuclear official as responsible for the dam.

Lead: the proof and the bans

In the 1960s, thousands of American children each year went to the hospital with lead encephalopathy, and about one in four of them died. Encephalopathy means swelling and damage of the brain. A 2007 review in the journal *Environmental Health Perspectives* states those numbers.

David Rosner and Gerald Markowitz, writing in the *American Journal of Public Health* in 2012, describe where the lead came from. Before the 1960s, they write, the poisoned children usually lived in old, poorly kept slum housing. The children had swallowed flakes of lead paint and went into convulsions, fits of violent shaking they could not control. Rosner and Markowitz call lead paint in older buildings the major source of lead around children. The 2007 review names the main ones to blame: the paint and pigment industry, the oil industry and a few scientists paid by industry. Lead harms a child's growing brain. It lowers intelligence and causes trouble with reading, paying attention and behavior. The review states that no safe level of lead is known.

Clair Patterson, a geochemist at Caltech, measured lead in the air at about 1,000 times its natural level. A geochemist is a scientist who studies the chemistry of rocks and the Earth. In a paper in 1965, Patterson called Kehoe's "safe level" idea "an ill-defined opinion unsupported by any evidence." In the 1970s, Herbert Needleman, a children's doctor in Pittsburgh, measured the lead in the baby teeth of about 2,500 schoolchildren. Children with more lead in their teeth did worse in school. Scientists paid by the lead industry challenged his work. Later reviews backed his findings, according to Kovarik.

In 1971 the members of Congress passed the Lead-Based Paint Poisoning Prevention Act. Under that law, homes built or repaired with federal money could have only limited amounts of lead paint. In 1972 the limit for lead in paint was set at 0.5 percent. In 1978 officials of the U.S. Consumer Product Safety Commission banned lead paint in all homes. From then on, house paint could hold no more than 0.06 percent lead. Homes built before 1978 are still likely to have some lead paint.

EPA officials began work on a rule to cut the lead in gasoline in 1972 and 1973. Gas stations began selling unleaded gasoline, and car makers built cars for it, in 1975 and 1976. The Clean Air Act's ban on leaded gasoline for cars and trucks took effect on January 1, 1996. On January 29, 1996, EPA Administrator Carol M. Browner announced the last step in 25 years of cutting lead out of gasoline. She said the amount of lead in children's blood had fallen 70 percent.

Poisoned ground put on the cleanup list

The Superfund program is the federal program for cleaning up the country's most dangerous waste sites. The National Priorities List is the list of sites chosen for that cleanup. In 1983 EPA officials put both the Anaconda smelter site in Montana and the Church Rock mill on the list.

Smelting at Anaconda stopped in 1980. EPA staff count nearly 100 years of smelting at the whole site, and it left arsenic, cadmium, copper, lead and zinc over more than 200 square miles. EPA lists Atlantic Richfield as the company responsible for the cleanup.

2000 to Today

Joint Russian and American teams made elements 114 through 118 between 1998 and 2010. The atoms formed at Dubna, in Russia. Scientists from American labs brought detectors and, for element 117, the only target material in the world that would work. In 2015 and 2016, IUPAC's officials recognized the last four elements of the seventh row of the periodic table and gave them names.

EPA staff were still counting old uranium mines and cleaning up poisoned ground. As of June 2026, they count 523 abandoned uranium mines on the Navajo Nation. From 2014 to 2015, after managers appointed by Michigan's governor switched the water supply of Flint, Michigan, the water carried lead from old pipes to the city's people.

Finishing the seventh row

Scientists at the Joint Institute for Nuclear Research in Dubna, Russia, worked with scientists from Lawrence Livermore National Laboratory in California. For elements 115 and 117, scientists from Oak Ridge National Laboratory and Vanderbilt University joined them. The first atom of element 114 formed at Dubna in December 1998. Element 116 followed in 2000.

In May 2012, IUPAC's officials named element 114 flerovium, for Russia's Flerov Laboratory. They named element 116 livermorium, for the Livermore laboratory and the city of Livermore, California.

On December 30, 2015, IUPAC's officials recognized elements 113, 115, 117 and 118. That filled the seventh row of the periodic table. IUPAC's officials announced the names on November 28, 2016. Scientists at RIKEN, a research institute in Japan, made element 113, the first element discovered in Asia, and it became nihonium. Element 115 was named moscovium, for the region around Moscow, and element 117 tennessine, for Tennessee.

Element 118 became oganesson, for Yuri Oganessian, the Dubna physicist who led the hunt for these heavy elements. It was only the second element named for a living person, after seaborgium. His colleagues asked him to leave the conference call before they voted on the name. IUPAC's officials credited these elements to the joint teams, made up of scientists from several countries who worked together.

Tennessine and the berkelium target

The partnership on element 117 began when Joe Hamilton of Vanderbilt University introduced Jim Roberto of Oak Ridge to Yuri Oganessian. To make element 117, the Dubna team needed a target made of berkelium-249. The only place that could make it was a research reactor at Oak Ridge National Laboratory. The berkelium spent 250 days in the reactor. Oak Ridge chemists then spent 90 days working on it. They ended up with 22 milligrams. A milligram is one thousandth of a gram.

The berkelium was shipped in June 2009. Russian customs officials, who check what comes into a country at its border, twice rejected the paperwork, so the package crossed the Atlantic Ocean five times. At Dubna, scientists fired a beam of calcium-48 atoms at the target for six months. They made six atoms of element 117. The team published the discovery in April 2010.

Tennessee became the second American state named on the periodic table, after California. The atoms of tennessine formed in Russia. Promethium, found at Oak Ridge in 1945, is still the only element discovered in Tennessee.

> ### Clarice Phelps
>
> **Who:** A nuclear chemist at Oak Ridge National Laboratory and a U.S. Navy veteran. Her laboratory's staff profile describes her as the first Black woman involved in the discovery of an element.
>
> **When and where:** Oak Ridge National Laboratory, Tennessee, from 2009. Her berkelium work began in 2010, and the laboratory recognized her in 2019.
>
> Clarice Phelps served in the U.S. Navy and graduated from Tennessee State University. She joined Oak Ridge National Laboratory in 2009. Her first job there was as a nuclear operations technician.
>
> From 2010 she worked in the laboratory's Nuclear Security and Isotope Technology Division. There she was part of a team that helped purify berkelium-249. To purify a substance means to remove everything else from it. Scientists used that berkelium to

> confirm the discovery of element 117. The berkelium for the first run at Dubna had shipped in June 2009, before she began this work.
>
> A 2019 news release from Oak Ridge National Laboratory described her as "the first African American woman to be involved with the discovery of an element, tennessine." That first is her laboratory's claim. IUPAC's officials credited Oak Ridge as a laboratory, not its scientists one by one. Also in 2019, she was named to the Periodic Table of Younger Chemists, a project of IUPAC and the International Younger Chemists Network.

Toward element 120, and the end of federal helium

In 2024 the Heavy Element Group at Berkeley Lab made two atoms of livermorium in a new way. They fired a beam of titanium-50 at plutonium-244 in the lab's 88-Inch Cyclotron. Berkeley Lab's news center reported the result on July 23, 2024. The test showed that the method could work for element 120. Element 120 would start the eighth row of the periodic table, and it would be the heaviest atom ever made. The Berkeley team began runs to make it in 2025, firing titanium-50 at californium-249. As of August 2026, no one had announced a discovery.

Federal officials sold the Federal Helium System to Messer, a company that sells industrial gases. The system included the reserve, the Cliffside gas field and a pipeline 423 miles long. The sale was completed in June 2024. Messer's accepted bids, opened in January 2024, totaled $423.35 million. Officials of the Bureau of Land Management, a federal agency, stated in 2024 that the sale in the end sent about $460 million to the U.S. Treasury. The Treasury is the government's money office. Helium is still scarce. Hospitals need it for MRI machines, which take pictures of the inside of the body. Rocket makers and computer chip makers use it too.

Uranium on Navajo land today

Elsie Mae Begay, a Navajo woman, lived in Monument Valley below the abandoned Skyline uranium mine. Two of her sons who had lived with her died, one of lung cancer and the other of a tumor. Linda Richards, who reported her story in 2013, calls them rare cancers. Richards does not say whether doctors linked the sons' cancers to the mine.

Begay's family hogan, a traditional Navajo house, gave off radiation up to 100 times the acceptable level, the Associated Press reported. When her children were young, they had played in piles of uranium tailings, the ground-up rock left over after uranium is taken out.

Richards writes that people testing Navajo homes found dangerous radioactivity where families had built with mine debris or mixed it into concrete floors. EPA officials treated the Begay hogan as nuclear waste. In 2001 men in radiation suits took it apart and hauled it away.

In 2005 the members of the Navajo Nation Council passed the Diné Natural Resources Protection Act. Under it, uranium mining is banned on Navajo land.

The counts of old mines differ. EPA staff count 523 abandoned uranium mines on the Navajo Nation as of June 2026. They have money to study and clean up 230 of them, and they list 46 as priority mines. In 2013, Richards counted at least 1,032 abandoned mine sites on Navajo land. She also counted 38 water sources with more radioactive elements than health limits allow.

By June 2026, EPA's agreements and settlements over the mines were worth more than $1.7 billion. A settlement is an agreement to pay money to end a legal fight. One of the settlements was made in 2015 with the Tronox company in bankruptcy court, the court that handles a company that cannot pay its debts. An EPA page updated in September 2026 states that EPA officials have added the Lukachukai Mountains Mining District to the Superfund list.

By March 2001, about 3,975 uranium workers had applied for payments under the Radiation Exposure Compensation Act, according to Brugge and Goble. The law ran out for a time. The members of Congress renewed it as part of the One Big Beautiful Bill Act, which became law on July 4, 2025. According to the Department of Justice in September 2026, workers must file claims by December 31, 2027. A uranium worker who qualifies receives $100,000, paid once.

Lead in the water of Flint

Flint, Michigan, is a majority-Black city. In April 2014, emergency managers appointed by Michigan Governor Rick Snyder switched Flint's water supply. An emergency manager is an official appointed by the state to run a city in place of its elected leaders. Flint had been getting Detroit's water, drawn from Lake Huron. The new supply came from the Flint River.

Governor Snyder later appointed the Flint Water Advisory Task Force to find out what went wrong. Its 2016 report states that Flint's emergency manager Ed Kurtz approved using the Flint River. Darnell Earley, the emergency manager in April 2014, oversaw the switch. A timeline published by the Centers for Disease Control and Prevention (CDC), the federal health agency, states that the river water had no corrosion control. Corrosion control is a treatment that keeps water from eating into pipes.

Detroit's water carried a chemical called orthophosphate, which protects pipes from corrosion. The Flint River water had none, and it was high in chloride, a salt. The river water ate into the city's old pipes. Between 10 and 80 percent of Flint's service lines were made of lead, according to an estimate published in 2016 in the *American Journal of Public Health*. Service lines are the pipes that carry water from the main line under the street into each house. Lead was in the water for about 18 months, reporters for NPR, a national radio network, said in 2023.

Mona Hanna-Attisha was a children's doctor at Hurley Medical Center in Flint. She and her colleagues compared blood tests of 1,473 children in Flint with 2,202 outside the city. Their study was published in 2016. Among Flint children under 5, the share with high lead in their blood rose from 2.4 percent in 2013 to 4.9 percent in 2015. In the parts of the city with the most lead in the water, it rose from 4.0 to 10.6 percent. Children absorb 40 to 50 percent of the lead they swallow in water. Adults absorb 3 to 10 percent. Babies who drank formula mixed with tap water were at the highest risk.

Miguel Del Toral, an EPA expert on lead in water, warned officials of Michigan's Department of Environmental Quality (MDEQ) on February 27, 2015. He wrote that MDEQ's instructions for collecting water samples made the lead readings come out low. He also wrote that a federal rule, the Lead and Copper Rule, required Flint to have corrosion control. The same day, Stephen Busch of MDEQ wrote back that Flint had working corrosion control. The task force found that this was wrong. On April 25, 2015, Del Toral asked Pat Cook of MDEQ how Flint could meet the rules with no corrosion control. Cook, Busch and Mike Prysby of MDEQ then traded e-mails about his question. In July 2015 Brad Wurfel, MDEQ's spokesman, wrote that Flint's residents "do not need to worry about lead in the water supply."

In September 2015, Hanna-Attisha and her colleagues at Hurley Medical Center told pregnant women and children to stop drinking the water. Flint was connected again to a regional water system in 2015. Snyder asked for federal help on January 14, 2016. President Barack Obama declared a federal emergency in Flint on January 16, 2016. EPA officials issued their own emergency order on January 21.

Legionnaires' disease is a lung infection, a kind of pneumonia, caused by bacteria that grow in poorly treated water. From June 2014 to October 2015, Genesee County, where Flint is, had 90 cases. State health officials counted 10 dead in one report and 12 in another. In 2018, NPR reporters linked the outbreak to low chlorine in Flint's water. Chlorine is a chemical that kills germs in drinking water. Reporters for the PBS program *Frontline* found more deaths from pneumonia that the official count missed. The official count is disputed.

In April 2016, Michigan Attorney General Bill Schuette, the state's top lawyer, charged Busch, Prysby and Mike Glasgow of Flint with crimes, according to news reports. In December 2016 he charged Earley and the emergency manager who followed him, Gerald Ambrose, along with others. In June 2017 he charged the state health director, Nick Lyon, with involuntary manslaughter, which means causing a person's death through carelessness, without meaning to kill. He also charged the state's chief medical executive, Eden Wells.

In January 2021, two more lawyers for the people of Michigan brought new charges. They were Solicitor General Fadwa Hammoud, a top lawyer in the Michigan attorney general's office, and Kym Worthy, the lawyer who brings criminal cases for Wayne County. Snyder faced two counts of willful neglect of duty, which means knowingly failing to do his job. Lyon and Wells each faced nine counts of involuntary manslaughter. Earley faced three counts and Ambrose four counts of misconduct in office, which means breaking the law while doing a government job. Howard Croft, Nancy Peeler, Richard Baird and Jarrod Agen were charged too. In 2022 the judges of the Michigan Supreme Court ruled that the one-judge grand jury used to charge them broke the state constitution. A one-judge grand jury is a single judge who decides alone whether to charge someone with a crime. The 2021 cases ended on October 31, 2023, with no one found guilty.

Flint's people sued. On November 10, 2021, U.S. District Judge Judith Levy approved a settlement, an agreement to pay money to end the lawsuits, of $626.25 million for more than 90,000 Flint residents and businesses.

PART 4

Work, Food, and Money

Chapter 14: Work and Workers

Before 1500

Before 1500, the people of North America farmed, hunted, fished and built canoes, but nobody worked for wages. A wage is pay from an employer for work done. No one hired another person for pay, set their hours or fired them. People planned their work around the seasons and the needs of their own households. Work for wages began here only after people from Europe arrived.

Work by season and by household

In Eastern Woodlands communities, in the forests of eastern North America, men and women did different work. Women farmed corn, beans and squash, and they gathered wild foods. Men hunted and fished.

On the biggest jobs, men and women worked together in larger groups. They did this at planting time and at harvest, for building canoes and for maple sugaring. Maple sugaring means boiling down the sap of maple trees to make sugar.

Where farmers grew enough food for whole towns, some people could spend their time on one kind of work. They became traders, stoneworkers or religious leaders.

The 1500s

The first work that newcomers organized in this land was forced work. Spanish settlers in Florida and the Southwest made Native people work for them, with little pay or none. Spanish officials ran that forced work under two systems, the encomienda and the repartimiento.

The encomienda and the repartimiento

Under a system of the king of Spain called the encomienda, Spanish settlers could force Native people to work for them and to hand over tribute. Tribute is a payment of goods or labor that people are forced to give to those who rule them. In return the settlers were supposed to give

the Native people "protection and religious instruction." Settlers used the encomienda from Florida across the Southwest.

From the middle of the 1500s, Spanish officials in the colonies also used a second system, called the repartimiento. Under it, the officials sent Native workers in groups, by turns, to work on Spanish projects. The officials were supposed to pay the workers. In New Mexico, Spanish governors used the repartimiento to farm and to trade. They also forced enslaved people to do the work, though Spanish law forbade it.

Acoma, 1599: forced work as a sentence

In February 1599 Juan de Oñate, the leader of the Spanish colony in New Mexico, sentenced the Acoma survivors to twenty years of forced labor. Forced labor means work a person is made to do and is not free to leave. Acoma Pueblo is the town of the Acoma people, with their fields around it.

In December 1598 Spanish soldiers led by Oñate's nephew, Juan de Zaldívar, came to Acoma to demand food. In the Acoma people's own account, the soldiers raped an Acoma woman. Rape means forcing a person into sex. The Acoma killed Zaldívar and eleven to fourteen of his men. Accounts differ on the number. In January 1599 Oñate sent about seventy soldiers back to Acoma, led by Vicente de Zaldívar. Over two or three days they killed Acoma men, women and children and burned much of the town. Nobody counted the dead, and estimates run from about 300 to about 1,500.

Oñate sentenced the men over 25 to have one foot cut off. He also sentenced them to work for Spanish households for twenty years, with no right to leave. Boys and men from 12 to 25, and girls and women over 12, got the same twenty years of forced labor. Whether anyone carried out the cutting of feet is disputed. In the Acoma people's own account, Oñate had the right feet of 24 captive men cut off. Two historians who studied the Spanish records for years, Marc Simmons and John Kessell, came to doubt it. Kessell points out that no record describes an Acoma man with one foot.

The 1600s

Over the whole colonial period, between one-half and two-thirds of the European immigrants to the English colonies came as indentured servants. Under a contract, each of them had to work for a master for a set number of years, and most got no wages. They could not quit. Around Chesapeake Bay, masters worked them in the tobacco fields, and a sickness in the first

summer killed more than half of the newcomers. Virginia judges had runaway servants whipped and added years to their time. In the same century, English colonists began to hold Africans in slavery for life.

Bound for years: indentured servants

An indentured servant was a person bound by a written contract, called an indenture, to work for a master for a set number of years. Most terms ran four to seven years, and the servant could not leave. Most servants got no wages. A skilled servant named Buckland was paid 20 English pounds a year on top of his food, drink, washing and a place to sleep, and his contract was unusual.

Counts of how many European immigrants came this way differ. Most estimates run from one-half to two-thirds of all European immigrants to the colonies. Some estimates go as high as three-quarters. In the colonies around Chesapeake Bay, about 50,000 servants arrived between 1630 and 1680. They made up three of every four newcomers. In the 1630s there were about six men for every woman among them.

Servants there worked tobacco "from dawn until dusk, six days a week through the growing season." Many newcomers fell sick in their first summer. People called this sickness the seasoning, and it killed more than half of the new arrivals. One writer of the time said immigrants died "like cats and dogs." Virginia's lawmakers also punished women servants who had a baby without being married. Such a woman had an extra year added to her term, or she had to pay her master 1,000 pounds of tobacco.

At the end of the term, a master owed the servant "freedom dues," goods to start a free life with. In Virginia a man got ten bushels of corn, thirty shillings and a musket. A bushel is a measure of grain, about eight gallons. A shilling was an English coin, and a musket was a long gun. A woman got fifteen bushels of corn and forty shillings.

Masters also took children and teenagers as apprentices. An apprentice worked for a master in order to learn a trade, such as printing or shoemaking.

At home, families did their own spinning, weaving, brewing and candle-making. Brewing means making beer.

Martin's Hundred, on the land of Tsenacomoco

Martin's Hundred was an English plantation on the James River in Virginia. Its main settlement was Wolstenholme Towne. The plantation stood inside Tsenacomoco, the land of the Powhatan chiefdom. The chiefdom was a union of many Native nations under one high

chief. Tsenacomoco ran north from the James River to the Potomac River, and from Chesapeake Bay west to the places where the rivers drop in falls from higher ground. About 15,000 people lived there, and estimates run from 13,000 to just over 22,000.

On March 22, 1622, the Powhatan leader Opechancanough led an attack on most of the English settlements. Colony officials recorded 347 colonists killed. They got no report from some settlements, so the real number was probably higher. The Powhatan fighters killed at least 58 colonists at Martin's Hundred. They killed more colonists at Wolstenholme Towne, its main settlement, than at any other settlement.

Richard Frethorne

Who: An indentured servant in Virginia, probably a young teenager, whose letters home to his parents survive.

When and where: Martin's Hundred, Virginia, from December 1622 until his death, recorded by February 1624.

Richard Frethorne wrote home from Virginia to beg his parents to buy him out of his indenture. He had arrived at Martin's Hundred in December 1622 on a ship called the *Abigail*, nine months after the attack. He was probably a young teenager.

In March and April 1623 he wrote to his parents in England. He asked them to pay off his indenture, or else to send food. Since he left the ship, he wrote, he had eaten nothing but peas and loblollie. Loblollie was water gruel, a thin porridge boiled in water. He also wrote, "when we are sick there is nothing to comfort us."

By February 1624 a muster list had been made, a count of the living and the dead at each settlement. The list records Frethorne, spelled "Frethram," among the dead at Martin's Hundred.

Runaways, and a sentence for life

Servants who ran away and were caught faced the whip and more years of work. The governor of Virginia and his council sat together as the colony's highest court, called the General Court. On July 9, 1640, these judges heard the case of three runaway servants of Hugh Gwyn, a planter, or owner of a plantation. The judges ordered two of them, a Dutchman called Victor and a Scotsman named James Gregory, whipped with thirty lashes each. A lash is one stroke of the whip. Both men also had to serve extra years.

The third runaway was John Punch, a Black man. For the same escape, the same judges ordered him to serve his master "for the time of his natural Life," which meant for the rest of his life.

On July 22, 1640, the same judges ordered thirty lashes for other runaways. They also ordered three of them, Christopher Miller, Peter Wilcocke and a Black man named Emanuel, "to be Burnt in the cheek with the letter R." This punishment is called branding. To brand a person was to press a red-hot iron into the skin. The burn left the letter on the cheek as a scar for life. The court records name the letter R and the cheek, but they do not describe the iron used. They do not name the men who did the whipping and the branding. The judges also ordered Miller and Emanuel to work in shackles, iron rings locked around the legs, for a year or more.

In March 1643 Virginia's lawmakers wrote two punishments for runaways into law. A runaway had to serve double the time he had been gone. A servant who ran away a second time was to be "branded in the cheek with the letter R." The law did not say who was to do the branding.

1700 to 1750

A boy who learned a trade between 1700 and 1750 moved up through three ranks: apprentice, journeyman and master. A journeyman was a skilled worker paid by the day. Sailors and dock workers made up the other large group of people who worked for wages. Officers of the British navy could seize those men and force them to serve at sea. In the colonies around Chesapeake Bay and in the Lowcountry along the southern coast, colonists held more and more people in slavery. Slave traders brought about 8,600 enslaved Africans to Virginia between 1701 and 1710, about 6,200 between 1711 and 1720, and about 13,000 between 1721 and 1730.

The ladder of a trade

A trade such as printing, shoemaking, carpentry or blacksmithing had three ranks. A child or teenager started as an apprentice, bound to a master to learn the work. When the apprentice's time was up, he became a journeyman. A journeyman was a skilled worker who earned wages, paid by the day. A journeyman who set up a shop of his own became a master.

In the towns, enslaved men also worked at skilled trades. Owners "hired out" some of these men to other employers. The employers paid wages for the work, and the owners kept the wages.

Benjamin Franklin

Who: A runaway apprentice. At 12 he was bound to work in his brother James's print shop, and at 17 he ran away.

When and where: Boston, New York and Philadelphia, 1718 to 1723.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS in April 2022. It is about Franklin's life.

Benjamin Franklin ran away from his apprenticeship at 17. In 1718, when he was 12, he was bound as an apprentice to his brother James, a printer in Boston. Under his indenture he had to work in James's shop until he was 21. Only in the last year would he be paid a journeyman's wages.

Franklin later wrote that his brother beat him. He also admitted that he himself may have been "too saucy and provoking." He meant that he may have been rude to James and made him angry. In September 1723, with about four years left on his indenture, he ran away. He went first to New York and then to Philadelphia. He reached Philadelphia on October 6, 1723, with almost no money.

Sailors, press gangs and the Knowles Riot

Sailors and dock workers were paid wages. Officers of Britain's Royal Navy could also impress them. To impress a man was to seize him and force him to serve on a navy ship. The groups of men sent to grab them were called press gangs.

In November 1747, press gangs working for Commodore Charles Knowles seized 46 men in Boston. A commodore was a navy officer who commanded a group of ships. The men seized included boatmen, sailors and even carpenters. Beginning on November 17, a crowd made up mostly of working people rioted in Boston for three days. They took some of Knowles's officers as hostages. The crowd forced Knowles to free the seized men in exchange for his officers. The fight is called the Knowles Riot.

1750 to 1800

Hired workers in Philadelphia began to act together against their employers in the late 1700s. In 1786 journeymen printers there went on strike, stopping work together until their employers met their demands. They won pay of at least $6 a week. In 1794 journeymen shoemakers in the

same city formed a trade union, a group of workers who bargain together with employers, and it lasted.

The printers' strike of 1786

In a strike, workers stop work together until the employer meets their demands. In 1786 the journeymen printers of Philadelphia struck against a cut in their wages. A U.S. Labor Department list of important events in labor history records the start of the strike as June 2, 1786. The printers won, and their employers agreed to pay at least $6 a week.

The printers also set up a fund of money to support one another during the strike, the first strike fund on record. The same Labor Department list describes theirs as "the earliest authenticated strike of workers in the United States in a single trade." Authenticated means proven by the records. The labor historian Selig Perlman, writing in 1922, noted that the usual list of American strikes began with New York's bakers, who stopped work in 1741. He found that those bakers were master bakers, the shop owners, protesting a city rule that set the price of bread. By his account, the 1786 printers' walkout was the earliest real strike of workers against their employers known in America.

The shoemakers' union of 1794

Shoemakers in those days were called cordwainers. In May 1794, journeymen shoemakers in Philadelphia formed the Federal Society of Journeymen Cordwainers. A trade union is a group of workers in one trade who join together to bargain with employers over pay and hours. The Federal Society was the first trade union in the United States that lasted.

Its members called a "turn-out" to hold a standard wage, the same pay for the same work across the trade. A turn-out was their word for a strike.

1800 to 1850

In the first half of the 1800s, factory owners ran their workers' days by bells. In the mills of Lowell, Massachusetts, young women worked about 12 hours a day. Children tended machines, and Irish immigrants dug canals and railroads. In 1806 a jury in Philadelphia found shoemakers guilty of a crime for forming a union to raise their pay. A union is a group of workers who join together to bargain with employers, which means to talk with them to reach a deal on pay and hours. By 1842 a Massachusetts judge had ruled that a union could be lawful. Through these years workers fought for a working day of ten hours.

Unions on trial, 1806

In November 1805 the union shoemakers of Philadelphia, the cordwainers, held a turn-out, their word for a strike. In March 1806 lawyers led by Jared Ingersoll and Joseph Hopkinson put eight of them on trial. Judge Moses Levy heard the case in the Mayor's Court of Philadelphia, a city court. The jury found the eight men guilty "of a conspiracy to raise their wages." A conspiracy is a secret plan by two or more people to do something against the law. Each man had to pay a fine of $8 and the costs of the trial. After this verdict, prosecutors could take workers to court as criminals for forming a union to raise their pay.

Children, diggers and charcoal burners

Children worked in the mills, and that was legal. Children tended the machines and did the doffing. To doff was to take the full bobbins, the spools that held the spun thread, off a spinning machine and put empty ones on.

Gangs of laborers dug the new canals and graded the new railroad lines, which means they leveled the ground for the tracks. Many of these men were immigrants from Ireland.

At Hopewell Furnace, a place in Pennsylvania where workers made iron, the furnace burned charcoal. Charcoal is wood that has been burned slowly, with little air, until only a black fuel is left. More than 100 of the workers Hopewell paid from 1835 to 1837 were woodcutters. One count by the National Park Service lists 112 woodcutters out of 213 workers, and another lists more than 100 out of nearly 250. Most woodcutters worked part of the year, cutting and splitting hardwood through the winter with only axes. A woodcutter cut about two cords a day and was paid by the cord, a stack of cut wood of a set size.

About 20 colliers, the men who made the charcoal, worked there in the 1830s. Each tended 8 or 9 slowly burning mounds of wood, 24 hours a day for 10 to 14 days, and was paid by the bushel of charcoal. A bushel is a measure of about eight gallons. The colliers lived in huts beside the mounds.

Duffy's Cut, 1832

In late June 1832, 57 Irish immigrants arrived on the ship *John Stamp*. They came from Donegal, Tyrone and Derry in Ireland, and their average age was 22. A contractor named Philip Duffy hired them to dig a cut for the Philadelphia and Columbia Railroad. A cut is a channel dug through high ground so the tracks can run level. They also built up a bank of earth for the tracks. The site was at mile 59 of the line, in Chester County, Pennsylvania.

By early August the disease cholera had reached their camp. Cholera is an infection of the gut, spread by water or food that carries traces of a sick person's waste. In bad cases it causes watery diarrhea and vomiting, and the body loses water so fast that a person can go into shock and die. All 57 men died. Some died of cholera, and their remains later showed that someone killed others. Local people stayed away from the camp.

From 2009 to 2012, a team of researchers dug up some of the men's remains. Some of the skulls had been struck by blows at about the time of death. One man had a bullet in his skull, fired at close range. None of the remains the team dug up showed wounds from trying to defend themselves. Someone beat several of the men and shot one. The records do not say who, and no record shows that anyone was charged. To explain the killings, the historian who led the dig, William E. Watson, points to fear of cholera and perhaps to nativism, which is hatred of immigrants.

Lowell and the mill girls

The owners of the mills built the mill city of Lowell, Massachusetts, at Pawtucket Falls on the Merrimack River. The falls were a fishing and gathering place of the Pennacook people. In the 1600s two Pennacook towns, Pawtucket and Wamesit, stood where Lowell stands now. Their leaders were the sachems Passaconaway and his son Wannalancet. A sachem is a chief.

In 1675 and 1676 Native nations led by Metacom, a Wampanoag leader the English called King Philip, fought the English colonies of New England. About 9,000 people died in King Philip's War. Wannalancet kept peace with the English. In 1676, at Cocheco in New Hampshire, an English captain named Richard Waldron seized Native people who had come to him in peace. He sent them to Boston, where the governor and council of Massachusetts decided what to do with them. Officials in Boston hanged seven or eight of them. About 200 were enslaved for life and shipped to Barbados, an island in the Caribbean Sea. The records do not name the men who sold them. Wannalancet and his people moved north to St. Francis in Canada. By the end of the war they no longer lived in the lower Merrimack valley.

The Lowell mills belonged to a group of Boston merchants called the Boston Associates. Among them were Francis Cabot Lowell, Nathan Appleton and Patrick Tracy Jackson. Their mills spun cotton that enslaved people had grown in the South. The mills also made a cheap cloth that the owners sold to plantations to clothe enslaved people.

Most of the mill workers were young New England women, aged 15 to 25. They are known as the mill girls. Under the companies' rules they had to work at least a year, to live in a company boardinghouse and to go to church. On average a mill girl stayed about three years.

A report of the Massachusetts lawmakers in 1845 recorded the working day. From May through August, work began at 5 in the morning and ended at 7 at night. The workers had half an hour for breakfast and 45 minutes for the midday meal. From September through April, work began "as soon as they can see" and ran until 7:30 at night. Across the year, the mills ran an average of twelve hours and ten minutes a day. Bells rang the start and the end of work.

The Lowell turn-outs of 1834 and 1836

In February 1834 the mill managers announced wage cuts of 12 to 25 percent. About 800 women turned out, which meant they walked off the job together. The strike failed.

In October 1836 the women who ran the boardinghouses told the mill managers they could not make ends meet. The managers then took more money out of each woman's weekly pay for room and board. That was the same as a cut in pay. About 1,500 women struck and formed the Factory Girls' Association. They were better organized than in 1834, and this time they won part of what they asked for. Managers at the Boott and Merrimack mills took back the whole increase. At the Hamilton mill, managers took it back only for workers paid by the day.

> ### Harriet Hanson Robinson
>
> **Who:** A child worker in a Lowell mill who led the girls of her room out on strike at age 11, and later wrote a book about the mill girls.
>
> **When and where:** Lowell, Massachusetts, 1835 to 1848. Born February 8, 1825. Died 1911.
>
> Harriet Hanson was 11 years old when she led the girls of her room out on strike in October 1836. She had started work in a Lowell mill at 10, as a doffer.
>
> On the day of the turn-out, the girls in her room could not decide whether to leave. She later remembered saying, "I don't care what you do, I am going to turn out, whether anyone else does or not." She walked out, and the others followed her.
>
> Harriet stayed at the mills until 1848. In 1898 she published a book about her years there, called *Loom and Spindle, or Life Among the Early Mill Girls*, and in later life she worked for women's right to vote.

The ten-hour day

Workers in Philadelphia, in Lowell and on federal building jobs wanted a working day of ten hours. In 1835 coal heavers on the docks of the Schuylkill River in Philadelphia stopped work. A coal heaver moved coal on and off boats. Other workers joined them. By June 10, workers in

more than forty trades, or kinds of skilled work, had struck, nearly 20,000 people in all. It was the first general strike in the United States. In a general strike, workers in many different trades stop work at the same time. Philadelphia's city officials agreed to the ten-hour day and to raises.

On March 31, 1840, President Martin Van Buren ordered a ten-hour day for laborers on building projects of the United States government. His order covered only workers paid by the federal government. It did not cover anyone who worked for a private employer.

Commonwealth v. Hunt, 1842

In 1842 the judges of the highest court in Massachusetts, the Supreme Judicial Court, heard a case called Commonwealth v. Hunt. Chief Justice Lemuel Shaw ruled that in Massachusetts a trade union was not a criminal conspiracy just for being a union. Workers there could lawfully form a union, and they could lawfully strike. In 1806 a Philadelphia jury had found union shoemakers guilty of a crime for doing the same thing.

Sarah Bagley and the ten-hour petition

In the winter of 1844 and 1845, Lowell mill workers formed the Lowell Female Labor Reform Association. Its president was Sarah Bagley. The women sent petitions to the Massachusetts lawmakers, asking for a ten-hour day. A petition is a written request signed by many people. After the petitions came in, the lawmakers looked into conditions in the mills.

In 1845 Bagley spoke to a committee of the Massachusetts House. She told them that she had "worked in the Lowell Mills eight years and a half." The committee's chairman was William Schouler. All the committee members agreed "that legislation is not necessary at the present time." They meant that no new law was needed. They turned down the ten-hour petition. Bagley said afterward that the committee had "misrepresented" what she told them.

1850 to 1900

From 1850 to 1900, working people in mines, mills, rail yards and sweatshops did dangerous work, and children worked beside adults. A sweatshop was a crowded workshop where people sewed clothing for long hours and low pay. In the cotton mills of the South, children worked 12-hour days, six days a week. Workers formed the first national unions to fight for higher pay and an eight-hour day. Police, private guards, state militia (the part-time soldiers of each state) and federal soldiers broke many of their strikes, and they shot and killed strikers.

The Chinese railroad strike, 1867

In the 1860s thousands of Chinese workers built the Central Pacific Railroad through the Sierra Nevada mountains of California. White workers on the line earned $40 a month. The Chinese workers earned $35. On June 25, 1867, several thousand of them went on strike. Estimates of their number run from 2,000 to 5,000.

They asked for the same pay as white workers, shorter hours and an end to whipping. The records do not name the men who whipped them. The company's managers cut off the food supply to their camps. After eight days the strike ended with no promises from the company, though pay later rose a little. It was the largest strike by workers in the country up to that time.

Avondale, 1869

On September 6, 1869, a fire broke out at the Avondale coal mine in Plymouth Township, near Wilkes-Barre, Pennsylvania. Above the mine stood the breaker, a tall wooden building where coal was broken up and sorted. The breaker stood over the mine's only shaft, the one way in and out. Sparks from the furnace that pushed air through the mine set the breaker on fire.

The men and boys below had no other way out. The fire killed 110 people. Among the dead were five boys and two men who tried to rescue the workers. In 1870 Pennsylvania's lawmakers passed a mine safety law that required more than one exit from every mine.

The Knights of Labor

On December 9, 1869, a tailor named Uriah Smith Stephens founded the Knights of Labor in Philadelphia. At first it was a secret society. Terence V. Powderly later led it and opened it up to the public. In 1879 the Knights had fewer than 10,000 members. By 1886 they had about 700,000.

The Knights let women join, and in some places Black workers too. Besides higher wages, they called for an eight-hour day, equal pay for equal work, and an end to child labor and to the work of prisoners leased to companies. They also wanted the public, not private owners, to own utilities, the companies that supplied things like gas and water.

Servants, children and sweatshops

The census is the count of all the people in the country that the United States government takes every ten years. The census of 1870 was the first to count women's work carefully. It found 867,354 domestic servants, people paid to cook, clean and care for other families' homes. They

made up about half of all women who worked for pay. Domestic service stayed the largest job for women in every census from 1870 to 1940.

The same census found that about 1 in 8 children had jobs. By 1900 it was more than 1 in 5. From 1890 to 1910, at least 18 percent of all children aged 10 to 15 worked. In Philadelphia, the pay children brought home made up 28 to 46 percent of their family's income, depending on the family's ethnic group.

In the South, cotton mill owners hired children in growing numbers. In 1900, 25,000 of the nearly 100,000 textile workers in the South were children under 16. By 1904 there were 50,000 children in the mills, and 20,000 of them were under 12. They worked 12-hour days, six days a week. Mill owners said the fingers of adult farm workers were too "knotted and gnarled" for mill work.

In the hard-coal fields of Pennsylvania, breaker boys sat on benches in the breakers and picked slate, a kind of rock, out of the coal. In the cities, people sewed clothing in sweatshops set up in lofts, the open upper floors of buildings, and in tenements. A tenement was a cheap apartment building packed with families.

The Great Railroad Strike, 1877

In July 1877 John W. Garrett, the president of the Baltimore and Ohio Railroad, cut his workers' wages by 10 percent. It was not the first cut. Workers at Martinsburg, West Virginia, walked off the job. The strike spread through West Virginia, Maryland, Pennsylvania, New York, Missouri and Illinois.

Governors called up their state militias, the part-time soldiers of each state. President Rutherford B. Hayes sent federal troops. He issued orders for West Virginia on July 18, Maryland on July 21 and Pennsylvania on July 23. In Pittsburgh on July 21, militiamen brought in from Philadelphia opened fire on a crowd. They killed more than twenty people, among them a woman and three small children. The official death count for Pittsburgh was 26, and the real number was likely higher. In Reading, Pennsylvania, on July 23, a crowd threw bricks and stones down on militiamen marching through a deep cut for the railroad. Some of the soldiers fired into the crowd, and at least ten people were killed. By September 1877, state and federal troops had broken the strike. The workers won nothing at the time.

The telephone operators

Telephone companies created a new job. Calls went through a switchboard, where an operator connected each caller to the person being called. The first operators were teenage boys. On September 1, 1878, a telephone company in Boston hired Emma Nutt as the first woman operator. Her sister Stella was hired the same day. Emma Nutt earned $10 a month for a 54-hour week. Telephone companies replaced the boys with women, and by the late 1880s nearly all operators were women.

The eight-hour day and Haymarket, 1886

On May 1, 1886, workers across the country went on strike for an eight-hour day. In Chicago about 35,000 workers struck. On May 3, Chicago police fired on strikers at the McCormick Harvesting Machine Company plant and killed at least two of them.

On May 4, workers held a meeting in Chicago's Haymarket Square to protest the killings. Inspector John Bonfield marched on the meeting with 176 police officers and ordered the crowd to break up. Then someone threw a dynamite bomb at the police. No one has ever proved who threw it. The police drew their guns and fired wildly. Counts of the dead differ. A Library of Congress history page lists seven police officers and at least four people in the crowd killed. A Chicago History Museum page lists eight police officers dead and sixty wounded, and states that an unknown number in the crowd were killed or wounded.

A Chicago jury convicted eight anarchists of conspiracy. Anarchists are people who believe there should be no government. The eight were Albert Parsons, August Spies, Louis Lingg, Samuel Fielden, Adolph Fischer, Michael Schwab, George Engel and Oscar Neebe. None was shown to have thrown the bomb. Judge Joseph E. Gary sentenced seven of them to death and Neebe to fifteen years in prison. On November 11, 1887, officials at the Cook County Jail hanged Parsons, Spies, Engel and Fischer. Lingg killed himself in his cell with a small bomb that someone smuggled in to him.

After Haymarket, most members left the Knights of Labor. By 1890 the Knights had about 100,000 members, down from about 700,000 in 1886.

In June 1893 Governor John Peter Altgeld of Illinois pardoned the three men still in prison. A pardon is an order that frees a person from punishment for a crime. Altgeld found that the trial had been unfair. He wrote that Judge Gary ran the trial with "malicious ferocity," meaning with cruel, spiteful anger. A court officer named Ryce, chosen at the suggestion of the state's attorney, the lawyer who brought the case, had called in a jury set against the men on trial. Altgeld wrote that "much of the evidence given at the trial was a pure fabrication," which

means it was made up. He also wrote that some leading police officials had threatened men with torture and had offered money and jobs to anyone who would swear to what the police wanted.

The American Federation of Labor

On December 8, 1886, leaders of craft unions met in Columbus, Ohio, and founded the American Federation of Labor, the AFL. A craft union takes in the skilled workers of one trade, such as cigar makers or carpenters. The AFL's unions bargained with employers, talking with them to reach a deal, for higher wages and shorter hours. This way of running unions was called "pure and simple" unionism.

Samuel Gompers

Who: A cigar maker who became the first president of the American Federation of Labor.

When and where: Born in London, January 27, 1850. Worked in New York. President of the AFL from 1886 to 1924, except for 1895.

Samuel Gompers led the American Federation of Labor for almost forty years. He was its first president, and he served from 1886 to 1924, except for one year, 1895.

He was born on January 27, 1850, in Spitalfields, in London. He made cigars from boyhood. In New York he rolled cigars in tenement shops.

Gompers built the AFL around wages and hours. In 1886 its unions had about 140,000 members. By 1924 they had nearly 3 million.

Brakemen and the coupler

A brakeman on a railroad joined, or coupled, the cars of a train by hand. He stood between two cars as they moved together and guided an iron link into a socket. Brakemen's hands were crushed, and missing fingers were called "the badge of the experienced worker." Thousands of brakemen died.

A safer way already existed. In 1873 Eli Janney got a patent for an automatic coupler. A patent is a government paper that makes an inventor the only one allowed to make and sell an invention for a set time. The Westinghouse air brake, a brake worked by air pressure, had existed since 1869. Railroad owners did not put them on most of their cars. In 1893 members

of Congress voted through the Safety Appliance Act, which required both on trains by 1900. Coupling accidents fell from about 11,000 in 1892 to about 2,000 in 1902, while the number of railroad workers grew.

Homestead, 1892

In 1892 steelworkers at Carnegie Steel's works in Homestead, Pennsylvania, were on strike, and they held the plant. On July 6, 300 agents of the Pinkerton detective agency, a private company, tried to land from barges and take the plant back. Henry Clay Frick had hired them for Carnegie Steel. Strikers and Pinkertons fought a gun battle. Seven workers and three Pinkerton agents were killed. Some accounts count more.

On July 12, 8,000 state militiamen, sent by the governor of Pennsylvania, arrived at Homestead. By November the strike had failed, and the steelworkers at Homestead no longer had a union.

Pullman, 1894

The Pullman Palace Car Company made and repaired railroad cars near Chicago. Its workers lived in Pullman, Illinois, a company town. In a company town, one company owns the houses and collects the rent. In 1893 and 1894 the company's managers cut wages by about 25 to 35 percent. They did not cut the rents.

The workers belonged to the American Railway Union, founded in June 1893. It was the first industrial union, which means it took in every kind of railroad worker in one union, not one craft at a time. In June 1894 the union's members held a convention, a big meeting of delegates sent by its branches. The delegates voted for a national boycott of Pullman cars. In a boycott, people refuse to buy from, use or work for a company. Railroad workers across the country refused to handle trains that carried Pullman cars. On June 28, 1894, while the boycott spread, President Grover Cleveland signed a law making Labor Day a federal holiday.

Attorney General Richard Olney, the federal government's top lawyer, took the union to court. On July 2, 1894, federal judges William Woods and Peter Grosscup issued an injunction. An injunction is a court order that tells people to stop doing something. The judges ordered Eugene V. Debs, the union's founder, and its other officers to stop anything that got in the way of the mail. They also had to stop anything that got in the way of trade between the states. On July 3, over the protest of Governor Altgeld, President Cleveland ordered federal troops into Chicago. More than 16,000 troops were called up across the country. The soldiers arrested boycotters and rioters and sometimes shot them.

About 30 people were killed across the country, and some counts reach 34. Accounts of the strike do not say who killed each of them. Federal judges and soldiers ended the boycott.

Jennie Curtis

Who: A seamstress in the Pullman shops whose speech helped start the Pullman boycott.

When and where: Pullman, Illinois, 1893 and 1894. Born 1871. Died 1917.

Jennie Curtis spoke to the American Railway Union's convention in June 1894. Her speech helped persuade the delegates to vote for the Pullman boycott.

She was a seamstress in the sewing room of Pullman's repair shops for five years. She told how the women there made "all the carpets, and all the silk, satin, plush, and velvet drapings for the dining cars." They also sewed the cloth covers for the seats. Before the depression of 1893, a time when many businesses failed and many people lost their jobs, she earned $1.50 to $2.25 a day. Then Pullman's managers cut her pay twice in one week in November 1893. Her pay fell to about 80 cents a day. Many of the girls she worked with averaged 40 to 50 cents.

Curtis was president of Local 269, the union's branch for young women workers, which had 125 members. In 1894 she told the United States Strike Commission, a panel that looked into the strike, about wages, rents and abusive supervisors. She said her father had worked for Pullman for 13 years. When he died, he owed back rent, and Pullman's managers collected it.

Eugene V. Debs

Who: A locomotive fireman who founded the American Railway Union and went to jail for leading the Pullman boycott.

When and where: Terre Haute, Indiana, and Chicago. Founded the union in June 1893.

Movie: *American Socialist: The Life and Times of Eugene Victor Debs* (2017), a documentary directed by Yale Strom. It is about Debs's life.

Eugene V. Debs went to jail for six months for leading the Pullman boycott. As a young man in Terre Haute, Indiana, he was a locomotive fireman, the worker who shoveled coal into the engine's fire. He became an officer of the Brotherhood of Locomotive Firemen, a union for that one craft.

> In 1893 he founded the American Railway Union, which took in all railroad workers. After the Pullman boycott, judges found him guilty of contempt of court, which means disobeying a court's order. For that, in 1895, he served six months in the jail at Woodstock, Illinois.
>
> Debs later ran for president five times as a Socialist. Socialists wanted the public, not private owners, to own the big industries. In 1918 he gave a speech against the war, and he was sentenced to ten years in prison for it. He ran for president for the last time in 1920 from his prison cell, as Convict 2253. He got between 900,000 and 1 million votes. President Warren Harding shortened his sentence, and Debs went free at Christmas 1921.

Lattimer, 1897

On September 10, 1897, nearly 400 immigrant coal miners marched from Harwood to Lattimer, Pennsylvania, to support a strike. They carried no weapons. Luzerne County Sheriff James Martin had deputized nearly 90 men, which means he had given them the power to act as officers of the law. The deputies fired on the marchers. They killed 19 men, who were Polish, Slovak and Lithuanian, and wounded 38. Many were shot in the back.

Martin and his deputies were tried for murder from February 1 to March 2, 1898. The jury found every one of them not guilty. By 1900 the United Mine Workers, the coal miners' union, was the fastest-growing union in the country.

Convict leasing

In the South after the Civil War, state officials leased, or rented out, prisoners to mines, railroads and planters, who forced them to work. This was called convict leasing. Most of the prisoners were Black men. In Alabama, more than 90 percent of the state prisoners who were leased out were Black. Sheriffs arrested many of them for small offenses under the Black Codes. Southern lawmakers passed these laws from November 1865, and they made Black people prove they had work. In Alabama, contractors whipped prisoners who tried to escape or did not work hard enough. Every year 4 to 5 percent of Alabama's leased state prisoners died.

1900 to 1950

A federal law of 1938 set a minimum wage of 25 cents an hour. It also set a work week of 44 hours, falling to 40 by 1940, and banned most work by children under 16. Since 1935 workers had had the legal right to form unions, under a federal law that members of Congress passed that year. In the first years of the century, children still worked in mills and mines. In 1900, 1,489 coal miners were killed at work, and in 1907, 3,242. In 1911 a fire killed 146 workers in a New York garment factory. At Ludlow, Colorado, in 1914, National Guard soldiers burned a camp of striking miners' tents, and the fire killed 13 women and children hiding in a pit under one tent. In Chicago in 1937, police shot and killed ten people who were marching to support a steel strike.

The hard-coal strike, 1902

In May 1902, 147,000 hard-coal miners and breaker boys in Pennsylvania went on strike. Breaker boys were boys who picked waste rock out of the coal. They stayed out for about five months, until October. President Theodore Roosevelt stepped in. Earlier presidents had sent troops to break strikes, as in 1877 and 1894. Roosevelt acted as a mediator instead, a go-between who helps both sides reach a deal. It was the first time a president had done this in a strike.

Roosevelt set up a commission, a group of people chosen to look into the strike. The commission heard 558 witnesses. Some of them were breaker boys younger than nine. In March 1903 the commission's members ruled that the miners should get a 10 percent raise and a nine-hour day.

> ### Mother Jones
>
> **Who:** Mary Harris Jones, a union organizer for coal miners whom a prosecutor called "the most dangerous woman in America."
>
> **When and where:** Baptized in Cork, Ireland. She said she was born in 1830, but her baptism record gives August 1, 1837. Organizing from the 1870s, and for the United Mine Workers from the 1890s. Died 1930.
>
> Mary Harris Jones, known as Mother Jones, spent the last part of her long life organizing workers. In 1902 a prosecutor in West Virginia called her "the most dangerous woman in America."

She had worked as a dressmaker. In 1867, in Memphis, Tennessee, her husband and all four of her children died of the disease yellow fever. In 1871 she lost her home and her shop in the great fire in Chicago. After that she became a full-time organizer. From the 1890s she worked above all for the United Mine Workers, the coal miners' union.

In July 1903 she led the March of the Mill Children. Children who worked in textile mills in Philadelphia were on strike. Mother Jones marched with them from Philadelphia toward the home of President Theodore Roosevelt at Oyster Bay, New York. She wanted people across the country to look at child labor.

She said she was born in 1830, and on May 1, 1930, she celebrated her "100th" birthday. The record of her baptism in Cork gives August 1, 1837, which would have made her 92. She died in 1930.

Deaths in the coal mines

In 1900, 1,489 coal miners were killed at work. The worst year on record was 1907. That year 3,242 coal miners were killed out of 680,492 miners.

On December 6, 1907, explosions in two mines at Monongah, West Virginia, mines No. 6 and No. 8, killed hundreds of men and boys. Some of the boys were as young as eight. The official count was 362 dead. The West Virginia Mine Wars Museum and later estimates put the dead at more than 500. About 1,000 children lost their fathers. Accounts differ on which company ran the mines, the Fairmont Coal Company or the Consolidation Coal Company. The Fairmont company's president, C. W. Watson, blamed "the careless use of a mining lamp." No record shows that anyone was charged.

Lewis Hine photographs the children

Lewis Hine left his job as a teacher in 1908 to take photographs of working children. He worked for the National Child Labor Committee, a group trying to end child labor. From 1908 to 1917 he made thousands of pictures of children at work in mills, mines, food-canning plants and on city streets.

Addie Card

Who: A child spinner in a Vermont cotton mill whose photograph by Lewis Hine appeared on a United States postage stamp in 1998.

When and where: North Pownal, Vermont, 1910. Died 1993.

> In 1910 Lewis Hine photographed Addie Card at her spinning machine in the cotton mill at North Pownal, Vermont. She was 12 years old, according to Hine. The girls at the mill told him she was 10.
>
> Hine wrote her name down wrongly as "Addie Laird." He called her an "anemic little spinner." Anemic means pale and weak because the blood is not carrying enough of what the body needs. In 1998 the picture appeared on a United States postage stamp.
>
> In 2005 and 2006, a researcher named Joe Manning, working with the novelist Elizabeth Winthrop, found her real name and traced her life. In 1915, at 17, she married Edward Hatch. They split in 1925, and he won custody of their daughter. She married again, to Ernest Lavigne, and got another job in a mill in Cohoes, New York. In her last years she lived in a housing project in Cohoes. She died in 1993.

The shirtwaist makers and the Triangle fire

A shirtwaist was a woman's blouse. In New York City, many young immigrant women sewed shirtwaists in garment shops. On November 22, 1909, the shirtwaist makers held a meeting at Cooper Union, a hall in New York. Clara Lemlich, a shirtwaist maker, was still bruised from a beating by men hired by her company. She stood up and spoke in Yiddish, the language of many Jewish immigrants. "I have no further patience for talk," she said. "I move we go on strike." About 20,000 garment workers struck for eleven weeks. The strike is called the Uprising of the 20,000.

On March 25, 1911, a fire broke out on the top floors of the Triangle Waist Company's building near Washington Square in New York. The fire killed 146 workers. Most of them were young immigrant women, and some were only 14. On the ninth floor, the door to one stairway was locked. No record proves who locked it. Dozens of workers jumped from the building.

The owners of the company, Max Blanck and Isaac Harris, were tried for manslaughter. Manslaughter is the crime of killing someone without meaning to, through a wrongful act or through carelessness. On December 27, 1911, the jury acquitted them, which means it found them not guilty. The prosecutors could not prove that the owners knew the door was locked. New York's lawmakers then set up the Factory Investigating Commission, and they rewrote the state's factory safety laws.

Rose Rosenfeld Freedman

Who: A worker who survived the Triangle fire and spent the rest of her life telling what happened there.

When and where: New York City, March 25, 1911. Died February 15, 2001, at 107, the last survivor of the fire.

Rose Rosenfeld was two days short of her 18th birthday when the Triangle fire broke out. She got out by following the company's executives up the stairs to the roof of the building, on the tenth floor. From the roof, rescuers pulled the survivors across.

She later said that the owners offered her money to keep quiet about the locked doors. She said she turned the money down. For ninety years she told people the truth about the locked doors.

Rose Rosenfeld Freedman died in Beverly Hills, California, on February 15, 2001. She was 107, and she was the last survivor of the Triangle fire.

Frances Perkins

Who: A woman who watched the Triangle fire, later became the first woman in a president's Cabinet, and pushed for the law that set the country's first federal minimum wage.

When and where: New York, 1911. Secretary of Labor in Washington, 1933 to 1945.

Movie: *Summoned: Frances Perkins and the General Welfare* (2020), a documentary by Mick Caouette, shown on PBS. It is about Perkins's life.

Frances Perkins was having tea near Washington Square on March 25, 1911, when the Triangle fire broke out. She ran to the building and watched the workers jump. She later said the New Deal began on that day. The New Deal was the set of programs that President Franklin Roosevelt started in the 1930s.

After the fire, Perkins worked as an investigator for New York's Factory Investigating Commission. In 1933 President Roosevelt made her Secretary of Labor. She was the first woman in a US Cabinet, the group of top advisers who run the government's departments. She held the job until 1945. She pushed for the Fair Labor Standards Act and for Social Security, the government's program of payments to people who are old or cannot work.

Lawrence, 1912

In 1912 Massachusetts lawmakers cut the legal work week from 56 hours to 54. Mill owners in Lawrence, Massachusetts, then cut their workers' pay. On January 12, 1912, the workers struck. Most of them worked for the American Woolen Company. More than half of the mill workers were women and children, and they spoke more than a dozen languages. Leaders of a union called the Industrial Workers of the World sent organizers, who ran committees that gave out food and help.

In February the strikers began sending their children to live with families in other cities. On February 24, police at the Lawrence railroad station clubbed women and children who were trying to send children away. The police jailed 30 women. On March 12 the owners agreed to a 15 percent raise, double pay for overtime (extra hours of work) and no punishment for the strikers.

The assembly line

On October 7, 1913, managers at Henry Ford's plant at Highland Park, Michigan, started a moving line to build car frames, called chassis. The work moved past 140 assemblers along 150 feet of line. Each man did the same few motions over and over, at the speed of the line. Building a chassis had taken more than 12 hours. On the line it took about 93 minutes.

Many men could not stand the pace, and they quit. In 1913 worker turnover at the plant reached 370 percent. That means that for every job, Ford's managers had to hire nearly four men in a year. On January 5, 1914, Ford announced a pay of $5 for an eight-hour day. Before that, pay had been about $2.34 for nine hours.

The $5 day came with conditions. Ford's managers called part of the money "profit-sharing," and they paid that part only to men who passed inspections of their homes. Company investigators, from an office that Ford's managers called the Sociological Department, checked whether a man drank, whether he saved money and how clean his home was. They also checked whether he took in boarders, people who paid to live in a room of his home. The managers left out workers under 22 and, at first, most women.

Ludlow, 1914

Coal miners in Colorado went on strike in September 1913. They wanted the state's mining laws enforced. They also wanted the mine owners to recognize their union, the United Mine Workers, which means to accept it and bargain with it over pay and hours. Most of them

worked for the Colorado Fuel and Iron Company. Its main owner was John D. Rockefeller Jr. The strikers and their families lived in tent colonies.

In October 1913 men in an armored car belonging to the company, called the "Death Special," fired on the tent colony at Forbes and killed one person. Governor Elias M. Ammons sent in the Colorado National Guard, the state's soldiers, and the mine owners paid for it.

On April 20, 1914, fighting broke out at the tent colony at Ludlow. Nobody knows who fired the first shot. Guardsmen burned the tents. At least 19 people were killed. One was a guardsman and five were miners. Thirteen were women and children who had hidden in a pit dug under a tent. They suffocated, which means they died because they could not get air. Guardsmen shot the strike leader, Louis Tikas, three times in the back.

After Ludlow, miners attacked mines across the region and killed supervisors and guards. Nobody knows exactly how many. On April 28 President Woodrow Wilson sent in the US Army. The strike ended in December 1914. The miners won none of their union's goals.

The first child-labor law, and the justices who threw it out

In 1916 members of Congress passed the Keating-Owen Act, the first federal law against child labor. Under it, a company could not ship goods to another state if it had used child workers to make them. It covered children under 14 in mills, food-canning plants and factories, and children under 16 in mines. Children aged 14 to 16 could not work more than 8 hours a day or 6 days a week, or at night.

Roland Dagenhart's sons worked in a cotton mill in North Carolina, and he sued to stop the law. On June 3, 1918, the justices of the Supreme Court ruled 5 votes to 4 in the case Hammer v. Dagenhart. They said the law broke the Constitution and could not be used. The majority ruled that Congress's power over trade between the states did not cover how goods were made. Justice Oliver Wendell Holmes disagreed. Members of Congress passed a second child-labor law in 1919, and the justices threw that one out too.

> #### Grace Fryer
>
> **Who:** A painter of glowing watch dials who was poisoned by radium at work and sued the company while she was dying.
>
> **When and where:** Orange, New Jersey. Worked from 1917 to 1920. Sued in 1927. Settled in June 1928.
>
> **Movie:** *Radium Girls* (2018), a drama inspired by the dial painters' case. Its main characters are two invented sisters, not Grace Fryer.

> Grace Fryer painted watch dials with glowing paint at the United States Radium Corporation in Orange, New Jersey, from 1917 to 1920. The paint glowed because it contained radium. Radium gives off radiation, energy that damages the body from the inside. Their supervisors taught the women who painted the dials to shape the tip of the brush with their lips, so the radium paint went into their mouths. "Our instructors told us to point [our brushes] with our lips," Grace Fryer said later. The supervisors told the women the paint was safe.
>
> Radium is in the same chemical family as calcium, so the body takes it into the bones and teeth. Almost all of it stays in the skeleton. Scientists who studied the dial painters found that it caused aplastic anemia, necrosis of the jaw and osteosarcomas. Aplastic anemia means the body stops making enough new blood cells. Necrosis means the bone dies, and the jawbone breaks down. An osteosarcoma is a cancer of the bone. In 1924 a dentist named Theodor Blum examined Grace Fryer and found that her jawbone was wasting away in a way he had never seen before.
>
> As the dial painters fell sick and died, company officials played down and disputed the poisoning. In May 1927 a lawyer named Raymond Berry sued the company for five of the women. They were Grace Fryer, Katherine Schaub, Quinta Maggia Macdonald, Albina Maggia Larice and Edna Hussman. Reporters called them "the five women doomed to die." Some of them were too sick to travel to court.
>
> In June 1928 the company's officials agreed to pay the women to end the lawsuit. This kind of deal is called a settlement. Each woman received $10,000 (some accounts say $15,000), $600 a year for as long as she lived and payment for her medical bills. A committee of three doctors had to approve the medical costs. The company's officials never admitted that the company was to blame.

Catherine Wolfe Donohue's case, 1938

At the Radium Dial Company plant in Ottawa, Illinois, a supervisor named Miss Murray also taught the dial painters to point their brushes with their lips. Catherine Wolfe Donohue was one of them. "We would first dip the brush into water, then into the powder, and then point the ends of the bristles between our teeth," she said. At a hearing on February 10, 1938, she brought a box of pieces of bone that she said had come from her jaw. When the judge asked her doctor about her chances, she collapsed. Several men carried her from the room. She weighed 71 pounds.

On April 5, 1938, the hearing officer, the official who ran the hearing, ruled that her illness came from her work at the plant. He awarded her $5,661, paid as $277 a year for life. The company's lawyers asked for a new ruling, which is called an appeal. On July 6, 1938, the members of the Illinois Industrial Commission, a state board that decided workers' claims, turned down the appeal and added $730. Donohue died later that month, at 35. The last appeal in her case ended in October 1938, after her death.

Hawks Nest tunnel, 1930 to 1932

From 1930 to 1932, managers of the Union Carbide company had workers dig a tunnel near Gauley Bridge, West Virginia, to carry water to a power plant. The plant was built to supply power to Union Carbide's alloy works, where metals were mixed. Union Carbide's managers hired the Rinehart and Dennis company of Charlottesville, Virginia, to do the digging. Almost 5,000 men worked on the tunnel. Most of them were Black men from the South.

The tunnel went through sandstone made mostly of silica, the hard mineral that sand is made of. A third of it was dug wider so that the silica could be mined. The men worked with no dust control and nothing to protect their breathing, in poor air underground.

Breathing silica dust causes silicosis. The dust forms scar tissue in the lungs, and the scarred lungs cannot take in enough oxygen. Silicosis cannot be cured, and in bad cases it kills.

The number of men who died is disputed. In 1936 members of a US House of Representatives committee held hearings and put the deaths at 476. In 1986 the scientist Martin Cherniack studied the records and found as many as 764. In 2002 scientists at the National Institute for Occupational Safety and Health, the federal agency that studies workers' health, said close to 1,000. The workers and their families filed 538 lawsuits. They ended in a settlement of $200,000 in all. Single payments ran from $30 to $1,600.

Building the skyscrapers, the bridge and the dam

Up to 3,400 workers a day built the Empire State Building in New York. By the official count, five of them died. Lewis Hine photographed the ironworkers high on the open steel frame in 1931. Mohawk ironworkers from Kahnawake, a Mohawk community just south of Montreal in Canada, worked in the building crews.

At the Golden Gate Bridge in San Francisco, the chief engineer, Joseph Strauss, required workers to wear hard hats. He spent about $130,000 on a safety net under the bridge. The net caught 19 men who fell, and they called themselves the "Halfway to Hell Club." One of them,

the ironworker Al Zampa, fell on October 19, 1936, and broke four bones in his back. He went back to ironwork. Eleven men died building the bridge. Ten of them died on February 17, 1937, when a falling platform tore through the net.

At Hoover Dam, the federal Bureau of Reclamation's official count is 96 deaths on the job. That count leaves out 42 deaths that were recorded as pneumonia, a disease of the lungs. The company that hired the workers, Six Companies, had its crews drive gasoline trucks inside the tunnels the men dug at the dam site. The trucks' exhaust filled the tunnels with carbon monoxide, a poison gas from engines. When tunnel workers fell very ill or died, company doctors said they had a form of pneumonia, according to a history of the dam kept by the University of Nevada, Las Vegas library.

In 1933, six workers sued Six Companies. They said the gas had poisoned them and left them with lasting illness, and each asked for $75,000 plus lost pay. The company hired a private detective to look into the men's pasts. In the end it settled with 50 workers and paid them an amount it kept secret. Historians Andrew Dunar and Dennis McBride, who recorded dam workers' memories in a book, describe carbon monoxide deaths among tunnel workers, deaths that company doctors called pneumonia. The true number of deaths at the dam is not known.

The right to organize and the sit-down strikes

During the Great Depression of the 1930s, many businesses closed and millions of people lost their jobs. At its worst, in 1933, about 12.8 million people, almost one worker in four, had no job. Federal officials hired people who were out of work through programs such as the Works Progress Administration and the Civilian Conservation Corps. In 1935 members of Congress passed the Wagner Act, which made it a legal right for workers to form unions.

That same year John L. Lewis and other union leaders formed a new group inside the American Federation of Labor, the AFL, to organize whole factories. The AFL was a large group of unions of skilled workers. The AFL's leaders threw them out, and the group became the Congress of Industrial Organizations, the CIO. Its unions took in every worker in a mass-production plant, such as a car factory or a steel mill.

In a sit-down strike, workers stop working but stay inside the plant, so the company cannot bring in other workers. On December 30, 1936, autoworkers in Flint, Michigan, sat down inside General Motors' Fisher Body plants. They stayed for 44 days, until February 11, 1937. The Women's Emergency Brigade, led by 23-year-old Genora Johnson, guarded the plants.

When police fired gas at the men inside, the women broke windows. General Motors' managers agreed to recognize the United Auto Workers, which meant they would bargain with it over pay and hours.

The Memorial Day Massacre, 1937

Several hundred people marched toward the Republic Steel plant on Sunday, May 30, 1937. The plant stood on Chicago's far Southeast Side, and the marchers were supporting the steelworkers' strike there. They were white, Black and Latino men, women and children, and about 200 of them were women. There, 264 Chicago police met them.

The police threw tear gas, fired their guns and beat the marchers with clubs. They killed ten people and shot 40. More than 90 people were wounded in all. The Paramount company filmed it and at first held back the newsreel. Senators on a committee led by Senator Robert La Follette Jr. looked into the killings. They found that the police had used "excessive force," which means far more force than was needed. The police had also made "baseless allegations," claims with nothing true behind them. The senators said the police "did not carry out an honest investigation." No record names any police officer who was ever punished.

A. Philip Randolph

Who: A union leader who organized the Pullman porters and won the first contract between a major American company and a union led by Black workers.

When and where: Founded the Brotherhood of Sleeping Car Porters in August 1925. Contract signed August 25, 1937. Washington, 1941.

Movie: *10,000 Black Men Named George* (2002), a television drama with Andre Braugher as Randolph. Also *A. Philip Randolph: For Jobs and Freedom* (1996), a documentary shown on PBS.

A. Philip Randolph won the first contract between a major American company and a union led by Black workers. In August 1925 he founded the Brotherhood of Sleeping Car Porters. Porters worked on the Pullman Company's sleeping cars on trains. All of the porters were Black men. The company required them to serve passengers with a smile, and passengers commonly called every porter "George."

On August 25, 1937, twelve years after the union began, the Pullman Company's officials signed a contract with it. The porters' working month had run to about 400 hours. Under the contract the working month fell sharply, and the porters got $1.25 million in raises.

> In 1941 Randolph threatened to lead a march on Washington. On June 25, 1941, President Franklin Roosevelt signed Executive Order 8802, an order from the president. It said there could be "no discrimination in the employment of workers in defense industries or government because of race, creed, color, or national origin." Defense companies made weapons and supplies for the military. Under the order, they and government offices could not refuse to hire people because of their race, religion or the country their families came from. In 1963 Randolph directed the March on Washington for Jobs and Freedom.

The Fair Labor Standards Act, 1938

On June 25, 1938, President Roosevelt signed the Fair Labor Standards Act, and it took effect on October 24, 1938. The law set the first federal minimum wage at 25 cents an hour, rising to 40 cents by 1945, and a work week of 44 hours, falling to 40 hours by October 1940. The law also banned most work by children under 16 in the jobs it covered, but it did not cover farm work.

In 1941 the justices of the Supreme Court changed their minds about their earlier rulings. They ruled that Congress did have the power to limit child labor under the 1938 law.

War work and the braceros

During World War II, women took jobs in war plants in large numbers. In 1940 women made up 27 percent of the workforce. By 1945 they made up nearly 37 percent, and about 6.5 million more women were working. Before the war about 1 percent of aircraft workers were women. In 1943 more than 310,000 women built aircraft, about 65 percent of all the workers in that industry.

In 1942 US officials started the bracero program to bring Mexican men to work on American farms and railroads during the war. Bracero is Spanish for a man who works with his arms. Over 22 years, more than 4.5 million contracts were signed. From 1942 to 1946, American employers held back 10 percent of every bracero's pay. The money went through American banks to banks in Mexico, for a savings fund the braceros were to receive when they went home. Most braceros never got that money, and the records of where it went do not add up. In 2009 Mexican officials agreed to pay former braceros or their families 38,000 pesos each.

> #### Naomi Parker Fraley
>
> **Who:** A war worker at the Navy yard in Alameda, California, whom a scholar found to be the woman in a 1942 photograph linked to the "We Can Do It!" poster.

> **When and where:** Alameda, California, 1942. Died January 20, 2018, at 96.
>
> Naomi Parker was a war worker at the Navy yard in Alameda, California. In 1942 a photographer took her picture at work. For decades, people said that the woman in that photograph was someone else.
>
> The photograph is linked to a poster of a woman worker with the words "We Can Do It!" J. Howard Miller made the poster for the Westinghouse company, which put it on display in 1943. Few people knew the poster during the war. It became famous in the 1980s.
>
> From 1984, the woman in the 1942 photograph was said to be Geraldine Hoff Doyle. Then a scholar named James J. Kimble found the original print of the photograph. Its caption named Naomi Parker. Nobody has proved that Miller used this photograph to make the poster. Naomi Parker Fraley died on January 20, 2018, at 96.

The strike wave of 1945 and 1946

When the war ended, workers struck in greater numbers than ever before. In 1945 there were 4,750 strikes involving 3.47 million workers. The Bureau of Labor Statistics, the federal office that counts jobs and workers, recorded 4,985 strikes involving 4.6 million workers in 1946. No other year in its records has more. Workers struck in steel, coal, railroads and car plants.

1950 to 2000

In 1954 about one American worker in three belonged to a union. After that the share fell for the rest of the century. By 1956 more Americans worked in offices, stores and schools than worked with their hands in factories, mines and building trades. The share of women with paid jobs rose from 34 percent in 1950 to 60 percent in 2000. New groups of workers organized: farmworkers, city garbage collectors, flight attendants and office clerks. After June 1979 the number of factory jobs fell, and by 2000 about 13 percent of workers belonged to a union.

Unions at their peak, and the move to the office

In 1954, 34.8 percent of Americans who worked for wages or salaries belonged to a union. That was the peak. On December 5, 1955, the AFL and the CIO joined into one big group of unions, the AFL-CIO, with about 15 million members. George Meany was its first president.

By 1956, for the first time, more Americans worked in white-collar jobs than in blue-collar jobs. White-collar workers work in offices, stores and schools. Blue-collar workers work with their hands in factories, mines and building trades.

Women also went to work for pay in growing numbers. In 1950, 34 percent of women were in the labor force, which means they had a paid job or were looking for one. By 2000 the figure was 60 percent. Over the same years, women's share of all workers rose from 30 percent to almost 47 percent.

The braceros at work

The bracero program went on after the war. Men who wanted contracts went through reception centers at the border. Officials of the federal agency that handled immigration ran them. One was the Rio Vista farm in El Paso, Texas. Men who went through Rio Vista remembered "poor food, humiliating medical examinations, and the fumigation." Officials had the men strip off their clothes, line up and be sprayed with DDT, a white powder that kills insects. The officials believed that Mexican workers carried insects and germs.

From 1948, growers could hire braceros right at the border. That let the growers skip the cost of moving the men and avoid government checks. Braceros worked six or seven days a week on farms and railroads in 26 states. Some were paid little and lived in poor housing. Supervisors cursed at some of them and attacked some of them physically. They worked with pesticides, chemicals that kill insects and weeds. Researchers later found these chemicals very harmful to farmworkers. In late 1963, members of Congress agreed to keep the program going for only one more year. They did not renew it again, so the law behind it, Public Law 78, ran out on December 31, 1964, and the program ended. Labor unions had pushed to end it. By then growers were also using more farm machines, and the public had learned about the braceros' working conditions.

The Mohawk ironworkers

Ironworkers from the Mohawk communities of Kahnawake, just south of Montreal, and Akwesasne, which lies across the border of the United States and Canada on the St. Lawrence River, worked high steel from the 1920s onward. Working high steel means building the steel frames of bridges and skyscrapers, walking on narrow beams far above the ground. Mohawk ironworkers helped build the Empire State Building, the Chrysler Building and Rockefeller Center in New York. Later they helped build the World Trade Center. The 9/11 Memorial and Museum has an exhibit about them called "Skywalkers."

Cesar Chavez and Dolores Huerta

Who: Organizers who built the farmworkers' union, together with the Filipino American grape pickers led by Larry Itliong, who walked out first.

When and where: Delano, California, 1965 to 1975.

Movie: *Cesar Chavez* (2014), a drama directed by Diego Luna, with Michael Peña as Chavez. *Dolores* (2017), a documentary about Dolores Huerta directed by Peter Bratt.

Cesar Chavez and Dolores Huerta led farmworkers to win the first union contracts in the California grape fields. Filipino American workers started the strike that led to those contracts. On September 8, 1965, about 1,500 grape pickers, most of them Filipino American, walked out of the vineyards around Delano, California. They belonged to the Agricultural Workers Organizing Committee, or AWOC, a union led by Larry Itliong. On September 16, members of Chavez and Huerta's National Farm Workers Association voted to join the strike.

From March 17 to April 11, 1966, strikers marched about 300 miles from Delano to Sacramento, the state capital. About 10,000 supporters were with them when they arrived. The two unions joined together and became the union now called the United Farm Workers. In February and March of 1968, Chavez went without food for 25 days as a call for nonviolence. Senator Robert Kennedy was with him when he ended the fast on March 10.

Across the country, people stopped buying California table grapes. This was the grape boycott. On July 29, 1970, 26 grape growers in Delano signed the first union contracts. Dolores Huerta negotiated the contracts. She also made up the union's slogan, "Sí, se puede," Spanish for "Yes, it can be done."

Since 1935 federal labor law had not covered farmworkers. In 1975 California's lawmakers passed the Agricultural Labor Relations Act. It was the first law in the United States to give farmworkers the right to collective bargaining, which means bargaining as a union with their employers.

In March 2026 the New York Times reported that Chavez had sexually abused two girls in the 1970s. The two women, Debra Rojas and Ana Murguia, are daughters of union organizers. They said the abuse began when they were 12 and 13. Rojas said Chavez raped her in a motel room when she was 15. Rape means forcing a person into sex. Dolores Huerta then said publicly that Chavez had pressured her into sex once and had raped her in a car in 1966, and that she became pregnant both times. She said she had kept the

> secret for 60 years because she believed the truth would hurt the farmworker movement. Chavez died in 1993, so no court has ever heard these accusations. The United Farm Workers canceled its events for Cesar Chavez Day. On March 26, 2026, California's lawmakers voted to rename the state holiday Farmworkers Day, and Governor Gavin Newsom signed the change into law.

Pesticides in the fields

Farmworkers who worked in fields sprayed with pesticides, chemicals that kill insects and weeds, had high rates of birth defects, cancer and burns. Cesar Chavez and Dolores Huerta campaigned to ban DDT on grape and lettuce ranches. In the 1980s, children in several towns of California's San Joaquin Valley had cancer at rates "800% above the norm."

The stewardesses' rules

Into the late 1960s, managers at US airlines fired stewardesses who married or who turned 32, and at some airlines 35. They also weighed the women and checked that they wore girdles, tight undergarments. Barbara "Dusty" Roads flew for American Airlines from 1950. She pressed members of Congress to change the rules and helped found the Association of Professional Flight Attendants, a union. The Civil Rights Act of 1964 banned treating workers unfairly in hiring and firing because they were women or men. Flight attendants brought cases under that law, and in those years airline managers dropped the age and marriage rules.

Memphis, 1968

On February 1, 1968, two Memphis garbage collectors, Echol Cole, 36, and Robert Walker, 30, took shelter from the rain inside the compactor of their garbage truck. The compactor is the part of the truck that crushes the garbage. The truck was not working properly, and the compactor crushed both men to death.

Eleven days later, 1,300 Black sanitation workers went on strike. They wanted the city's leaders to recognize their union, which means to accept it and bargain with it. They also wanted the work made safe and pay that was enough to live on. Many of them were paid so little that they were on welfare, and hundreds relied on food stamps to feed their families. The strikers carried signs that read "I AM A MAN."

On February 22 the members of the City Council voted to recognize the union. Mayor Henry Loeb rejected the vote. He said only the mayor could recognize a union, and he would not. He also kept the worn-out trucks on the streets and would not pay overtime for late-night shifts.

On February 23 police sprayed Mace and fired tear gas at marchers walking to City Hall.

On March 28 violence broke out during a march, and some people looted downtown shops. Members of a young Black Power group called the Invaders were accused of starting it. Police followed the marchers back to Clayborn Temple, a church, fired tear gas inside and clubbed people lying on the floor. A Memphis police officer shot and killed Larry Payne, a 16-year-old student. The officer said Payne came at him with a knife. Most people who saw it said Payne came out of a basement with his hands up, and none of them saw a knife. The officer was never charged or disciplined.

Dr. Martin Luther King Jr. came to Memphis to support the strikers. On the evening of April 4, 1968, James Earl Ray shot and killed him on the balcony of the Lorraine Motel. On April 16, city negotiators agreed that the City Council would recognize the union and raise wages. The union was AFSCME Local 1733, part of a national union of city and state workers.

Coal dust and a new safety law

On November 20, 1968, an explosion in the Consol No. 9 mine at Farmington, West Virginia, killed 78 miners. Members of Congress then passed the Federal Coal Mine Health and Safety Act of 1969. Under it, federal inspectors had to inspect every underground coal mine four times a year. They could shut a mine down if it put lives in danger. The law also set up federal payments for miners with black lung.

Black lung is a disease caused by breathing coal dust. The dust scars the lungs. In the worst form, masses of scar tissue leave the miner "gasping for every breath." More than 76,000 miners have died of black lung since 1968. In 1968, 311 coal miners were killed at work. In 1980 the number was 133, and in 2000 it was 38.

On December 29, 1970, President Richard Nixon signed the Occupational Safety and Health Act, a federal law on safety at work. In 1970 about 14,000 workers were killed on the job each year, about 38 a day.

Office workers organize

In 1973 two office workers in Boston, Karen Nussbaum and Ellen Cassedy, founded 9to5. Its members were women who did clerical work, such as typing, filing and answering phones. They organized over pay, promotion and harassment on the job. Harassment means treating a worker in ways meant to upset, shame or frighten her. In an early lawsuit, they won $1.5 million in back pay, the pay the women were owed, from publishing companies in Boston.

The checkout job changed too. At 8:01 in the morning on June 26, 1974, cashier Sharon Buchanan at a Marsh supermarket in Troy, Ohio, scanned a ten-pack of Juicy Fruit gum. It was the first sale rung up by scanning a barcode. Cashiers no longer had to key in each price by hand. The scanners also gave managers records, hour by hour, of what sold, and managers later used those records to set workers' schedules.

The mills close

On September 19, 1977, the managers of Youngstown Sheet and Tube suddenly shut the company's Campbell Works steel mill in Youngstown, Ohio, and 5,000 workers lost their jobs. People in Youngstown remember that day as "Black Monday." Factory jobs in the United States reached their highest number, 19.6 million, in June 1979. After that the number fell for forty years.

In 1983, 20.1 percent of wage and salary workers belonged to a union. By 2000 the share was about 13.4 percent.

> ### Frank Lumpkin
>
> **Who:** A Black steelworker who lost his job, his last paycheck and his pension when his Chicago steel mill shut down, and who fought for 17 years to win the money back.
>
> **When and where:** Wisconsin Steel, South Deering, Chicago, from the 1950s. Born 1916. Died March 1, 2010.
>
> Frank Lumpkin spent 17 years fighting to win back the pay and pensions that he and more than 3,000 other steelworkers lost when their mill closed in 1980. A pension is money paid to a worker after the worker retires. He was born in 1916 in Washington, Georgia, to a family of sharecroppers. Sharecroppers farm land that belongs to someone else and pay the owner with part of the crop. At 6 he hauled stone for an uncle. At 15 he left school to work on citrus plantations. He also boxed for money as "KO" Lumpkin.
>
> In 1940 he moved north to Buffalo, New York. He worked in construction, in an aircraft factory and at Bethlehem Steel, and he served in the Merchant Marine, the crews of American cargo ships. In the 1950s he went to work at Wisconsin Steel in the South Deering neighborhood of Chicago. He worked in the mill for about 30 years.
>
> International Harvester had owned the mill since 1902. In 1977 International Harvester's managers sold the mill to Envirodyne, a company with no experience in steel. They lent Envirodyne the money to buy it. In late 1979, Harvester's own workers went on strike. While the strike lasted, Harvester's managers bought none of the mill's steel, which had

been about 40 percent of what the mill made. In March 1980, Harvester's managers moved to collect the money Envirodyne still owed for the mill. They also told Chase Manhattan Bank, which had lent Envirodyne money, that they would no longer back the bank's emergency loans to the mill. The *International Directory of Company Histories*, a reference book about companies, describes these steps.

In late March 1980, while Envirodyne owned it, the mill closed without warning. The accounts do not name the person who gave the order. The workers lost their jobs, their health benefits, their back pay and their pensions. In April, officers of Chase Manhattan Bank told them that their final paychecks were worthless.

Lumpkin and his wife, Bea Lumpkin, started the Wisconsin Steel Save Our Jobs Committee. Its members were Black, Mexican American and other steelworkers and their families. They helped families with food, medical care and utility bills. First the members tried to get the mill reopened. Then they fought to recover the lost pay and benefits, and they sued International Harvester and Envirodyne. In 1987 the committee counted 600 former workers who had died in the seven years since the closing.

In 1988 the lawyer Thomas Geoghegan won a settlement of $14.5 million from International Harvester. Over 17 years the committee won about $17 million in all. That was about a third of the $40 million the workers were owed. Lumpkin also ran to become an Illinois state lawmaker and lost. He died on March 1, 2010, at 93.

The air traffic controllers, 1981

On August 3, 1981, about 13,000 federal air traffic controllers, the workers who guide airplanes in and out of airports, went on strike. Federal law did not allow federal workers to strike. President Ronald Reagan gave them 48 hours to return to work. On August 5 he fired 11,345 of them. Their union was decertified, which means federal officials no longer accepted it as the workers' union. The historian Joseph McCartin, who wrote a book about the strike, argues that the firings showed private employers that they could fight strikes and beat their unions.

El Monte, 1995

On August 2, 1995, state and federal agents and El Monte police raided a fenced apartment complex in El Monte, near Los Angeles. Inside they found 72 Thai garment workers who had been forced to sew clothes and were not allowed to leave, and they freed them. Suni Manasurangkun and her sons ran the operation. Recruiters in Thailand had taken the workers' passports when they arrived. The workers owed about $5,000 for the trip.

A high fence topped with razor wire surrounded the buildings, and an armed guard sat in the courtyard. The workers sewed clothes 84 hours a week, from early morning to midnight, for about $1.60 an hour. One worker, Rotchana Cheunchujit, was paid five to seven cents a garment. The owners made the workers buy food at their own store at high prices. Some workers had not been outside the fence for as long as seven years.

One woman escaped through a second-story window. A letter in pencil with a hand-drawn map reached the authorities, and the raid followed. The clothes carried "Made in the USA" labels and were sold at chain stores including Miller's Outpost, Mervyn's and Montgomery Ward. In February 1996 Suni Manasurangkun, three of her sons and three other people pleaded guilty to federal crimes. That means they told the court they had broken federal law. Two of her sons fled and were never caught. In 1997 the companies that had sold the clothes agreed to pay the workers the wages they were owed, to end lawsuits against them. One account puts the total at more than $4.5 million, and another at $4 million. After the case, and partly because of it, members of Congress passed a federal law in 2000 against human trafficking, the buying, selling and moving of people to force them to work.

2000 to Today

About 11.9 million Americans worked as independent contractors in their main job in July 2023, outside most labor laws, including the minimum wage law. Some of them found work through apps on their phones. In 2025 one worker in ten belonged to a union, according to the federal Bureau of Labor Statistics. Workers at Starbucks coffee shops and at an Amazon warehouse voted in their first unions in 2021 and 2022. Workers still die on the job. In 2024, 5,070 workers were killed at work.

Unions and pay today

In 2025, 10.0 percent of wage and salary workers belonged to a union, 14.7 million people, according to the Bureau of Labor Statistics. Union members were 32.9 percent of government workers and 5.9 percent of workers at private companies. In 1983 the share had been 20.1 percent, and in 1954 it had been about one worker in three.

The federal minimum wage has been $7.25 an hour since July 24, 2009, according to the Department of Labor. As of September 2026, members of Congress have not raised it.

Working through an app

An independent contractor is a person who works for themselves and sells their work to companies. Most labor laws, including the laws on the minimum wage and overtime pay, do not cover independent contractors. In July 2023, 11.9 million people, 7.4 percent of all workers, were independent contractors in their main job, according to the Bureau of Labor Statistics.

Some independent contractors find work through apps that send them rides to drive or food to deliver. The Pew Research Center is a research group. In a survey taken in August 2021, its researchers found that 16 percent of American adults had earned money through an online gig platform. A gig platform is an app or website that hands out short jobs one at a time. Nine percent had done so in the past year.

The managers of the app companies treat their drivers as independent contractors. In California, voters approved Proposition 22, a question put on the ballot, on November 3, 2020, with 58.63 percent of the vote. Under it, the app companies could keep treating drivers as independent contractors. They had to pay drivers at least 120 percent of the minimum wage for the time they spent on a ride or a delivery, plus pay for each mile.

Raef Lawson

Who: A food-delivery driver for Grubhub whose court case asked whether an app driver is an employee.

When and where: Los Angeles, 2015 and 2016. A federal judge ruled on his case in 2018 and 2023, and approved a settlement in 2026.

Raef Lawson sued Grubhub for the minimum wage and overtime pay, which is extra pay for hours past 40 in a week, saying that he had been its employee. He was an actor, writer and director in Los Angeles who was trying to make a career. In August 2015 he signed up to deliver food for Grubhub, a company whose app takes food orders from restaurants.

He picked blocks of two to five hours around mealtimes, week by week. From October 2015 to February 2016 he signed up for blocks on 69 days and made deliveries on 59 of them. Grubhub paid him for 35 hours in November, 105 in December and 60 in January. It paid nothing toward his gas or his phone. In 2016 Grubhub had 4,000 delivery drivers in California, and its managers classed all of them as independent contractors.

> On February 15, 2016, Grubhub's managers ended the company's agreement with him. They said he had not worked many of the blocks he signed up for. The judge at his trial also found that he sometimes "gamed" the app, which means he tricked it. He logged on late, and he switched his phone to airplane mode so no new orders came.
>
> Lawson sued for the minimum wage, overtime and his costs. In 2018 Judge Jacqueline Scott Corley ruled that he had been an independent contractor. Three months later, the justices of California's Supreme Court set a new rule: a company must prove that a worker is not an employee. On September 20, 2021, a federal appeals court, a higher court that checks the rulings of lower courts, sent Lawson's case back to Judge Corley.
>
> On March 30, 2023, Judge Corley ruled that under the new test Lawson had been an employee. She wrote that "food delivery is not outside the usual course of" Grubhub's business. She awarded him $65.11 in unpaid minimum wages for four months of work. In 2026 Grubhub agreed to pay $24.75 million to California drivers to end their claims, in a deal called a settlement. On July 30, 2026, the judge approved the deal. About 60,000 drivers are in the settlement, and each gets at least $25. Judge Corley called it "my oldest case."

The pandemic, 2020

In May 2020, during the COVID-19 pandemic, 35.4 percent of employed people, about 48.7 million, worked from home because of the pandemic, according to the Bureau of Labor Statistics. By April 2022 that share had fallen to 7.7 percent. Many office workers kept working from home for part of the week. Workers in grocery stores, warehouses, delivery and health care, called essential workers, kept going to work in person.

Unions at Starbucks and Amazon

Baristas, the workers who make the coffee drinks, at a Starbucks on Elmwood Avenue in Buffalo, New York, voted 19 to 8 to form a union on December 9, 2021. The Washington Post and ABC News reported that it was the first union at one of the company's roughly 9,000 US stores that Starbucks owned itself. Workers at hundreds of other stores followed.

Workers at Amazon's JFK8 warehouse on Staten Island, New York, voted 2,654 to 2,131 for the Amazon Labor Union. Officials of the National Labor Relations Board, the federal agency that runs union elections, announced the result on April 1, 2022. It was the first union at an Amazon warehouse in the United States.

Chris Smalls

Who: An Amazon warehouse worker who was fired and then organized the first union at an Amazon warehouse in the United States.

When and where: The JFK8 warehouse, Staten Island, New York, 2020 to 2022.

Movie: *Union* (2024), a documentary by Brett Story and Stephen Maing about the union campaign at JFK8. It won a Special Jury Award at the Sundance Film Festival in 2024.

Chris Smalls worked as a process assistant at Amazon's JFK8 warehouse on Staten Island. In March 2020 he led a walkout over safety from COVID-19, which means workers left their jobs together in protest, and Amazon's managers fired him.

Smalls and other workers then started the Amazon Labor Union. They organized at a bus stop across the road from the warehouse. They set up a table with food there and talked with workers as they came and went, thousands of conversations over many months. In April 2022 the workers won the vote.

Where the new unions stand in 2026

By June 2025 baristas at 600 Starbucks stores, about 12,000 workers, had joined the union Starbucks Workers United, according to the union. On November 13, 2025, they began a national strike. It grew to about 4,500 workers in more than 130 cities. The union called it the longest strike in the company's history. As of September 2026, the workers at no Starbucks store have voted to approve a first contract.

On April 2, 2026, members of the National Labor Relations Board ordered Amazon to begin talks with the union at JFK8 on a contract for pay and working conditions. They found that Amazon had "illegally and willfully" ignored the union, according to a Teamsters union press release. As of September 2026, no contract has been reported.

Injuries in the warehouses

Staff members working for Senator Bernie Sanders, who led a US Senate committee on labor, published a report on Amazon warehouses in December 2024. They were the staff of his party, which held most of the committee's seats, and not of the whole committee. They interviewed 135 workers. They found that Amazon warehouses recorded more than 30 percent more injuries than the average for warehouses in 2023. Amazon workers had been nearly twice as likely to be injured as other warehouse workers in each of the past seven years.

The report described the work. In 10- to 12-hour shifts, workers repeat the same movements "hundreds and thousands of times." A computer tracks how fast each worker goes. Workers who fall behind get penalties from the computer system automatically, and these can end in firing.

Children in the slaughterhouses

Managers at Packers Sanitation Services, a cleaning company based in Wisconsin, put 102 children aged 13 to 17 to work on night shifts. Officials of the US Department of Labor reported this in February 2023. The children worked at 13 meatpacking plants in 8 states, where animals are killed and cut up for meat, according to reporting by KCUR, a public radio station in Kansas City. The children cleaned back saws, brisket saws and head splitters, machines that cut up animals, using chemicals strong enough to burn skin. At least three of them were injured.

The JBS plant in Grand Island, Nebraska, had 27 of the children, and the Cargill plant in Dodge City, Kansas, had 26. The company paid $1.5 million, the most the law allowed. Jessica Looman of the Labor Department's Wage and Hour Division called the violations "systemic," which means built into the way the company worked, and "a corporate-wide failure."

On farms, federal law still allows children to work at younger ages than in other jobs. A child under 12 may work on a farm owned by a parent. Children of 12 and 13 may work on a farm with a parent's consent, and children of 14 and up may do farm work outside school hours.

Heat, floods and mines

From 1992 to 2006, 68 crop workers died of heat, according to a 2008 report by the Centers for Disease Control and Prevention. Their death rate from heat was 0.39 for every 100,000 workers. For all civilian workers it was 0.02. In July 2005 a 56-year-old tobacco worker in North Carolina died with a body temperature of 108 degrees. He was in the United States on a temporary farmworker visa. The report does not name him.

From 2011 to 2019, 345 workers of all kinds died of heat on the job, 43 of them in 2019, according to the Bureau of Labor Statistics. On August 30, 2024, officials of the Occupational Safety and Health Administration, the federal job-safety agency, proposed a rule to protect workers from heat. A rule like this is a requirement that employers must obey by law. The officials held public hearings from June 16 to July 2, 2025. As of September 2026 there is no final federal rule on heat at work.

On September 27, 2024, floods from Hurricane Helene reached the Impact Plastics plant in Erwin, Tennessee. Five employees and a contractor who cleaned the offices drowned. One worker who survived and the families of some who died gave their account. They said no one told the workers they could leave until the flood had covered the road and the plant had lost power.

Inspectors from Tennessee's job-safety agency found that the company had "exercised reasonable diligence," which means it had taken reasonable care. They gave the company no citations, the official notices for breaking safety rules. In July 2025 the local chief prosecutor, District Attorney General Steven Finney, closed the case with no charges. He found "no evidence" that workers were told they could not leave or would be fired if they did. The family of Johnny Peterson, one of the men who died, filed a lawsuit.

On April 5, 2010, an explosion of gas and coal dust at the Upper Big Branch mine in West Virginia killed 29 miners. The mine belonged to Massey Energy. Its chief executive, Don Blankenship, was found guilty in December 2015 of conspiring, which means plotting with others, to break federal mine safety laws. On April 6, 2016, Judge Irene Berger gave him the longest sentence the law allowed, one year in prison and a fine of $250,000. He was not convicted of causing the deaths.

In 2024, 5,070 workers were killed by injuries at work, according to the Bureau of Labor Statistics. That is one worker every 104 minutes, about 14 a day. Road crashes and other transportation accidents killed 1,937 of them. In 1970 about 38 workers a day had been killed on the job.

Wage theft and the tomato fields

Wage theft means that an employer does not pay workers all the money the law says they have earned. In 2017 researchers at the Economic Policy Institute, a research group that sides with labor unions, studied the ten states with the most people. They found that 2.4 million workers there were paid less than the minimum wage. Together they lost $8 billion a year. A worker who worked all year lost about $3,300, nearly a quarter of what they had earned.

In Immokalee, Florida, tomato pickers formed the Coalition of Immokalee Workers in 1993. The coalition's Fair Food Program has run since 2011. Big buyers such as McDonald's and Walmart pay a little extra for each pound of tomatoes. They buy only from growers who follow a code of conduct written by the workers. The code sets a lowest pay, requires shade and water and bans harassment. Checkers visit the farms, and workers can call a complaint line.

More and more farmworkers come to the United States on temporary H-2A visas, which allow them to do farm work for a season. According to the US Department of Agriculture, about 48,000 H-2A jobs were approved in fiscal year 2005 and about 385,000 in fiscal year 2024. A fiscal year is the government's budget year. More than 90 percent of the visas go to Mexican workers.

Chapter 15: Food and Farming

Before 1500

Farming in North America was thousands of years old by 1500. Native farmers had turned a wild grass into corn, and corn fed whole towns. People in each region also ate the foods that grew or lived best there, such as bison on the Plains and salmon in the Northwest.

Europeans later carried corn, beans and squash from these fields across the ocean to the rest of the world. Corn became an everyday food across Europe, Africa and Asia.

How corn was made

Corn did not grow wild. Native farmers bred it from a grass called teosinte. The seed head of teosinte holds only a few hard kernels. Farmers began changing it about 9,000 years ago in the Balsas River valley of southern Mexico. Scientists have confirmed that date and place in two ways. They studied the genes of corn and teosinte. Genes are the tiny instructions inside every living thing that parents pass on to their young. They also studied ancient corn dug from the ground.

Breeding a plant means choosing which plants to take seed from, year after year, so the crop changes over time. Native farmers bred teosinte for thousands of years, and the result was corn. Corn is so changed from the wild grass that it cannot reseed itself. It grows only where people plant it. Over thousands of years, Native farmers grew corn a little farther north at a time, until it reached what is now the United States.

The Three Sisters

Native farmers planted corn, beans and squash together in the same field, and each plant helped the other two grow. The three crops are called the Three Sisters.

The corn grew tall, and the bean vine climbed up the corn stalk. Bean roots hold tiny living things called bacteria. These bacteria take nitrogen, a gas in the air, and put it into the soil. Plants need nitrogen to grow, so the beans fed the soil that all three plants shared. The squash

spread wide leaves over the ground. The shade kept water in the ground and blocked the sunlight that weeds needed.

The three crops also fed people well together. Protein is the part of food the body uses to build muscle. Corn and beans eaten in the same meal give the body a fuller mix of the protein it needs than either food gives alone.

Farming began in the East too

Native people in the eastern part of North America started farming on their own, long before corn reached them. They took wild plants and bred them into crops. About 5,000 years ago they had tamed a kind of squash. They also grew six plants for their seeds: sunflower, goosefoot, sumpweed, maygrass, little barley and erect knotweed. Sunflower and sumpweed seeds are rich in oil. The seeds of the other four are starchy, and maygrass and little barley are grasses whose grain can be ground into flour. People cooked and ate goosefoot's small seeds.

Scientists call this group of crops the Eastern Agricultural Complex. Eastern North America is one of the places in the world where people started farming on their own, without learning it from anyone else.

Foods by region

Cahokia was a Native town near where St. Louis is today. Around the year 1100, between about 10,000 and 20,000 people lived there, and corn farming fed them.

People in other regions lived mainly on other foods. On the Great Plains, hunters killed bison. By a widely used estimate, about 30 million bison still lived there in the early 1800s. Along the Northwest coast and its rivers, salmon was the main food. People on the coasts gathered shellfish. In the Northeast, people collected sap from maple trees.

Around the Great Lakes, people harvested manoomin, a wild rice that grows in shallow water. In Ojibwe, the word means "the good berry." People harvest it from canoes. The Ojibwe are one of the Anishinaabe peoples, a family of related nations that also includes the Odawa and the Potawatomi. In an Anishinaabe prophecy, a teaching about what was to come, the people were led to the place where they would find "the food that grows on water." Manoomin is still a central food of Ojibwe life today.

No farmer from before 1500 is known by name. Corn cannot reseed itself, so every generation of Native farmers had to save the seed and plant it again. Seed keepers in Native nations still grow these crops today.

The 1500s

In the 1500s, Europeans began carrying crops and farm animals across the Atlantic Ocean in both directions, and Africans carried their own crops to the Americas. This movement is called the Columbian Exchange. The historian Alfred W. Crosby named it in his 1972 book *The Columbian Exchange*. Native people here still grew and ate their own foods.

What crossed the ocean

Europeans carried American crops and animals home to Europe. These included corn, potatoes, tomatoes, beans, squash, peanuts, peppers, cacao, vanilla and turkeys. Cacao is the bean that chocolate is made from. Corn and potatoes later became main foods across Europe, Africa and Asia.

Europeans brought wheat, rice, sugarcane, citrus fruit (the family of fruit that includes oranges and lemons), and honeybees to the Americas on their ships. They also brought cattle, pigs, sheep, goats and chickens. Columbus brought horses on his second voyage, in 1493. Spanish colonists founded St. Augustine, in Florida, in 1565, and began a colony in New Mexico in 1598. In both places they planted wheat and citrus and raised cattle.

The word exchange can sound like a friendly trade. It was not one. Europeans took American crops home from lands they were invading. Much of what arrived was grown to feed the colonists. Before long, planters were forcing enslaved people to grow sugarcane on plantations. Slave traders carried most of the Africans who came to the Americas across the ocean in chains. Those Africans brought their own crops and the skill to grow them. These included okra, watermelon, yams, sorghum, black-eyed peas and African rice.

De Soto's army and Apalachee corn

The Spanish soldier Hernando de Soto landed near Tampa Bay, in Florida, in May 1539, with an army of more than 600 people. He carried no food supplies except a small herd of pigs. Men who marched with him wrote accounts of the trip, and those accounts say the herd began with about 13 pigs. By 1542 the herd had grown to about 700. The army rarely killed the pigs for food. Pigs that escaped ran wild across the Southeast.

De Soto's army moved from town to town and took the corn that Native villagers had stored, and the soldiers ate it. Without that corn, the villagers were often at risk of starving. De Soto also seized dozens of Native men, women and children. His soldiers forced them to carry the army's equipment and supplies and to do the work of the camp.

Rodrigo Ranjel, de Soto's secretary, kept a diary of the march. An account written from it states that the Spaniards took the men "to have more slaves and servants." Some of the captives died and others ran away, so the soldiers seized more. The same account records that the soldiers wanted the women "for their lewdness and lust," which means they wanted them for sex. The women were prisoners and could not refuse. The soldiers raped them. Rape means forcing a person to have sex.

In October 1539, de Soto's army seized Anhaica, the main town of the Apalachee. Tallahassee, Florida, stands there today. The army lived in the town until March 1540. The Spanish took the town's stored food, which was enough to feed 600 men and 220 horses for five months. Archaeologists, scientists who study the past by digging up what people left behind, have found burned corncobs at the site. The Apalachee fought back with quick raids and ambushes, and they went after the Spaniards' horses.

The 1600s

Native corn kept the first English colonists at Jamestown and Plymouth alive in the 1600s. The colonists bought some of that corn and grew some of it with Native teaching, and they took some by force. In Virginia, planters then grew tobacco, a crop that is not food, in place of food.

Jamestown: hunger, and corn the English took by force

The colonists at Jamestown, in Virginia, planned to live partly on food they traded from the Powhatan people and partly on supply ships from England. In the autumn of 1609, Powhatan leaders stopped trading food with them, and Powhatan warriors surrounded the fort. The winter of 1609 to 1610 is called the Starving Time. About 500 colonists were alive when it began. By spring, about 61 were still alive.

The colonists ate their horses, dogs and rats, and they ate leather. Some ate the bodies of people who had died. Archaeologists found the bones of a girl whom researchers call Jane. The bones show that colonists ate her body after she died. Scientists at the Smithsonian announced the finding in 2013.

English soldiers also took corn by force and destroyed Native fields. On August 10, 1610, George Percy led English soldiers against the Paspahegh town near Jamestown. They burned the houses, cut down the cornfields and took corn. Percy wrote that they killed 15 or 16 people. Other accounts put the number of villagers killed as high as 75.

The soldiers captured the wife and two children of Wowinchopunck, the Paspahegh weroance, or leader. When Percy hesitated, his men complained. Percy then agreed to kill the children. His soldiers threw the children overboard from a boat and shot them in the head in the water.

That night at Jamestown, Captain Davis told Percy that Lord De La Warr, the colony's governor, wanted the children's mother burned alive. Captain Davis and two soldiers took her into the woods and killed her with a sword. Percy wrote that he did not believe the order really came from the governor.

In March 1622 Powhatan warriors attacked the English settlements. After that, colonial soldiers marched out almost every summer for ten years to attack Powhatan towns and cornfields. In 1623 colonists at a peace meeting poisoned the Powhatans' wine, shot them, and then destroyed their cornfields.

Tobacco in place of food

John Rolfe grew Virginia's first successful tobacco crop in 1612. He planted a sweet kind of tobacco. Planters sold it for so much money that many of them grew it in place of food crops.

Members of Virginia's assembly, the colony's lawmaking body, passed laws again and again to make planters grow food. Under a tobacco law of 1629 and 1630, a family could grow 2,000 tobacco plants for each family member and no more. The lawmakers set the limit partly so that families would still plant food crops.

Plymouth: corn dug up, then corn planted

The first corn the Plymouth colonists ate was corn they took. In November 1620, men from the *Mayflower* went exploring on Cape Cod. There they found baskets of corn that the local people had buried in the ground. The owners were saving it as seed for the next spring. The Englishmen dug up about ten bushels of the corn and a bag of beans. A bushel is a measure of about 8 gallons. They wrote that they planned to "satisfy them for their corn," which meant to pay the owners later. They named the place Cornhill.

The same group of men dug up graves nearby. They opened bundles that held the bones of a man and a small child. They wrote that they "brought sundry of the prettiest things away," meaning they took several of the objects buried with the dead.

The owners of the corn were Nauset people. In the summer of 1621, the colonists met one of them and promised to pay him. They offered to bring the owners as much corn as they had taken. Later in 1621 the colonist Edward Winslow wrote that the owners had been given "full content," meaning they were fully satisfied. His letter does not say what they were given.

The colonists built their town on the land of Patuxet, a Wampanoag town. An epidemic, a disease that spreads quickly through many people, had killed most of the people of Patuxet between 1616 and 1619. The colonists listed as one reason for settling there the "good corn-ground ready to our hands." The Patuxet people had cleared those fields.

In the spring of 1621, the colonists planted about 20 acres of corn. The corn did well. Their first harvest, that autumn, fed them through their second winter.

Squanto (Tisquantum)

Who: A Patuxet man who taught the Plymouth colonists to plant corn, after an English captain had kidnapped him.

When and where: Patuxet, where the colonists built Plymouth, in what is now Massachusetts. Kidnapped 1614, home 1619, taught the colonists in the spring of 1621, died 1622.

Movie: *Squanto: A Warrior's Tale* (1994), a feature film that mixes his real story with invented events.

Squanto, also called Tisquantum, showed the Plymouth colonists how to plant corn in the spring of 1621. He also interpreted between the colonists and the Wampanoag, which means he put each side's words into the other's language.

In 1614 an English captain named Thomas Hunt kidnapped Squanto and took him to Spain to be sold as a slave. Squanto reached England and learned English there. In 1619 he came home with an English expedition. He found his town of Patuxet empty. An epidemic had killed most of its people.

The colonist Edward Winslow wrote about the corn planting in a letter of December 1621. He wrote that "according to the manner of the Indians, we manured our ground with herrings, or rather shads." To manure ground means to put something into the soil to feed the crops. Herring and shad are kinds of fish. The colonists buried fish in the ground with the corn seed. Squanto taught them to do this.

Scholars have argued for decades about where Squanto learned it. In 1975 Lynn Ceci, an anthropologist, or scientist who studies how people live, argued in the journal *Science* that burying fish with corn was a European method. She argued that Squanto probably learned it during his years among Europeans. She found little evidence that many Native farmers used fish this way. Other scholars defended the older account, and none of them has settled the question. Winslow himself called it "the manner of the Indians."

Squanto died in 1622.

What the colonists ate

The English colonists learned corn dishes from Native cooks. One was hominy, which is dried corn cooked in water. For samp, cooks pounded corn into coarse meal and boiled it into a mush. The name comes from the Narragansett word *nasàump*. Johnnycakes were flat cakes baked from cornmeal. Along with their corn, the colonists ate beans, and once their hogs had multiplied, they ate pork and drank cider made from apples. Americans went on eating these corn dishes for centuries.

1700 to 1750

Between 1700 and 1750, planters in the Carolina Lowcountry forced enslaved Africans to grow rice, and the planters became some of the richest people in the colonies. The Lowcountry is the flat, wet land along the coast of South Carolina. Enslaved Africans built the rice fields and did the work in them. Planters paid more for captives from West Africa who already knew how to grow rice.

Farther north, farmers in Pennsylvania, New York and New Jersey grew more wheat than they could eat and shipped flour to other places. New Hampshire's town histories say that settlers there planted the first potato patches in North America that lasted.

Carolina rice and African skill

English settlers first brought a small amount of rice to Charles Town, now Charleston, in 1670. No record shows that anything grew from it. By July 1699, samples of Carolina rice were on sale in London to test whether buyers wanted it. The first crops grew on dry, high ground. By the 1720s, planters had moved their rice into freshwater swamps inland. They had enslaved workers build dams to hold the water in ponds.

From 1698 to 1702, Carolina planters shipped out about 269,000 pounds of rice a year. From 1738 to 1742, they shipped out more than 30 million pounds a year. One kind of Carolina rice later became known as Carolina Gold.

Planters put out advertisements asking for captives from the part of West Africa known as the Rice Coast. That coast included Senegambia, the land along the Senegal and Gambia rivers, and Sierra Leone. Planters paid more for people from there because those people knew how to grow rice. Records from Carolina fields show African methods at work. Enslaved workers built

earth banks around fields beside the tidal rivers so they could flood and drain them. They sowed seed by pressing it into the mud with the heel and toe. They separated the grain from its husks by tossing it in coiled baskets called fanner baskets.

Scholars disagree about how much of Carolina's rice farming came from African knowledge. In her 2001 book *Black Rice*, the geographer Judith Carney argued that African knowledge was the base of the whole rice business. A geographer is a scientist who studies the land and how people use it. In 2005 the historians David Eltis, Philip Morgan and David Richardson argued that she had made the African share too large. Records also show that in the early years of the colony, more captives came from Angola than from any other place. Angola is not on the Rice Coast. Most scholars now hold a middle view: planters built the rice business with their money and by force, and they also depended on African skill.

Whose land the rice grew on

The Kiawah, Etiwan and Stono people lived along the Ashley, Cooper and Stono rivers. They were still there in 1670, when English colonists settled among them at Charleston Harbor.

English colonists captured Kussoe people who fought back in 1671, and Stono people in 1674, and sold them into slavery in the Caribbean. The Kiawah left the Ashley River in the early 1680s and moved to the island now named for them. By the early 1680s no nation of the Lowcountry had more than fifty bowmen. The Stono had sixteen hunters. In the spring of 1684, leaders of eight nations signed away their land claims to the English who ran the colony.

Before 1720, English colonists in Carolina made their biggest profits from two kinds of goods they shipped out. One was ship supplies, such as tar made from pine trees. The other was Native people, whom they sold as slaves. In 1770 a colonist named William Bull wrote of the Native nations along the coast that "there remains now, except a few Catawbas, nothing of them but their names, within three hundred miles of our sea coast."

The rice workers, unnamed in the records

Planters' records list the enslaved rice workers by first name, age and price. They say almost nothing else about them. No single rice grower from these years can be followed through life in the records.

Planters gave each enslaved worker a set task every day. The usual task was to work a quarter of an acre of land. A worker who finished the task had the rest of the day. Workers labored in direct sun, standing in water or mud, among mosquitoes, horseflies, snakes and alligators.

Enslaved Africans dug the banks and canals of the rice fields. Nic Butler, a historian at the Charleston County Public Library, has written that the earth they moved across the Lowcountry is about as much as all the great pyramids of Egypt put together.

Until the 1760s, more enslaved people died in the Lowcountry than were born there. Many of the dead were children. Planters kept buying new captives to replace them. In 1710 slave traders rarely landed more than 300 enslaved Africans a year at Charles Town. They landed more than 1,000 a year by 1720, and more than 3,000 a year by 1770. More than four of every ten Africans brought to North America in the slave trade came in through Charleston Harbor. By 1708 more Black people than white people lived in South Carolina.

Eliza Lucas Pinckney

Who: A planter's daughter who ran her family's South Carolina plantations as a teenager and made the colony's first successful indigo dye.

When and where: Wappoo plantation, near Charleston, South Carolina. Indigo experiments from 1739, first successful dye in 1744.

Eliza Lucas produced the first successful indigo dye in South Carolina in 1744. Indigo is a plant, and dye made from it colors cloth blue. It is a farm crop but not a food.

In 1739 her father, George Lucas, went back to the island of Antigua, in the Caribbean, to serve as its lieutenant governor. Eliza was about 16. She took charge of Wappoo plantation and of the 20 enslaved people who worked it. She also oversaw the family's two other plantations, which were much larger.

That same year she began experimenting with indigo seed. Turning the plant into dye was skilled work done by experts. She first worked with an indigo maker from the island of Montserrat. Her best results came with an indigo maker of African descent whom her father hired from the French islands of the Caribbean.

She used her 1744 crop to make seed and gave the seed to other planters. Planters in South Carolina shipped out about 5,000 pounds of indigo in the shipping year 1745 to 1746. By 1748 they shipped out 130,000 pounds. She later married and took the name Pinckney.

Wheat, potatoes and everyday meals

Pennsylvania, New York and New Jersey were called the breadbasket colonies. Farmers there grew more wheat than their families needed. Merchants shipped the extra wheat as flour out of the ports of Philadelphia and New York.

In 1719 settlers known as the Scots-Irish planted potatoes at Londonderry, New Hampshire. The Scots-Irish were families of Scottish background who had lived in the north of Ireland. New Hampshire's histories count their patches as the first lasting potato fields in North America. The potato first grew as a crop in the Andes mountains of South America. People carried it to Europe, and settlers later brought it back across the ocean to North America.

Most colonial families ate corn, pork and bread, and drank cider. Rich families also bought tea, sugar and wine from overseas, and they ate bread made of wheat.

1750 to 1800

About nine of every ten working people in the United States were farmers when the country began, by a widely used estimate from the US Department of Agriculture. The first census, a count of the people, was taken in 1790. It counted about 4 million people.

Thomas Jefferson wrote that farmers were God's chosen people, while people he enslaved farmed his land. In 1796 Amelia Simmons became the first American to write a cookbook for American kitchens. Some of its recipes used American cornmeal.

> ### Matthew Patten
>
> **Who:** A New Hampshire farmer, carpenter and judge whose diary records what his family grew, caught and ate.
>
> **When and where:** Bedford, New Hampshire, on the Merrimack River. His surviving diary runs from 1754 to 1788.
>
> Matthew Patten kept a diary that shows how one farm family in New Hampshire fed itself. He headed each little booklet of it "A Day Book continued." His entries for the year 1767 record the family's food through the seasons.
>
> Patten was born in Ireland on May 19, 1719. He came to the colonies in 1728, when he was nine, and settled at the place later named Bedford in 1738. He was a joiner, a carpenter who does the finer woodwork in a house. He also farmed, worked as a judge, and surveyed land, which means he measured it and marked its borders.

> On January 3, 1767, a neighbor, James Gilmore, paid Patten three pecks of corn for surveying his land. A peck is about 8 quarts. That same day Patten bought tea and 7 pounds of sugar, and he took corn and rye to a neighbor's mill to be ground into meal and flour. On January 30 he butchered the family's hogs. In February and March, other neighbors paid him in bushels of corn for surveying and for writing deeds, the papers that prove who owns a piece of land.
>
> On March 4 he opened the pit where the family's potatoes had been buried for the winter. He wrote that they were "sound and good." In April and May the family sowed peas, then planted potatoes, corn, barley, hemp and flax. Hemp and flax are plants whose fibers are made into rope and cloth. He wrote that "the boys" planted the field behind the barn with corn and potatoes and spread manure from the barn on it.
>
> In May, Patten helped haul a net in the Merrimack River from dark to sunrise. His share was 60 shad, a fish the family took from the Merrimack each spring. From May 28 to June 6 he fished at Amoskeag Falls and sent 354 fish home. The name Amoskeag comes from a Pennacook word that means roughly "good fishing place." Long before Bedford was a town, Pennacook people strung large nets across the river at the falls and caught sturgeon, salmon and a fish called the alewife. Bedford lies in Pennacook country.
>
> In June and July Patten took salmon weighing from 6 to 19 pounds and split them with two neighbors. In August he reaped his rye and wrote, "I have 40 Stooks in all this year." A stook is a bundle of cut grain stood up to dry. Later that month he mowed his meadow and counted 205 piles of hay.
>
> Patten died on August 27, 1795, in one of the town's fields. He had carried dinner out to the men who were mowing.

Jefferson's farmers and Monticello's rations

Thomas Jefferson believed that family farms made free citizens. He wrote about the idea in his book *Notes on the State of Virginia*, first printed in 1785: "Those who labour in the earth are the chosen people of God, if ever he had a chosen people." For about a hundred years afterward, American leaders wrote land laws meant to put land in the hands of family farmers.

People Jefferson enslaved did the farm work at Monticello, his plantation in Virginia. Jefferson owned more than 600 enslaved people during his adult life. In the years Jefferson had tobacco grown at Monticello, enslaved children picked worms off the tobacco plants.

Each week, Jefferson gave each enslaved worker at Monticello a set amount of food, called a ration: a peck of cornmeal, half a pound of pork or pickled beef, and four salted fish. Nursing mothers received extra, and workers got whiskey at harvest. Researchers who studied the Monticello records found that these rations were not enough food for a person to live on. So in their little free time, enslaved people hunted, fished, trapped, kept gardens and raised animals.

Enslaved families also sold chickens and vegetables from their own gardens and flocks to the Jefferson family. Jefferson's granddaughter Anne Cary Randolph wrote down these purchases in the household accounts. Most of the sellers she recorded were enslaved people who worked in the house, many of them members of the Hemings family.

Corn into whiskey

The backcountry was the land far from the coast, beyond the older farms and towns. Farmers there could not easily haul wagons of corn over the long roads to buyers. So they turned their extra corn into whiskey, which they could carry to market in jugs.

> ### Amelia Simmons
>
> **Who:** The author of *American Cookery*, the first cookbook written by an American for American kitchens.
>
> **When and where:** Hartford, Connecticut, 1796.
>
> Amelia Simmons wrote *American Cookery*, the first cookbook written by an American for American kitchens. It was printed in Hartford, Connecticut, in 1796. On the title page she called herself "an American orphan." Nothing else about her life is known.
>
> Her book contains the first known printed recipes that used American cornmeal. Among them were johnnycake, "Indian slapjack" and Indian pudding. Colonists called corn "Indian corn" and cornmeal "Indian meal," so the word Indian in these names meant that the dishes were made with cornmeal.
>
> Her book also contains the first printed recipe that used pearlash to make dough rise. Pearlash is a salt made from wood ashes. Bakers used it to make dough rise before baking powder existed. The book also contains some of the earliest printed uses of the words "cookey" (cookie) and "slaw" (a salad of shredded cabbage), which came into American English from Dutch settlers in America.

1800 to 1850

In the first half of the 1800s, Americans began to keep food fresh and sell it to strangers far away. Merchants sold food sealed in tin cans, and they shipped ice cut from frozen ponds. In the Deep South, planters, the owners of large farms worked by enslaved people, spread cotton fields over land that federal troops had forced Native nations to leave. On the prairie of the Midwest, farmers used a new steel plow to turn thick grassland into fields of wheat and corn.

Food in cans, and ice from ponds

Food spoils when it sits too long. In 1809 a Frenchman named Nicolas Appert proved that food sealed in a container and then heated would keep. The method is called canning.

Americans soon took up canning. William Underwood opened a cannery in Boston in 1820 or 1821. In New York, Thomas Kensett canned seafood, fruit and vegetables. In 1825 he received an American patent for tin cans. A patent is a government paper that gives an inventor the sole right to make and sell an invention for a set number of years. Food sealed in a can could be sold far from the farm where it grew, to people the grower never met.

Other merchants sold ice. Workers cut blocks of ice from frozen ponds in New England in winter, including Walden Pond. Merchants shipped the ice to cities. People used it to keep food, fresh fish and drinks cold. Families kept ice in a box called an icebox, which became a common piece of kitchen furniture.

Frederic Tudor

Who: A Boston merchant, called the Ice King, who built a business shipping New England pond ice to warm places around the world.

When and where: Boston. First cargo of ice to Martinique in 1806. Ice to India in 1833. Died 1864.

Frederic Tudor built a business selling New England pond ice in hot countries far away. His first cargo of ice left Boston in 1806, bound for the Caribbean island of Martinique. A Boston newspaper, the *Boston Gazette*, printed: "No joke. A vessel has cleared at the Custom House for Martinique with a cargo of ice. We hope this will not prove a slippery speculation." To clear at the Custom House meant to get permission from officials at the port to sail. A speculation is a risky business deal.

> Much of the ice melted during the three-week voyage. Tudor sold what was left. He lost about $4,500 on the trip, though some accounts say $4,000. He kept at the business for years. In 1812 and 1813 he spent time in debtors' prison, a jail for people who could not pay what they owed.
>
> On May 12, 1833, his ship, the *Tuscany*, sailed from Boston for Calcutta, in India. It carried 180 tons of ice cut the winter before. The ship reached India in September, about four months later. About 100 tons of the ice were still frozen. About 80 tons had melted on the way.
>
> Tudor died in Boston on February 6, 1864.

Cotton fields on Native farms

Across the Deep South, planters spread cotton so widely that they pushed food crops to the edges of their land. Many planters bought corn and pork from Midwestern farms instead of growing enough food on their own plantations.

The new cotton fields were the farms and hunting grounds of the Cherokee, Muscogee (Creek), Choctaw, Chickasaw and Seminole nations. In 1830 President Andrew Jackson signed the Indian Removal Act. Under it, federal troops forced these nations off their land and moved them west. The Cherokee removal of 1838 and 1839 is called the Trail of Tears. Soldiers under General Winfield Scott forced more than 16,000 people from their homes. Starting in May 1838, the soldiers rounded up most of the Cherokee and held them as prisoners in crowded, dirty camps. Measles, whooping cough and dysentery, a disease of the gut that causes bloody diarrhea, spread through the camps. People had too little food and water and no shelter from the weather. More than 4,000 Cherokee died of disease, hunger and cold in the camps and on the march west. That is the usual count. In 1984 the scholar Russell Thornton estimated that the number of dead may have been twice as high.

Enslaved people did the work in the cotton fields. They were held as property by the planters and forced to work without pay. They worked in groups called gangs, from sunup to sundown, six days a week.

Breaking the prairie

Farmers moving onto the prairie of Illinois found thick, sticky sod. Sod is the top layer of soil, held together by the tangled roots of grass. Prairie sod stuck to iron plows and stopped them.

John Deere was a blacksmith, a worker who shapes iron and steel by heating and hammering it, in Grand Detour, Illinois. In 1837 he made a plow of polished steel. The sod slid off its smooth blade instead of sticking, so the plow could cut through the prairie. By 1846 Deere was selling nearly a thousand plows a year.

In 1831, six years before Deere made his plow, Cyrus McCormick had shown his reaper at Steele's Tavern, Virginia. A reaper is a machine that cuts grain. Before it, farmers cut wheat by hand, with tools such as the sickle, a curved blade. A reaper cut grain many times faster than a person with hand tools, so a family could plant far more wheat. Within one generation, farmers had turned the prairie into fields of wheat and corn.

Deere's plows broke land that Native nations had lived on. Early settlers at Grand Detour saw signs of a Ho-Chunk village inside the bend of the river.

In 1832 US soldiers and militia, citizens called up to fight, went to war against Sauk and Meskwaki people led by Black Hawk. On August 1 and 2, 1832, at Bad Axe on the Mississippi River, Black Hawk's band of perhaps 500 men, women and children tried to cross the river. Soldiers on the army steamboat *Warrior* fired on them. About 1,300 soldiers and militia under General Henry Atkinson attacked the people still on the east bank. The soldiers shot some of the Sauk and Meskwaki before they could reach the far shore, and others drowned trying to get across. Thomas Ford, a governor of Illinois, later estimated that 150 were killed and as many drowned. Others have disputed his count.

In September 1832, Ho-Chunk leaders signed a treaty with General Winfield Scott and Illinois governor John Reynolds. A treaty is a written agreement between nations. In it the Ho-Chunk gave up their lands south and east of the Wisconsin River and the Fox River of Green Bay, with a border running up the Rock River. US officials agreed to pay them $10,000 a year for 27 years.

In 1833, at a treaty meeting in Chicago, Potawatomi leaders sold the last of their land in northern Illinois and all of their land in southeastern Wisconsin to the United States. In return they received 5 million acres in Iowa, $100,000 in goods and supplies, and $14,000 a year for 20 years. They had to leave Wisconsin by 1838.

The potato blight

In 1843 a potato disease called late blight broke out near the ports of Philadelphia and New York. It is caused by a water mold, a tiny living thing that destroys potato plants. The blight spread through potato fields in the eastern United States. American farmers lost potato crops, but they had other food to eat.

By 1845 the blight had reached Europe. In Ireland, poor families depended on potatoes and had no other food. The blight destroyed their crop. A famine is a time when there is so little food that people starve. During the Great Famine in Ireland, from 1845 to 1852, about 1 million people died.

1850 to 1900

By 1900, food was grown, packed and shipped as a big business, from Texas ranches to Chicago meatpacking plants to the cities of the East. Under the Homestead Act, families claimed millions of acres of free farmland that US officials and soldiers had taken from Native nations. Cowhands drove millions of cattle north from Texas, and meatpackers in Chicago shipped their beef east in cold railroad cars. Starting in 1867, farmers formed groups of their own to buy supplies together and to speak up against the rates railroad companies charged them.

Homestead farms on taken land

The Homestead Act became law on May 20, 1862. Under it, a person could claim 160 acres of public land for free. To keep the land, the person had to live on it and farm it for five years. Women could claim land. After 1868 Black Americans could claim land too. Most Native people could not.

Over the years the law was in force, people filed about 4 million claims. About 1.6 million of them finished the five years and received a land patent, the government paper that made the land theirs. Together they received about 270 million acres, close to one tenth of all the land in the United States.

All of this land had belonged to Native nations. US officials and soldiers had taken it by treaty, by purchase and by war. In 1887 members of Congress passed the Dawes Act. Under it, federal officials broke up land that each Native nation held together into separate plots for single families. Officials then sold the land they called surplus, meaning left over, and much of it went to white farmers. Native nations held about 138 million acres in 1887. By 1934 they held about 48 million. Through the plots and the sales, federal officials had taken about 90 million acres from them, two of every three acres they had held. In 1889 federal officials opened land in Oklahoma to settlers. US officials had taken that land from Native nations. Settlers raced in to claim it.

Uriah and Mattie Oblinger

Who: A homesteading family whose letters describe the food and work of a Nebraska farm claim.
When and where: Fillmore County, Nebraska. Uriah filed his claim in 1872. Mattie and their baby, Ella, arrived in May 1873. The family letters run from 1862 to 1911.

The letters of Uriah and Mattie Oblinger describe what one homestead family in Nebraska grew and ate in the 1870s. The Library of Congress and the Nebraska State Historical Society keep the family's letters. The Library of Congress collection holds 318 of them, written from 1862 to 1911. Uriah and Mattie married on March 25, 1869.

In the fall of 1872, Uriah went ahead from Indiana to Nebraska. He filed a claim about eleven miles west of the town of Geneva, in Fillmore County. He broke the prairie sod and built a house out of blocks of sod. On December 1, 1872, he wrote about the other young families starting out around him. "We will all be poor here together," he wrote. The Otoe-Missouria and the Pawnee had signed over most of their land in this part of Nebraska in treaties of 1854 and 1857. Homesteaders began filing claims in the county in 1866.

Mattie and their baby daughter, Ella, joined Uriah in May 1873. On June 16, 1873, Mattie wrote a letter about the garden and the crops. She spelled words her own way. "Uriah has 23 acres of sod corn planted it looks real well," she wrote. Sod corn was corn planted straight into newly plowed prairie sod. In 1902 an Iowa settler, L. S. Coffin, described how it was done. A man struck an axe deep into the sod, and a boy or girl dropped three or four kernels into the slot and stamped it shut with one foot. "We have a nice lot of Squashes and Cucumbers & Mellons & Beans comeing on." She was growing tomato plants too. She bought milk and butter from a neighbor, Mrs. Furgison, and paid twelve cents a pound for the butter. "I like the sod house the best," she wrote. She also wrote that "every lick we strike is for our selves and not half for some one else."

Over the next years the family lived through blizzards, drought, swarms of grasshoppers and low prices for their crops. In February 1880 Mattie died giving birth, and her newborn son died with her. She was 36. She left three daughters, Ella, Stella and Maggie. Uriah moved the family to Minnesota that year. The family later lived in Nebraska, Kansas and Missouri, and came back to Nebraska in 1894.

Sharecropping: growing a crop someone else sold

After the Civil War, most freedpeople, the men, women and children who had been freed from slavery, had no land of their own. Many became sharecroppers. A landowner gave a sharecropping family food, seed, tools and a cabin on credit, which meant the family would pay for them later. This was called the furnish. The family usually worked about twenty acres.

At harvest the landowner sold the crop and took out the cost of the furnish plus interest, an extra charge for paying later. Then the landowner paid the family its share. The share was usually half of the crop's value or less. The landowner held a lien on the crop, which meant the landowner had a legal claim to it until the debt was paid. The landowner also kept the account books. Most sharecropping families stayed in debt to the landowner year after year. They grew food and cotton but did not control the money from selling it.

The bison killed, the cattle driven north

About 30 million bison lived on the Great Plains in the early 1800s. By 1900 fewer than 1,000 were left. One count in 1884 found 325. Hunters killed bison to sell their hides. Railroad building, disease and drought also shrank the herds. US Army commanders encouraged the killing, because the herds were the food supply of the Plains nations. By 1881 the people of the Lakota leader Sitting Bull were starving, because the bison herds were nearly gone. They surrendered at Fort Buford in July 1881.

Ranchers put cattle on the grasslands where the bison had lived. Between 1866 and 1884, cowhands drove about 5.2 million Texas cattle north to railroad towns. In 1867 Joseph McCoy built a market for cattle at Abilene, Kansas, where the railroad line reached. Herds came up to it along the Chisholm Trail. In Texas, as many as one cowhand in four was Black. Many others were Mexican or Mexican American.

The open range was grassland with no fences, where cattle could graze and travel freely. The long drives ended as barbed wire fences and quarantine lines closed the open range. Joseph Glidden received a patent for barbed wire on November 24, 1874. A quarantine line was a border that cattle from some areas were not allowed to cross. Under a Kansas quarantine law of 1885 and 1886, Texas cattle could not enter Kansas. Herds could no longer use the trails that crossed those lines.

> #### Charles Goodnight
>
> **Who:** A Texas cattleman who invented the chuckwagon, the kitchen on wheels that fed cowhands on cattle drives.

> **When and where:** Texas, 1866.
>
> Charles Goodnight invented the chuckwagon in 1866. A cattle drive crossed open grassland for months, and its crew had to eat every day. Goodnight took a leftover Army wagon and built a hinged pantry box onto it. Part of the box dropped down flat to make a table where the cook could work.
>
> The chuckwagon carried the food for the trail, such as beans, bacon, biscuits and coffee. On a drive, the cook ranked second only to the trail boss, the man in charge of the whole drive. Some characters in the novel *Lonesome Dove* are partly based on Goodnight.

Beef from the Plains to a city plate

The Union Stock Yards opened in Chicago on December 25, 1865. Stock yards are pens where cattle, hogs and sheep are held until they are sold. The Chicago yards became the largest market for farm animals in the world.

Gustavus Swift was a meatpacker, a businessman who ran a plant where animals were killed and cut up into meat for sale. He shipped beef east from Chicago already butchered, instead of shipping live animals. In 1878 an engineer named Andrew Chase designed a railroad car for Swift that was cooled with ice. Beef packed in it stayed cold all the way to the cities of the East. A steer, one of the male cattle raised for beef, could now be raised in Texas, killed in Chicago and eaten in New York.

Farmers join together

In 1867 Oliver Hudson Kelley founded the Patrons of Husbandry, better known as the Grange. Husbandry is an old word for farming. Kelley was a Minnesota farmer and a clerk in the federal Department of Agriculture. The Grange was the first large farmers' group with members across the whole country. Grange members met in their own halls and bought supplies together to get lower prices. They also spoke up together against the rates the railroad companies charged to carry their crops.

In 1862 members of Congress passed the Morrill Act. Under it, federal officials gave each state 30,000 acres of public land for each of the state's members of Congress. That land had been taken from Native nations. State officials sold the land and used the money to start colleges that taught farming and the skills of working with machines. These schools are called land-grant colleges. In 1887 members of Congress passed the Hatch Act, named for William Hatch, a member of the US House of Representatives from Missouri. Hatch led the House committee on

farming. Under the act, each state's land-grant college received $15,000 a year at first to run a farm experiment station. At these stations, scientists studied soil, seed and farm animals and sent their results to farmers. There are stations today in all 50 states.

1900 to 1950

Between 1900 and 1950, federal officials took on new jobs in how Americans got their food. Federal inspectors went into the meatpacking plants in 1906. In the 1930s, federal officials paid farmers to grow less, bought up extra food and gave it to hungry families. During World War II, officials limited how much sugar, meat and coffee each person could buy. In 1946 President Harry Truman signed a law that made school lunch a permanent federal program. On the farms, tractors took the place of horses, and new kinds of seed corn and chicken farming began.

What was in the meat: the 1906 food laws

On June 30, 1906, President Theodore Roosevelt signed two food laws on the same day. Under the Pure Food and Drug Act, no one could sell adulterated or mislabeled food and medicine from one state to another. Adulterated food is food that has been made impure, or mixed with something that should not be in it. Scientists at the Bureau of Chemistry, part of the Department of Agriculture, enforced this law. In 1927 federal officials handed that work to a new office in the Department of Agriculture. In 1930 they renamed the office the Food and Drug Administration, or FDA.

The second law was the Meat Inspection Act. Under it, federal inspectors worked inside the packing plants and checked the meat. Members of Congress passed both laws within a few months after a novel about Chicago's meatpacking plants came out.

Upton Sinclair

Who: A novelist whose book about the Chicago meatpacking plants came out months before the 1906 food-safety laws.

When and where: Chicago, 1904. His novel *The Jungle* came out as a book in February 1906.

Upton Sinclair wrote *The Jungle* to show how immigrant workers in Chicago's meatpacking plants lived. In 1904 he spent about seven weeks working undercover in the plants. His novel was printed in parts in 1905 and came out as a book in February 1906.

Readers fixed instead on what Sinclair described going into the meat. Within months, Roosevelt signed the two food laws of June 30, 1906. Later that year Sinclair wrote about how readers had taken his book: "I aimed at the public's heart, and by accident I hit it in the stomach."

George Washington Carver

Who: A scientist who taught poor Southern farmers how to rebuild worn-out cotton land and grow their own food.

When and where: Born enslaved near Diamond, Missouri, about 1864. Taught at Tuskegee Institute, Alabama, from 1896 until his death in 1943.

Movie: *George Washington Carver: An Uncommon Life* (Iowa PBS, 2018), a documentary.

George Washington Carver taught Southern farmers to plant crops that rebuilt their soil. He was born near Diamond, Missouri, in about 1864. No record gives the exact date. Moses and Susan Carver enslaved his mother, Mary, and so they claimed him as their property too. When he was a few months old, a band of men kidnapped him and his mother from the farm to sell them. A neighbor got the baby back. His mother was not brought back. Moses and Susan Carver raised him and his older brother, Jim. He was the first Black student at Iowa State, and later he taught there. In October 1896 he took charge of farming studies at Tuskegee Institute in Alabama, and he stayed until he died in 1943.

Year after year of cotton had worn out the soil on many Southern farms. Carver taught crop rotation, which means changing the crop planted in a field from one year to the next. A farmer planted peanuts, cowpeas (a kind of bean) or sweet potatoes, which built the soil back up, and then went back to cotton, which wore it down.

Carver wrote 44 practical bulletins and gave them to farmers for free. A bulletin is a small printed booklet. He also sent out the Jesup wagon, a wagon pulled by a mule that was used to show farmers new ways of farming. His best-known bulletin came out in 1916 and was reprinted for decades. It was called *How to Grow the Peanut and 105 Ways of Preparing It for Human Consumption*. In his laboratory he made hundreds of test products from peanuts and sweet potatoes.

Many people believe that Carver invented peanut butter. He did not. The Aztecs of Mexico made peanut paste centuries earlier. Marcellus Gilmore Edson received a patent for a peanut paste in Canada in 1884, and John Harvey Kellogg received one in 1895. A patent

> is a government paper that gives an inventor the sole right to make and sell an invention for a set number of years.

Pellagra: a disease from a corn diet

Pellagra is a disease caused by a diet missing a vitamin called niacin. Between 1900 and 1940, about 3 million Americans got pellagra, and about 100,000 died of it. Those hit hardest were poor farmers, sharecroppers and cotton-mill workers in the South. Sharecroppers were families who farmed land owned by someone else in return for a share of the crop. They lived mostly on cornmeal, molasses and dried pork, with few fresh vegetables and little meat or milk. Many mill owners paid workers in scrip, a kind of paper money that could be spent only at the company's own store. Those stores sold mostly cornmeal, dried meat and molasses.

A person with pellagra got skin rashes, diarrhea and dementia, which means confusion and loss of memory. The disease could end in death.

In 1915 Joseph Goldberger, a doctor with the US Public Health Service, tested the diet on prisoners. Mississippi's governor, Earl Brewer, agreed to the test. Starting on April 19, 1915, Goldberger fed eleven volunteer prisoners at the Rankin State Prison Farm the corn-based meals poor Southerners ate. They got biscuits, mush, grits, gravy, cornbread, sweet potatoes, cane syrup and coffee. In return, the men were promised pardons, meaning they would be let out of prison. Accounts of the results differ. About half of the eleven men got pellagra, and the others showed some signs of it. The men had skin rashes and stomach illness. The men who got pellagra recovered. In 1916 Goldberger injected himself, his wife and other volunteers with blood from pellagra patients, to show that the disease did not spread from person to person.

In 1937 a scientist in Wisconsin found that the missing nutrient was niacin, also called vitamin B3. Federal and state laws passed during World War II required that niacin be added to bread.

Sugar and pineapple from Hawaii

Sugar plantations made up most of the business of the Hawaiian Islands. In 1901 James Dole started the Hawaiian Pineapple Company. Workers at his company canned pineapple in huge amounts for kitchens on the mainland. The United States had taken over the islands three years before, in 1898.

Hawaii was a kingdom with its own queen until 1893. On January 17 of that year, a group of mostly American businessmen moved to overthrow Queen Liliuokalani. John L. Stevens, the top US official in Hawaii, had 162 US sailors and Marines brought ashore from the warship

USS *Boston*. The queen gave up her power under protest. In 1897 Native Hawaiians signed 21,269 names on petitions, written requests, asking that Hawaii not be joined to the United States. On July 7, 1898, President William McKinley signed the Newlands Resolution, a measure to annex Hawaii. To annex a place means to take it over and make it part of a country.

Tractors, hybrid corn and chickens

In 1917 Henry Ford's company began selling a cheap tractor called the Fordson. In 1920 American farms had 246,000 tractors and about 26 million horses and mules. Most of the pulling was still done by animals. In 1924 the International Harvester company brought out the Farmall. The Farmall could also cultivate row crops, meaning it could work the soil between rows of growing plants. That had been the last big farm job that still needed horses.

A farm horse ate crops too. It took about five acres to grow the feed for one horse. When a farmer sold a horse or stopped using it, the farmer could plant those acres with food for people.

In 1926 Henry A. Wallace founded Pioneer Hi-Bred, the first company that sold hybrid seed corn. Hybrid seed comes from crossing two different parent plants.

Cecile Steele

Who: A Delaware farmer who began the business of raising chickens for meat after a hatchery sent her 500 chicks by mistake.

When and where: Ocean View, Delaware, 1923. She lived from 1900 to 1940.

In 1923 Cecile Long Steele ordered 50 chicks for her farm in Ocean View, Delaware. The hatchery made a mistake and sent her 500. She raised them indoors. At 16 weeks old she sold them for 62 cents a pound.

She ordered 1,000 chicks on purpose in 1924, and by 1926 she was raising 10,000. The Delmarva Peninsula is the land where Delaware, Maryland and Virginia meet. By 1928 about 500 farms there were raising broilers. A broiler is a young chicken raised for its meat.

Chicken later became the meat Americans eat most, by weight. The National Chicken Council is a group that speaks for chicken companies. Its staff add up how much meat each American eats in a year. By their count, each American ate about 32 pounds of chicken in 1965. Their figures for 2025 put each American at about 103 pounds of chicken, 59 pounds of beef and 49 pounds of pork.

Dust, pigs and food stamps in the 1930s

During World War I, wheat sold for high prices. Farmers on the southern Great Plains plowed up the grassland to plant it. A drought began in 1931, and the wheat died. The bare, dry soil blew away in dust storms. The storm of April 14, 1935, is called Black Sunday. Crops failed year after year. Farm families lived on vegetables from their gardens, canned food, food handed out by federal officials, and jackrabbits.

No one kept an official count of the people the dust killed. In Kansas alone, dozens of people died of dust pneumonia in 1935. Dust pneumonia happened when dust settled deep in a person's lungs. It stopped the cilia, the tiny hairs that sweep the airways clean, from moving. The person had fever, chest pain, coughing and trouble breathing.

Under the Agricultural Adjustment Act of May 1933, federal officials paid farmers to grow less, so that crop prices would rise. In 1933 farmers plowed under about 10 million acres of cotton that was already growing, which means they plowed the young plants back into the ground. Federal officials bought about 6 million pigs and had them killed. At the same time, hungry people across the country stood in breadlines, long lines for free food. In 1936 judges threw out the farm law, and members of Congress wrote a new one in 1938. Federal payments to farmers have continued ever since.

Many Americans were angry that federal officials were having food destroyed while people went hungry. Federal officials set up the Federal Surplus Relief Corporation to give extra farm food to families on relief, meaning families getting government help. On May 16, 1939, the first Food Stamp Program began in Rochester, New York. Mabel McFiggin was the first buyer. People bought orange stamps that paid for food. With them came free blue stamps, which could buy only foods that federal officials listed as surplus, meaning extra.

Who got the cotton money

Under the cotton contracts of 1934 and 1935, federal officials paid landowners to take land out of cotton. Sharecroppers, the families who farmed that land for a share of the crop, were supposed to get a part of the payment. Under the contracts, their share was only about 11 percent. A landowner could keep the whole payment by evicting the sharecroppers, meaning forcing them off the land, and hiring day laborers, workers paid one day at a time, instead. Planters were the owners of big farms. When planters cut their cotton land by 40 or 50 percent, they cut the number of families working it by the same share.

In July 1934, seven Black men and eleven white men met at the Sunnyside School in Poinsett County, Arkansas. They started a union, a group of workers who join together to demand better pay and treatment. They called it the Southern Tenant Farmers' Union, and they started it to fight the evictions. A tenant farmer is a farmer who works land that someone else owns. Planters and lawmen answered with force. In January 1935 Sheriff J. D. Dubard of Poinsett County arrested a white organizer, Ward Rodgers, at the end of a union meeting in Marked Tree. Rodgers was held in jail there.

At a union meeting in Gilmore, four armed white men broke in. They ordered the Black members to leave. They told them they would be lynched, meaning killed by a mob, if they were caught at another union meeting. Many members were beaten and threatened with guns. The Encyclopedia of Arkansas account of the union does not name the men who did it. On March 15, 1935, at Birdsong, about forty armed planters, their riding bosses and lawmen broke up a union crowd. Riding bosses were men on horseback who watched over the field workers. Later that month a mob attacked the home of the union's lawyer, Cornelius Tyree Carpenter.

The Agricultural Adjustment Administration was the federal office that ran the farm payment program. Some of its lawyers, led by Jerome Frank, decided that landowners had to keep the same tenant families. In February 1935 the agency's head, Chester Davis, had Secretary of Agriculture Henry Wallace fire them.

Ration books and victory gardens

During World War II, federal officials rationed food, which means they limited how much of it each person could buy. Every person got a ration book of stamps, even babies. Sugar was the first food rationed, in May 1942. Coffee followed that November. In March 1943 meat, cheese, fats and canned foods were added. Sugar was also the last food to come off the list, in June 1947.

Federal officials allowed each person 26 pounds of sugar a year, about 8 ounces a week. In 1945 they cut the amount to as little as 4.5 ounces a week. Every month each person got 64 red points for meat and fats and 48 blue points for processed foods, such as canned goods. A shopper had to hand over the right points, along with money, to buy these foods.

Americans also grew their own food. They planted about 20 million victory gardens, home vegetable gardens grown to help feed the country during the war. By 1943 and 1944, these gardens grew about 40 percent of the country's fresh vegetables, roughly 9 to 10 million tons. Accounts differ on which of the two years was the peak.

Frozen food was already on sale by the war years. Clarence Birdseye's quick-frozen foods first went on sale on March 6, 1930, in 18 stores in Springfield, Massachusetts.

Adelaide Wisdom Benjamin

Who: A girl whose family grew a victory garden and shopped with ration stamps during World War II. She told her story in an oral history for the National WWII Museum in 2013.

When and where: New Orleans, Louisiana, and El Paso, Texas, 1941 to 1945. She was born in New Orleans in 1932.

Adelaide Wisdom grew up in New Orleans. During the war her father tried to join the Army and the Navy but did not meet their requirements. He was accepted by the Marines. After boot camp he was posted to El Paso, Texas, as a Marine recruiter, and the family moved with him.

At the store, the family could buy sugar, butter and some vegetables only with the right ration stamps. Beef and lamb were hard to find. With so little to serve, the family could not have guests over for meals.

The family grew a victory garden in New Orleans and in El Paso. "We grew mirlitons, and string beans and tomatoes in our backyard," she said in 2013. A mirliton is a pale green squash. The crops grew well in New Orleans. They did not grow well in El Paso. She collected scrap metal with her brother, including old coat hangers and bicycle tires. She put 10 cents of her 25-cent weekly allowance into war savings stamps.

When Germany surrendered in 1945, she bought a chocolate soda, a comic book and bubble gum. She later graduated from Tulane University Law School. With her husband, Eddie Benjamin, she practiced law for 55 years.

Farms taken from Japanese Americans

On February 19, 1942, President Franklin Roosevelt signed Executive Order 9066, an order from the president that has the force of law. In March and April, General John L. DeWitt ordered about 120,000 people whose families came from Japan forced out of their homes on the West Coast. Under his orders, US officials sent both citizens and noncitizens away and locked them up in prison camps behind barbed wire.

Many of these families were farmers. Lawrence Hewes ran the Farm Security Administration in the region. His agency was the federal office put in charge of handing their farms to new farmers. He said his agents had registered 6,000 Japanese American farms, covering about

200,000 acres. In March 1942 alone, Japanese American families lost more than 1,000 of those farms, about 50,000 acres, and new farmers took them over. That same month, leaders of the California Farm Bureau, a farmers' group, said Japanese American farmers grew 40 percent of the state's vegetables. Those included nearly all of its tomatoes, celery, strawberries and peppers. In April 1942 officials of the federal Wartime Civil Control Administration estimated that the crops on 21 percent of the land might be lost. The families who farmed it had been forced out, and no one had been found to take their place.

Inside the camps, the people held there farmed. About 15,000 people were sent to the camp at Tule Lake, California, alone.

Braceros in the fields

In 1942 US officials started the bracero program to bring Mexican workers into the country for farm and railroad work. The workers were called braceros. Over 22 years, workers signed more than 4.5 million contracts. Braceros picked much of the country's fruit and vegetables until the program ended in 1964.

From 1942 to 1949, US employers held back 10 percent of each bracero's pay. They sent the money through two US banks, Wells Fargo and the Union Trust Company of San Francisco, to banks in Mexico. Under the program's rules, the workers were to get the money back when they went home. Many braceros never got it. A Mexican report of 1946 said $8 million had been paid back to braceros that year, and no one could say where another $6 million had gone. Former braceros sued to get the money. In 2009, under a settlement, an agreement that ends a lawsuit, former braceros, or the families of braceros who had died, received a one-time sum of 38,000 pesos, about $3,500.

School lunch

Towns and charities had run school meal programs for decades. In the 1930s, federal officials gave these programs extra food that they had bought from farmers. During World War II, many young men called up to serve in the military failed their physical exams because of malnutrition. Malnutrition means a person has not had enough of the right food. General Lewis Hershey ran the draft, the system that called men into the military. After the war he told members of Congress that malnutrition put the country's safety at risk. On June 4, 1946, President Harry Truman signed the National School Lunch Act. The law states that Congress passed it "as a measure of national security," a way to keep the country safe, and to protect the health of the nation's children. Under it, federal money for school lunches became permanent.

1950 to 2000

After 1950, American farms grew fewer and bigger, and each acre grew more food. Farmers used tractors, hybrid seed, fertilizer and pesticides. Swanson sold 25 million frozen TV dinners in 1955, and fast-food stands served hamburgers in seconds. In the 1980s, after land prices fell and interest rates rose, about 300,000 farms could not pay their loans. At the same time, some farmers and cooks began to grow food by organic methods and to serve food from nearby farms.

Tractors outnumber horses, and farms grow bigger

The Census of Agriculture is the federal government's count of the country's farms. The 1954 Census of Agriculture was the first count in which American farms had more tractors than horses and mules. Farms had about 4.6 million tractors that year and about 4 million horses and mules. In 1920 there had been about 25 to 26 million horses and mules.

The number of farms fell too. In 1935 the country had 6.8 million farms, the most it ever had. After that the number kept dropping, toward 2 million. The farms that were left were bigger. Many of them grew only a few kinds of crops and relied on chemical fertilizers and pesticides.

By the 1950s nearly all the corn in the country grew from hybrid seed. For about a hundred years, farmers had grown roughly 25 to 30 bushels of corn on an acre. A bushel is a measure that holds about 8 gallons. By the 1970s farmers were growing more than 100 bushels an acre.

Fast food and the TV dinner

Richard and Maurice McDonald opened a drive-in restaurant in San Bernardino, California, in 1940. In 1948 they rebuilt it around what they called the Speedee Service System, with a menu cut down to 15-cent hamburgers, french fries and milkshakes. The carhops, the servers who had carried food out to people's cars, lost their jobs. Workers made the food on a kind of assembly line, where each worker did one job over and over, and customers got their food in seconds.

In 1953 the Swanson company put a frozen turkey dinner in an aluminum tray on sale and called it a TV dinner. It cost about 98 cents. The company sold more than 10 million in 1954 and 25 million the next year. According to company stories, Swanson had too many turkeys left over after Thanksgiving. Who thought of the TV dinner is disputed. For decades a salesman named Gerry Thomas said the idea was his. The company's owners were the brothers Gilbert and Clarke Swanson. Their relatives, and a Swanson scientist named Betty Cronin, said the

brothers came up with it at the company and that Thomas took the credit. Frozen meals had been sold before either claim. In 1945 the Maxson company made frozen "Strato-Plates" to serve on airplanes.

Ray Kroc

Who: A milkshake-machine salesman who became the McDonald brothers' franchise agent and then bought them out.

When and where: Visited San Bernardino, California, in 1954. Opened his first McDonald's in Des Plaines, Illinois, on April 15, 1955. Bought out the brothers in 1961.

Movie: *The Founder* (2016), a drama based on his story and the brothers'.

Ray Kroc sold milkshake machines. In 1954 he went to see the McDonald brothers' stand in San Bernardino. He became the brothers' franchise agent. A franchise is a deal in which a business owner lets other people open stores under the owner's name and system, in return for fees.

On April 15, 1955, Kroc opened his own McDonald's in Des Plaines, Illinois. In 1961 he bought the brothers out for $2.7 million. The brothers said Kroc had made a handshake promise to keep paying them royalties, a share of the money from every sale, and never kept it. Kroc also opened a McDonald's near their original stand, in competition with it. The movie *The Founder* is a drama based on these events.

Norman Borlaug

Who: An Iowa-born plant scientist whose wheat helped poor countries grow far more grain, in what was called the Green Revolution.

When and where: Mexico from 1944. India and Pakistan in the 1960s. Nobel Peace Prize in 1970.

Movie: *The Man Who Tried to Feed the World* (PBS American Experience, 2020), a documentary.

Norman Borlaug bred wheat that grew more grain on the same land. Starting in 1944, he worked in Mexico for a program run by the Rockefeller Foundation, a charity started by the Rockefeller family. He crossed thousands of kinds of wheat. The result was a semi-dwarf wheat, with short stems, that resisted plant diseases. By 1956 Mexico grew all the wheat it needed.

> In the 1960s, experts predicted famines in India and Pakistan. A famine is a time when there is so little food that people starve. Farmers there planted Borlaug's wheat, and the famines they predicted did not happen. In 1970 Borlaug won the Nobel Peace Prize. He is the only farm scientist to have won it. Many writers credit his work with saving as many as a billion lives. That number is a common estimate, not a count. The rise in grain harvests in poor countries that followed is called the Green Revolution.
>
> Farmers grew his wheat together with chemical fertilizer and irrigation, water brought to the fields by pipes and ditches. This made farmers depend on bought chemicals. Many farmers also stopped planting old kinds of crops, so fewer kinds were grown.

Pesticides in the fields

Farmers sprayed their crops with pesticides, chemicals that kill insects and weeds. DDT, a chemical that kills insects, was in wide use from the mid-1940s. It made the shells of eagles' eggs thin. By 1963 only 417 pairs of bald eagles were nesting in the lower 48 states. In September 1962 Rachel Carson's book *Silent Spring* had described what these long-lasting pesticides did to birds, soil, water and people. Officials at the Environmental Protection Agency banned DDT in 1972.

Farmworkers in steady contact with pesticides had high rates of burns, cancer and children born with birth defects. In the 1980s, children in several towns of California's San Joaquin Valley had cancer at rates "800% above the norm," according to the Walter P. Reuther Library at Wayne State University. Cesar Chavez, Dolores Huerta and the United Farm Workers organized the people who picked the crops. They are known for the grape strike in Delano, California, when grape pickers refused to work until growers met their demands.

In March 2026 the New York Times reported that Chavez had sexually abused two girls in the 1970s, beginning when they were 12 and 13. The two women, Debra Rojas and Ana Murguia, are daughters of union organizers. Rojas said Chavez raped her in a motel room when she was 15. Rape means forcing a person into sex. Dolores Huerta then said publicly that Chavez had pressured her into sex once and had raped her in a car in 1966, and that she became pregnant both times. Chavez died in 1993, so no court has ever heard these accusations. On March 26, 2026, California's lawmakers voted to rename the state holiday Cesar Chavez Day as Farmworkers Day, and Governor Gavin Newsom signed the change into law.

Black farmers and their land

In 1920 Black farmers ran more than 900,000 farms, about 15 percent of all the farms in the United States. Between 1910 and 1997, the amount of farmland Black Americans owned fell by nearly 90 percent. In 2022 five economists published a study that put the value of the land lost from 1920 to 1997 at about $326 billion in today's dollars. By 2007 about 1.5 percent of the country's farms, 32,938 of them, were run by Black farmers.

Researchers at the Union of Concerned Scientists, a science group, named two of the causes in a 2023 report. Lloyd Wright once ran the civil rights office of the US Department of Agriculture, or USDA. He called the department "the last plantation," because its officials had kept Black farmers from getting the loans and grants that would have kept them on their land. Plantations were the big farms where enslaved people had been forced to work. The second cause was heirs' property. A will is a paper that says who gets a person's things after the person dies. When a landowner died without a will, the land passed to the landowner's heirs, the family members who inherit it. All the heirs owned the land together. Each owned a share of the whole farm, not a piece of land of their own. Any one of them could ask a court to force a sale of the whole farm. A land buyer could buy one heir's share and then ask a court to sell the farm at auction. Farms sold that way went for far less than they were worth. USDA officials have called heirs' property "the leading cause of Black involuntary land loss," meaning land lost when the owners did not choose to sell.

Black farmers took the USDA to court. The case was called *Pigford v. Glickman*. The farmers showed that from 1983 to 1997, USDA officials treated Black farmers worse than white farmers because of their race. The officials also failed to look into the farmers' complaints. Members of local county committees made the decisions on USDA farm loans. Black farmers said committee members turned down their loans, or made them wait longer for approval than white farmers. The Congressional Research Service report on the case does not name the committee members. On April 14, 1999, Judge Paul L. Friedman approved a settlement. Under it, 15,645 farmers had their claims approved, out of 22,721 who qualified. Farmers whose claims were approved under the part of the settlement called Track A each received $50,000, and USDA officials canceled what they owed on their USDA loans. The payments and debt relief came to about $1.06 billion. On February 18, 2010, a second settlement of $1.25 billion was announced for farmers who had missed the first deadline.

Organic farming rules become law

Organic farmers grow food without man-made chemical fertilizers and pesticides. They build up their soil with compost, which is rotted plant and animal matter. In 1942 J.I. Rodale began a magazine called *Organic Farming and Gardening* in Emmaus, Pennsylvania. He spent decades urging farmers and gardeners to farm this way. In 1990 members of Congress passed the Organic Foods Production Act. It required national rules for what could be sold as organic. The USDA organic seal, a label for food that meets those rules, came into use on October 21, 2002.

Alice Waters

Who: A cook who built her restaurant around food from nearby farms and started a school garden where children grow and cook their own food.

When and where: Chez Panisse restaurant, Berkeley, California, opened in 1971. The Edible Schoolyard, Berkeley, started in 1995.

Movie: *Alice Waters and Her Delicious Revolution* (PBS American Masters, 2003), a documentary.

In 1971 Alice Waters opened a restaurant called Chez Panisse in Berkeley, California. She cooked with food that was fresh, grown nearby, in season and organically grown. Chez Panisse was one of the first restaurants of the style later called California cuisine, cooking built on fresh food from local farms. Waters helped start the farm-to-table idea, which means buying food straight from local farms.

In 1995 Waters started the Edible Schoolyard at Martin Luther King Jr. Middle School in Berkeley. Students there grow a garden, cook what they grow and eat it.

The farm crisis of the 1980s

In the 1970s, American farmers sold large amounts of grain to other countries. They planted "fencerow to fencerow," every acre up to the fences. Interest is the extra money a borrower pays back on top of a loan. In the early 1980s, interest on loans rose high. At the same time, the price of farmland fell. In parts of the Midwest, farmland lost as much as 60 percent of its value between 1981 and the mid-1980s. By 1984 American farmers owed about $215 billion, twice what they had owed in 1978.

During the 1980s, an estimated 300,000 farms defaulted, meaning they could not pay back their loans. About 300 banks in farm country failed, meaning they ran out of money and closed. On September 22, 1985, Willie Nelson, John Mellencamp and Neil Young held a concert called Farm Aid in Champaign, Illinois. About 80,000 people came, and the concert raised more than $7 million for farm families. Farm Aid concerts still take place.

Russel and Mary Jane Jordan

Who: An Iowa farm couple who sold their machinery, livestock and household goods at auction to pay their bank. Their daughter filmed it.

When and where: Iowa. The family had owned its farm for 125 years. Their bank was in Atlantic, Iowa.

Movie: *Troublesome Creek: A Midwestern* (1995), a documentary about the family. It won the Grand Jury Prize at the Sundance Film Festival and was nominated for an Academy Award.

Russel and Mary Jane Jordan owned a farm in Iowa that had been in their family for 125 years. A company called Norwest, which owned banks in several states, bought their bank in Atlantic, Iowa. A man from the company's headquarters, Tim Wolf, took over their loans. The bank's officers called in a debt of $70,000 that had built up over the years, meaning they demanded it be paid. Each year the Jordans also took out a loan of $150,000 to pay for that year's farming. Together the old debt and the yearly loan came to about $220,000.

The Jordans held an auction. They sold all their machinery, their livestock and even their household goods. The Jordans kept only the land. The sale raised about $300,000, more than enough to pay the back debt. Russ and Mary Jane moved to a rented house in Atlantic. Their son Jim took over farming the home place with his own equipment. Later the crop land was rented out to neighbors.

Their daughter, Jeanne Jordan, and the filmmaker Steven Ascher made the film about the family.

2000 to Today

Since 2000, Americans have argued over what goes into their food, who picks it and who can get enough of it. The 2022 Census of Agriculture, the USDA's count of the country's farms, found 1.9 million farms in the United States. That was 7 percent fewer than in 2017. It was the

first count below 2 million since before the Civil War. In 1935 there had been 6.8 million.

Weight, hunger and food stamps

Researchers at the Centers for Disease Control and Prevention, or CDC, measure obesity, which means a body weight high enough to raise the risk of illness. By their count, 30.5 percent of American adults had obesity in 1999 and 2000. The share rose to 41.9 percent in the years 2017 to March 2020. It was 40.3 percent from August 2021 to August 2023. Doctors link type 2 diabetes and heart disease to diet. Type 2 diabetes is an illness in which the body cannot keep the sugar in the blood at a healthy level.

Some Americans live far from a place to buy fresh food. USDA officials map low-income areas that are far from a supermarket. In a city, far means more than 1 mile away. In the country, it means more than 10 miles. An area counts when at least 500 people, or a third of the people who live there, are that far away. People call these areas food deserts. By that measure, USDA data for 2019 put about 19 million people, about 6 percent of the population, in them. A broader measure used for 2015 counted 39.4 million. The number depends on which measure is used.

Since 1995, USDA economists had counted households that did not always have enough food. In September 2025, USDA officials under Agriculture Secretary Brooke Rollins announced that they would end the count. They called it "redundant, costly [and] politicized." The last report came out on December 30, 2025. It found that in 2024, 13.7 percent of households did not always have enough food. Nearly 48 million people lived in those households, including more than 14 million children.

The Supplemental Nutrition Assistance Program, or SNAP, is the program once called food stamps. On July 4, 2025, President Donald Trump signed the One Big Beautiful Bill Act. The law cuts federal spending on SNAP. Economists at the Congressional Budget Office, which works out costs for Congress, figured that the cut will come to $186.7 billion over ten years.

Farmers' markets and the 2020 pandemic

Farmers' markets, where farmers sell their own crops straight to shoppers, grew in number. USDA counted 1,755 of them in 1994 and 8,771 in 2019. The number grew about 7 percent a year until about 2011, and then it stopped growing much.

In 2020 the disease COVID-19 spread through plants that process meat and poultry, which means chickens and turkeys. In April and May 2020, 23 states reported 16,233 cases of COVID-19 among workers in 239 plants, and 86 of those workers died. This count comes from

a CDC report of July 2020. Of the sick workers whose race was recorded, 87 percent were members of racial or ethnic minority groups.

Changed seeds and new kinds of meat

Genetic engineering means scientists change a plant's DNA, the chemical instructions inside every cell, in a laboratory. In 2025, about 92 percent of the country's corn acres, 96 percent of its soybean acres and 93 percent of its cotton acres were planted with genetically engineered seed, according to USDA economists. Scientists had changed that seed so the plants survive sprays that kill weeds.

In 2016 the National Academies of Sciences, a group of leading American scientists, reviewed about 1,000 studies. The scientists wrote that they found no convincing proof that eating these foods harms people's health. Many Americans still argued against them. Under federal rules in force since January 2022, foods that contain changed DNA that tests can detect must carry a "bioengineered" label. Industry histories name the Flavr Savr tomato, sold in 1994, as the first engineered food sold in stores.

Companies also began selling new kinds of meat. The Impossible Burger, made from plants, came out in 2016. Beyond Meat also makes meat from plants. In 2019 the public could buy its shares, small parts of the company, for the first time. Their price rose more on the first day than that of any other company's new shares that year. In June 2023 USDA officials gave two companies, UPSIDE Foods and GOOD Meat, the first approval in the United States to sell chicken grown from animal cells instead of from a live bird. People call it lab-grown meat.

Other companies grew vegetables indoors on shelves stacked high, called vertical farms. Investors put money into them, and the business grew fast. In June 2023 AeroFarms, an early company of this kind, filed for bankruptcy, a court process for a business that cannot pay its debts. The company later reorganized and stayed in business.

Who picks the food

USDA economists report that most hired crop workers in the United States were born in other countries. In recent years about 15 percent of crop-farm jobs have gone to workers on H-2A visas. A visa is a paper that lets a person from another country enter the United States. An H-2A visa lets a farmworker come for one season of farm work. More than 90 percent of H-2A workers come from Mexico. By the USDA economists' figures, officials at the US Department of Labor approved about 48,000 H-2A jobs in 2005 and about 372,000 in 2022. The Labor Department's own count for 2025 was 398,258 jobs.

From 1992 to 2006, 68 crop workers died from heat, according to a CDC report of 2008. Crop workers died of heat at about 20 times the rate of all American workers. One of them was a 56-year-old H-2A worker harvesting tobacco by hand in North Carolina in July 2005. It was his third day on the job, and no one had trained him about heat. His body temperature reached 108 degrees Fahrenheit, and he died of heat stroke, which happens when the body cannot cool itself. The report does not give his name.

Federal law lets children work on farms at younger ages than in other jobs. Outside school hours, a child under 12 may work on a farm owned or run by a parent. With a parent's permission, a child under 12 may also work on a small farm that does not have to pay the minimum wage, the lowest pay the law allows. Children of 12 and 13 may work with a parent's permission or on a farm where a parent works. At 14, a child may do farm jobs outside school hours.

Lucas Benitez

Who: A tomato picker who helped start the Coalition of Immokalee Workers and its Fair Food Program.

When and where: Born in Guerrero, Mexico. Moved to Immokalee, Florida, at 17. The coalition began in 1993, and the Fair Food Program began in 2011.

Movie: *Food Chains* (2014), a documentary about the coalition. Benitez appears in it.

Lucas Benitez came to Immokalee, Florida, from the state of Guerrero in Mexico when he was 17. He picked tomatoes in the fields there. In 1993 he helped start the Coalition of Immokalee Workers, a group of farmworkers.

In November 2010 the coalition and Florida's tomato growers announced an agreement, and the Fair Food Program began running in 2011. Under it, large buyers of tomatoes, such as McDonald's and Walmart, agree to pay a premium, an extra amount of money, for the tomatoes. People often call it an extra "penny per pound," and it raises the pickers' pay. The buyers also agree to hold growers to a code of conduct, a written set of rules. The code sets a lowest pay rate and requires shade, water and protection from abuse for the pickers. The code also bans forced labor, sexual assault and putting children to work as a regular practice. Sexual assault means any sexual touching or attack against a person's will, and it includes rape. When any of these happens on a farm, the program's managers suspend the farm from the program until its owners fix the problem. Checkers called auditors make sure growers follow the code.

> In October 2023 Benitez received the University of Michigan's Wallenberg Medal, an award for people who defend human rights. Benitez had helped investigate cases of slavery on farms, where workers were held and forced to work. In one case alone, he helped free about 700 workers, according to WGCU, a public radio station in Florida.

Black farmers in the new century

The 2022 Census of Agriculture counted 46,738 Black farmers on 32,653 farms, according to a USDA report of June 2024. They made up 1.4 percent of all the country's farmers and worked 5.3 million acres. The number of farms run by Black farmers was 8 percent lower than in 2017.

On July 31, 2024, USDA officials paid about $2 billion to more than 43,000 farmers, ranchers and forest owners who had faced discrimination in USDA farm loans. Discrimination means treating people worse because of who they are, such as their race. The NAACP Legal Defense Fund reported the payments that day. The money came from a section of the Inflation Reduction Act, a law that members of Congress passed in 2022.

The first farmers, still farming

Native nations are working to control their own food. This is called food sovereignty. Tribes run bison herds, seed banks that save the seeds of old crops, and programs that bring back traditional foods. Native chefs and seed keepers are rebuilding the ways their nations cooked and ate. Among the Ojibwe of the Great Lakes, manoomin, or wild rice, is harvested by canoe and is still a central food.

> #### Nephi Craig
>
> **Who:** A White Mountain Apache and Diné (Navajo) chef who opened a café built around Apache foods.
>
> **When and where:** Café Gozhóó, Whiteriver, on the White Mountain Apache Reservation in Arizona, opened in 2021.
>
> **Movie:** *Gather* (2020), a documentary about Native food sovereignty that features him.
>
> Nephi Craig is a chef. In 2021 he opened Café Gozhóó, a café built around Apache foods, in Whiteriver, Arizona, on the White Mountain Apache Reservation. Apaches who are recovering from addiction to alcohol or drugs work in the café's kitchen through a job-training program run by the tribe's Rainbow Treatment Center. In 2026 Craig said he had been sober himself for 15 years. That year he published a book about his life and his cooking, *Our Knives Will Save Us*. He also founded the Native American Culinary

> Association, a group for Native cooks. The 2020 documentary *Gather* follows him and others who are bringing back Native foods. Among them are Twila Cassadore, a San Carlos Apache woman who gathers wild foods, and Elsie DuBray, a student scientist from the Cheyenne River Sioux.

Chapter 16: Economy

Before 1500

Before 1500, Native people here had economies of their own. An economy is the way people make, share and trade the things they need. People here had no coins and no wages, and nothing had a set market price. They traded by barter, which means swapping one good for another, and by giving gifts between people and between nations. Goods such as stone tools, shells and copper traveled hundreds of miles. No record names any one person who took part in this trade.

Cahokia and its hoe blades

Cahokia stood near what is now St. Louis. It was the largest city north of Mexico, and it was at its biggest from about 1050 to 1150. Its farmers grew more corn than they ate. That extra corn, called a surplus, fed specialists. A specialist is a person who spends most of their time on one kind of work, such as making tools, instead of growing food.

The people of Cahokia controlled the making and trading of hoe blades. A hoe is a farm tool for breaking up soil. The blades were chipped from Mill Creek chert, a tough stone found only in southern Illinois. Workers dug it out of quarries, open pits for stone. Some of the pits were 10 to 20 feet deep. Archaeologists are scientists who study the past from the things people left behind. They have found these blades more than 400 miles away, in places from Louisiana to Minnesota and in the Arkansas River valley.

Shell, copper and obsidian

People carried whelk shells north from the coast of the Gulf of Mexico. A whelk is a large sea snail. Traders also moved copper from the land around Lake Superior. At Cahokia, workers made shell beads in large numbers, and families on small farms made them as well.

In the West, people traded obsidian across their own trade networks. Obsidian is a natural glass that forms in volcanoes. Archaeologists have traced pieces found in western Canada back to Obsidian Cliff, in what is now Wyoming, and Bear Gulch, in what is now Idaho. Some pieces had traveled as far as 750 miles from where the stone formed.

The 1500s

The kings and queens of Spain, France and England paid for voyages to this coast in the 1500s to find gold and silver. In the land that became the United States, their explorers found none. The Spanish silver came from mines in Mexico and South America. Fishing was the first steady European business in these waters. Some ship crews also traded with Native people on the coast, and some of that trade was for furs. Almost no Europeans settled here yet, so there was no colonial economy.

Fish, furs and a rope from a cliff

European fishing crews worked the cod waters off the northeast coast all through the 1500s. They dried their catch on shore. The Spanish town of St. Augustine in Florida began in 1565 as a military post. The Spanish king's government paid its costs. Unlike the English colonies that came later, it was not set up to make a profit.

In 1524 the crew of Giovanni da Verrazzano's ship met Abenaki people on the coast of what is now Maine. The Abenaki would not let the crew come ashore. Instead they traded from the top of a cliff, lowering baskets of goods to the ship on a rope. Crews of earlier European ships had already taken Native people from the Maine coast to sell as slaves. That is why the Abenaki kept this crew off the land. Verrazzano called the place "the land of bad people." The records do not say whether the baskets held furs.

In July 1534, at Chaleur Bay, north of Maine in what is now Canada, Mi'kmaq traders held up beaver furs on sticks to the crew of Jacques Cartier. They traded the furs for knives and other iron goods. Cartier wrote the trade down in his own account of the voyage. It is one of the earliest recorded trades of furs between Europeans and Native people on the Atlantic coast of North America. The fur trade reached the land that became the United States in the next century.

The 1600s

Tobacco became Virginia's main business in the 1600s. Indentured servants from England did the early work in the tobacco fields. They had signed contracts to work for a master for a set number of years. Near 1700, the planters who owned the fields switched to buying enslaved

Africans, whom they could hold for life. Dutch traders shipped beaver skins to Europe. Lawmakers in London wrote rules that required colonists to ship their main crops only to England or its colonies.

Tobacco in the Chesapeake

The first colonists at Jamestown hoped to find gold. John Smith wrote that there was "no talk, no hope, no work but dig gold, wash gold, refine gold, load gold." They found none. Colony officials tried glassmaking and other small businesses, and none of them made money. Then Virginia's planters began to grow tobacco as a cash crop. A cash crop is a crop grown to sell rather than to eat. Planters in Virginia shipped about 2,300 pounds of tobacco in 1615 and 1616. By 1617 they shipped about 20,000 pounds, and by 1629 and 1630 about 1.5 million pounds.

By 1700, planters in Virginia and Maryland together sent about 22 million pounds of tobacco a year to England. These two colonies, around Chesapeake Bay, are called the Chesapeake colonies. Planters there also used tobacco as money.

John Rolfe

Who: A Jamestown colonist whose tobacco shipments to London began Virginia's trade in its main crop.

When and where: Jamestown, Virginia, 1612 to 1614.

John Rolfe began Virginia's export trade in tobacco. An export is a good sent away to be sold in another place.

Rolfe lived at Jamestown, the English colony in Virginia. By July 1612 he was growing tobacco from seed brought in from the West Indies, the islands of the Caribbean Sea. He sent his first shipments of tobacco to London in 1614.

Indentured servants

For most of the 1600s, the tobacco work was done by indentured servants. An indentured servant signed a contract, called an indenture, to work for a master for a set number of years. In return, the master paid for the servant's trip across the ocean and gave food, clothing and a place to sleep. Adults usually served four to seven years. Children sometimes served much longer. At the end of the term, the master owed the servant "freedom dues." Depending on the contract and the colony, these could be land, tools, clothes or farm animals.

Counts of servants are estimates made from ship records and court records. About 50,000 servants came to the Chesapeake colonies between 1630 and 1680. They were about three out of every four people who arrived there. Of about 120,000 English people who moved to Virginia and Maryland in the 1600s, about 90,000 came as servants. The historian Abbot Emerson Smith made an estimate for all the British colonies. From the 1630s to the Revolution, he found, one-half to two-thirds of the white people who moved there came as indentured servants.

Planters gained from each servant in two ways. Under Virginia's headright rule, whoever paid for a person's passage, the cost of the ocean trip, received 50 acres of land for that person. A planter who paid a servant's passage got the servant's years of work and 50 acres as well. The large tobacco planters built their estates, their large holdings of land, this way.

What servants went through

Masters could whip their servants. When a servant ran away, judges in the colony's courts added years to the servant's term. They also added years when a woman servant had a child outside marriage. Under a Virginia law of March 1662, she served two more years or paid her master 2,000 pounds of tobacco. Some of the fathers were the masters themselves. Virginia's lawmakers wrote a second law in December 1662 about a woman servant "gott with child by her master." When her years ran out, officers of the local church, called churchwardens, sold her to work two more years "for the good of the parish," the church district where she lived. Under this law the churchwardens sold the woman, not the master who was the father. Some masters also forced women servants into sex. Julie Richter, a historian of colonial Virginia, writes that some masters "physically and sexually abused their servants." She gives no count of how many. A Virginia law required masters to give servants "Competent Dyet, Clothing & Lodging," which meant enough food, clothes and shelter. The same law required masters not to "exceed the Bounds of moderation in correcting them." Correcting meant punishing.

The Virginia Company of London, a group of investors in England, started Jamestown in 1607 and ran the colony until 1624. That year the king of England took the colony away from the company and put it under his own control. Under the company's first form of contract, used from 1609 to 1619, its officers in Virginia could hang, burn to death or shoot runaway servants they caught.

Many servants died of disease before their contracts ended. Most of those who lived to the end of their terms stayed poor.

From servants to enslaved Africans

By 1650, about 300 Africans lived in Virginia, next to about 4,000 white servants. In the 1660s, members of Virginia's assembly, the colony's lawmakers, passed the colony's first laws that treated Africans as slaves for life. The first came in March 1661. Under it, an English servant who ran away together with Africans had to serve extra time for the Africans' missing time as well as his own. Judges punished runaway servants by adding years to their terms, but the law's words said the Africans were "incapable of makeing satisfaction by addition of time." No years could be added to their time, because they were already held for life.

In Bacon's Rebellion of 1676 and 1677, an armed uprising in Virginia, servants and enslaved Africans fought on the same side. After it, the planters who ruled Virginia passed new laws. Historians at the College of Charleston describe the purpose of those laws as "to harden Virginia's racial caste system." A caste system sorts people into ranks at birth, and they cannot leave their rank. In 1705 the members of Virginia's assembly gathered the colony's slave laws into one slave code. Under it, enslaved people were property, and being baptized did not free anyone. Being baptized means going through the church ceremony that makes a person a Christian. A master who killed an enslaved person while "correcting" them faced no punishment.

Near 1700, the planters chose to buy enslaved Africans instead of servants. Fewer English servants were coming by then, because life in England had improved. In the same years, the Atlantic slave trade grew. Ship crews in that trade carried captive Africans across the ocean to be sold. The economist David Galenson explains the planters' choice in money terms. A servant worked for a master for about five years. A planter who bought an enslaved person held that person, and that person's children, for life. So the planter got a whole lifetime of unpaid work, and the work of the children too, instead of five years.

Beaver skins, and rules from London

In 1626, one ship of the Dutch West India Company, the *Arms of Amsterdam*, carried 7,246 beaver skins to Amsterdam in a single cargo. It also carried the skins of otters, minks, lynxes and muskrats. The cargo is listed in a letter known as the Schaghen letter. People in Europe bought hats made of felt from beaver fur, and those buyers were the reason traders wanted the skins.

English leaders followed an idea called mercantilism. They held that colonies existed to make the home country richer. Colonists were to send raw goods, such as tobacco, to England and buy back finished goods, things already made in England. Members of Parliament, England's

lawmakers, wrote this idea into laws called the Navigation Acts. The act of 1651 required colonists to ship their trade goods only in English or colonial ships. The act of 1660 listed "enumerated goods," a phrase that means listed goods. Colonists could ship these only to England or to other English colonies. The list included tobacco, sugar, cotton, indigo and ginger. Indigo is a plant used to make blue dye.

1700 to 1750

By 1774, free colonists earned more on average than the people of England. The economic historians Peter Lindert and Jeffrey Williamson published that finding in 2016. They also found that income among free colonists was spread more evenly than in any other place they could measure at that time. Much of the colonies' wealth, most of all in the South, came from the work of enslaved people. Their owners paid them nothing. From 1718, British judges also sent about 50,000 convicts across the ocean to be sold as laborers.

What the colonies sold

Tobacco came from the Chesapeake colonies, wheat and flour from the middle colonies, such as Pennsylvania, New York and New Jersey, and fish, rum and ships from New England. In the Lowcountry of South Carolina, the low land along the coast, enslaved workers grew rice and indigo and prepared them for sale.

Timber cost little in the colonies, so colonial shipbuilders could build ships for less than builders in England. By the Revolution, about one-third of the British merchant fleet had been built in America. A merchant fleet is all the ships that carry a country's goods for trade.

Rice, and the people who knew how to grow it

The rice fields of the South Carolina Lowcountry were built and worked by enslaved Africans. Rice was the Lowcountry's main cash crop from the early 1700s. From about 1708, enslaved Africans were a majority of the people in South Carolina. By 1740 they were about two out of every three.

Nic Butler of the Charleston County Public Library writes that enslaved people "moved earth on a massive scale" to build the rice fields. By the 1720s, Carolina planters were asking slave traders for Africans from the region called the Rice Coast. The planters wanted them because people from there already knew how to grow rice.

The wealth from rice, Butler writes, "remained concentrated in the hands of a small minority of white planters." Historians at the College of Charleston record that enslaved children in the Lowcountry died at especially high rates. Their account gives no count of those children's deaths in the early 1700s. The number of enslaved people there did not grow through births until the 1760s.

Eliza Lucas Pinckney

Who: A young woman who ran her father's three South Carolina plantations from the age of 16 and directed the colony's first successful indigo dye crop.

When and where: South Carolina, 1744 to the 1750s.

Eliza Lucas directed the first successful crop of indigo dye in South Carolina, in 1744. Enslaved workers on her father's plantations did the growing and the work of making the dye. Indigo is a plant used to make blue dye. She later married and became Eliza Lucas Pinckney.

From the age of 16, she ran her father's three plantations. Her 1744 crop made 17 pounds of dye, and she shared the seed with neighboring planters. South Carolina's indigo exports grew from about 5,000 pounds in 1745 and 1746 to about 130,000 pounds by 1748. By the middle of the 1750s, planters there shipped more than a million pounds a year. Indigo became the colony's second biggest export after rice. By the Revolution, it made up more than a third of the value of the colony's exports.

Other people did the work of making the dye. Her father sent skilled dye-makers from the Caribbean, and enslaved workers did the processing, the work of turning the plant into dye. She relied on their knowledge and their labor.

Convicts sold at the dock, 1718 to 1775

From 1718 to 1775, British judges sent about 50,000 people convicted of crimes to the North American colonies, where merchants sold them as laborers. In 1718 members of Parliament passed the Transportation Act. Transportation here meant sending convicts away across the ocean as a punishment. A felony is a serious crime. Under the act, a judge could send a person convicted of one of the less serious felonies to the colonies for seven years instead of hanging them. For worse crimes, a judge could send a person for fourteen years instead of hanging them. The convicts were about one in four of all the people who moved from Britain to colonial America in those years.

Most convicts went to Maryland and Virginia. There, merchants sold them at the dock as bound laborers, people who had to work for whoever bought them until their term ended. In the records of four Maryland counties, about 82 of every 100 convicts were men and 18 were women. On two ships of 1721 and 1724, most convicts were between 20 and 29 years old, and about half were laborers with no trade.

British government officials paid a London merchant named Jonathan Forward £3 for each convict he carried, and later £5. The pound, written £, was British money. A Maryland firm, Stevenson, Randolph and Cheston, sold convicts in Maryland from 1767 to 1775. The firm's own sales books record that most men sold for £11 to £14 and most women for £9 to £10. The planters who bought them got years of work without paying wages.

Convicts died on the crossing. On 38 voyages from London between 1718 and 1736, the ships carried 3,599 convicts, and 385 of them died. That is about 11 of every 100. The historian A. Roger Ekirch points out that the records of some of these voyages list no deaths at all. If those blanks are gaps in the clerks' records, the true count was about 15 of every 100. On 12 voyages from Bristol in the 1770s, 23 of 990 convicts died.

Rhode Island's slave ships

Merchants in Rhode Island sent out at least 1,000 slaving voyages in the century before 1807. That year members of Congress made a law that banned bringing captive Africans into the United States, starting on January 1, 1808. The Rhode Island ships carried more than 100,000 Africans into slavery. About 60 of every 100 slaving voyages that left North America sailed from Rhode Island, and in some years more than 90 of every 100 did. These numbers come from a 2006 report by Brown University called *Slavery and Justice*.

The merchants who sent out these ships made their money by buying and selling human beings. Their crews sailed a loop around the Atlantic Ocean. Colonists turned molasses from the Caribbean into rum. Molasses is a thick, dark syrup left over when sugar is made. Captains carried the rum and other goods to West Africa and traded them for captive people. Crews then carried the captives across the ocean, on the crossing called the Middle Passage, to be sold in the Caribbean and on the mainland. The ships brought sugar and molasses back north.

Parliament's molasses and iron laws

In 1733 members of Parliament passed the Molasses Act. Under it, colonists had to pay a duty, a tax on goods brought in, on molasses from colonies that did not belong to Britain. The duty was sixpence, six British pennies, for each gallon. Many colonists dodged the duty by

smuggling, which means bringing goods in secretly.

Under the Iron Act of 1750, raw iron from the colonies could enter Britain with no duty. The act forbade colonists to build new steel furnaces, rolling and slitting mills or plating forges. Those were the works that turned raw iron into finished goods. Colonists built them anyway.

1750 to 1800

Americans paid for the Revolution with paper money and debt. In 1790, the new national government and the states still owed about 79 million dollars for the war. Alexander Hamilton wrote the plan to pay those debts in full. Members of Congress taxed whiskey to help pay them, and in 1794 farmers in western Pennsylvania rose up against that tax. Both before and after the war, Rhode Island merchants sent ships to Africa to buy captive people.

The Browns and the slave ship Sally

In 1764 four merchant brothers of Providence, Rhode Island, sent their ship *Sally* to West Africa to buy people. They were Nicholas, John, Joseph and Moses Brown. By that year the colony had about 30 rum distilleries, places where rum is made, and 22 of them were in Newport. The distillers made the rum from molasses shipped from the Caribbean. The *Sally* carried 17,274 gallons of rum, along with chains, shackles and guns. Shackles are metal rings locked around a person's wrists or ankles.

The captain, Esek Hopkins, bought 196 Africans. Hopkins kept the ship on the African coast for more than nine months while he bought them. Nineteen died before the ship left Africa. They included several children and a woman who hanged herself below deck. On the day the ship sailed, another woman was "left for dead," in the report's words. The report does not say who left her or what became of her. Four more, a woman and three children, died in the first week at sea. Sixty-eight people died during the whole crossing, and 20 more died soon after the ship reached the West Indies. One more captive died on the way to the Brown brothers in Providence. The report's stage counts of 19, 68 and 20 add up to 107, but the report gives the total at that point as 108. With the death on the way to Providence, the historians who wrote Brown University's report count at least 109 deaths among the 196. The captives died from disease and starvation, by killing themselves, and in an uprising.

When the captives rose up, Hopkins's crew fired on them. Hopkins wrote in his account book: "Slaves Rose on us was obliged fire on them and Destroyed 8 and Several more wounded badly." By "Destroyed 8" he meant that his crew killed eight people. The survivors were so sick

that buyers paid only £5 for some of them.

John Brown kept trading in people. In 1795 the crew of his ship *Hope* took 229 Africans from the Gold Coast of Africa, and 198 of them lived to be sold in Cuba. A law of 1794 already banned Americans from owning, equipping, putting money into or working on ships that carried captive people to other countries. Members of the Providence Abolition Society, a group working to end slavery, took Brown to a United States court for breaking that law. On August 5, 1797, he became the first American tried under it. A jury found him not guilty, and the court ordered the men who had charged him to pay his court costs. He did not get the *Hope* back.

Paying for the war with paper money

Members of the Continental Congress had almost no power to tax. From 1775 they paid for the war by printing paper money called Continental dollars. The paper dollars quickly lost their value. By the end of 1777, it took about 4 paper dollars to buy what 1 silver dollar bought. By 1781 it took about 100, and the paper money was close to worthless. The saying "not worth a Continental," meaning worth nothing at all, comes from this money.

> ### Alexander Hamilton
>
> **Who:** The author of the plan to pay the Revolution's debts in full.
>
> **When and where:** The new United States government, 1790 and 1791.
>
> **Movie:** Alexander Hamilton (American Experience, 2007), a two-hour documentary shown on PBS, with Brían F. O'Byrne as Hamilton.
>
> Alexander Hamilton planned how the new United States would pay the debts of the Revolution. In January 1790 he set out the plan in his First Report on Public Credit. He counted the national debt at about 54 million dollars. The states owed about 25 million dollars more for the war.
>
> Hamilton proposed that the national government pay every debt in full. He also proposed that it take over the states' war debts, a step called assumption. The people who were owed money would then look to the new government to be paid. They would want it to last, so that they got their money. Paying in full would also build the government's credit. Credit means that lenders trust a borrower to pay back what it borrows.
>
> In June 1790, assumption did not have enough votes to pass in the House of Representatives. Thomas Jefferson invited Hamilton and James Madison to dinner, and the three men made a deal. After it, members of Congress voted assumption through, and

> they placed the country's permanent capital on the Potomac River.
>
> Hamilton's Report on Manufactures is dated December 5, 1791. In it he laid out a plan to grow American manufacturing, the making of goods in workshops and mills, with tariffs and subsidies. A tariff is a tax on goods brought in from other countries. A subsidy is money paid to help a business grow. Members of Congress never brought the plan to a vote. Hamilton also helped found the Society for Establishing Useful Manufactures. Through it, he and the other founders started an industrial town at the falls of the Passaic River, which is Paterson, New Jersey.

The whiskey tax

In 1791 members of Congress passed a national excise on distilled spirits, such as whiskey, to help pay the war debt. An excise is a tax on goods made and sold inside the country. The tax was 7 cents a gallon. Farmers in western Pennsylvania sent their corn to market as whiskey, so the tax fell on the crop they sold.

The farmers fought the tax. In September 1791 a gang in disguise caught a tax collector named Robert Johnson and tarred and feathered him. That means they coated him with hot tar and stuck feathers to it. In July 1794, about 600 armed men attacked the house of John Neville, the tax inspector, at a place called Bower Hill. When their leader, James McFarlane, stepped into the open, someone inside the house shot and killed him. The accounts do not say who fired. The attackers then set the house on fire. This uprising is called the Whiskey Rebellion.

President George Washington called up about 13,000 militia, soldiers drawn from the states. The rebels broke up without a battle. On November 13, 1794, troops under General Henry Lee broke into houses at night, pulled people from their beds and arrested about 150 of them. They held the prisoners in animal pens and basements. For years afterward, people in the area called it "the Dreadful Night." The troops took 20 of the prisoners to Philadelphia for trial. Two men, Philip Wigle and John Mitchell, were found guilty of treason, the crime of making war against their own country. Washington pardoned them both, which means he set aside their punishment.

1800 to 1850

Cotton grown by enslaved people was the country's biggest export in these years. An export is a good sold to other countries. By 1860, enslavers valued the people they held at 3 billion dollars or more. In 1800 most American families grew and made most of what they used. By 1850 far more of them grew crops and made goods to sell, and bought what they needed. The name for this change is the market revolution. In the panics of 1819 and 1837, many people rushed to get their money out at once, and businesses closed. In 1819 about 50,000 people in three big cities had no steady work. By one estimate, a third of all workers had no jobs by the fall of 1837.

From household to market

Farm families and workshops could sell goods far from home once moving them got cheaper. Before the Erie Canal opened in 1825, it cost about 100 dollars to haul a ton of goods by road from Buffalo to New York City. By canal boat the same ton cost about 10 dollars. The trip took about ten days instead of twenty.

The owners of the new cotton mills in New England hired young women from farm families and paid them wages in cash. These women were among the first large groups of Americans who worked for cash wages.

In 1843 a rush for copper began on the Keweenaw Peninsula of Michigan, a point of land with water on three sides. It began after Douglass Houghton, the state geologist, reported on the copper there. A geologist is a scientist who studies rocks. By 1849 miners there dug 96 of every 100 pounds of copper mined in the United States.

Gold was found at Sutter's Mill in California early in 1848. About 80,000 people went to dig for it in 1849, and about 300,000 people came to California between 1848 and 1855. The merchants who sold the miners their supplies made steadier money than most of the miners did.

King Cotton

Cotton was the most valuable American export, and enslaved people did the work of growing it. They planted it, picked it and got it ready for sale. In 1840 cotton made up 51.6 percent of the value of everything the United States sold to other countries. It stayed above half almost every year until the Civil War. About three of every four pounds grown here were sent abroad. From 1820 to 1860, about 80 of every 100 pounds of cotton used in the world came from the United States. The crop was known as King Cotton.

The cotton crop more than doubled in six years. Enslaved people grew about 300 million pounds of cotton in 1831 and more than 600 million pounds in 1837. To grow it, enslavers forced people out of the older slave states and into the new cotton states. They moved about 155,000 enslaved people this way in the 1820s and at least 250,000 in the 1830s. Between about 1790 and 1860, enslavers moved more than 1 million people from the Upper South to the Deep South. The Upper South means the older slave states farther north, such as Virginia. The Deep South means the cotton states farther south.

People counted as property worth billions

Enslavers counted the people they held as capital. Capital is money or property that an owner uses to make more money. In 1860 census takers, the government workers who count every person in the country, counted 3,953,760 enslaved people in the United States. Enslavers valued them at 3 billion dollars or more. That is the price enslavers put on human beings as property. It was more than all the money invested in American railroads and factories put together.

Enslavers used enslaved people as capital in two ways. The people grew the cotton and were paid nothing for it. Enslavers could also borrow money by promising the people themselves to a lender. If the loan was not repaid, the lender could take the people and sell them.

Banks and bond sellers

In the 1830s, planters in Louisiana and Mississippi set up their own banks. The banks lent planters money on mortgages. A mortgage is a loan in which the borrower promises property to the lender. These mortgages covered land and enslaved people. The banks then sold bonds, which are paper promises to repay a loan with interest, to investors in Europe and in the Northern states. The mortgages on land and people backed those bonds.

The historian Edward E. Baptist of Cornell University names the banks and the firms that sold their bonds. Baring Brothers of London sold 2.5 million dollars in bonds for the Consolidated Association of the Planters of Louisiana. Baring Brothers and its New York partners, Prime, Ward and King, sold 7 million dollars in bonds for the Union Bank of Louisiana in 1832. Hope and Company of Amsterdam sold 12 million dollars in bonds for the Citizens' Bank of Louisiana in 1833. The Mississippi Union Bank sold 15.5 million dollars in state bonds. By 1836 the banks of New Orleans held 64 million dollars in capital, more than the banks of any other American city.

In January 2005 the bank JPMorgan Chase reported on two of the older banks it grew out of. The two were Louisiana banks, the Citizens Bank and the Canal Bank. The report states that they had taken about 13,000 enslaved people as collateral on loans to planters. Collateral is property a borrower promises to hand over if the loan is not repaid. When planters failed to pay, the two banks came to own about 1,250 of those people. JPMorgan Chase's leaders apologized and set up a 5-million-dollar scholarship fund for students in Louisiana. They made the report because a 2003 law in Chicago required companies that did business with the city to search their records for ties to slavery.

Insurers, cotton traders and Northern mills

Northern insurance companies sold enslavers policies on the lives of enslaved people. A policy is a written deal. The enslaver paid the company a fee, and when an enslaved person died, the company paid the enslaver. From 1846 to 1848, New York Life, then called Nautilus Insurance, insured the lives of 520 people who appear to have been enslaved. It paid 15 claims, which means it paid out money for 15 deaths. In March 2000, leaders of the insurer Aetna apologized for policies the company sold on enslaved people's lives in the 1850s. They said Aetna would pay no reparations, which are payments made to make up for a wrong.

The brothers Henry, Emanuel and Mayer Lehman sold goods in Montgomery, Alabama. They took raw cotton grown on slave-labor plantations as payment for goods, and then they began trading in cotton. The 1860 census lists Mayer Lehman as the owner of seven enslaved people. Their firm, Lehman Brothers, lasted until it failed in 2008.

Northern mill owners also made money from slave-grown cotton. Francis Cabot Lowell, Nathan Appleton, Patrick Tracy Jackson and the other Boston merchants who built the Lowell mills were called the Boston Associates. In 1813 they founded the Boston Manufacturing Company. Their mills spun cotton grown by enslaved people in the South. The mills also made a cheap, rough cloth known then as "negro cloth." Negro was the word white Americans of that time used for Black people. The mill owners sold the cloth to planters, who used it to clothe the people they enslaved. By 1845, 31 textile companies tied to the Boston Associates, in Massachusetts, New Hampshire and southern Maine, made one-fifth of all the cotton and wool cloth in the United States. Senator Charles Sumner of Massachusetts called the tie between planters and mill owners an "unholy union ... between the lords of the lash and the lords of the loom." The lash is a whip. A loom is a machine that weaves thread into cloth.

The Panic of 1819

The Panic of 1819 was the first major depression that the American public lived through. A panic happens when many people try to get their money out, or to sell what they own, at the same time. A depression is a long stretch of hard times, when businesses close and many people lose their work. This one lasted from about 1819 to 1822.

Several things caused it. The prices that buyers paid for cotton fell sharply. Officers of the Second Bank of the United States called in loans, which means they asked borrowers to pay back money right away. Under an 1817 order from Congress, buyers of land from the national government had to pay in gold or silver coin. American factories closed because buyers chose cheaper goods from Britain.

During the panic, employers let workers go, and judges jailed people who could not pay their debts. In New York, Philadelphia and Baltimore, about 50,000 people had no work or only odd jobs. One observer from abroad estimated that half a million people across the country had no work. Nobody made a real count. In those years, a person who was owed money could sue, and a judge could order the borrower arrested and locked in a debtors' prison, with no set date for release. In Philadelphia, judges sent 1,808 people to debtors' prison this way. In Boston, judges sent 3,500. Farmland in Pennsylvania fell from 150 dollars an acre in 1815 to 35 dollars in 1819. Property in Richmond, Virginia, lost half its value. In New York City, the number of paupers, people too poor to feed themselves without help, rose from 8,000 in 1819 to 13,000 in 1820. The city had about 120,000 people. Mathew Carey, a publisher and economist in Philadelphia, estimated that 3 million people, about one-third of the nation, were hurt by the panic.

Small cotton planters went bankrupt in 1819, and again in 1837. Going bankrupt means being unable to pay one's debts, so that the lenders can take what the borrower owns. Larger planters bought up the small planters' land and the enslaved people those planters had held.

The Panic of 1837

A depression began with the Panic of 1837 and lasted until about 1843. In the years before it, buyers speculated in western land and in cotton. To speculate is to buy something in the hope of selling it later at a higher price. Then British lenders made loans harder to get, and the price of cotton fell. In New Orleans cotton prices fell by half. On May 10, 1837, the bankers of New York City stopped paying out gold and silver. People who brought in the banks' paper money could no longer trade it for coins.

Counts of the banks that failed differ. A history collection edited by Hubert Howe Bancroft in 1902 says that of 850 banks in the country, 343 closed and 62 more partly failed. That is about 4 of every 10 banks. A college textbook, *U.S. History I*, says that 200 banks closed. It adds that the governments of seven states and one territory did not pay back their loans.

Nobody counted how many workers lost their jobs in 1837. All the figures are later estimates, and the teaching guides that repeat them do not say where the numbers came from. One widely repeated estimate says that a third of all workers had no jobs by the fall of 1837. The same estimate says that within two years, employers cut the pay of people who kept their jobs by 30 to 50 percent. Unemployment is the share of people who want work and cannot find it. Other estimates put New York's unemployment at about 25 or 30 percent in 1837 and 1838.

Food had already grown costly before the banks stopped paying. Between 1836 and 1837, a barrel of flour in New York rose from 7 dollars to 12. On February 13, 1837, about 5,000 New Yorkers met in City Hall Park to protest the price of food and fuel. Part of the crowd broke into the store of the flour merchants Eli Hart and Company. They took or destroyed 500 to 600 barrels of flour and 1,000 bushels of wheat. A bushel is a measure of grain. A bushel of wheat weighs about 60 pounds.

Mississippi planters owed 33 million dollars to the banks of New Orleans. Their 1837 cotton crop sold for only 10 million dollars. Lawmakers in Mississippi and Florida later refused to pay the bonds their states had backed. The planters kept their land and the people they enslaved. The investors in Europe and the North who had bought the bonds lost their money.

When debtors could not pay, their creditors seized the people the debtors enslaved and sold them. A creditor is a person who is owed money. Judges ordered the property of debtors taken. Many debtors fled to Texas at night and took the people they enslaved with them. When a debtor failed to pay, a single creditor's claim could force the sale of a whole enslaved community. Its people were sold to different buyers and scattered. Sales like these split families. The Equal Justice Initiative, a group that studies the history of slavery, counts that the trade in enslaved people inside the country separated nearly half of the people it moved from a husband, a wife or a parent.

> ### Philip Hone
>
> **Who:** A New York merchant whose diary recorded the Panic of 1837 as it happened.
>
> **When and where:** New York City. He kept the diary from 1828 to 1851.

> Philip Hone wrote down how business in New York City stopped during the Panic of 1837. He lived from 1780 to 1851. He sold goods at auction, and he served as the city's mayor in 1826 and 1827.
>
> Hone kept a diary from 1828 until 1851. During the panic, he wrote: "No goods are selling, no business stirring, no boxes encumber the sidewalks of Pearl Street." Encumber means to crowd or block. Hone lost part of his own fortune in the crisis years. His diary was printed in 1889, after his death, as *The Diary of Philip Hone*.

1850 to 1900

Between 1850 and 1900 the United States became an industrial country. In an industrial country, much of the work is done in mines, mills and factories. Railroad track grew from about 9,000 miles in 1850 to 193,346 miles by 1900. In 1900 American mills made 11.4 million tons of steel, more than Britain and Germany together. After slavery ended, Southern landowners farmed with sharecroppers, families who worked a landowner's land for a share of the crop and stayed in debt to him. Officials in Southern states leased prisoners, which means they rented them out, to private companies. In Alabama, 90 or more of every 100 prisoners were Black. After the Panic of 1873, by estimates of the time, about one in four workers in New York City lost their jobs. After the Panic of 1893, estimates for the whole country run from about 17 to 25 percent of workers. The era is called the Gilded Age.

The Gilded Age

The name Gilded Age comes from a novel of 1873 by Mark Twain and Charles Dudley Warner, *The Gilded Age: A Tale of Today*. In it, the two writers made fun of their own time. Gilded means covered with a thin layer of gold. The name means a thin shine of gold over serious problems underneath.

Steel, rails, cattle and metal

Steel rails got cheap in these years. According to histories of the steel industry, a ton of steel rails cost about 140 dollars in 1872, about 35 dollars in 1882 and about 20 dollars by 1900. American mills made more steel than Britain's by about 1889 or 1890.

Cattle ranchers in Texas drove herds north to the railroads in Kansas. A Texas longhorn worth up to about 5 dollars at home could sell for up to about 40 dollars at a Kansas railroad town. From 1866 to 1884, cowboys drove more than 5 million cattle north. The open range was land with no fences, where cattle grazed wherever they wandered. Four things ended the open-range cattle business. Barbed wire fences went up across the range, and more railroads were built. Officials put a quarantine on cattle in 1885 and 1886. A quarantine keeps animals apart from others to stop the spread of a disease. Then came the winter of 1886 to 1887.

In 1862 members of Congress passed the Homestead Act. Under it, a settler could claim up to 160 acres of land and own it after living on it and farming it for five years. Settlers filed about 4 million claims. About 270 million acres, about a tenth of the country's land, became private farms. US officials had taken that land from Native nations.

The Comstock Lode, found near Virginia City, Nevada, in 1859, was the richest body of silver in North America. A lode is a long vein of metal running through rock.

Copper from Michigan, and later from Butte, Montana, became the wire for electric lights and telephones.

On February 23, 1886, Charles Martin Hall, a 22-year-old college graduate, made aluminum by a new method in his family's woodshed in Oberlin, Ohio. His sister Julia helped him. The Pittsburgh Reduction Company began making the metal by his method in 1888, and a new industry began. A pound of aluminum cost about 12 dollars in the early 1880s and less than 1 dollar by the middle of the 1890s.

The panics of 1857 and 1873

On August 24, 1857, the Ohio Life Insurance and Trust Company failed. Its manager in New York had stolen from it, and its officers had made bad loans. News of the failure went out by telegraph. People in many places rushed to take their money out of banks. This rush is called a bank run. A depression followed. It was short but deep.

The Panic of 1873 began on September 18, when the investment bank Jay Cooke and Company failed. An investment bank sells bonds and shares to raise money for businesses such as railroads. Jay Cooke and his partners had put too much money into bonds of the Northern Pacific Railroad. The New York Stock Exchange, where people buy and sell shares of companies, closed for ten days. It had never closed like this before. About 18,000 businesses failed. Economists study how people make, buy and sell things. Economists at the National

Bureau of Economic Research set the dates when hard times begin and end. By their count, this depression lasted 65 months, until March 1879. It was the longest stretch of hard times on their record until the 1930s.

By the winter of 1873 to 1874, about one of every four workers in New York City had lost their jobs, according to estimates drawn from newspapers of the time. The historian Howard Zinn wrote that more than 90,000 homeless workers, almost half of them women, slept in New York police stations.

On January 13, 1874, about 7,000 people with no work met in Tompkins Square Park in New York City. They wanted Mayor William F. Havemeyer to create public jobs. Soon after 10 in the morning, New York police, some of them on horseback, charged into the crowd. Abram Duryée was the police commissioner, the official in charge of the city's police. The police beat people with clubs, and men, women and children ran. The accounts give no count of the people who were hurt. Men from a German workers' club fought back, and someone hit one policeman on the head with a hammer. The police drove the crowd out of the square and arrested 46 people.

Farmers and the railroads

Farmers were angry about what railroads and grain elevators charged them. A grain elevator is a tall building where grain is stored before it is shipped. In 1867 Oliver Hudson Kelley founded the Patrons of Husbandry, known as the Grange. Husbandry is an old word for farming. By the middle of the 1870s it had about 800,000 members.

Grange members pushed state lawmakers to pass the Granger laws, which set the highest rates that railroads and grain elevators could charge. In *Munn v. Illinois* in 1877, the justices of the Supreme Court ruled that those laws were allowed under the Constitution.

The Panic of 1893 and Coxey's Army

In the Panic of 1893, about 500 banks and 15,000 businesses failed. More than 150 railroad companies later went bankrupt. Nobody counted the people out of work at the time. Later estimates for the worst of it run from about 17 to 25 percent of workers. The economic historian Stanley Lebergott estimated that unemployment rose from about 3 percent in 1893 to 18.4 percent in 1894.

In 1894 a businessman named Jacob Coxey led a march of men without work from Massillon, Ohio, to Washington, D.C. About 100 men left on March 25. About 500 arrived on May 1, and a crowd of about 30,000 watched them. The marchers, called Coxey's Army, asked the national government for a 500-million-dollar program of public works. Under it, the government would

have hired people without jobs to build public projects. When Coxey tried to speak at the Capitol, police arrested him for walking on its grass. He served 20 days in jail. His was the first large protest march on Washington.

Sharecropping and debt

After the Civil War, most freedpeople in the South had no land. Freedpeople were the people freed from slavery. Many families went to work as sharecroppers. Sharecropping was a way of farming someone else's land in return for a share of the crop.

A landowner gave a family a plot of land, usually about twenty acres. He also "furnished" the family with food, seed, tools and a cabin on credit, which means the family would pay later. This was called the furnish. Interest is a fee a borrower pays for borrowing. On the furnish, landowners charged interest far above a fair rate. At harvest the landowner sold the crop and took out the cost of the furnish and the interest. Then he gave the family its share, usually half of what was left or less.

Landlords held a lien on the crop. A lien is a legal claim on property until a debt is paid. Landlords also kept the account books. So most sharecroppers were still in debt when the landlord settled the yearly accounts, year after year. A landlord could put a sharecropping family off the land whenever he chose.

Sharecropping lasted into the 1930s. In 1930 census takers counted 1,831,470 tenant farmers in the South. Tenant farmers farmed land they did not own, and they were about half of all farmers in the South. About 700,000 of them were share tenants, who owned mules or tools and kept two-thirds to three-quarters of the crop. By 1935, 77 of every 100 Black farmers in the country owned no land. Nearly half of white farmers owned none. In 1937 members of the President's Committee on Farm Tenancy counted about 775,000 sharecroppers in the South, almost equal numbers of white and Black.

Debt peonage and Alonzo Bailey

Peonage means forcing a person to work to pay off a debt. Members of Congress banned it in the Peonage Abolition Act of 1867. Lawmakers in Southern states then wrote laws that had the same effect. Peonage was most common in the turpentine camps of southern Mississippi, Alabama, Georgia and the Florida panhandle, and in the cotton belt, the part of the South where cotton was grown. In turpentine camps, workers collected sap from pine trees to make turpentine, a liquid used in paint.

Alonzo Bailey was a Black farm laborer in Montgomery County, Alabama. On December 26, 1907, he signed a work contract with H. C. Borden, the manager of the Riverside Company, a company that ran a farm. Bailey received 15 dollars before he started work, to be paid back out of wages of 12 dollars a month. He quit after about a month. Under Alabama law, a worker who quit without paying back money he got this way was a criminal. In an Alabama court, Bailey was found guilty. He was fined 30 dollars and sentenced to 136 days of hard labor, heavy work done as a punishment.

A Montgomery lawyer, Edward S. Watts, and a city judge, William H. Thomas, helped Bailey take his case to the United States Supreme Court. Booker T. Washington helped in secret. On January 3, 1911, in *Bailey v. Alabama*, the justices ruled that the Alabama law broke the Thirteenth Amendment, the part of the Constitution that bans slavery. Other states' peonage laws stayed in force until the justices struck down Georgia's and Florida's in the 1940s.

Convict leasing in Alabama

The Thirteenth Amendment bans slavery "except as a punishment for crime." Under that exception, state and county officials in the South rented out prisoners to private companies. This was called convict leasing. The companies paid the government a fee for each prisoner. The companies' bosses made the prisoners work in mines, on farms and in lumberyards.

Officials in Alabama leased prisoners from 1846 to July 1, 1928. After a money crisis in the state government in 1875, the warden John G. Bass leased state prisoners to coal mines, farms and lumberyards for monthly fees. A warden is the official in charge of a prison. From 1883, under the warden John Hollis Bankhead, most state prisoners went to three coal companies. These were the Pratt Coal and Iron Company, the Tennessee Coal, Iron and Railroad Company, called TCI, and the Sloss Iron and Steel Company. In 1888 TCI signed a ten-year contract for every state prisoner able to work. It paid the state 9 to 18.50 dollars a month for each prisoner.

More than 95 of every 100 county prisoners in Alabama were Black, and so were 90 of every 100 state prisoners. The companies' bosses whipped prisoners to make them work. Coal company officials wrote false reports of "bad conduct" so that the prisoners would have to serve longer sentences.

Alabama's state officials collected money from leasing prisoners. Fees for leased prisoners were about 10 of every 100 dollars the state took in during 1883. In 1898 they were nearly 73 of every 100 dollars.

Leased prisoners died in the mines. In 1896, 1,710 state prisoners worked in the mines, and 233 state prisoners had died in the two years before. That year 745 county prisoners worked in the mines, and 181 had died in the two years before. In 1895 Dr. Thomas D. Parke, the health officer of Jefferson County, reported that 90 of every 1,000 prisoners at Sloss's Coalburg mine died each year. According to Digital History, a history website of the University of Houston, 25 of every 100 Black leased prisoners in Alabama died in 1873. The same source says that death rates for leased prisoners were about ten times the rates for prisoners in states that did not lease them.

In 1924 a prisoner named James Knox, from Mobile, was killed at Sloss's Flat Top mine. Men there whipped him with a steel wire and lowered him into a vat of boiling water. The published accounts of his death do not name the men who did it. His death was first reported as a suicide by poison. An autopsy, an examination of a dead body by doctors, found that his heart had stopped and that the poison had been put into his body after he died. Investigators found that the whipping and the boiling water caused the injuries that killed him. His death led to an investigation. The Sloss company kept county prisoners working in its mines until 1928. In 1928 Alabama's officials ended convict leasing. Alabama was the last state to end it, about five years after Florida.

TCI also used leased prisoners in Tennessee, where officials leased prisoners from 1871 to 1896. A TCI official told the *New York Times* that "one of the chief reasons" the company took up convict leasing "was the chance it offered for overcoming strikes." In a strike, workers stop working until their employer agrees to better pay or conditions. The official said free miners would not want to strike once they saw the company had plenty of prisoners to put to work. The account of the interview does not give his name. A union is a group of workers who join together to bargain with their employer, and TCI's managers used prisoners to keep unions out of the mines.

Andrew Carnegie

Who: A Scottish immigrant who started work as a mill boy, built a steel company, sold it for 480 million dollars and gave away more than 350 million dollars.

When and where: Scotland and Pennsylvania, 1835 to 1919. He built steel mills from the 1870s and sold his company in 1901.

Movie: The Richest Man in the World: Andrew Carnegie (American Experience, 1997), a documentary about him shown on PBS.

Andrew Carnegie went from a job paying 1.20 dollars a week to selling his steel company for 480 million dollars. He was born in Dunfermline, Scotland, in 1835. In 1848 his family moved to Allegheny, Pennsylvania. At about 13 he went to work in a cotton mill as a bobbin boy, changing the spools that held the thread.

Carnegie worked as a telegraph messenger and then as a manager for the Pennsylvania Railroad. From the 1870s he built steel mills, among them the Edgar Thomson works. In 1889 he wrote an essay called "The Gospel of Wealth." In 1901 he sold Carnegie Steel to a group led by J. P. Morgan for 480 million dollars. He gave away more than 350 million dollars, including money for about 2,500 public libraries. Counts of the libraries vary, and some go above 2,800 around the world.

In 1892 workers went on strike at Carnegie Steel's works in Homestead, Pennsylvania, which means they stopped working. Henry Clay Frick, one of the men running Carnegie's company, hired 300 armed agents from the Pinkerton detective agency, a private company that hired out guards and detectives, to take back the plant. On July 6, 1892, the Pinkertons came up the river on barges, and they and the strikers fought a gun battle. Seven workers and three Pinkertons were killed, and some accounts count more. No record names the men who fired the shots that killed them. Governor Robert E. Pattison of Pennsylvania sent about 8,000 state soldiers. By November the strike had failed, and Frick and the company's other managers had broken the steelworkers' union at Homestead. A union is a group of workers who join together to bargain with their employer.

John D. Rockefeller

Who: The founder of Standard Oil, which by 1880 controlled about 90 percent of oil refining in the United States.

When and where: Cleveland, Ohio, from 1870. He lived from 1839 to 1937.

Movie: The Rockefellers (American Experience, 2000), a documentary shown on PBS about four generations of his family, not about him alone.

John D. Rockefeller built the company that controlled most of America's oil refining. Refining is the work of turning crude oil from the ground into fuels people can use. He founded the Standard Oil Company in Cleveland in 1870. By 1880 his company controlled about 90 percent of the oil refining in the United States.

Kerosene was the fuel that ordinary families burned in their lamps. In 1870 a gallon of kerosene cost about 26 cents. It cost about 9 cents by 1880 and about 7 cents by 1890. Lamp light became cheap for ordinary homes.

Rockefeller became the richest man in the country. Later he gave large sums of money to universities and to medical research.

1900 to 1950

In these fifty years Americans lived through a stock boom, the Great Depression and the Second World War. A stock is a share in the ownership of a company. After stock prices crashed in October 1929, about one of every four workers had no job by 1933. In Chicago and Pittsburgh, more than half of Black workers had no job in 1932, by later estimates. In 1935 members of Congress and President Franklin D. Roosevelt set up old-age pensions and unemployment insurance in the Social Security Act. A pension is a regular payment to a person too old to work, and unemployment insurance pays workers who have lost their jobs. The law left out farmworkers and domestic workers, people who cleaned, cooked and cared for children in other people's homes. Most Black workers did those two jobs. Two accounts disagree about who made that choice. In 1944, with factories making goods for the war, unemployment fell to 1.2 percent.

Henry Ford

Who: The carmaker who roughly doubled his workers' pay in 1914 and cut the price of his Model T car from 825 dollars to 260 dollars.

When and where: Ford's Highland Park car factory. He announced the five-dollar day on January 5, 1914.

Movie: Henry Ford (American Experience, 2013), a documentary about him shown on PBS.

Henry Ford roughly doubled his workers' pay in 1914. He did it to stop workers from quitting, and workers who earned more could also buy the cars they built. An assembly line moves each car past a row of workers, and each worker does one step over and over. After Ford's managers put in the assembly line, the work never let up and was dull. In 1913 turnover at the Highland Park factory reached 370 percent. Turnover counts the workers who quit and had to be replaced. At 370 percent, managers had to hire almost four new workers in a year for every job.

> On January 5, 1914, Ford announced five dollars for an eight-hour day. Before, a Ford worker earned about 2.34 dollars for a nine-hour day. The new rate began on January 12.
>
> The raise came with conditions. Ford paid the extra money as profit-sharing, a share of the company's profits, and a worker qualified only after six months. Staff of the company's Sociological Department inspected workers' homes before granting the full rate. They checked whether workers saved their money and whether they drank alcohol. They also checked for what they called "proper" living. Ford left out men under 22, and at first most women.
>
> After the raise, fewer workers quit. The price of the Model T kept falling, from 825 dollars in 1908 to 260 dollars by 1925.
>
> Ford fought unions for decades. A union is a group of workers who join together to bargain with their employer. Ford owned a newspaper, the *Dearborn Independent*, and he published antisemitic articles in it through the 1920s. Antisemitic means hateful toward Jewish people. Ford later apologized in public for the articles.

The crash and the Great Depression

The Dow Jones average fell by 89 percent between September 1929 and July 1932. The Dow is a number built from the stock prices of a group of large companies. It rose from 63 in August 1921 to 381 on September 3, 1929. Prices fell hard on Black Thursday, October 24, 1929, and again on Black Tuesday, October 29. By July 8, 1932, the Dow stood at 41.

The hard times of the 1930s are called the Great Depression. By 1933 about 25 percent of workers, one in four, had no job. Government officials and scholars made that estimate later, because nobody counted the jobless every month at the time.

GDP is the total value of all the goods and services made in the country in a year. It fell from about 104 billion dollars in 1929 to about 56 billion dollars in 1933. Prices fell too. From October 1929 to April 1933, the prices of the things people bought every day dropped by about 27 percent. Counted as the amount of goods and services, with the fall in prices taken out, output fell by about 30 percent. About 9,000 of the country's 25,000 banks failed and closed by 1933.

Hungry people stood in breadlines, which are lines for free food. Some people lived in shantytowns, groups of shacks, which people called Hoovervilles.

The Bonus Army

In the summer of 1932, veterans of the First World War camped in Washington, D.C., to ask for a bonus they were owed for their war service. The bonus was not due until 1945, and the veterans asked to be paid early in cash. Estimates of their number run from about 10,000 to more than 20,000. Many had their families with them. On June 17, members of the Senate voted the payment down.

On July 28, police tried to clear veterans out of some buildings in the city. Police shot and killed two veterans, William Hushka and Eric Carlson. Hushka had come from Lithuania. He sold his butcher shop to join the army in the First World War and became a citizen while he served. He was buried at Arlington National Cemetery less than a week after he was shot.

President Hoover then ordered the Army to clear the camps. General Douglas MacArthur sent in infantry, who are soldiers on foot, and cavalry, who are soldiers on horseback, with tanks and tear gas. Tear gas stings the eyes, nose and throat, so people cough and their eyes stream with tears. MacArthur's soldiers burned the main camp.

Members of Congress later voted to pay the bonus over the veto of President Franklin D. Roosevelt. A veto is a president's refusal to sign a bill. The payments began in June 1936.

Benjamin Roth

Who: A lawyer in Youngstown, Ohio, who kept a diary of the Great Depression for more than ten years.

When and where: Youngstown, Ohio. He began the diary in June 1931.

Benjamin Roth, a lawyer in Youngstown, Ohio, kept a record of the Depression from June 1931 for more than ten years. He lived from 1894 to 1978.

In his diary Roth wrote about the banks that closed and the stocks that became worthless. He wrote down prices, and what lawyers and workers earned. In 2009 his son, Daniel B. Roth, and James Ledbetter edited the diary, and the publisher PublicAffairs printed it as a book, *The Great Depression: A Diary*.

Last hired, first fired

Black workers lost their jobs first and at higher rates than white workers. Employers hired Black workers last and fired them first, a pattern called "last hired, first fired." By 1932 nearly half of all Black Americans had no work, according to the National Museum of African

American History and Culture.

History.com, drawing on the Library of Congress, reports that in 1932 more than half of Black workers in Chicago and Pittsburgh had no job. About a quarter of white workers in Northern cities had none. In Atlanta in 1934, nearly 70 percent of Black workers had no job. These numbers are all later estimates, because nobody kept an official count by race.

From 1929, government officials and private employers forced people whose families came from Mexico to leave for Mexico. In 2005 California's lawmakers found that about 400,000 American citizens and legal residents had been forced to go from California alone. They estimated that about two million people were forced out across the country, and that about 1.2 million of them had been born in the United States. Local officials sold some families' property to pay for sending them away.

The New Deal

Before 1933, the federal government, the national government in Washington, paid no unemployment insurance and no old-age pensions. Members of Congress set up both in the Social Security Act of 1935. President Roosevelt and his officials started many programs from 1933 on, including the CCC, the WPA and Social Security. Together they are called the New Deal.

President Roosevelt set up the Civilian Conservation Corps, or CCC, on March 31, 1933. It was a federal jobs program for young men. About 3 million young men worked in it over the years it ran. They earned 30 dollars a month and sent about 25 dollars of it home.

The Works Progress Administration, or WPA, ran from 1935 to 1943. About 8.5 million people worked for it. WPA workers built about 650,000 miles of roads, 125,000 public buildings and 75,000 bridges.

On August 14, 1935, President Roosevelt signed the Social Security Act. The first monthly old-age check went to Ida May Fuller of Ludlow, Vermont, on January 31, 1940. It was for 22.54 dollars. She had paid a total of 24.75 dollars in Social Security taxes.

Frances Perkins

Who: The Secretary of Labor who chaired the committee that planned Social Security, and the first woman in a United States Cabinet.

When and where: Secretary of Labor from 1933 to 1945. She lived from 1880 to 1965.

Movie: Summoned: Frances Perkins and the General Welfare (2020), a documentary about her.

> As chair of the Committee on Economic Security, Frances Perkins led the planning of Social Security. She was Secretary of Labor from 1933 to 1945. She was the first woman in a United States Cabinet, the group of the president's top officials.
>
> President Roosevelt set up the committee on June 29, 1934. Its members planned old-age pensions and unemployment insurance. They sent their report to President Roosevelt on January 15, 1935. He signed the Social Security Act on August 14, 1935.
>
> According to the historian Larry DeWitt, Perkins wanted farmworkers and domestic workers covered by the new law, and so did Harry Hopkins, the official in charge of aid to the jobless. Those workers were not in the law as it passed.

Who Social Security left out

Under the Social Security Act of 1935, farmworkers and domestic workers could not get old-age pensions or unemployment insurance. Domestic workers cleaned, cooked and cared for children in other people's homes. In 1930, 65 of every 100 Black workers did one of these two kinds of work. So about two-thirds of Black workers could get neither payment, and in the South the share was higher. Derrick Johnson, president of the NAACP, a civil rights group, gave these figures in 2020.

At the hearings on the bill in 1935, Charles Hamilton Houston spoke for the NAACP. He said the bill would leave out "Negro sharecroppers and Negro cash tenants, who are just about at the bottom of the economic scale." Negro was a common word for Black people at that time. A sharecropper farmed a landowner's land and paid with part of the crop. A cash tenant rented land and paid in money. Houston called the law "a sieve with the holes just big enough for the majority of Negroes to fall through." A sieve is a strainer full of holes.

Two accounts disagree about who made the choice to leave these workers out. Jon Dubin, in a 2024 article in a Stanford law journal, points to Southern members of Congress. Senator Harry Byrd of Virginia opposed a rule that payments be high enough for "decency and health." He said that rule "might serve as an entering wedge for federal interference with the handling of the Negro question." An entering wedge is a first step that opens the way to more. Byrd did not want federal officials to have a say in how matters touching Black people were handled.

Edwin Witte, executive director of the Committee on Economic Security, reported that Byrd's position was "supported by nearly all of the southern members of both committees," the two committees in Congress that worked on the bill. Representative Howard Smith of Virginia argued for keeping Black sharecroppers and domestic workers dependent on their employers.

Larry DeWitt, a historian at the Social Security Administration, gave a different account in 2010. He found that Treasury Secretary Henry Morgenthau asked for the changes to the bill that left these workers out. DeWitt said Morgenthau's reasons had to do with collecting the tax. DeWitt wrote that the charges of "racial bias in the founding of the Social Security program" did "not hold up under detailed scrutiny." Racial bias means unfair treatment because of race. Scrutiny means close study.

Members of Congress changed the law in 1950 to cover farm and domestic workers who worked regularly for one employer. In 1954 they covered the rest. Representative Smith opposed these changes too. Of eight House members who voted against them, six were Southern Democrats. Senators John Stennis of Mississippi and Harry Byrd also opposed them.

Farm payments and evicted sharecroppers

Federal farm payments in the 1930s went to landowners, and many sharecroppers lost their places on the land. The landowners are also called landlords, or planters. In May 1933 members of Congress passed the Agricultural Adjustment Act. Under it, officials of the Agricultural Adjustment Administration, or AAA, ran a farm program under Agriculture Secretary Henry Wallace. They paid farmers to grow less. That year farmers plowed under about 10 million acres of growing cotton, which means they turned the plants back into the soil. AAA officials bought about 6 million pigs and had them killed.

Under the AAA's cotton contracts of 1934 and 1935, officials paid landowners to take land out of cotton. Agriculture Secretary Henry Wallace "rented" about three-eighths of the country's cotton land in this way. Sharecroppers got only about 11 percent of the payments. A landlord could keep the whole check by evicting the sharecroppers and hiring day laborers, who were paid by the day. Evicting means putting people off the land or out of their homes. When planters cut their cotton land by 40 or 50 percent, they cut the number of their tenants, the families who farmed their land, by the same share.

More than two-thirds of Black sharecroppers made no profit or went into debt, according to the National Museum of African American History and Culture.

In July 1934, seven Black men and eleven white men met at the Sunnyside School in Poinsett County, Arkansas, and founded the Southern Tenant Farmers' Union to protest the evictions. Planters and the men who worked for them attacked the union. In January 1935 lawmen at Marked Tree arrested and jailed a white organizer, Ward Rodgers. At a union rally at Gilmore, four armed white men broke in. They ordered the Black members to leave and told them they would be lynched, killed by a mob, if they were caught at another union meeting. Many union

members were beaten and threatened with guns. The accounts do not name the men who beat them. On March 15, 1935, at Birdsong, about forty armed planters, their riding bosses and local lawmen broke up a union crowd. Riding bosses were men on horseback who watched over the field workers for the planters. Later that month a mob attacked the home of the union's lawyer, Cornelius Tyree Carpenter.

A group of AAA lawyers, led by Jerome Frank, ruled that landlords had to keep the same tenants. In February 1935, AAA administrator Chester Davis had Wallace fire those lawyers. This firing is called the AAA purge.

In 1936 the justices of the Supreme Court ruled the AAA unconstitutional, which means against the Constitution. Members of Congress wrote a new version in 1938. Federal officials have paid farmers ever since.

War work ends mass unemployment

During the Second World War, factory workers made war goods. Unemployment fell from 14.6 percent in 1939 and 1940 to 1.2 percent in 1944. The figure for 1939 and 1940 was estimated later. The official yearly records begin in 1944, and 1.2 percent is the lowest rate in them.

Workers in American factories built 299,230 military aircraft from January 1940 to August 1945. Real GDP counts output with the changes in prices taken out. It rose about 72 percent from 1940 to 1945. By 1945 the United States made about half of all the manufactured goods in the world.

1950 to 2000

The income of the typical American family roughly doubled between 1947 and 1973, even after counting the rise in prices. Families who were poor, in the middle and rich all gained. In the 1970s prices and unemployment rose at the same time. Factory jobs peaked at 19.6 million in June 1979. By the 2000s, more than 80 of every 100 jobs outside farming were in services, in places such as stores, offices, hospitals and schools. In the Mahoning Valley around Youngstown, Ohio, about 50,000 people lost jobs in steel and related work within about five years of 1977. In the 1980s about 300,000 farms could not repay their loans. From March 1991 to March 2001, the country went 120 months in a row without a downturn.

The postwar boom

For about twenty-five years after the Second World War, pay rose for families at every level of income. Between 1947 and 1973, the median family income roughly doubled, counted with the rise in prices taken out. The median is the middle one. Half of all families earned more than the median family, and half earned less. A general rise in prices is called inflation. Inflation means each dollar buys less than before.

The economists Claudia Goldin and Robert Margo studied the gap between high wages and low wages. They found that the gap narrowed sharply in the 1940s and stayed narrow into the 1970s. They named this the Great Compression. To compress means to squeeze together.

Under the G.I. Bill, veterans of the Second World War could use federal money for school or job training, and federal officials backed their home loans. By July 1956, when the first version ended, 7.8 million of the 16 million veterans had used its money for education or job training. From 1944 to 1952, officials of the VA, the federal agency for veterans, backed about 2.4 million home loans. Backing a loan means promising to repay the lender if the borrower cannot.

In the Employment Act of 1946, members of Congress made "maximum employment, production, and purchasing power" a stated duty of the federal government. Purchasing power means how much people can buy with their money. Under the same act they created the Council of Economic Advisers, a group of economists who advise the president. The ideas behind the act came from the British economist John Maynard Keynes. Keynes argued that government spending could fight slumps, the times when business falls off. Members of Congress took a promise of full employment out of the bill before they passed it.

On April 26, 1956, Malcom McLean's ship *Ideal X* carried 58 large shipping boxes, called containers, from Port Newark to Houston. By the economist Marc Levinson's calculation, loading loose cargo onto a ship by hand cost about 5.86 dollars a ton in 1956. Loading it in containers cost about 16 cents a ton.

Stagflation in the 1970s

In the 1970s prices and unemployment rose together. Most economists had thought this could not happen. The mix of inflation and a stagnant economy, one that is not growing, was called stagflation.

In October 1973, leaders of Arab oil-selling countries stopped the sale of their oil to the United States. Such a ban on trade is called an embargo. The price of oil roughly quadrupled in six months. Consumer prices, the prices of the things people buy for daily life, rose about 11 percent in 1974. Unemployment reached 9.0 percent in May 1975.

Inflation passed 13 percent in 1979 and 1980. In 1980 prices rose 13.5 percent. In November and December 1982, unemployment reached 10.8 percent. That was the highest rate since the Great Depression.

Factory jobs fall

After 1950, a shrinking share of American workers had jobs in manufacturing, the making of goods in factories. In 1955, 30.6 of every 100 jobs outside farming were in manufacturing. By 2005 about 11 of every 100 were, and by the 2020s about 8. The number of factory jobs peaked at 19.6 million in June 1979. By the 2000s, more than 80 of every 100 jobs outside farming were in service industries.

On September 19, 1977, the managers of Youngstown Sheet and Tube announced that they would close the company's Campbell Works steel mill in Youngstown, Ohio. About 5,000 workers lost their jobs at once. The day became known as Black Monday. Within about five years, about 50,000 people in the Mahoning Valley around Youngstown lost jobs in steel and related work. These numbers come from later news reports.

Gerald Dickey

Who: A Youngstown steelworker who proposed that the workers and the town buy their closed mill and reopen it.

When and where: Youngstown, Ohio, 1977 to 1979.

After the Campbell Works closed, Gerald Dickey proposed that the steelworkers and the people of Youngstown buy the mill and reopen it. From 1976 to 1979 he was the recording secretary of Local 1462 of the United Steelworkers union. A union is a group of workers who join together to bargain with their employer. A local is a union's branch in one place. A recording secretary keeps the written record of its meetings.

Church leaders led the Ecumenical Coalition of the Mahoning Valley, and its members took up Dickey's plan. Ecumenical means bringing together people of different churches.

The plan needed about 100 million dollars in federal loan guarantees. A loan guarantee is a promise that the government will repay a loan if the borrowers cannot. Officials in President Carter's government first signaled that they supported the guarantees. In 1979 officials of the Economic Development Administration, a federal agency, turned the guarantees down, and the mill stayed closed. Accounts differ a little on when officials first signaled support. All of them agree on the refusal and the closing.

> Dickey and the coalition spread the idea of workers owning their own workplaces through the labor movement.

The farm crisis of the 1980s

In the 1980s about 300,000 farms defaulted, which means their owners could not repay their loans. About 300 farm banks failed.

In the 1970s farmers sold more crops abroad, planted more of their land and borrowed at low rates of interest. Interest is the extra money a borrower pays a lender for a loan. Then officials of the Federal Reserve raised interest rates under their chairman, Paul Volcker. The Federal Reserve is the country's central bank, the government's bank that sets interest rates for other banks. On January 4, 1980, President Jimmy Carter stopped many sales of American farm goods to the Soviet Union after Soviet troops invaded Afghanistan. The Soviet Union was a large country, ruled from Moscow in Russia, and the main rival of the United States. Carter's order canceled contracts for about 17 million metric tons of wheat, corn and soybeans. A metric ton is about 2,205 pounds. Under this grain embargo, farmers lost some sales abroad, and exports fell. Farmers had borrowed against the value of their land. In parts of the Midwest, farmland lost up to 60 percent of its value from 1981 to 1986. Farm debt reached about 215 billion dollars by 1984, double the debt of 1978.

On September 22, 1985, Willie Nelson, John Mellencamp and Neil Young played the first Farm Aid concert, at Memorial Stadium in Champaign, Illinois. About 80,000 people came. The concert raised more than 7 million dollars for farm families.

The 1980s and 1990s

Income tax rates on the highest incomes fell in the 1980s. Under the Economic Recovery Tax Act of 1981, President Reagan's tax cut, the top income-tax rate fell from 70 percent to 50 percent. Under the Tax Reform Act of 1986, it fell to 28 percent. The top rate is the tax on each dollar of income above a high level.

Inflation fell from 13.5 percent in 1980 to between 3 and 4 percent by the middle of the 1980s. The national debt roughly tripled during the 1980s. The national debt is the total that the federal government owes on money it has borrowed.

From March 1991 to March 2001, the country went 120 months in a row without a downturn. A stretch of growth like this is called an expansion. It was the longest expansion on record until then, according to the National Bureau of Economic Research. That group of economists dates

the country's booms and downturns. Unemployment fell to 3.9 percent in the fall of 2000. In the government's budget years of 1998 through 2001, federal tax money coming in was more than federal spending. A year like that is called a budget surplus.

The NASDAQ is an index, a single number built from the stock prices of many companies, including many technology companies. It rose about 600 percent from 1995 to March 2000.

2000 to Today

Since 2000 the country has gone through three recessions. A recession is a stretch of months when output falls and people lose their jobs. The longest of the three ran from December 2007 to June 2009, after home prices crashed. In the crash, lenders took homes from Black and Latino families at higher rates than from white families. This is called foreclosure: a lender takes a home because the borrower cannot keep up the loan payments. In August 2026 the unemployment rate was 4.1 percent, and about 86 of every 100 jobs outside farming were in services. From April to June 2026, the richest tenth of households held 68.9 percent of all household wealth, and the poorer half held 2.3 percent.

The dot-com crash

Technology stock prices crashed from 2000 to 2002. The NASDAQ index peaked at 5,048 on March 10, 2000. By October 2002 it had fallen about 78 percent. The boom and the crash are called the dot-com bubble, after companies that did business on the internet. A bubble is a time when prices climb far above what things are worth and then fall.

A recession followed, from March to November 2001. It lasted eight months.

The crash of 2008

The Great Recession, from December 2007 to June 2009, began with a crash in home prices. Home prices rose for years before the crash. Lenders made home loans, called mortgages, that many borrowers could not repay. Bankers bundled many of these mortgages together into investments and sold the investments as safe. When home prices fell, the investments failed, and some of the biggest financial firms began to fail too.

The financial firm Lehman Brothers failed on September 15, 2008. It owed about 619 billion dollars. It was the largest bankruptcy in the country's history. Bankruptcy is a court process for a person or a company that cannot pay its debts.

In October 2008 members of Congress passed a rescue plan for financial firms, the Troubled Asset Relief Program, or TARP, worth up to 700 billion dollars. Treasury officials paid out about 443 billion dollars under it, and the firms that got the money paid most of it back.

Employers cut about 8.7 million jobs in the Great Recession. Unemployment peaked at 10.0 percent in October 2009. Lenders foreclosed on about 3.8 million homes from 2007 to 2010. Estimates for the whole crisis run from 7.7 million to 10 million homes.

Who lost homes and wealth

Black and Latino homeowners lost their homes at higher rates than white homeowners, and they lost more of their wealth. Latino and Hispanic both name Americans whose families came from Spanish-speaking countries. African American is another name for Black Americans.

The Center for Responsible Lending, a research group that campaigns on lending, studied people who took out home loans from 2005 to 2008. By 2010, lenders had foreclosed on about 8 percent of the African American borrowers and 8 percent of the Latino borrowers. For non-Hispanic white borrowers the figure was 4.5 percent. Counting all homeowners, 17 percent of Latino homeowners and 11 percent of African American homeowners had lost a home or were close to losing one. For white homeowners the figure was 7 percent. White families still made up about 56 percent of all completed foreclosures, because there were more white borrowers.

Lawyers at the Justice Department said that from 2004 to 2008, Countrywide Financial, a mortgage lender, charged at least 200,000 qualified Black and Latino borrowers higher fees and rates or steered them into subprime loans. A subprime loan has a higher interest rate and is meant for borrowers that lenders think are more likely to fall behind. Bank of America had bought Countrywide. In December 2011 its officers agreed to pay 335 million dollars to settle the case. It was the largest settlement up to that time in a case about lenders treating borrowers unfairly because of their race. A settlement is an agreement to pay money to end a legal case.

On July 12, 2012, officers of the bank Wells Fargo agreed to pay at least 175 million dollars. Of that, 125 million dollars went to borrowers, and 50 million dollars went to help with down payments. A down payment is the part of a home's price that the buyer pays at the start. The Justice Department's lawyers said Wells Fargo charged Black and Latino borrowers higher rates and fees, and steered some into subprime loans when they qualified for regular ones. The lawyers reviewed 2.7 million loans made from 2004 to 2009. They said at least 34,000 borrowers in 36 states and Washington, D.C., were treated this way.

Assistant Attorney General Tom Perez said that a Black borrower in the Chicago area with one kind of Wells Fargo loan paid on average 2,937 dollars more than a similar white borrower. Wells Fargo's officers denied that the bank discriminated, which means treating people unfairly because of their race. They said they settled to avoid a fight in court.

Wealth, or net worth, is what a household owns minus what it owes. The Pew Research Center, a research group, reported in 2011 on wealth from 2005 to 2009, using surveys by the Census Bureau. With inflation taken out, the median wealth of Hispanic households fell 66 percent. For Black households it fell 53 percent, and for white households 16 percent.

In 2009 the typical Black household had 5,677 dollars in wealth, and the typical Hispanic household had 6,325 dollars. The typical white household had 113,149 dollars. The typical white household's wealth was 20 times that of the typical Black household and 18 times that of the typical Hispanic household. These were the largest gaps since the government began collecting the numbers in 1984. About 35 percent of Black households and 31 percent of Hispanic households owned nothing or owed more than they owned. For white households the figure was 15 percent.

Ed Neufeldt

Who: A worker who built cabinets for recreational vehicles in Elkhart, Indiana, lost his job in 2008 and introduced President Obama in 2009.

When and where: Elkhart, Indiana, from 2008 into the middle of the 2010s.

In the fall of 2008, after 32 years of building cabinets at Monaco Coach, an RV plant in Elkhart, Indiana, Ed Neufeldt lost his job. An RV, or recreational vehicle, is a home on wheels. Elkhart was known as the "RV capital of the world." As the RV plants shut, unemployment in Elkhart's county went from about 5 percent to nearly 20 percent in about a year.

On February 9, 2009, Neufeldt introduced President Obama at a town hall meeting in Elkhart. Obama was on his first trip to promote the stimulus bill, a plan to spend federal money to bring back jobs.

Reporters from ProPublica, NPR and NBC News followed Neufeldt for years. He worked three low-wage jobs. Later he got a factory job again. NPR reporters visited him again in 2015 and 2016.

The long recovery and the shift to services

The recovery after 2009 was slow at first, with years of high unemployment. It then became the longest expansion in the country's records, which go back to 1854. It lasted 128 months, from June 2009 to February 2020. The National Bureau of Economic Research announced these dates on June 8, 2020.

By August 2021, 16 percent of American adults had earned money at some time through an online gig platform, according to the Pew Research Center. A gig platform is an app or a website that connects workers with short, one-time jobs.

In August 2026 there were 159.1 million jobs outside farming. About 12.6 million of them, about 8 percent, were in manufacturing. About 137.5 million, about 86 percent, were in services, counting government jobs. The Bureau of Labor Statistics, the government office that counts jobs and prices, gave these numbers. They are early figures that the bureau can still change.

2020 and the price rises after

The shortest recession on record lasted two months, from February to April 2020, as the COVID-19 pandemic began. A pandemic is a disease that spreads around the world. Unemployment reached 14.8 percent in April 2020.

On March 27, 2020, members of Congress passed the CARES Act, a relief law of about 2 trillion dollars. It was the largest relief law up to that time. From April to June 2020, GDP fell at a yearly rate of 31.4 percent. A yearly rate shows how far output would fall in a full year at that speed. From July to September, output rose at the fastest rate on record.

Consumer prices rose 9.1 percent in the 12 months to June 2022, according to the Bureau of Labor Statistics. That was the largest rise since November 1981. Economists disagree about the causes. Some blame breakdowns during the pandemic in supply chains, the chains of factories, ships and trucks that bring goods to stores. Others point to federal relief spending, or to higher energy prices after Russian forces invaded Ukraine. By the middle of 2023, prices were rising near 3 percent a year.

The economy in 2026

In August 2026 the unemployment rate was 4.1 percent, the same as in July. That was about 7.0 million people. Unemployment was 3.7 percent for white workers, 6.0 percent for Black workers, 4.8 percent for Hispanic workers and 3.2 percent for Asian workers. Employers added

162,000 jobs that month. The Bureau of Labor Statistics released these figures on September 4, 2026.

Consumer prices rose 3.4 percent in the 12 months to August 2026. Leaving out food and energy, they rose 2.4 percent. Energy prices rose 16.3 percent, and food prices rose 2.7 percent. The Bureau of Labor Statistics released these figures on September 11, 2026.

Real GDP grew 2.1 percent in 2025, according to the Bureau of Economic Analysis, the government office that measures the country's output. From April to June 2026, real GDP grew at a yearly rate of 1.5 percent, by the bureau's estimate of August 26, 2026. As of September 2026, the National Bureau of Economic Research had announced no recession since the two months in 2020.

Economists at the Federal Reserve, the country's central bank, publish figures on who holds the country's wealth. From April to June 2026, American households held about 185.7 trillion dollars in net worth. The richest 10 percent of households held 68.9 percent of it. Within that group, the richest one household in every thousand held 15.0 percent. The next 40 percent of households held 28.8 percent. The poorer half of all households together held 2.3 percent. Households that Federal Reserve economists count as white held 82.4 percent of household wealth. Black households held 3.2 percent, and Hispanic households held 2.4 percent.

Chapter 17: Money

Before 1500

Before 1500, nobody in this land used money. People here had no coins, paper bills, banks or prices. They got what they needed by barter, which means trading one thing straight for another. They also gave gifts and owed each other duties, both between neighbors and between nations.

Some goods went a long way. People carried shells from the Gulf coast, copper from Lake Superior and obsidian from the West hundreds of miles along rivers and trails. Obsidian is a black glass that forms in volcanoes and can be chipped into sharp blades.

Wampum

Wampum was not money before Europeans came. People used it to keep records, to make agreements between nations, in ceremonies and as gifts.

Wampum is beads made from shell. The white beads came from the shells of whelks, which are large sea snails. The purple-black beads came from the shells of quahogs, a hard-shelled clam of the Atlantic coast. People strung the beads on cords or wove them into belts.

The Haudenosaunee are a league of Native nations in what is now New York State. Among them, the beads of a belt recorded spoken agreements and histories. People presented the belts at meetings of leaders, called councils, and read them there.

Wampum first passed as money in the 1600s, after colonists arrived. Colonists and Native traders used it that way in their dealings with each other.

The 1500s

In the 1500s, far to the south in lands ruled by the king of Spain, Spanish officials forced Native men to dig silver. A mint is a workshop where coins are made. Workers at Spanish mints struck the silver into a coin called the piece of eight. Almost none of those coins reached the land that became the United States during the 1500s. This land still had no mint of its own.

The piece of eight

The piece of eight was a silver coin worth 8 reales. A real was a Spanish unit of money. In English the coin was also called the Spanish dollar. Workers at Spanish mints in the Americas made it from silver dug at Potosí, in what is now Bolivia, and at Zacatecas, in Mexico. Silver was found at Potosí in 1545.

Native men of the Andes, the high mountains of South America, did the digging at Potosí. In 1573 Francisco de Toledo began forcing thousands of them to work in the mines, in turns. Toledo was the viceroy, the man who governed Peru for the king of Spain. His system was called the mita. Toledo took the name and the idea of turns of work from an older system used by the Inca.

Toledo's rules covered Native men aged 18 to 50 in the highland provinces between Potosí and Cuzco. Each year about one man in seven from those villages had to go to the mines. That came to more than 11,000 men a year.

The men worked in shifts, one week in the mines and then two weeks of rest. Many brought their families and carried most of their own food. They were paid a little, and most of that pay went to the tax they owed the colonial government. The work was dangerous and unhealthy. By sending the men away from their home villages, Toledo also broke up life there. Across the Andes, disease killed far more Native people than work in the mines did. No reliable count shows how many of the forced workers died from the work at Potosí.

Writers on the history of money, among them Alejandra Irigoin and Bridget Millmore, call the piece of eight the first money used around the whole world. Traders carried it from South America to Europe, and across the Pacific Ocean to Asia.

Almost none of that coin reached this land. Some did reach St. Augustine, in Florida, a town where Spanish soldiers were posted. Pedro Menéndez de Avilés founded it in September 1565 at Seloy, a Timucua village, in the homeland of the Timucua-speaking peoples. The Spanish soldiers there were paid from Spanish colonial funds, with the coin of a foreign empire.

Later, Thomas Jefferson and members of Congress based the United States dollar on the piece of eight. Spanish coins stayed legal tender in the United States until February 21, 1857. Legal tender is money that the law says must be accepted to pay a debt. Americans still call a quarter "two bits." The piece of eight was divided into eight parts called bits, so two bits made a quarter of a dollar.

The 1600s

The English colonies were short of coins from the start. Little English coin reached them. Colonists spent the coins they did get on goods shipped in from overseas, and those coins went back across the ocean. To trade with each other, colonists paid in tobacco, corn, beaver skins and wampum. Massachusetts leaders opened a mint of their own without England's permission. In 1690 they printed paper money, the first printed by any government in Europe or the lands Europeans had settled.

Money made of goods

Colonists called payment in goods "country pay." Colonial lawmakers set how much each kind of goods was worth when it was used to pay a debt. Money of this kind is called commodity money, because the money is a useful thing in itself.

English money counted in pence, shillings and pounds. Twelve pence made a shilling, and twenty shillings made a pound.

In Virginia, lawmakers set a value on tobacco so it could be used as money from the 1620s, and in 1642 they made it legal tender. People in Virginia, Maryland and North Carolina used tobacco as money through much of the colonial period. In the northern colonies, beaver pelts and corn also passed as money.

New England colonists used wampum for small payments. The nations that made wampum had not used it as money before colonists came. Members of the Massachusetts General Court, the colony's lawmakers, voted on November 15, 1637, to accept wampum. The rate was 6 beads a penny, for sums under 12 pence. Thirteen years later, on October 18, 1650, they set the rate at 8 white beads or 4 black beads a penny. They also made wampum legal tender for debts up to 40 shillings, but not for taxes. They canceled the law on May 22, 1661.

The pine-tree shilling, 1652

In 1652 members of the Massachusetts General Court voted to set up a mint in Boston. They did not ask anyone in England first. By English law, only the king could make coins. In 1652 England had no king. Supporters of the king had fought a civil war against supporters of Parliament, England's lawmakers. Afterward the judges of a court set up by Parliament found King Charles I guilty of making war on Parliament and on the people of England. Their sentence called him a "traitor" and a "murderer." Fifty-nine of the judges, Oliver Cromwell

among them, signed the order for his death. On that order the king was beheaded in London on January 30, 1649. Workers at the Boston mint struck silver coins worth threepence, sixpence and a shilling.

The mint's coins included the pine-tree shilling, named for the tree stamped on it. Workers at the mint struck pine-tree shillings from about 1667 to 1682. But nearly all of the colony's silver coins carry the date 1652.

Coin experts who write in the magazine CoinWeek and in older books on early American coins explain the date as a cover. Charles II became king of England in 1660. A coin dated 1652 could pass as a leftover from the years without a king. A coin with a later date would show that the men of Massachusetts were still making coins without the king's permission.

The mint closed in 1682. A charter is a legal paper that gives a colony or a company the right to exist and states what it may do. In 1684 officials acting for King Charles II canceled the Massachusetts charter. The illegal mint was one of their complaints against the colony.

John Hull

Who: A Boston silversmith who ran the colony's mint against English law and struck the pine-tree shilling.

When and where: Boston, Massachusetts. Mintmaster from 1652 until the mint closed in 1682. Lived 1624 to 1683.

John Hull ran the Massachusetts mint from 1652 until it closed in 1682, without permission from England. He was born on December 18, 1624, in Market Harborough, England, the son of a blacksmith. He came to Boston with his parents in 1635, when he was 11. He trained as a silversmith, a craftsman who makes things out of silver.

In 1652 members of the Massachusetts General Court named him mintmaster, the man in charge of the mint. He was 27. His appointment was dated May 27, 1652. Robert Sanderson worked with him as his partner. Hull's contract paid him a share of every batch of coins he struck.

Hull's share of the coins made him one of the richest men in New England. He later became the colony's treasurer, the official in charge of its money.

> A story says Hull gave his daughter Hannah her weight in pine-tree shillings as her dowry. A dowry is money or goods that a bride's family gives when she marries. The story is a legend. The writer Nathaniel Hawthorne retold it in his book *Grandfather's Chair* and added details of his own.

1690: the first government paper money

In 1690, soldiers from Massachusetts attacked the French city of Quebec, in Canada, during King William's War. The attack failed. When the soldiers came home, the colony's treasury held too few coins to pay them. According to accounts from the time, the troops were close to mutiny, which means rising up against their officers.

Massachusetts lawmakers decided to pay the soldiers in paper. They began voting on it in December 1690. The first bills totaled 40,000 pounds. The paper bills were called bills of credit. Each bill stated that the colony's treasurer would accept it "in all Public payments." It also stated that the bill could later be exchanged for coins.

These bills were the first paper money printed by any government in the Western world. The Western world means Europe and the lands that Europeans settled. China had used paper money centuries earlier.

People took the bills and passed them from hand to hand. By 1714 Massachusetts lawmakers had put out 240,000 pounds in paper money. By 1718 lawmakers in the other New England colonies were printing their own.

1700 to 1750

In the early 1700s lawmakers in more colonies began printing paper money, and in time lawmakers in every colony printed their own. Some of that paper kept its value and some lost it, depending on how much the lawmakers printed. Benjamin Franklin argued for paper money in Pennsylvania and then printed it. In South Carolina, which had no banks, enslavers borrowed money by pledging land and the people they enslaved. If a loan was not paid back, the lender could take the land or the enslaved people who had been pledged.

Paper that held its value and paper that lost it

Economists at the Federal Reserve Bank of Cleveland compared the paper money of the colonies. Economists are people who study how money and trade work. The Cleveland bank is one of twelve Federal Reserve banks, which serve as banks for the nation's banks. In Pennsylvania, New York and New Jersey, lawmakers printed limited amounts, and the bills held their value. In New England and the Carolinas, lawmakers printed large amounts. Prices counted in paper money rose there, and each bill was worth less silver than before.

In Virginia, people began to pass paper receipts for tobacco as money. Virginia lawmakers set up public warehouses for tobacco, with government inspectors, in the 1720s and 1730s. A planter, a farmer who grew tobacco to sell, brought his tobacco to a warehouse. An inspector checked it, and it stayed in the warehouse. The inspector then wrote a receipt, called a tobacco note, for the inspected tobacco. People passed tobacco notes from hand to hand as money.

Benjamin Franklin

Who: A Pennsylvania printer who argued for paper money, then printed it with leaf patterns that were almost impossible for counterfeiters, people who make fake money, to copy.

When and where: Pennsylvania, from 1729.

Movie: *Benjamin Franklin* (2022), a documentary by Ken Burns, shown on PBS. It is about his whole life, not only his work on money.

Benjamin Franklin printed paper money for three colonies and made it hard to fake. In 1729, when he was 23, he published a pamphlet, a short printed booklet. Its title was *A Modest Enquiry into the Nature and Necessity of a Paper-Currency*, which means a modest look at what paper money is and why it is needed. In it he argued that Pennsylvania needed more paper money. Partly because of the pamphlet, Franklin won the contract to print Pennsylvania's bills in his shop. His firm printed money for Pennsylvania, New Jersey and Delaware.

A counterfeiter is a person who makes fake money. To stop counterfeiters, Franklin printed the shapes of real leaves on the bills. Every leaf has its own pattern of veins. A counterfeiter could almost never carve that pattern into a printing plate by hand. The method is called nature printing. Franklin almost certainly worked it out from leaf prints he made with his friend Joseph Breintnall. The printing plates were probably cast in metal from plaster molds of real leaves.

> In 2023 scientists at the University of Notre Dame studied 600 notes printed by Franklin's firm. They found the leaf prints. They also found tiny shiny flakes of a mineral called mica in the paper, and colored fibers mixed into it. Printers kept putting leaf prints like Franklin's on colonial money into the Revolution.
>
> Colonial bills carried the words "To Counterfeit is Death." Under colonial laws, a court could sentence a counterfeiter to death.

Paper money lent against land and people

In colonial South Carolina, enslavers used the people they enslaved as security to borrow money. Security is something a borrower promises to hand over if the loan is not paid back. The colony had no banks, and its paper money lost most of its value between 1703 and the late 1720s.

South Carolina's colonial lawmakers began printing paper money in 1703. At first, 1.5 South Carolina pounds were worth one English pound. By the late 1720s it took about 7 South Carolina pounds to equal one English pound.

With no banks, people borrowed through private agreements called mortgages and bonds. A bond was a written promise to pay back a loan. A mortgage is a loan in which the borrower pledges property as security. If the borrower does not pay, the lender can take that property. A mortgage could be on land. It could also be on movable property, called chattel. In these loan papers, enslavers and lenders listed enslaved people as chattel. So when an enslaver did not pay, the lender could take the people he had pledged.

Nic Butler of the Charleston County Public Library described in 2024 how these loans worked. He wrote: "A slave owner could mortgage their human chattel to a slave broker to secure credit used to purchase more slaves, then use their collective labor to satisfy the debt." A slave broker was a dealer in enslaved people. The enslaver pledged the people he enslaved to get a loan. He used the loan to buy more people. Then he paid off the debt with what the people's forced work earned.

Hundreds of colonial land mortgages survive in the Charleston County Register of Deeds, the county office that keeps records of land. Thousands of early chattel mortgages survive in the South Carolina Department of Archives and History.

1750 to 1800

Members of the British Parliament banned new paper money as legal tender in New England in 1751 and in all thirteen colonies in 1764. Colonists added the ban to their complaints against Britain. During the Revolution, members of the Continental Congress paid for the war with paper money, and by 1781 that paper was close to worthless. After the war, Thomas Jefferson, Alexander Hamilton and members of Congress planned a new money system. Members of Congress chose a dollar divided into tenths and hundredths in 1785. They set up a national bank in 1791 and created a mint in 1792.

The Currency Acts

Parliament is the lawmaking body of Britain. In the Currency Act of 1751, its members barred Massachusetts Bay, Rhode Island, Connecticut and New Hampshire from printing new paper bills as legal tender. They passed the act because New England's paper money had lost so much of its value.

Thirteen years later, on April 19, 1764, members of Parliament passed a second Currency Act. It extended the ban to all thirteen colonies. Colonists were already short of coins. Without new legal-tender paper, they had even less money to pay debts and buy goods. Colonists listed the Currency Acts among their complaints against Britain.

Not worth a Continental

The Continental Congress was the group of men the colonies sent to lead the Revolution. Its members had no power to tax. From June 1775 its members paid for the war by printing paper money, called Continental currency. In all, they put out $241,552,780 in Continental bills.

People working for the British side printed fake Continental bills on purpose, so that the real bills would lose their value faster. Most of this faking was done in New York City, which the British army held for most of the war. On April 14, 1777, an advertisement in the *New York Gazette* asked people going into the other colonies to take fake bills with them. In January 1780 General Henry Clinton, the British commander, wrote about the plan in a letter. It went to Lord George Germain, the official in London in charge of the American colonies. Stuart Hatfield, who wrote about the British faking of Continental bills in the *Journal of the American Revolution* in 2015, calls that letter the clearest sign that British leaders approved the plan.

In Philadelphia, one silver dollar was worth about 4 paper dollars at the end of 1777. At the end of 1778 it was worth about 8. By 1781 a silver dollar was worth about 100 paper dollars, and people stopped using the paper. In North Carolina the rate reached 210 paper dollars to one silver dollar.

Continental bills with about $226 million printed on them ended up worthless. Counted in silver, the loss was about $40 million. Whoever was holding the bills as they lost value lost that money, and most of them were ordinary people. Americans began to call anything worthless "not worth a Continental." By the late 1800s people in Britain were using the saying too.

Counterfeiting was a hanging crime

Officials in New York hanged Owen Sullivan, whose name was also spelled Syllavan, in 1756 for faking that colony's paper money. Colonial bills carried the warning "To Counterfeit is Death," and New York officials carried it out.

Sullivan was born in Ireland in about 1720. He was an engraver, a man who cuts designs into metal plates for printing. He had also worked as an armorer, someone who makes and repairs weapons, for colonial soldiers. He ran gangs of counterfeiters who passed fake colonial bills from New England to New York.

Before that, officials in Rhode Island had punished Sullivan for faking that colony's bills. On October 9, 1752, the *Boston Evening Post* printed a report from Providence, Rhode Island. The report states that he had "lately had both his Ears crop'd, and been branded on both his Cheeks with the Letter C." Cropping meant cutting off part or all of each ear. Branding meant burning the letter C, for counterfeiter, into the skin of each cheek with a hot iron. The C marked him as a counterfeiter to anyone who saw his face. The report does not name the officials who carried out the punishment.

Sullivan went on counterfeiting. At a session of the Supreme Court for the City and County of New York, he was found guilty of faking and passing New York's bills of credit from 1737. He was hanged on Monday, May 10, 1756. A pamphlet about his life, which says it was "taken from his own mouth," was printed the same year.

Building the dollar

In 1784 Thomas Jefferson wrote notes on what the new nation's money should be. He proposed the Spanish dollar as the basic unit. He wanted it divided into tenths and hundredths. The English system of pounds, shillings and pence did not divide by tens.

On July 6, 1785, members of Congress voted "that the money unit of the United States of America shall be one dollar." They also voted that the coins should "increase in decimal ratio," which means counting up by tens. With that vote, the United States became the first nation whose coins were fully based on tens.

Members of Congress set up the United States Mint in Philadelphia with the Coinage Act of April 2, 1792. The Mint's building was the first building the national government put up under the Constitution. The act defined the dollar as the unit of money. Under the act, the decimal system of dollars, dimes, cents and mills became law. A dime is one tenth of a dollar, and a mill is one tenth of a cent.

The act listed coins in three metals: gold coins, including a ten-dollar coin called the eagle, silver coins from the dollar down to the half-dime, and copper coins, the cent and the half-cent.

Alexander Hamilton

Who: The first Secretary of the Treasury. He planned the national bank and the United States Mint.

When and where: Secretary of the Treasury, 1789 to 1795. Lived 1757 to 1804.

Movie: *Alexander Hamilton* (2007), a documentary in the PBS series *American Experience*.

Alexander Hamilton planned the national bank and the Mint in reports he wrote for Congress. On September 11, 1789, President George Washington chose him to be the first Secretary of the Treasury, the head of the government department in charge of money. He served until 1795.

In December 1790 Hamilton sent Congress his *Report on a National Bank*. He proposed a bank that would hold the government's money and put out banknotes that people could trust. A banknote is paper money printed by a bank.

Lawmakers in Congress then passed a bill to charter the First Bank of the United States, in Philadelphia, for twenty years. A charter is a legal paper that allows a company to exist and states what it may do. Thomas Jefferson and James Madison argued that the Constitution did not give Congress the power to create a bank. In the House, Madison asked whether starting a bank was "among the powers" the Constitution gave to Congress. President Washington asked Hamilton to answer the objections, so that he would have "the arguments for and against the measure." Then Washington signed the bill, on February 25, 1791. Twenty years later, in 1811, a new charter lost by one vote in each house of Congress.

> In January 1791 Hamilton sent Congress his *Report on the Establishment of a Mint*. In it he defined the dollar in both silver and gold, with 15 ounces of silver worth 1 ounce of gold. Members of Congress built the Coinage Act of 1792 on his plan and set up the Mint under it.

1800 to 1850

The United States had a national bank twice before 1850, and both banks lost their federal charters. A charter is a legal paper that allows a bank or company to exist and states what it may do. The First Bank's charter ran out in 1811. President Andrew Jackson vetoed, or refused to sign, a new charter for the Second Bank in 1832, and its federal charter ran out in 1836. From 1836 until 1862 the country had no national paper money. Americans paid with gold and silver coins and with paper notes printed by state banks. A bank's notes were worth less the farther from that bank a person tried to spend them.

Banknotes lent against enslaved people

By the 1830s, planters in Louisiana had set up banks that lent out their own paper money against mortgages on enslaved people. Planters were the enslavers who ran large farms. A mortgage is a loan in which the borrower pledges property, and the lender can take that property if the loan is not paid back. The paper notes people carried in their pockets in Louisiana had been lent out against enslaved human beings.

At the Consolidated Association of the Planters of Louisiana, an enslaver pledged "slaves and cultivated land" to the bank in a mortgage. He could then borrow up to half of what the bank's officers judged those people and that land to be worth. He received the loan in the bank's own paper notes.

To raise money to lend, the banks put out bonds. A bond is a paper that promises to repay a loan with interest. Louisiana lawmakers backed $2.5 million of the Consolidated Association's bonds, at 5 percent interest. Backing them meant the state promised to pay the bonds if the bank did not. Baring Brothers, bankers in London, paid the money up front and sold the bonds to investors in Europe. The Union Bank of Louisiana, founded in 1832, put out $7 million in state bonds. The Citizens' Bank of Louisiana, chartered in 1833, had $12 million in bonds that Hope and Company of Amsterdam agreed to sell.

A typical bond was for $1,000. Edward E. Baptist wrote in 2010 that this was "roughly the price of a field hand," an enslaved man who worked in the fields. An investor in Europe could own a share of a debt backed by thousands of enslaved people without owning any one person.

In 1824 the merchant Vincent Nolte lent $48,000 to the Louisiana enslaver Alonzo Walsh. Walsh pledged "from 90 to a 100 head of first rate slaves." Head is the word used to count cattle. The account of the loan gives no names for these people. At New Orleans auction prices they were worth up to $80,000.

Many enslavers had placed several mortgages on the same person. Then cotton prices fell, from 18 cents a pound in 1834 to under 10 cents by late 1836. By March 1837 ten large New Orleans cotton firms had failed. The enslavers owed the New Orleans banks alone $33 million. They could expect to make no more than $10 million from the 1837 crop. When they could not pay, the people they had mortgaged were sold in forced sales to pay their debts. The accounts of the crash do not name who ran each sale. Buyers spent what little cash they had at the first sales, and then the prices of land and of enslaved people fell sharply.

In Mississippi and Florida, state officials refused to pay bonds that their states had backed. In Baptist's account, the bondholders in Europe and the northern states lost their money, and the enslavers kept the people they held. In January 2005 officials of the bank JPMorgan Chase published a report on two Louisiana banks it grew out of, Citizens Bank and Canal Bank. Officers of those two banks had accepted about 13,000 enslaved people as collateral, which is property pledged for a loan. After borrowers failed to pay, the two banks came to own about 1,250 of those people.

The Bank War

The Bank War was the fight over whether the country should keep a national bank. A national bank is a bank chartered by the national government to hold the government's money. Members of Congress chartered the Second Bank of the United States in 1816, for twenty years, after the money troubles of the War of 1812. Its main office was in Philadelphia.

Nicholas Biddle became president of the Bank in 1823. Under him the Bank held the government's deposits, the money the government kept in the Bank's care, and moved money across the country. Its officers also collected the notes of state banks and presented them to those banks for payment in gold and silver coins. A state bank had to hold enough coins to pay, so its owners could not print as many notes as they wanted.

Andrew Jackson and his supporters argued that the Bank was a private company with public power, with owners in other countries and no control by voters. They said its officers gave favors to rich people with connections. Biddle and the Bank's defenders argued that the Bank kept the country's money the same everywhere and kept its value sound. They said that without it, nothing would stop state banks from printing too much paper.

Henry Clay was running against Jackson for president in 1832. In July of that year, four years before the old charter ran out, Clay led the push for a new one. Members of Congress passed it. Jackson vetoed the charter on July 10, 1832. A veto is a president's refusal to sign a bill into law. In his veto message he called the Bank "unauthorized by the Constitution, subversive of the rights of the States, and dangerous to the liberties of the people." Subversive means working to weaken something from the inside. That fall Jackson beat Clay and won a second term.

In 1833 Jackson ordered the government's deposits moved out of the Bank and into state banks he chose. His opponents called them "pet banks." Two Treasury secretaries would not move the money, and Jackson replaced them. Roger Taney, the third, moved it. Biddle struck back in 1833 and 1834 by cutting the Bank's lending to force a new charter. Borrowing became hard, and Biddle lost supporters.

On March 28, 1834, members of the Senate censured Jackson, which means they voted to blame him officially for what he had done. The Bank's federal charter ran out in 1836. In 1837 senators voted to remove the censure from the record. The Bank went on as a Pennsylvania state bank and failed for good in 1841. Biddle died in 1844, facing lawsuits.

Andrew Jackson

Who: The president who vetoed the Second Bank's new charter and moved the government's money out of it.

When and where: The United States. Veto in 1832, removal of the deposits in 1833.

Movie: *Andrew Jackson: Good, Evil and the Presidency* (2007), a two-hour PBS documentary narrated by Martin Sheen. It covers his whole presidency, not only the Bank War.

Andrew Jackson distrusted banks and paper money after a land deal left him with debts that took him about 15 years to pay off. In August 1795, at 28, he sold 68,000 acres of land to David Allison. The accounts of the sale do not say where the land lay or which Native nation had lived on it. Jackson was selling for himself, for John Overton and for others.

> Allison paid with promissory notes, which are written promises to pay money later. Jackson used the notes to buy supplies for a trading post. In 1797 Allison could not pay his debts, and his notes were worth nothing. The people holding the notes came to Jackson for payment instead. It took him about 15 years to pay his way out. Allison's creditors, the people he owed, had him put in debtors' prison in Philadelphia. A debtors' prison held people who could not pay what they owed. Allison died there on September 28, 1798.
>
> A 2001 article in *American Heritage* magazine described what Jackson took from all this. By the end, the article states, he had settled ideas about "debt, paper money, and speculation: He hated them all." Speculation means buying something only to sell it later at a higher price.
>
> As president, Jackson vetoed the Second Bank's new charter in 1832 and ordered the government's money moved out of it in 1833. No national bank replaced it. From 1836 until 1862, American paper money was whatever the state banks printed.

State banknotes and counterfeit detectors

From 1836 until 1862, paper money meant notes printed by banks that state lawmakers had chartered. Each bank printed its own designs. A note was worth only as much as people trusted the bank that printed it. Far from that bank, people would take its notes only for less than the amount printed on them. The difference was called a discount.

Store owners checked notes against a printed guide before they took them. The guides were called bank note reporters and counterfeit detectors. A counterfeit is a fake made to pass as the real thing. Publishers put them out weekly or monthly from about 1826 to 1866. Each issue listed the discount on each bank's notes and described the fake notes going around. Shopkeepers kept them by the cash drawer.

Some banks were called wildcat banks. They were set up under state laws, called free-banking laws, with few rules for opening a bank. The story went that some stood so far out in the woods that only wildcats lived nearby, so nobody could get there to trade the notes for coins. Economists today, among them Gerald Dwyer and the team of Rolnick and Weber, have found that the story is somewhat exaggerated. Most free banks were not frauds. The people holding their notes did lose money, but less than the legend says.

Whose land the Michigan banks lent against

In the late 1830s, Michigan's wildcat bankers lent money against land in the southeast of the state, around Ann Arbor. Until 1807 that land belonged to the Potawatomi, Ojibwe, Odawa and Wyandot nations.

A treaty is a written agreement between nations. In the Treaty of Detroit, on November 17, 1807, leaders of those four nations signed the land over to the United States. William Hull, the governor of Michigan Territory, signed for the United States. The land included the place that later became Ann Arbor. The treaty page of the Nottawaseppi Huron Band of the Potawatomi states that the land came to about 8 million acres. A history page of the Ann Arbor District Library states 5,611,532 acres. United States officials paid as little as 1.2 cents an acre, $57,717.32 in all. The library's page states the land's estimated value as $6,400,000.

Alpheus Felch

Who: A Michigan bank commissioner who inspected the state's new banks and found boxes of nails and glass under a top layer of coins.

When and where: Michigan, 1838 and 1839. Born September 28, 1804. Died June 13, 1896.

Alpheus Felch was one of three officials who inspected Michigan's banks in 1838, and he wrote down the frauds he found. He was a lawyer in Monroe, Michigan, from 1833. As a state lawmaker, he was one of four who voted against Michigan's free-banking law.

Michigan lawmakers passed that law on March 15, 1837. Before it, Michigan had 9 banks. Within months there were 18, and then 40. On December 30, 1837, three bank commissioners were appointed to inspect the banks. Felch served as one of them in 1838.

Felch described the inspections in 1880. Some banks kept "grossly insufficient books," meaning records far too poor to show what the bank held. One bank had nothing of value at all. At another, bankers showed the commissioners boxes of coin. Under a top layer of coins, the boxes were filled with nails and glass. At three banks in a row, the bankers showed the commissioners the same coins as their own. Local accounts say the bankers sent word ahead of the commissioners' route and carried the coins from bank to bank.

The commissioners could close a bank by court order. They could also hand it to a receiver. A receiver is an official who takes over a failed bank and pays its debts from what is left. After the commissioners' reports, many banks closed and criminal cases followed in the courts. Michigan lawmakers suspended the free-banking law in 1838. By September

1839 only 9 banks were left. Felch resigned as commissioner in 1839. In 1845 the judges of the Michigan Supreme Court ruled that the law broke Michigan's constitution, the state's basic set of laws.

Michigan bank notes lost an estimated 60 percent of the amount printed on them, according to the Ann Arbor District Library. In 2014 the economists Dove, Pecquet and Thies found that the true wildcat period lasted less than a year and involved "perhaps a dozen" banks. They put the noteholders' losses from those wildcat banks at about $350,000. In 1985 the economist Hugh Rockoff gave a larger figure, for all of Michigan's failed free banks. He estimated that their losses would have come to about $1 million if the state Supreme Court judges had not stopped the closing-down of those banks. Dove, Pecquet and Thies also argued that when the judges threw out the law in 1845, many notes became worthless.

Felch went on to serve as a justice of the Michigan Supreme Court from 1842 to 1845, as governor of Michigan from 1846 to 1847 and as a United States senator from 1847 to 1853.

The Panic of 1837: the runs

A panic, in money, is a time when fear spreads and many people rush to get their money out of banks. A bank run happens when many people rush to a bank at once to trade its notes or their deposits for coins. A bank keeps only part of its money in coin, so it cannot pay everyone at the same time.

On May 10, 1837, the officers of New York City's banks stopped paying out gold and silver for their notes and deposits. Bank officers across the country did the same. This was called suspending specie payments. Specie means coins of gold and silver. People who lined up at the banks got paper promises or nothing.

The country had about 850 banks. By about 1843, roughly 4 in 10 of them had failed, wholly or in part. No surviving record counts the depositors who lost their savings. The records give only the number of banks that closed.

1850 to 1900

By 1860 more than 10,000 different kinds of banknotes were in use in the United States. Federal officials today estimate that from one-third to nearly one-half of that paper money was fake. During the Civil War, members of Congress created a national paper money in 1862. Then they taxed state banknotes until banks stopped printing them. For the rest of the century Americans argued over what should stand behind a dollar, gold alone or gold and silver together.

Greenbacks

On February 25, 1862, members of Congress passed the Legal Tender Act to help pay for the Civil War. Under the act, they approved $150 million in paper money called United States Notes. Nobody could trade these notes at the Treasury for gold or silver. They were money because members of Congress made them legal tender, which means the law said people had to accept them to pay debts. Later acts raised the total to $450 million. The backs of the notes were printed in green ink, so people called them greenbacks.

Salmon P. Chase, the Treasury Secretary, managed the new paper money. He put his own portrait on the first $1 United States Note, in 1862.

In the National Banking Acts of February 25, 1863, and June 3, 1864, members of Congress created national banks, which got their charters from the national government. These banks put out national bank notes of one design, backed by government bonds. In 1865 members of Congress put a tax of 10 percent on state banknotes. Bankers stopped printing their own notes. The state notes still in use fell from $143 million in 1865 to $4 million by 1867. By then, people everywhere in the country used the same national paper money.

The words "In God We Trust" first appeared on American coins in these same years. In November 1861 a Pennsylvania minister, the Reverend M. R. Watkinson, wrote to Chase asking that God be named on the coins. His letter survives in Treasury records. Chase told officials at the United States Mint, the government's coin-making office, to prepare a motto. In the Coinage Act of April 22, 1864, members of Congress approved a two-cent coin. It was the first United States coin to carry the words IN GOD WE TRUST. The motto became the national motto in 1956. It first appeared on paper money in 1957, after a law passed in 1955.

Counterfeiters and the Secret Service

History pages of the U.S. Marshals Service and the Secret Service state that about one-third of the paper money in use in the 1860s was counterfeit. A 2025 release from the Department of Homeland Security puts it at nearly one-half. Nobody made a full count at the time, so these figures are estimates.

On July 5, 1865, Treasury officials formed the Secret Service Division, as part of the Treasury Department, to catch counterfeiters. Its first chief was William P. Wood. Treasury Secretary Hugh McCulloch swore him in.

Guarding presidents was not part of the job at first. On September 6, 1901, Leon F. Czolgosz shot President William McKinley at a public event in Buffalo, New York. McKinley died on September 14. Afterward, members of Congress asked the Secret Service to protect presidents. In 1902 its agents took on full-time protection of the president.

Emanuel Ninger

Who: A sign painter who drew fake money by hand and was caught when his ink ran on a wet bar top.

When and where: New Jersey and Manhattan, 1883 to 1896. Lived 1845 to 1924.

Emanuel Ninger drew fake banknotes by hand for thirteen years, until his ink smudged on a wet bar. He was a sign painter, born in Germany, who lived in New Jersey. He drew United States banknotes, mostly $50 and $100 bills, with a pen, a pencil and a brush made of camel's hair.

To make a bill, Ninger laid a real note against glass and traced over it. He used colored inks for the parts printed in color. One bill took him weeks. From 1883 to 1896 he spent his fakes in Manhattan.

On March 28, 1896, Ninger laid one of his bills on a saloon bar. The bar was wet, and the ink smudged. A man working for the bartender followed him and had him arrested. The tellings of the story differ a little on how the arrest happened. All of them include the smudged ink on the wet bar.

Ninger pleaded guilty in May 1896, and a judge sentenced him to six years in prison. Newspaper writers and experts at the time marveled that each fake had cost him more work than honest sign painting would have paid.

The Freedman's Savings Bank, 1865 to 1874

The Freedman's Savings Bank held the savings of people freed from slavery. It failed in 1874, and about 31,000 of its depositors never got any of their money back.

President Abraham Lincoln signed the law that created it, its charter, on March 3, 1865. The full name was the Freedman's Savings and Trust Company. By 1871 it had about 37 branches in 17 states and Washington, D.C. About 70,000 people opened accounts over the bank's life. Accounts ranged from about $5 to $50. Deposits over those years added up to more than $57 million.

At first the bank could hold only safe government bonds. In 1870 members of Congress changed its charter to let it make loans on land and buildings, and other loans. Henry D. Cooke sat on the bank's board and also served his family's banking business. The Office of the Comptroller of the Currency is the government office that oversees national banks. A history it published states that Cooke used the Freedman's Bank's money and property "to benefit the latter," meaning his family's business. The bank's headquarters, on Lafayette Square across from the White House, cost more than $200,000. Charles Meigs, a bank examiner, an official who inspects banks, reported the bank's problems in February 1873. Then came the Panic of 1873, a time of fear when at least 100 banks failed, and many of the Freedman's Bank's loans went bad. Meigs reported the bank's problems again in 1874.

Frederick Douglass became the bank's president in March 1874. He put $10,000 of his own money into the bank to restore trust in it. Then he saw that it could not be saved. The bank closed on June 29, 1874.

When the bank closed, it owed 61,144 depositors nearly $3 million, by the count in the Comptroller's history. Between 1875 and 1883 the commissioners who closed out the bank's business paid back 62 percent of what was owed, in five payments. Of the 61,131 depositors who could claim, 29,996 turned in their passbooks, the small books that recorded their savings. About 31,000 never collected anything. The records do not say why they did not.

The bank's signature books and deposit records from 29 branches survive at the National Archives. They list depositors' names, ages, jobs and family members. Black families today use them to trace their history.

Bank runs of 1873 and 1893

There was no deposit insurance in the 1800s. Deposit insurance is a promise, backed by the government, to repay people's savings if their bank fails. Without it, every depositor in a failed bank waited for whatever the receiver, the official who took over the failed bank, could collect

from the bank's leftover property.

At least 100 banks failed in the Panic of 1873. Banks failed in Washington, D.C., Pennsylvania, New York, Virginia, Georgia, Indiana, Illinois and Ohio. The New York Stock Exchange is the market in New York City where people buy and sell shares of companies. On September 20, 1873, the exchange closed for ten days, the first time it had ever closed.

In 1893 the gold the Treasury held fell to about $100 million, from $190 million in 1890. Writers for the Federal Reserve's history website count more than 100 banks that suspended in June 1893. To suspend meant to shut the bank's doors or stop paying out cash. Between mid-July and mid-August, 340 more banks suspended. Some of them later reopened, so counts differ. An Encyclopedia.com article puts the banks that failed in 1893 at about 500.

No surviving record counts how many depositors lost savings in 1873 or 1893, or how much they lost.

Gold against silver

Americans argued over whether gold alone or gold and silver should stand behind the dollar. Farmers and others who owed money were on one side, and bankers on the other.

With the dollar tied to gold, the supply of money grew slowly. Prices fell through most of the years from 1865 to 1896. A farmer's crop brought fewer dollars each year, but his mortgage payment, the money he owed each year on a loan against his farm, stayed the same. Supporters of "free silver" wanted the government to coin all the silver brought to it, at 16 ounces of silver to 1 ounce of gold. That would have put more money in use and raised prices, which would have made debts easier to pay. Debtors and many people in the states that mined silver wanted silver. Bankers and bondholders wanted gold alone. Bondholders were people who had lent money by buying bonds.

In the Coinage Act of February 12, 1873, members of Congress dropped the standard silver dollar from the list of coins. After that, in practice, the dollar was tied to gold alone and not to silver, just as western mines were producing more and more silver. People on the silver side called the act "the Crime of '73."

Two later laws required the government to buy some silver. The Bland-Allison Act of 1878 required the Treasury to buy $2 million to $4 million of silver each month and coin it into silver dollars. Lawmakers passed it over President Hayes's veto. Under the Sherman Silver Purchase Act of 1890, the purchases rose to 4.5 million ounces a month. Treasury officials paid

for the silver in notes that could be traded for gold. As holders traded the notes in, the government's gold shrank. In 1893, during the panic, members of Congress canceled the Sherman Act because President Cleveland insisted on it.

William Jennings Bryan

Who: A 36-year-old former congressman from Nebraska whose speech for silver made him the Democratic Party's candidate for president.

When and where: The Democratic convention in Chicago, July 9, 1896.

William Jennings Bryan became the Democratic Party's candidate for president in 1896 with a speech for silver. On July 9, 1896, at the Democratic convention in Chicago, he gave the last speech in the debate over the party's platform, its list of positions. Bryan was 36 years old and a former congressman from Nebraska.

He ended the speech with words aimed at the supporters of gold. "You shall not press down upon the brow of labor this crown of thorns," he said. Then he said, "you shall not crucify mankind upon a cross of gold." To crucify means to put someone to death by nailing them to a cross. Both pictures come from the Bible's account of the death of Jesus. Bryan was comparing that suffering to the gold standard, which means a dollar backed by gold alone. Under it prices fell, and farmers and working people found their debts harder to pay each year. After the speech, the delegates, the party members sent to the convention, chose him as their candidate for president on the fifth round of voting.

Republicans wrote support for the gold standard into their platform. The Republican candidate was William McKinley. Bryan's votes came mostly from the South, the rural Midwest and the Rocky Mountain states. McKinley was strongest in the cities and in the Northeast, the Upper Midwest and the Pacific Coast.

Each state had a number of electoral votes, set by its seats in Congress, and a candidate needed more than half of them to become president. McKinley won 271 electoral votes to Bryan's 176. He won 7,112,138 votes from the people, 51.0 percent, to Bryan's 6,510,807, 46.7 percent. Bryan ran against McKinley again in 1900 and lost again.

1900 to 1950

Between 1900 and 1950, members of Congress and two presidents set up two guards for people's savings. One was the Federal Reserve, a bank for the nation's banks. The other was deposit insurance, a government promise to pay savers back if their bank fails. Both are still in place to guard against bank runs, times when many people rush to take their money out of a bank at once. In the Gold Standard Act of March 14, 1900, members of Congress made gold the only metal behind the dollar, at $20.67 an ounce. After that, silver was no longer a standard in law. Members of Congress created the Federal Reserve in 1913, six years after the Panic of 1907, and deposit insurance in 1933, after thousands of banks had failed. In 1933 President Franklin Roosevelt also ordered Americans to turn in their gold coins. From 1934 on, a dollar in an American's hand was paper that could not be traded for gold.

The Panic of 1907

In October 1907 depositors, the people who kept money in banks, rushed to pull their money out of New York's trust companies. A trust company was a kind of bank that took deposits and managed people's money. The country had no central bank, a bank for the country's banks, to stop the run, so a private banker, J.P. Morgan, organized the rescue.

The trouble began with a failed attempt to corner the stock of United Copper. To corner a stock means to buy up so much of it that the buyers can set its price. When the attempt failed, the banks of the men behind it were ruined, and depositors grew afraid of other banks linked to those men.

On October 22, 1907, so many depositors demanded their money from the Knickerbocker Trust Company that its officers stopped paying out money. It was one of the largest trust companies in New York. Depositors then ran on the Trust Company of America and others, standing in lines around the block. Some hired people to hold their place in line. Charles T. Barney, the Knickerbocker's former president, shot himself on November 14, 1907.

A central bank holds the cash other banks keep on hand, called their reserves, and lends to them in a crisis.

> #### J.P. Morgan
>
> **Who:** A New York banker who ran the rescue in the Panic of 1907 from his own library.
>
> **When and where:** New York City, October and November 1907.

> J.P. Morgan was 70 years old when he took charge of stopping the Panic of 1907. He worked from his private library at 36th Street and Madison Avenue in New York City.
>
> Under Morgan's rescue, teams of examiners went through the books of the trust companies. They decided which ones were sound enough to save. Officials of the Treasury, the government department in charge of its money, deposited $25 million of the government's money with Morgan's group of banks. Morgan also got the presidents of banks and trust companies to promise money to shared rescue funds.
>
> On the night of November 2 to 3, 1907, Morgan gathered the presidents of the trust companies in his library and had the doors locked. In the account told by the Morgan Library & Museum and others, he kept the key in his pocket. He kept the presidents in the room until they agreed to put up $25 million to save the weakest trusts. They signed the deal near 5 in the morning. Memoirs differ on small details, such as who held the key and the exact hour. Today the exhibition on the panic at the Morgan Library & Museum describes the locked-door meeting.
>
> People at the time drew a lesson from the panic: the country's money system had depended on one 70-year-old private banker. In 1908 members of Congress passed the Aldrich-Vreeland Act. In it they created the National Monetary Commission to design a better system.

Jekyll Island and the Federal Reserve, 1913

The Federal Reserve, the central bank of the United States, began with a secret meeting in November 1910. Six men traveled to the Jekyll Island Club, on an island off Georgia. To keep the trip secret, they traveled as a duck-hunting party. They were Senator Nelson Aldrich, Treasury official A. Piatt Andrew, the bankers Henry Davison, Frank Vanderlip and Paul Warburg, and Aldrich's secretary, Arthur Shelton. On the island they wrote a plan for a central bank.

The men who were there did not admit to the meeting in public until the 1930s. Today the Federal Reserve's published history describes the trip. Members of Congress never passed their plan, called the Aldrich Plan. Three years later they used much of its design in the law they did pass.

President Wilson signed the Federal Reserve Act on December 23, 1913. The act provided for twelve Reserve Banks in different parts of the country, run under a board in Washington. The Reserve Banks opened on November 16, 1914.

The Federal Reserve is a bank for banks. It holds their reserves, which are the money a bank keeps on hand instead of lending it out, and it moves money between them. Its officers can lend to a sound bank that is facing a run, so the bank can pay its depositors and stay open.

Black-owned banks, and Greenwood's losses

In the early 1900s Black Americans started their own banks, among them Maggie Lena Walker in Richmond and Jesse Binga in Chicago. Black depositors and business owners later lost money when banks failed and when a white mob burned Tulsa's Black district in 1921.

Maggie Lena Walker opened the St. Luke Penny Savings Bank in Richmond, Virginia, in November 1903, and became its first president. She was the first Black woman to found a bank in the United States. On the first day, people deposited more than $8,000, in amounts from 31 cents to over $100. During the Great Depression of the 1930s, Walker merged it with other Black-owned banks into the Consolidated Bank and Trust Company. That bank lasted into the 2000s as the longest continuously run Black-owned bank in the country. Walker lived from 1864 to 1934.

Jesse Binga opened a private bank in Chicago in 1908, mainly for Black customers, because many bank managers turned them away. In 1921 he opened the Binga State Bank. Binga lived at 5922 South Park Avenue, in a white neighborhood. His home and his offices were bombed at least five times. The records do not say who set the bombs.

In 1930 Illinois state officials closed the Binga State Bank when it could not meet a requirement to hold $400,000 in cash. Accounts date the closing to June or to July 31, 1930. Binga lost his own fortune. Many depositors lost their savings, and the records do not count them. In 1933 a jury found Binga guilty of embezzlement, which means taking money a person was trusted to look after. A judge sentenced him to ten years in prison. Governor Dwight H. Green of Illinois pardoned him in 1941. A pardon is an official act that forgives a crime and ends the punishment.

On May 31 and June 1, 1921, a white mob attacked Greenwood, the Black district of Tulsa, Oklahoma, where about 10,000 people lived. The mob included men whom the Tulsa police had deputized, which means sworn in as temporary officers. National Guard units took part in the attack. The attackers destroyed more than 1,000 homes and businesses. Estimates of the number of people killed run from 50 to 300. The count is uncertain because many of the dead were never identified and lie in unmarked graves. Most Black Tulsans lost their homes, and

thousands lived in tents through the winter of 1921 to 1922. No white person went to prison for the murders or the burning. An all-white grand jury blamed Black Tulsans. A grand jury is a group of citizens who decide whether to charge people with crimes.

Greenwood's residents filed more than $1.8 million in damage claims with the city of Tulsa between June 1921 and June 1922. All but one of the claims were turned down. A 2021 Brookings study of the claims does not name the officials who turned them down. The one claim paid went to a white shop owner, for guns taken from his store. Officers of the insurance companies refused to pay for the burned property. They called the attack a "riot," and their policies did not cover riot damage. No rebuilding money came from the city, the state or the federal government.

Greenwood's residents rebuilt the district. In 1925 the National Negro Business League held its national meeting in Greenwood. "Negro" was a common word for Black people at the time. By the 1940s Greenwood had 242 Black-owned businesses.

1930 to 1933: the runs, the holiday and deposit insurance

From 1930 to 1933 more than 9,000 American banks failed, and their depositors lost about $1.34 billion. Federal deposit insurance did not begin until 1934, so the losses fell on the depositors.

Banks had failed at a rate of more than 600 a year even in the 1920s, mostly small banks in farm country. The count grew after 1929. The Federal Deposit Insurance Corporation, or FDIC, is the government agency that insures bank deposits. Its later records list 1,350 banks that suspended, meaning they closed their doors or stopped paying depositors, in 1930. They list 2,293 in 1931, 1,453 in 1932 and 4,000 in 1933. That makes 9,096 in all. A fact sheet from the Franklin D. Roosevelt Presidential Library gives the number as about 9,000 of the country's 25,000 banks. By an estimate on the history website ushistory.org, about nine million savings accounts had been lost by March 1933.

On December 11, 1930, the Bank of United States in New York City failed. It was the largest bank failure in the country up to then. It had about 400,000 depositors. Many were immigrants who worked in the clothing factories, and small savers in the Bronx and Brooklyn.

A history published by the FDIC in 1998 states that Federal Reserve officials "did little to ease the liquidity problems of banks." Liquidity means having cash on hand to pay depositors. Most of the banks that failed in 1930 had not joined the Federal Reserve system, and its officials felt no responsibility for them.

On February 14, 1933, the governor of Michigan closed every bank in the state for eight days. That left 900,000 depositors unable to reach their money. Runs then spread from state to state.

Franklin Roosevelt became president in March 1933. On March 6, two days after he took office, he closed every bank in the country. This was called the bank holiday. On March 9 members of Congress passed the Emergency Banking Act. On the night of Sunday, March 12, Roosevelt gave the first of his radio talks called fireside chats. About 60 million people listened. He explained in simple terms how banks work, and he said money was safer in a reopened bank than under the mattress. Banks reopened from March 13 to 15, after federal officials reviewed them. When they opened, people put in more money than they took out.

On April 5, 1933, Roosevelt signed Executive Order 6102, a written order from the president. It required Americans to turn in their gold coins, gold bars and gold certificates to the government at $20.67 an ounce. A gold certificate was a paper note that could be traded for gold. Americans could keep small keepsakes and collections. In the Gold Reserve Act of January 30, 1934, members of Congress moved all the gold the country used as money to the Treasury. They set a new price of $35 an ounce. From then on, Americans could not trade their dollars for gold. Foreign governments still could.

Between those two gold measures, on June 16, 1933, members of Congress created the Federal Deposit Insurance Corporation, the FDIC, in the Banking Act. Its insurance began on January 1, 1934, and covered each depositor up to $2,500. In July 1934 the limit rose to $5,000. If an insured bank failed, its depositors would be paid back from the insurance fund, up to the limit. With that promise, depositors no longer had a reason to rush to the bank to get their money out first.

Lydia Lobsiger

Who: The first depositor in the United States to be paid back by federal deposit insurance.

When and where: East Peoria, Illinois, 1934. Her grave record gives her life as 1870 to 1956.

Lydia Lobsiger received the first federal deposit insurance check ever paid. It was for $1,250 and dated July 3, 1934.

Her bank was the Fond du Lac State Bank of East Peoria, Illinois. It failed in the spring of 1934. It was the first bank with FDIC insurance to fail. The insurance had begun only a few months earlier, on January 1, 1934.

> From 1930 to 1933, before the insurance began, depositors in failed banks had lost about $1.34 billion. When Lobsiger's bank failed, reporters at newspapers across the country wrote that a depositor with a small account had not lost her savings.

War bonds

During World War II, about 85 million Americans, roughly half the country, lent money to the government by buying war bonds. Together they paid in about $185.7 billion.

One kind was the Series E bond. A buyer paid $18.75 for it and got back $25 ten years later. Children bought war stamps for 10 cents or 25 cents each and saved them toward a bond.

From 1942 to 1945, officials of the Treasury and the Office of Education ran a program called Schools at War. Students bought stamps and bonds toward goals set at their schools. About 200,000 schools and 30 million students took part. They raised more than $2 billion. Their money paid the price of at least 90,000 jeeps and several thousand airplanes for the armed forces. Eleanor Roosevelt spoke in support of the program on the radio on September 25, 1942.

1950 to 2000

The dollar lost its last link to gold in 1971. In the same years Americans began to pay with plastic cards and take cash from machines. On August 15, 1971, President Nixon ended the right of foreign governments to trade dollars for gold. Since then no metal has stood behind the dollar. Prices rose fast for about seventeen years, from about 1965 to 1982, and a dollar saved in 1965 bought about a third as much in 1982. Paul Volcker, head of the Federal Reserve, stopped that rise in the early 1980s by letting interest rates rise past 20 percent.

Plastic: the charge card and the credit card

The first card that people could use to pay at many different businesses was the Diners Club card, in 1950. Frank McNamara started the company with Ralph Schneider and other partners. The first cards were made of cardboard. At first a couple dozen restaurants in New York took them. The first use was at Major's Cabin Grill in February 1950.

The Diners Club card was a charge card. The holder had to pay the whole bill each month. A story often told says that McNamara had the idea in 1949 after he forgot his wallet at dinner. Matty Simmons, the company's first publicity man, was there. He said later that the story was

made up for publicity. According to Simmons, McNamara simply had the idea and worked on it.

In September 1958, officers of Bank of America mailed about 60,000 ready-to-use cards, called BankAmericards, to people in Fresno, California. None of those people had asked for a card. The BankAmericard was a true credit card. The holder could pay part of the bill and owe the rest later. About 22 percent of the accounts fell behind on payments, against the 4 percent the bank's officers had planned for. There was also fraud, which means cheating to get money or goods. The bank lost millions of dollars in the card's first years. In 1970 members of Congress banned mailing credit cards to people who had not asked for them. Officers of Bank of America licensed the card to other banks across the country, and in 1976 it was renamed Visa.

Until 1974, a lender who turned down a woman for credit because she was a woman broke no federal law. A blog post by the Consumer Financial Protection Bureau, a federal agency, states that "discrimination against women applying for credit was common." Lenders who made mortgages, or home loans, "often discounted a married woman's income, especially if she was of childbearing age." That means they counted her pay as worth less when they decided whether to lend to her. Lenders were more likely to turn down single women. In October 1974 members of Congress passed the Equal Credit Opportunity Act. Under the act, it became illegal for lenders to treat people differently because of their sex or whether they were married. In March 1976 members of Congress added race, color, religion, national origin, age, and receiving public assistance. Public assistance is money from a government aid program.

The ATM

The first automated teller machine in the United States, a machine that pays out cash without a bank clerk, opened on September 2, 1969. It stood at a Chemical Bank branch in Rockville Centre, New York. Docutel, a company in Dallas, built the machine, called the Docuteller, from an idea by Don Wetzel. The bank's advertisement said, "On September 2, our banks will open at 9:00 and never close again."

August 15, 1971: the last tie to gold

After 1934, Americans could not trade dollars for gold, but foreign governments still could, at $35 an ounce. This deal was part of an agreement among countries made after World War II, called the Bretton Woods system. By 1971 far more dollars were held outside the country than the United States had gold to pay for them. Foreign governments were trading in dollars for American gold, and the country's gold was running down. It was a run on the nation's gold.

President Nixon spent a weekend at Camp David with his advisers. They included Arthur Burns, the chairman of the Federal Reserve, John Connally, the Treasury Secretary, and Paul Volcker, a Treasury official. On Sunday night, August 15, 1971, Nixon announced that Treasury officials would no longer trade gold for the dollars foreign governments turned in. He called the change temporary. No president has reversed it.

Since that night the dollar has been fiat money. Fiat money is money backed by no metal. It is worth what it can buy. People accept it because it is legal tender, which means the law says it must be accepted to pay a debt, and because they trust the government that prints it. The greenbacks of 1862 worked the same way.

The Great Inflation

From about 1965 to 1982, prices in the United States rose fast year after year. Economists call this the Great Inflation. Inflation means prices going up, so that each dollar buys less.

In the early 1960s prices had risen 1 or 2 percent a year. Food prices rose more than 20 percent over the year to late 1973. Prices overall rose about 11 percent in 1974. That year President Ford started a campaign called "Whip Inflation Now," with buttons that said WIN. Prices went on rising. At the peak, in 1979 and 1980, they rose more than 1 percent a month, and for all of 1980 they rose 13.5 percent.

A dollar saved in 1965 bought about a third as much in 1982, so savings put aside in 1965 had lost about two-thirds of their buying power. Borrowing became costly. In October 1981 the average interest rate on a 30-year home mortgage, a loan to buy a house, was 18.63 percent. That is the highest rate ever recorded in the Freddie Mac survey of home loan rates.

> ### Bruce Bent and Henry Brown
>
> **Who:** Two men who met at a pension company and set up the first money market fund, a way for small savers to earn more than the legal limit on bank interest.
>
> **When and where:** The United States, 1969 to 1973. Bent was born in 1937. Brown lived from 1926 to 2008.
>
> Bruce Bent and Henry Brown set up a fund that let ordinary savers earn the higher interest that only large investors could get before.
>
> Since 1933 a federal rule called Regulation Q had forbidden banks to pay more than a set rate of interest on a savings account. Federal Reserve officials first put it in place in September 1933. In July 1973 Federal Reserve officials raised the limit on an ordinary

bank savings account from 4.5 percent to 5 percent. Most banks paid exactly the limit. In 1974 prices rose about 11 percent. Money in a savings account at 5 percent lost about 6 percent of its buying power that year.

Large investors could earn more by buying short-term debt from the government and from large companies, such as Treasury bills, which are short loans to the government. Only large investors could buy that debt directly. Bent and Brown met while working at TIAA-CREF, a pension company. In August 1969 Bent proposed a fund that would pool the money of many small savers and buy that debt for them.

They set up the Reserve Fund in 1970. A saver needed $1,000 to start, and each share cost $100. The fund opened to savers in 1971 or 1972, depending on the source. Bent and Brown had no sales staff. They phoned financial advisers and handed out brochures. On January 7, 1973, the reporter Robert D. Hershey Jr. wrote an article about the fund in the *New York Times*. By the end of 1973 it held $100 million.

Federal Reserve History counts 1 money market fund in 1972, 36 in 1975, 90 in 1980 and 649 in 1990. The limits of Regulation Q were phased out by 1986 under a law members of Congress passed in 1980. The Reserve Fund later grew into the Reserve Primary Fund, which held about $62 billion in 2008.

Paul Volcker

Who: The chairman of the Federal Reserve who brought down the Great Inflation with interest rates above 20 percent, at the cost of a recession with 10.8 percent unemployment.

When and where: Washington, D.C., 1979 to 1983.

Paul Volcker stopped the Great Inflation by letting interest rates rise past 20 percent. He was six feet seven inches tall and known for smoking cheap cigars. President Jimmy Carter appointed him chairman of the Federal Reserve in August 1979. In 1979 and 1980 prices were rising more than 1 percent a month.

On Saturday night, October 6, 1979, Volcker announced a new policy. He and the other Federal Reserve officials would control how much money was in the economy. They would let interest rates rise as high as that took them. The federal funds rate, the rate banks charge one another for overnight loans, passed 20 percent in 1981.

> In the recession of 1981 and 1982, unemployment reached 10.8 percent, the highest since the 1930s. A recession is a time when business shrinks and people lose jobs. Farmers drove tractors to the Federal Reserve's building in protest. Home builders in debt mailed sawed-off pieces of two-by-four lumber to the Federal Reserve.
>
> Inflation fell from 13.5 percent in 1980 to 3.2 percent in 1983. Prices next rose as fast as in late 1981 in the 12 months to June 2022, when they rose 9.1 percent.

The savings and loan crisis

From 1989 to 1995, federal officials closed 747 failed savings and loans. Kenneth Robinson, writing for the Federal Reserve's history website, estimates that taxpayers paid as much as $124 billion of the cost. A savings and loan, also called a thrift, took in people's savings and made long-term home loans at fixed interest rates.

When interest rates climbed in the late 1970s and early 1980s, the thrifts lost money. Under Regulation Q, thrifts could not pay savers the rates they could get elsewhere. The old fixed-rate home loans they held lost value. By 1983 closing the thrifts that could not pay their debts would have cost about $25 billion. Their insurance fund, the Federal Savings and Loan Insurance Corporation, or FSLIC, held only $6 billion. In the Garn-St Germain Act of 1982, members of Congress let thrifts make new kinds of loans beyond home mortgages. Many of those loans carried more risk.

In 1989 members of Congress passed a law. In it they closed the FSLIC and moved thrift deposit insurance to the FDIC. They also created the Resolution Trust Corporation to shut down failed thrifts. By the end of 1995 its officials had closed the 747 savings and loans, which together held more than $407 billion in loans and other property. Savers with insured accounts were paid in full.

Banks failed in the same years. FDIC records count 120 failed insured banks in 1985, 145 in 1986, 203 in 1987 and 280 in 1988. In 1984 federal officials rescued Continental Illinois National Bank, which held $45 billion in loans and other property, instead of letting it fail.

2000 to Today

Most American payments today are made by credit or debit card. In 2024 cards made up 65 percent of payments, according to the Federal Reserve's yearly payment diary, and in 2025 Americans used cash for 14 percent. Runs came back. In 2008 savers ran from money market

funds, and in 2023 depositors ran from Silicon Valley Bank and other banks. Both times, federal officials promised to cover money that no insurance protected. Since 2009 people have also used digital coins, such as bitcoin, that no government and no bank puts out.

2008: the run comes back

In September 2008 savers ran on money market funds, the kind of fund Bruce Bent and Henry Brown had started. In a money market fund, the managers pool many people's money to buy short-term loans to the government and to large companies. Many people treated these funds like bank accounts. A share was meant to stay worth exactly $1. The funds had no deposit insurance.

On September 15, 2008, the large financial firm Lehman Brothers failed. The next day, the Reserve Primary Fund "broke the buck," which means its shares fell below $1, to 97 cents. The fund held $62.5 billion, and $785 million of it was in Lehman's debt. According to a study in the *Journal of Financial Crises*, published by Yale University, investors pulled more than $40 billion out of the fund in two days. On September 17 alone they pulled about $144.5 billion out of money market funds across the country.

On September 19, 2008, Treasury officials announced a guarantee for money market funds. President George W. Bush approved it, and Treasury Secretary Henry Paulson put up to $50 billion of the Treasury's Exchange Stabilization Fund behind it. The guarantee worked like deposit insurance, set up within a week, and the run stopped. Later, officials of the Securities and Exchange Commission charged Bruce Bent and his son with fraud over the Reserve Primary Fund's collapse. On November 12, 2012, a jury cleared them of the fraud charges. The same jury found the son, Bruce Bent II, responsible on one charge of carelessness, which the law calls negligence. The jurors also found the two companies named in the case, Reserve Management and Resrv Partners, responsible on other charges, Reuters reported.

Banks failed too. From 2008 through 2013, 489 insured banks failed, according to a history the FDIC published in 2017. Their failures cost the deposit insurance fund about $73 billion. IndyMac failed on July 11, 2008, with losses of about $12 billion, the most costly failure in the FDIC's history. Washington Mutual failed on September 25, 2008. It held $307 billion in loans and other property, which made it the largest bank failure in the country's history. On October 3, 2008, members of Congress raised the deposit insurance limit from $100,000 to $250,000. In 2010 they made the $250,000 limit permanent.

Money issued by nobody

Bitcoin is a digital coin that no government and no bank puts out. It runs on a public record of who owns which coins, kept by many computers that check one another's work.

On October 31, 2008, a person or group using the name Satoshi Nakamoto published a paper describing Bitcoin. On January 3, 2009, Nakamoto started the system by creating its first block of records. The code of that first block includes a headline from that day's *Times* of London: "Chancellor on brink of second bailout for banks." The Chancellor is the British government's top money official, and a bailout is government money given to businesses in trouble. No one has shown who Nakamoto is.

People hold bitcoin as an investment, hoping its price will rise, and others use it to pay for things. Economists disagree about whether it is money, property owned for its value, or a bet on a price.

Laszlo Hanyecz

Who: A programmer who made the first recorded purchase with bitcoin: two pizzas for 10,000 coins.

When and where: Florida, May 22, 2010.

On May 22, 2010, Laszlo Hanyecz paid 10,000 bitcoins for two pizzas. It was the first recorded time anyone traded bitcoin for a real thing.

Hanyecz was a programmer in Florida who had worked on Bitcoin's code. He wrote the first version of the Bitcoin program for Apple's Mac computers, and he was the first to use a computer's graphics card to create new bitcoins, which is called mining. In May 2010 he posted an offer on the Bitcoin forum, a website where users wrote to one another. He would give 10,000 bitcoins to anyone who got two large pizzas delivered to him. A forum user named jercos took the deal and ordered the pizzas. The pizzas cost jercos about $25. At the time of the offer, the 10,000 bitcoins were worth about $41, according to the bitcoin.it wiki.

The same wiki estimates that at the high point of May 2025, those 10,000 coins would have been worth about $1.1 billion. In a 2019 interview, reported by the news site CoinDesk, Hanyecz said, "A trade happens because both parties think they're getting a good deal." May 22 is now marked each year as Bitcoin Pizza Day.

Payday loans

A payday loan is a small loan meant to be paid back from the borrower's next paycheck. Researchers at the Consumer Financial Protection Bureau, a federal agency, released a study of these loans on April 24, 2013. They found that a $350 payday loan with the typical fee of $15 for every $100 borrowed cost an annual percentage rate of 391 percent. An annual percentage rate is the cost of a loan over a full year, written as a share of the amount borrowed.

Storefront payday lenders charged fees of $10 to $20 for every $100 borrowed, the study found. Nearly half of payday borrowers took out more than 10 loans in a year, and 14 percent took out 20 or more. The typical borrower was in debt to a payday lender 199 days of the year.

Inflation returns, 2021 to 2026

Prices rose fast again from 2021 to 2023, and Federal Reserve officials raised interest rates faster than at any time since Volcker. In the 12 months to June 2022, prices rose 9.1 percent, according to the Bureau of Labor Statistics. That was the largest rise since November 1981. Energy prices rose 41.6 percent that year and food prices 10.4 percent. Federal Reserve officials raised their main interest rate from near zero in March 2022 to more than 5 percent in 2023. By the middle of 2023, prices were rising at close to 3 percent a year.

Economists still disagree about the causes, as a report by the Congressional Research Service, which does research for members of Congress, describes. The causes they name include broken supply chains (the network of factories, ships and trucks that moves goods), federal spending on pandemic relief and higher energy prices.

In the 12 months to August 2026, prices rose 3.4 percent, the Bureau of Labor Statistics reported. Energy prices rose 16.3 percent, and food prices 2.7 percent.

FTX and stablecoins

FTX was a company where people bought, sold and kept cryptocurrency, digital money such as bitcoin. In November 2022 it went bankrupt, which means it could not pay what it owed and went to court to settle its debts. Its founder was Sam Bankman-Fried. According to the *Washington Post*, he had used customers' money to buy luxury real estate, to make investments and to give political donations.

In November 2023 a federal jury found him guilty of wire fraud, conspiracy to commit fraud and conspiracy to commit money laundering. Wire fraud is cheating people using phones, email or the internet. A conspiracy is a plan by two or more people to commit a crime. Money

laundering is hiding where money from a crime came from. On March 28, 2024, Judge Lewis Kaplan sentenced him to 25 years in prison and ordered him to give up more than $11 billion.

The people running the bankruptcy paid customers back what their accounts were worth on the day FTX filed for bankruptcy in November 2022. On that day one bitcoin sold for $16,080. By May 2024 it sold for close to $62,675, according to CBS News. Customers who had held bitcoin did not get back that later value. Another payment went out to customers on July 31, 2026. An FTX press release in 2026 states that, after it, customer claims had received 105 percent of their value in all, and small claims 120 percent. Payments above 100 percent were interest added to the claims. FTX's chief executive, John Ray, described the plan in 2024 as "100% of bankruptcy claim amounts plus interest."

On July 18, 2025, President Trump signed the GENIUS Act, a law with rules for stablecoins. A stablecoin is a digital coin that the company behind it promises to trade for a fixed amount, such as one dollar. Under the law, a company that puts out stablecoins must hold at least one dollar of approved reserves, such as cash, insured bank deposits or Treasury bills, for every coin. The law states that stablecoins are not federally insured, according to a 2025 report by the Congressional Research Service. In the 1800s, before national paper money, banks chartered by the states printed their own notes. Each note was only that bank's promise to pay in coin. A stablecoin works the same way: a private promise to pay, backed by what the company holds, with no federal insurance behind it.

2023: the run on Silicon Valley Bank

In March 2023 federal officials protected every depositor at two failed banks, including money above the insurance limit. On March 9, 2023, depositors took $42 billion out of Silicon Valley Bank in California in a single day. About 88 percent of the bank's deposits were above the $250,000 insurance limit. If the bank failed, the owners of that money stood to lose it. On March 10, officials of California's Department of Financial Protection and Innovation closed the bank. On Sunday, March 12, officials of New York's Department of Financial Services closed Signature Bank. About 90 percent of its deposits were uninsured.

Also on March 12, Treasury Secretary Janet Yellen, after consulting the president, used an emergency power. She protected every depositor at both banks, insured or not. On March 27, 2023, FDIC Chairman Martin Gruenberg told Congress that FDIC officials estimated the cost at about $20 billion for Silicon Valley Bank and $2.5 billion for Signature Bank. They planned

to collect that money from other banks through special fees, not from taxpayers. On May 1, 2023, California officials closed First Republic Bank, and JPMorgan Chase took over all its deposits.

Cash fades, and the penny ends

In 2025 cash was the third most used way to pay in the United States, after credit cards and debit cards. Federal Reserve researchers track this with the Diary of Consumer Payment Choice, in which people record the payments they make.

In 2016 cash was the most used way to pay, at about a third of all payments. In 2024 cash was used for 14 percent of payments, credit cards for 35 percent and debit cards for 30 percent. Adults aged 18 to 24 paid by phone 45 percent of the time that year. In 2025 people made about 47 payments a month, according to the diary's report released in May 2026. Cash was 14 percent of them, about 6 a month. It was the sixth year in a row that cash came third. People aged 55 and older paid cash about 10 times a month, against about twice for people aged 18 to 24. In the countryside the count was about 9 a month, and in cities and suburbs about 6. Ninety percent of people said they planned to keep using cash.

In the 2024 budget year, each penny cost the U.S. Mint 3.69 cents to make and ship. The Mint's losses on pennies came to about $85 million that year. On February 9, 2025, President Trump said he had told the Treasury Secretary to stop making new pennies. A PBS and Associated Press report at the time said it was unclear whether he had that power, because members of Congress set the rules for coins. On November 12, 2025, at a ceremony at the Philadelphia Mint, the last pennies made for everyday use were struck. The first federal cents had been made 232 years earlier, in 1793. The expected savings were about $56 million a year. Pennies already made are still legal tender.

On September 14, 2026, members of the House of Representatives passed the Common Cents Act, and senators passed it on September 28, 2026. The bill would end penny production in law. When a customer paid cash and exact change was not available, the total would round up or down to the nearest five cents. Payments by card or check would not round. As of October 2, 2026, the bill was waiting for President Trump's signature.

Chapter 18: Marketplace and Consumer Life

Before 1500

People in this land got goods from far away long before 1500. They had no stores. They traded one thing for another. At some places, people from many nations gathered to fish and to trade. One of the biggest was on the Columbia River in the Northwest. Goods passed from one person to the next, sometimes across hundreds of miles.

The Dalles and Celilo Falls

The biggest trading place in the Northwest was a ten-mile stretch of the Columbia River. It ran from Celilo Falls down to a place called The Dalles, on the border of what are now Oregon and Washington. People fished and lived there. Archaeologists, scientists who study the past from what people left behind, date the first human use of the site to at least 10,000 years ago. Some newspaper and museum writers give 15,000 years.

Traders came from as far north as what is now British Columbia and as far south as California. The Oregon Historical Society reports that, by some accounts, traders came from as far east as the Great Lakes. Northern traders brought coiled baskets, skins and berries. Traders from the south carried obsidian, a black volcanic glass that makes sharp blades, along with bows and captives. Captives were people seized by force and then traded away with the other goods. The accounts of the trade do not name who seized them. Camas root and buffalo hides arrived from the east, and wapato root, whale oil and dentalium shells from the coast. Camas and wapato are roots that people dug up and ate.

Horses came later. Spanish colonists had brought horses to the Americas. In the early 1700s, Native traders passed horses north to this part of the river.

Dentalium shells are the shells of a small sea animal. Each one is shaped like a tiny elephant tusk and can grow a few inches long. Most of them came from the sea off Vancouver Island. People passed them from hand to hand over a wide area. So many people accepted them that traders used them to measure what other goods were worth.

In October 1805, Meriwether Lewis and William Clark reached this stretch of river. Clark wrote in his journal that it was the "Great Mart of all this Country." A mart is a market. People had been trading there long before his visit.

The trading place is now under water. Workers for the US Army Corps of Engineers, the part of the army that builds dams and other large works, built The Dalles Dam eight miles downstream. At 10 o'clock on the morning of March 10, 1957, the dam's floodgates were closed. The written account of that day does not name who gave the order. Four and a half hours later, Celilo Falls lay under the lake behind the dam. The villages of Wyam, on the Oregon side, and S'kin, on the Washington side, went under too. US government officials later paid the Warm Springs, Yakama, Umatilla and Nez Perce nations $26.8 million for the fishing sites they lost.

Goods that traveled without a store

Archaeologists have found copper from Lake Superior, shells from the Gulf of Mexico, obsidian from the West and turquoise from the Southwest hundreds of miles from where each was dug up or gathered. People carried and traded these goods over those distances, one exchange at a time.

Cahokia was a city near what is now St. Louis. It was at its largest from about 1050 to 1150. Around 1100, about 10,000 to 20,000 people lived there. People at Cahokia controlled the trade in hoe blades made from Mill Creek chert, a hard stone that holds a sharp edge. Archaeologists have found those blades more than 400 miles away. People that far from Cahokia got the blades by trading for them.

No trader from before 1500 is known today by name.

The 1500s

In the 1500s, Native people in what is now eastern Canada traded with the crews of European whaling and trading ships. Native traders passed the metal they got far inland, as far as the Great Lakes. There were still no stores. Native traders chose which European goods they wanted. Archaeologists can see those choices in the kettles that the traders cut up and made into new things.

What Native customers chose

In the late 1500s, Native buyers in the Northeast and around the Great Lakes traded for copper and brass kettles. Kettles were among the European goods they wanted most. Basque, French and Dutch traders carried the kettles across the ocean because those buyers asked for them. The Basques come from the Basque Country, a region in the mountains on the border of Spain and France. Basque ship crews crossed the ocean to hunt whales. They traded with the Beothuk of Newfoundland, the Innu of Labrador and the Mi'kmaq.

Many of these kettles were not used for cooking. Archaeologists dig them up cut into flat sheets. Native craftspeople turned the sheets into beads, tubes, arrow points and pendants, which are ornaments that hang from a cord. For a long time, people in these nations had made the same shapes from copper found as pure metal in the ground. Buyers like these used a kettle as a supply of metal.

Pieces of Basque copper kettles from the late 1500s and early 1600s turn up from the Canadian Maritimes, on the Atlantic coast, to the lower Great Lakes. Native traders passed the metal along among themselves, far inland. Basque kettles and axes reached the lands of the Huron and their neighbors in what is now Ontario.

Native traders chose carefully what they took in trade. They were skilled bargainers who asked for useful tools and for fine goods alike. In the fur trade of later years, Native customers also traded for wool cloth, linen shirts, glass beads, iron knives, awls, axes, fish hooks, blankets, guns and gunpowder. An awl is a pointed tool for punching holes in leather. The Hudson's Bay Company, a fur-trading company, began in 1670. Its Native customers demanded good guns. The men running the company sent gunsmiths to its trading posts to check the guns and repair them.

The 1600s

English colonists in the 1600s paid for goods with crops, with other goods and with work, as well as with coins. At John Pynchon's shop in Springfield, Massachusetts, customers seldom paid in coins at all. A shopkeeper wrote down what each customer owed and let the debt run for months. Public markets and trading posts also opened in the English colonies in this century.

Market days

A market day was a set day when farmers brought meat, milk, butter, cheese, fruit and vegetables into town to sell. Town people could not travel out to the farms for these foods, so the farmers came to them.

In 1634, Governor John Winthrop of Massachusetts ordered a market for Boston. It is the first public market of the European kind recorded by officials in the English colonies. Hartford, in Connecticut, had a market in 1643. New York had one by 1686, and Philadelphia had one in 1693.

Trading posts

A trading post was a building where colonists traded goods with Native people and with other traders. In 1627, the colonists of Plymouth Colony built one at Aptucxet, on the Manomet River on Cape Cod. It was about 20 miles from Plymouth. The post stood on land of the Wampanoag people, who used the place as summer fishing grounds. The name Aptucxet meant "little trap in the river."

At Aptucxet the Plymouth colonists traded with the Wampanoag for corn and beans. They also traded with Dutch traders. That same year, Isaack de Rasieres, the secretary of the Dutch colony, brought wampum into Plymouth's trade. Wampum is small beads made from shells and strung together.

The ledger

A colonial shopkeeper kept two books. The first, the journal, listed every sale and every purchase in the order it happened. The second, the ledger, gave each customer a page of their own. The customer's purchases went on the left side of the page and the customer's payments on the right.

Buying without paying at once is called buying on credit. The amount still owed is the debt. A shopkeeper usually let a customer's debt run for up to a year. Customers paid in crops, in other goods, in work and sometimes in coins.

John Pynchon kept a shop in Springfield, Massachusetts. The town and the shop stood on land that the Agawam people had sold to his father. On July 15, 1636, William Pynchon bought land from the Agawam on both sides of the Connecticut River. He took a deed for it, a signed paper that records who owns a piece of land. The deed names Commucke and Matanchan, "ancient Indians of Agaam," acting for the community, and Cuttonus as "the right owner." Pynchon paid 18 fathoms of wampum, 18 coats, 18 hatchets, 18 hoes and 18 knives. A fathom is six feet, here

a length of strung beads. The deed states that the Agawam kept their planted fields and their right to take fish, deer, ground nuts, walnuts and acorns. It also states that they would be paid if English cattle damaged their corn.

Seven of John Pynchon's account books survive, covering 1651 to about 1702. Almost every adult in Springfield bought goods at his shop. The editors who printed the books found only a few payments in coins. Books like these record what ordinary colonists bought, item by item.

John Stewart

Who: A Scottish soldier, captured in war and sold into forced labor, who became the blacksmith of Springfield and bought on credit at John Pynchon's shop for more than thirty years.

When and where: Springfield, Massachusetts, 1653 to 1689.

John Stewart bought his own freedom on credit. He was a Scottish soldier. Soldiers of Oliver Cromwell's army captured him at the Battle of Dunbar, in Scotland, in 1650. The men on the council that ruled England ordered Sir Arthur Haselrig, the governor at Newcastle, to hand over 150 of the Dunbar prisoners to the agents of John Becx and Joshua Foote. These two men had put money into an ironworks in Massachusetts, a works that made iron. In his own recorded words, Stewart was "sold for eight years service." That meant he was forced to work for whoever owned his service until the eight years ran out. As prisoners in the hands of Becx and Foote's agents, Stewart and the other men boarded a ship called the *Unity*, whose master was Augustine Walker. Stewart arrived in New England in December 1650. He worked at the ironworks at Lynn, in Massachusetts. Then the merchant John Pynchon bought his service and took him to Springfield.

On December 29, 1653, Pynchon wrote in his account book that Stewart owed him £30 "for releasing him from my Service." The sign £ stands for pounds, the main English unit of money. Shillings and pence were smaller units. Stewart agreed to pay an extra 12 shillings a year for three years while Pynchon waited for the £30. He paid that extra in blacksmith's work, "in mending or making of Iron worke."

Stewart became the Springfield blacksmith. His page in Pynchon's ledger lists what he bought, item by item. A forge is the fire where a blacksmith heats iron to shape it. For his forge he bought 241 pounds of iron by weight in one purchase, then more bars of iron every few weeks, bars of steel and a coal basket. He also bought a sword and belt, a grindstone, a pair of boots, wool cloth, silk and buttons, a bushel of apples, soap, a comb, pepper and ginger. Pynchon charged him for using Pynchon's tools at the shop and for an old bellows, the air pump that blows on a forge fire.

> Almost none of it was paid in coins. By December 23, 1654, Stewart had paid in two lots of wampum and in smith's work, including work on Pynchon's mill. Neighbors also paid wheat to Pynchon for him. He still owed £13 6s. The letter s stands for shillings. Later he paid in land and in a day of haymaking.
>
> The editors of the account books explain that in 1660 he was fined for striking a man named William Morgan and breaking his nose. In 1662 he was fined for playing cards at his house. The books do not say who set the fines. By 1664, ten years after his first purchases, he was still buying on the book: sugar again and again, salt, gunpowder, scissors, pins, a knife for "the Boy," and iron for the troopers' horseshoes. Troopers were soldiers on horseback. On February 20, 1666, he owed £11 17s 1d. The d stands for pence. The same page charges him £1 as a fine for himself and his wife for "unseasonable night meetings."
>
> Pynchon's books list his purchases until 1689. He died at Springfield on April 21, 1691. The Scottish Prisoners of War Society, a group that traces the Dunbar prisoners, knows of no family he left when he died.

1700 to 1750

In the 1700s, colonial families began buying British-made goods in large amounts. Goods made in Britain became cheap enough for them. Shops in the port towns sold these goods, and in Philadelphia Benjamin Franklin made advertisements pay for much of his newspaper. Colonists also bought and sold enslaved people. In New York, city officials set up a market where enslaved people were sold. Printers, Franklin among them, ran advertisements offering enslaved people for sale.

The consumer revolution

A consumer is a person who buys goods to use them. The words "consumer revolution," meaning a big change in buying, name what happened in the colonies during the 1700s. Colonists had made many of their own clothes, tools and kitchen things. Now they began buying them instead, mostly from Britain.

In Britain, makers found better ways to make goods. Merchants got better at shipping goods across the ocean and at selling them on credit. Prices fell. At the same time, colonial families earned more. Goods that only rich families had owned became ordinary.

Tea came with a whole set of goods: a teapot, cups, sugar and a table to set them on. Buying goods like these became a sign that a family was respectable.

A market where people were sold

In New York, colonists bought and sold enslaved people at a market that city officials set up. The Common Council was the group of men who ran New York City, and its members were called aldermen. On November 30, 1711, the aldermen passed a law that set up the market at the bottom end of Wall Street, near Pearl Street and Water Street.

Slaveholders sold enslaved Africans at this market and rented them out to others as workers. They sold and rented out Native people held in slavery there too. The law required owners who rented out enslaved people as workers by the day to do it at this market. Buyers also inspected the people for sale there, looking them over before buying. The accounts of the market do not describe how the inspections were done. The market was a wooden building with a roof and open sides. It held about 50 men. Slaveholders used it for 51 years, until 1762.

In 2015, Jim O'Grady, a reporter for the New York radio station WNYC, wrote that thousands of people were sold at the market: men, women, shiploads of children and captured Native people. In 1700, New York had about 5,000 people. At least 750 of them were enslaved. The city's aldermen chose the place for the market. The accounts of the market do not name the men who bought and sold people there.

In 2015, Jumaane Williams, a member of the New York City Council, asked for a sign to mark the place where the market stood. In June of that year, Mayor Bill de Blasio officially opened the sign at Wall Street and Water Street.

Newspaper advertising begins to pay

An advertisement is a notice that a seller pays to have printed, so that people will buy what the seller offers. On October 2, 1729, Benjamin Franklin bought a newspaper in Philadelphia, the *Pennsylvania Gazette*, from a printer named Samuel Keimer. Under Franklin, the money that sellers paid for advertisements became one of the paper's main sources of income.

Franklin changed the way the advertisements looked. He put more empty space around them and used letters of different sizes. The *Gazette* grew from two pages to four, partly to make room for more advertisements.

Benjamin Franklin

Who: The Philadelphia printer who made advertising pay for a newspaper, and who ran advertisements in it selling enslaved people.

When and where: Philadelphia, from October 2, 1729.

Movie: *Benjamin Franklin* (2022), a documentary by Ken Burns, shown on PBS. It covers Franklin's whole life.

Benjamin Franklin made his fortune as a printer partly by selling space in his newspaper to advertisers. When he took over the *Pennsylvania Gazette* in 1729, it had about 90 subscribers, the people who paid to get every copy. By 1748 it had more than 1,500. It was the most widely read newspaper in the colonies.

Some of the advertisements Franklin ran offered enslaved people for sale. Franklin published the *Gazette* for 37 years, counting the years after 1748 when he was David Hall's partner in the paper. In those 37 years, the *Gazette* printed at least 277 advertisements offering at least 308 enslaved people. Franklin ran these notices. He took the fees for these notices and acted as the go-between for the buyers and the sellers. He printed notices about servants who had run away from the people they were bound to work for.

In 1748, when he was 42, Franklin stepped back from printing. He made a partnership with a printer named David Hall. Hall ran the shop, and Franklin kept a share of the profits. Much of the money that let Franklin stop working at his trade early came from the paper's advertising.

Shops and shopkeepers in the port towns

Shops in the port towns sold cloth and other goods brought in from London. Some sold haberdashery, which means small sewing goods such as thread, ribbons and buttons. Shopkeepers ordered their goods from London. Colonists who bought on credit could end up in debt to a local shopkeeper or to a merchant in London.

Women ran some of these shops. Elizabeth Murray came to Boston from Scotland in 1749, when she was 23. She opened a shop that sold cloth and other goods from Britain. Her brother's business friends helped her get started. She traveled to London to choose the goods for her shop, and she earned enough to support herself. Later she helped other women open shops.

1750 to 1800

From 1767 to 1770, many colonists refused to buy British goods as a protest against British taxes. Merchants promised not to bring the goods in, and families made their own cloth instead of buying it. Members of merchants' committees warned shopkeepers who kept selling British goods. The men at Boston's town meeting voted to write two of those shopkeepers' names into the town record. At a shop door in Boston, Ebenezer Richardson shot and killed a boy, Christopher Seider. Away from the ports, a single storekeeper sold a whole farming neighborhood its goods on credit until the next harvest.

Non-importation

In 1767, members of Parliament, the lawmaking body in London, passed a tax law called the Townshend Revenue Act. It set duties, which are taxes on goods brought into the colonies from Britain. Colonists who opposed the duties answered by refusing to buy British goods. Refusing to buy something as a protest is called a boycott.

The seniors at Harvard College in Massachusetts voted in the autumn of 1767 not to drink tea or wear imported British clothes at their graduation. It was a protest against the Townshend duties. Imported goods are goods brought in from another country. At the next year's graduation, the seniors' printed theses were on paper made in New England. The theses were a printed sheet of the ideas the graduates were ready to argue for in public at the ceremony.

On August 1, 1768, about 60 Boston merchants and traders signed the Boston Non-Importation Agreement. They promised not to import most British goods from January 1, 1769, to January 1, 1770. Within two weeks, all but 16 of the town's merchants had joined.

The value of British goods brought into Boston fell from about £420,000 in 1768 to about £208,000 in 1769. That is about half. In 1770, members of Parliament took back most of the Townshend taxes. The agreement in Boston ended that year.

Spinning instead of buying

If families did not buy British cloth, they had to make their own. Cloth made at home was called homespun. To make it, women first spun wool or flax into yarn on a spinning wheel. Flax is a plant whose stems give the threads for linen. Then the yarn was woven into cloth.

Women in New England held at least 46 spinning meetings between 1768 and 1770, where they spun together in public. In all, 1,644 women took part. Ministers held 30 of the meetings, and those 30 drew 94 out of every 100 of the spinners.

In August 1769, women in Brookfield, Massachusetts, met at the minister's house from 5 o'clock in the morning. The young woman who did best on the linen wheel spun 70 knots. A knot was a measured length of yarn. One married woman did her morning work at home and made cheese first. Then she rode more than two miles carrying her wheel, spun from 9 in the morning to 7 at night, and finished 53 knots. After that she went home to do the milking.

Members of a society in Hartford, Connecticut, offered a prize of 12 pounds to whoever made the most yards of woolen cloth in a year. Printers ran newspaper stories about the meetings. Only six of those stories called the spinners "Daughters of Liberty," a name for women on the side of the protest.

Ame and Elizabeth Cuming

Who: Two sisters who kept a shop in Boston, refused to join the boycott and were named in the newspaper and the town record for it.

When and where: Boston, 1765 to 1776, then Halifax, Nova Scotia.

Ame and Elizabeth Cuming sold imported goods in Boston and would not stop when the town's merchants told them to. The sisters were not married and were in their middle thirties. Their parents were from Scotland, and they grew up in Concord, Massachusetts. By 1765 they lived in Boston and earned their own living. They sold fashionable goods from London, taught embroidery, which is sewing pictures and patterns with colored thread, and took in young women who paid to live with them. Elizabeth Murray had helped them start their business.

In late 1769, a shipment of silk and haberdashery worth £300 reached them from London. In the middle of November, men from the merchants' committee came to the shop. They warned the sisters of "consequences" if they sold the goods. The sisters refused. They said they had never entered into any agreement not to import. They called themselves "two industrious Girls" who were trying "in an honest way" to earn their bread.

A notice in the *Boston Gazette* described them as "enemies to their country" who "preferred their own little private Advantage to the Welfare of America." On March 19, 1770, the men at Boston's town meeting voted to write the sisters' names into the town record. The wording of the vote states that this was so that "POSTERITY may know" they had "opposed their Country." Posterity means the people who live later.

> In March 1776, the Cuming sisters left Boston with the Loyalists, the colonists who sided with Britain in the Revolutionary War, and went to Halifax, Nova Scotia. By 1780 they were "more prosperous than ever they were in Boston."

A killing at a shop door, 1770

In February 1770, a Boston man named Ebenezer Richardson shot and killed a boy, Christopher Seider, during a protest at a shop door. Theophilus Lillie kept the shop, in Boston's North End. He went on selling imported goods during the boycott. On February 22, 1770, a carved head on a long pole was set up in front of his shop door. Some accounts say it was a sign that read "Importer." Thomas Hutchinson's letter about that day does not name who put it there. A crowd of boys and young men gathered and let no one go into the shop.

Richardson was Lillie's neighbor. He was a customs informer. Customs officials collected the taxes on goods brought in by ship, and they paid informers like Richardson to report smugglers. Richardson tried to pull the pole down. The crowd threw stones and sticks at him, chased him into his house and broke his windows. From inside the house, Richardson fired a musket at the boys. The shot hit Christopher Seider in the chest, and he died soon after. Christopher was 10 and a half years old in the letters of Thomas Hutchinson, and 11 in most other accounts. Hutchinson was the acting governor of Massachusetts, running the colony for the king while the governor was away in England. Hutchinson wrote that Richardson "killed one & wounded another." The second boy was hit in the thigh.

Christopher Seider's funeral was on February 26, 1770. A funeral procession is the line of people who walk behind the coffin. Hutchinson wrote that people said Christopher's procession "reached from the Town House to Liberty Tree," two places in Boston. The modern editors of his letters call it the largest procession ever seen in Boston, as people reported it at the time. Richardson was tried for murder on April 20, 1770. The next day the jury found him guilty. The judges believed he was innocent, and they put off his sentence.

The country store and the crop ledger

Away from the port towns, one country storekeeper sold goods to a whole farming neighborhood. Customers paid in crops, in work and in promises to pay later.

The storekeeper wrote each family's debt in a ledger. A farm family bought goods all through the year and paid after the harvest. When a harvest failed, the family could not pay, and the debt carried into the next year.

Some of these account books survive, and they name the customers. Robert Townsend kept a shop in Oyster Bay, on Long Island, and kept account books there and in New York. His surviving books cover 1773 to 1785. Staff at the East Hampton Library have copied them out and published them. One book runs from April 1, 1773, to November 15, 1779. In 1773 it lists tea at 4 shillings 8 pence a pound, stockings, calico, which is a cotton cloth, linen cloth, gloves, packs of pins, molasses, and large barrels of spirits, a strong liquor.

Townsend's customers paid mostly in cash. Library staff counted the payments in his book from 1773 to 1779. In their count, 73 out of every 100 were cash, 22 were farm goods and 5 were notes, which are written promises to pay. Some customers also paid in work.

1800 to 1850

Peddlers carried goods from house to house in the first half of the 1800s, selling to farm families in the country. P.T. Barnum sold tickets to his shows with posters and newspaper advertisements, and he lied in them. His first show was an enslaved woman, Joice Heth, whom he advertised as 161 years old. In 1846, A. T. Stewart opened a store in New York with several floors of goods and a set price on each one.

The peddler's trade

A peddler traveled a route through the countryside and sold goods at people's doors. Some went on foot. Others drove a wagon. They carried tinware, clocks, pins, needles, combs, books and patent medicines, which were bottled remedies sold under a brand name. Tinware means pots, pans, cups and other things made of thin sheets of metal coated with tin. The tin peddlers from Connecticut were the best known.

> ### James Guild
>
> **Who:** A Vermont farm boy who set out to peddle with a trunk of goods and wrote down what happened to him.
>
> **When and where:** Tunbridge, Vermont, and the roads beyond it, 1818 to 1824.
>
> James Guild peddled goods from a trunk in 1818 and wrote down what happened to him. He lived in Tunbridge, Vermont, and from the age of 9 he was bound out to work on a farm. Being bound out meant he had to work for a farmer until he turned 21. In the

opening pages of his journal, Guild does not say who bound him out. He turned 21 on July 9, 1818. In his own words, "My disposition would not allow me to work on a farm." Disposition here meant his nature, the kind of person he was.

Guild held a note, a written promise that someone would pay him money. He could not turn the note into cash, so he traded it for "a trunk of goods." The first entry in his journal is headed "Tunbridge Oct, 5th 1818." Tunbridge is a town about thirty miles from Montpelier. He felt ashamed of the work. He wondered why he "should stoop so low as to follow so mean a calling." Here mean meant low, and a calling was a trade.

At the houses he visited, he asked, in his own spelling, "do you wish to by some harecombs, needles, buttons, buttonmolds, sewing silk." Customers who wanted to buy "would want to banter until they could get it for nothing." To banter here meant to haggle, or argue over the price.

At first he sold very little. On the road toward the Dog River, he wrote, "I think I traveled 3 days and selling but 30 cent worth of goods." At poor houses that wanted "a needle or a few pins," he gave them away, and he believed he gave away more than he sold. He killed a partridge with a stone and traded it for "a dish of bread and milk." A flood had carried off a bridge, so he crossed the river on a log and fell in with his trunk.

Over the next six years, Guild went from peddling to mending pots and pans as a tinker, then to teaching school, then to painting portraits. In the end he went to London. In 1937 an editor at the Vermont Historical Society printed his journal as *From Tunbridge, Vermont, to London, England*.

P.T. Barnum

Who: A showman who sold tickets through advertising, and whose first paid show was an enslaved woman he put on show under a false claim.

When and where: New York City and towns across the Northeast, from 1835.

Movie: *The Circus* (2018), a two-part documentary in the *American Experience* series on PBS. It is about the American circus and tells a large part of Barnum's story.

Phineas Taylor Barnum started his career in show business by showing an enslaved woman named Joice Heth to paying crowds. He lied about her age. In 1835 a man named R. W. Lindsay of Kentucky signed a contract to sell Barnum possession of Heth.

Possession meant that Barnum now held her. Under the contract, Barnum could show her for ten months. Heth was Black, elderly and blind. Barnum advertised her as George Washington's nurse and said she was 161 years old.

For seven months, Barnum and his partner, Levi Lyman, showed Heth to paying crowds in cities and towns across the Northeast. The two men put her on show in taverns and inns, which were places where people drank, ate and stayed the night, and in museums, railway houses and concert halls. To bring in the crowds, they used posters and advertisements in the *New York Sun*. When fewer people came, Barnum wrote a letter to a Boston newspaper without signing his name. In it he claimed that Heth was a machine made of whalebone and old leather, and not a person. People came back to see for themselves.

Joice Heth died in February 1836. Barnum then sold tickets to a dissection of her body. A dissection is the cutting open of a dead body to look at its insides. On February 25, 1836, at the City Saloon in New York, 1,500 people paid 50 cents each to watch. Dr. David L. Rogers, a surgeon, cut open her body. Doctors and medical students were in the crowd. Rogers examined her heart, her lungs, her brain and the places where the bones of her skull join. He decided that she had been no more than 75 years old, or at the most 80.

A humbug is a trick or a false claim made to fool people. Barnum called himself the "Prince of Humbug." He wrote a book called *The Humbugs of the World*. Its copyright is dated 1865, and its title page says 1866. In it he wrote that humbug did not include crimes or swindles, which are tricks to cheat people out of their money.

In 2017 a musical movie about Barnum came out, called *The Greatest Showman*. Its story is mostly made up, and it leaves out Joice Heth.

Barnum's American Museum

In 1841 Barnum bought John Scudder's American Museum, at Broadway and Ann Street in New York. A day's ticket cost 25 cents.

In 1842 Barnum showed the Feejee Mermaid there. His advertisements showed pictures of a beautiful creature, half woman and half fish. The object in the museum was the head and upper body of a monkey sewn to the tail of a fish. Large crowds came to see it in New York for about a month.

The Marble Palace

Alexander Turney Stewart opened a dry goods store at 280 Broadway in New York on September 21, 1846. Dry goods means cloth, clothing and sewing supplies. The building was faced with Tuckahoe marble, and it became known as the Marble Palace.

Stewart sold goods to shoppers on several floors, and that was new. Before, stores sold to shoppers only on the ground floor. The upper floors were used for wholesale, which is selling goods in bulk to other sellers, or as living space. Stewart also set a standard price on his goods, so that customers did not haggle. He held sales to bring in women customers.

Many writers call the Marble Palace the first American department store. A department store is a large store with many kinds of goods, each kind in its own section, called a department. Definitions of a department store differ, so other writers name Macy's or Wanamaker's as the first. The Marble Palace building still stands. It is now called the Sun Building.

1850 to 1900

Between 1850 and 1900, city shoppers and farm families both got new ways to buy. Department store owners such as John Wanamaker made price tags and money-back promises common. Mail-order sellers mailed catalogs to farm families, who could then order goods by mail. The A&P, a chain of stores, started in 1859, and N. W. Ayer & Son, usually called the first advertising agency in the country, started in 1869. Edward Clark, a partner in the Singer sewing machine business, began selling the machines across the whole country on monthly payments. Sellers also used advertisements to sell medicines that harmed people. In 1859 a slave dealer advertised the largest recorded sale of people in the United States.

Paying a little each month

In 1856 Edward Clark began selling Singer sewing machines on installments. Buying on installments means taking the goods home now and paying for them in small amounts over time. Isaac Singer's company made the machines, and Clark, a lawyer, was Singer's business partner.

In February 1856, Clark announced that customers could trade in any old sewing machine, even a worthless one, for $50 off a new Singer. In September 1856 he began the installment sales. Furniture makers in New York and clock makers in New England had already sold goods this way. Peter Lyon, who wrote the history of Singer's machine for the magazine *American*

Heritage in 1958, calls Clark's plan the first time a business selling across the whole country did it. A writer for the magazine *Scientific American* said that a woman "would rather pay $100 for a machine in monthly installments of five dollars" than pay $50 all at once.

A Singer machine that sold for $110 could cost as little as $23 to make.

The department store

Macy's department store began as a small dry goods store. Rowland Hussey Macy opened it at Sixth Avenue and 14th Street in New York on October 28, 1858. On the first day he took in $11.06, according to most accounts, or $11.08, according to others. In his first year he took in about $85,000.

John Wanamaker opened a store called the Grand Depot in Philadelphia in 1876. The store stood at Thirteenth Street and Market Street, in a building that had been a freight station of the Pennsylvania Railroad. A freight station is a building where trains load and unload goods.

Wanamaker gets the credit for making three practices common: one price for every customer, a printed price tag on the goods and a promise of money back on anything returned. He was not the first to use all of them. A. T. Stewart had set fixed prices in 1846, and histories of the Wanamaker stores call Wanamaker "one of the first" to use the other two.

With a money-back promise, a customer who bought something poor could return it and get the money back. Montgomery Ward, a mail-order seller, made the same promise to customers who bought goods without seeing them first.

John Wanamaker

Who: A Philadelphia merchant who gets the credit for spreading the price tag and the money-back guarantee in American stores.

When and where: Philadelphia, from 1861, and the Grand Depot from 1876.

John Wanamaker gets the credit for spreading the one-price rule: every customer paid the price marked on the goods. A. T. Stewart had already set fixed prices in New York in 1846. Before stores like these, customers bargained over prices, as James Guild's customers did when he peddled in Vermont. He opened a store selling men's clothes in Philadelphia in 1861, with his brother-in-law Nathan Brown. In 1876 he turned a railroad freight building into the Grand Depot.

> A guarantee is a promise. Wanamaker promised customers their money back on anything they returned. In 1879 he bought a whole page of a newspaper for one advertisement. It was the first full-page newspaper advertisement bought by an American department store.
>
> From 1889 to 1893, Wanamaker was the US Postmaster General, the official in charge of the national mail service. He pushed for rural free delivery, a service in which postal workers carried mail to farm families' homes. Later, mail carriers on those rural routes brought catalogs from mail-order companies, his competitors, to the same farms.

People sold at auction: Savannah, 1859

Slave dealers advertised sales of people in the newspapers, the same way sellers advertised goods. Pierce Mease Butler held people in slavery on Georgia plantation land. On March 2 and 3, 1859, he sold between 429 and 436 of them, men, women and children, to pay his gambling debts. The sale took place at the Ten Broeck Race Course, a racetrack near Savannah, Georgia. It was the largest single sale of enslaved people recorded in the United States.

Joseph Bryan, a slave dealer in Savannah, ran the sale. He advertised it for weeks in the Savannah newspapers and in papers in Charleston, Macon, Augusta, Mobile, New Orleans, Memphis and Richmond. The sale brought Butler $303,850. It rained hard on both days.

The terms of the sale stated that people would be sold in families, but only as far as the terms allowed. Under those terms, some husbands and wives could not be bought together. Different buyers bought the husband and the wife, and each buyer took away the person he had paid for. Black Georgians remembered the two days as "the weeping time."

Mortimer Thomson, a reporter for the *New York Tribune*, went to the sale pretending to be a buyer. He wrote a long account of what he saw, and the *Tribune* printed it under the title "What Became of the Slaves on a Georgia Plantation?"

Chain stores and the five-cent store

In 1859, George Gilman started a business in New York selling tea and coffee. Most company histories name George Huntington Hartford as his partner from the start. Other accounts say Hartford began by working for Gilman and rose to run the business later. In 1869 the owners named it the Great Atlantic and Pacific Tea Company, to mark the finishing of the first railroad

across the country. People called it the A&P. It became a chain store, one of many stores that belong to the same owners and sell the same kinds of goods. The A&P had 70 stores by 1878 and nearly 200 by 1900.

Frank Winfield Woolworth opened a store in Utica, New York, on February 22, 1879. Everything in it cost five cents. The store did well for about two weeks and then failed. On June 21, 1879, he opened another five-cent store in Lancaster, Pennsylvania, and that one succeeded.

Advertising agencies and patent medicines

Francis Wayland Ayer started an advertising agency in Philadelphia in 1869, when he was 21. An advertising agency is a business that plans advertisements for sellers and buys space for them in newspapers and magazines. His father, Nathan Wheeler Ayer, gave him $250, and Francis named the business after his father: N. W. Ayer & Son. It is usually called the first advertising agency in the country. Ayer showed his customers what each newspaper charged for space. That way the sellers knew he was working for them and not for the newspapers.

Lydia E. Pinkham's Vegetable Compound, a patent medicine, went on sale in the middle of the 1870s. Its advertisements stated that it cured almost any "female complaint," meaning a health problem of women. Smithsonian museum records and other histories give the mixture as 18 to 20 percent alcohol. Its label stated that the alcohol was there to dissolve and preserve the other ingredients. Pinkham's sons put her picture in the newspaper advertisements. She asked customers to write to her personally, and she used their letters to sell more of the compound.

Jeremiah Curtis and his partner, Benjamin A. Perkins, began selling Mrs. Winslow's Soothing Syrup in 1849. They sold it to mothers to give to babies who were teething, or growing their first teeth. The syrup held alcohol and morphine, about 65 milligrams of morphine in each ounce. Morphine is a strong painkilling drug. It slows a person's breathing, and too much can kill, especially a child. One teaspoon of the syrup held enough morphine to kill an average child. The makers advertised it on recipe cards, in newspapers, on calendars and on trade cards, which were small printed cards given out to customers.

In 1906, members of Congress passed a food and drug law that required makers to list the drugs in their medicines on the label. Some time after that law, the makers of Mrs. Winslow's syrup took out the morphine and dropped the word "soothing" from its name. In 1911, the American Medical Association, the national organization of doctors, printed a book called

Nostrums and Quackery. A nostrum is a fake cure, and quackery is selling fake medicine. The book listed Mrs. Winslow's syrup under the heading "Baby Killers." No one counted how many children the morphine in the syrup killed.

Mail order reaches the farm

On August 18, 1872, Aaron Montgomery Ward mailed his first catalog from Chicago. Mail order means choosing goods from a printed list, called a catalog, and ordering them by mail. Ward's first catalog was one sheet of paper. According to the Chicago History Museum, it listed 163 items. The reference work Encyclopedia.com gives about 150.

Late in 1872, leaders of the Illinois Grange, an organization of farmers, made Ward their buyer. His catalog grew to 32 pages in 1874 and to 152 pages in 1876, with about 3,000 items.

In 1886 Richard Warren Sears, a railroad station agent in Minnesota, began selling watches. A station agent was the railroad worker in charge of a station. He moved his watch business to Chicago. There he worked with a watchmaker, Alvah Roebuck. In 1893 their company became Sears, Roebuck and Company, and that year its catalog ran to 196 pages.

Many city people had their mail brought to their homes for free from 1863. Before 1896, farm families had to pick up their mail at the post office. A Postal Service history describes farmers who had to unhitch the horse from the plow and go five or six miles into town to get it. On October 1, 1896, postal workers began bringing mail to farm families' homes in West Virginia. The first three routes started from Charles Town, Halltown and Uvilla. This service was called rural free delivery. Within a year, 44 routes were running in 29 states.

Aaron Montgomery Ward

Who: A traveling salesman who worked out that a farm family could buy from a printed list instead of from a country store.

When and where: Chicago, from August 18, 1872.

Aaron Montgomery Ward built his mail-order business on a complaint he heard from farmers about their country stores. From 1865 he worked as a clerk at the Chicago store that later became Marshall Field's. Then he worked for a wholesale dry goods company, Willis, Gregg and Brown. After that he traveled as a salesman for Walter M. Smith and Company, a St. Louis company that sold goods in bulk to stores.

On the road, Ward heard the farmers' main complaint. Country general stores charged high prices and had few goods to choose from. The farmers also blamed the middlemen, the sellers between the maker and the buyer, for taking too much profit. Ward's plan was to buy straight from the factories, pay cash and sell straight to customers by mail.

The Chicago Fire of 1871 destroyed Ward's savings. In 1872 he started over with $1,600 of his own and $800 from his brother-in-law, George R. Thorne.

On November 8, 1873, the *Chicago Tribune* printed an article headed "Grangers, Beware!" The article described Montgomery Ward & Co. as a "swindling firm" that hid behind a post-office box. Ward sued the *Tribune* for libel and asked for $20,000. Libel is printing something false that harms a person's name. On December 24, 1873, the editors of the *Tribune* printed a notice taking back the charge. In it they called Ward's company "a bona fide firm, composed of respectable persons, and doing a perfectly legitimate business." Bona fide means real.

Ward promised that customers could send goods back for their money. His 1875 catalog included the words "satisfaction guaranteed or your money back." The Encyclopedia.com entry on Ward dates the promise a year earlier, to 1874. When he died in 1913, his company sold $40 million worth of goods a year and had 6,000 workers.

Richard Sears

Who: A railroad station agent who started by selling watches and went on to build the Sears catalog.

When and where: Minnesota in 1886, then Chicago.

Movie: *Mr. Sears' Catalogue* (1989), a documentary in the *American Experience* series on PBS, about Richard Sears and his catalog.

Richard Sears began his business with a shipment of watches that someone else refused. He was born on December 7, 1863, in Stewartville, Minnesota. In 1886 he was a station agent for the Minneapolis and St. Paul Railroad, at North Redwood, Minnesota. That is the station *Encyclopaedia Britannica* names. The Encyclopedia.com entry names Redwood Falls, the town next to North Redwood. He was 22 when the year began and 23 by its end.

That year a jeweler refused a shipment of watches that came to Sears's station. Sears got permission to sell the watches himself. He sold them to other station agents along the line for $14 each. Then he quit the railroad and started the R. W. Sears Watch Company in

Minneapolis. He moved the business to Chicago, where he hired a watchmaker, Alvah C. Roebuck, to repair watches that customers sent back.

Sears wrote the words in the catalog himself. At its biggest, the Sears catalog ran to about 1,500 pages and listed about 100,000 items. The documentary *Mr. Sears' Catalogue* states that it went to about 20 million people at its height. The company's own counts and later accounts differ, so these figures are estimates.

Sears resigned as president of the company in 1908 or 1909. *Encyclopaedia Britannica* gives 1908, and Encyclopedia.com gives 1909. He died on September 28, 1914.

Persis Foster Eames Albee

Who: The first woman to sell door to door for the company that later became Avon.
When and where: Winchester, New Hampshire, and across the Northeast, from 1886.

Persis Foster Eames Albee was 50 years old in 1886 when David McConnell hired her to sell perfume door to door. McConnell had sold books from house to house. He gave away perfume as a free gift with the books, and he found that customers liked the perfume more than the books. He started a perfume company, the California Perfume Company. It later became Avon.

Albee lived in Winchester, New Hampshire. She became the company's first General Traveling Agent. She sold the Little Dot Perfume Set, which held five scents: violet, white rose, hyacinth, lily of the valley and heliotrope, a small purple flower. She sold it from house to house in Cheshire County, New Hampshire, and then across the Northeast. She also found other women to sell for the company and trained them.

Most of what is known about Albee comes from Avon's own history of itself.

In 1886, women in most of the United States could not vote. Women did vote in three western territories, lands that were not yet states: Wyoming from 1869, Utah from 1870 and Washington from 1883. In 1887, lawmakers in Congress took the vote away from women in Utah, and judges on Washington's highest court struck down that territory's law. Wyoming became a state in 1890, and its women kept the vote.

> In 1920, 34 years after Albee started selling, the Nineteenth Amendment became part of the Constitution. An amendment is a change added to the Constitution. This one states that no state and no federal official may keep a citizen from voting because of whether the citizen is a man or a woman.

1900 to 1950

Chain stores grew fast between 1900 and 1950. A chain is a group of stores with the same owners and the same name. One grocery chain, the A&P, went from about 200 stores in 1900 to about 15,000 in 1930. Grocers began letting customers take goods off the shelves themselves. Families bought cars and radios on monthly payments. Sellers began paying radio and television stations to carry their advertisements into people's homes. In coal towns, coal companies paid miners in their own company money, which only the company's own store took at full value. During the Second World War, shoppers needed ration stamps from the government as well as money to buy many foods.

The chain store at full size

The A&P had 1,600 stores by 1915. By 1930 it had about 15,000 stores and sold $2.9 billion worth of goods a year. That made it the largest retailer in the world. A retailer is a seller who sells goods to the people who use them. The A&P was the largest grocery seller in the United States from 1915 to 1975.

Woolworth's stores had lunch counters, where customers sat and ate. In the South, the people who ran these counters served white customers only. Later, on February 1, 1960, four Black students from North Carolina A&T, a college in Greensboro, North Carolina, sat down at the Woolworth counter there and asked to be served. They were Ezell Blair Jr., Franklin McCain, Joseph McNeil and David Richmond. The counter staff refused to serve them. Hundreds of people joined their protest over the next six months. On July 25, 1960, the manager of the lunch counter picked three Black workers from the store's kitchen. He told them to get dressed, walk around the store like customers and then sit at the counter. One of them, Geneva Tisdale, ordered an egg-salad sandwich. In Tisdale's own telling, the three of them were chosen as the first Black people to eat at that counter.

F. W. Woolworth

Who: The storekeeper who built a national chain of five-cent and ten-cent stores and paid cash for the tallest building in the world.

When and where: Utica and Lancaster, 1879, and New York, 1911 to 1913.

Frank Winfield Woolworth turned his five-cent stores of 1879 into the largest store company in the world. On November 12, 1911, he signed agreements to join his chain with four rival chains. They were the Knox, Kirby, Charlton and C. S. Woolworth chains. The new F. W. Woolworth Company started with 596 stores and $65 million in capital, which is the money put into a business to run it. The new company was formally set up in 1912, so some histories give that year as its start.

In 1913 the Woolworth Building was finished in New York. At 792 feet, it was the tallest building in the world at the time. It cost $13.5 million, and Woolworth paid for it himself, in cash.

Self-service

In a self-service store, customers pick goods off the shelves themselves instead of asking a clerk to fetch them. Clarence Saunders opened the first Piggly Wiggly store at 79 Jefferson Street in Memphis, Tennessee, on September 6, 1916. Some accounts give the date as September 11. Customers came in through a turnstile, a gate with turning arms that lets one person through at a time. Then they had to follow a single fenced path past every shelf in the store before they reached the place where they paid.

Saunders asked the government for a patent on his "Self-Serving Store" on October 21, 1916. A patent is a government paper that lets only the inventor use an invention for a number of years. He received Patent 1,242,872 on October 9, 1917.

King Kullen opened in Jamaica, in Queens, New York, on August 4, 1930. Michael J. Cullen started it. He had worked for the Kroger grocery company and had sent its managers a plan for a supermarket, which they ignored. By the account of the Smithsonian, the national museum in Washington, King Kullen was the first supermarket. It met the museum's five tests: separate departments, self-service, low prices, many stores under one name and buying goods in huge amounts. Cullen's slogan, a short phrase repeated in advertising, was "Pile it high. Sell it low."

Clarence Saunders

Who: The Memphis grocer who started self-service shopping and then lost his company fighting traders on Wall Street.

When and where: Memphis, Tennessee, 1916 to 1923, and later stores. He died in 1953.

Clarence Saunders built Piggly Wiggly into a chain of 1,268 stores and then lost it in a fight over its stock. By 1923 the stores sold $100 million worth of groceries a year. Piggly Wiggly was the third-largest grocery business in the country. Saunders had put the company's stock up for sale on the New York Stock Exchange, a market where people buy and sell shares. A share of stock is a small piece of ownership in a company.

The Tennessee Encyclopedia and writers on the history of money and business tell the fight this way. In early 1923, some Piggly Wiggly stores in New York that other owners ran under the Piggly Wiggly name failed. Traders then began selling Piggly Wiggly stock short. Selling short is a bet that a stock's price will fall. The trader sells borrowed shares and plans to buy them back later at a lower price.

Saunders fought back. He borrowed about $10 million from bankers in the South, added his own money and kept buying shares. In the end he held orders for 196,000 of the 200,000 shares that existed. Then the men who ran the Stock Exchange stopped trading in the stock and gave the short sellers more time to pay. Within months Saunders was bankrupt, which means he could not pay his debts, and he was out of the company.

He started again with a new chain called the "Clarence Saunders, Sole Owner of My Name" stores. They did well until the 1930s, when they failed during the Great Depression, the years of hard times that began in 1929. Later he built the Keedoozle, a grocery store that worked like a vending machine. It never made a profit. Saunders died on October 15, 1953.

The company store

Many coal companies in Appalachia owned the store in their mining towns and paid their miners mostly in scrip instead of dollars. Scrip was the company's own money, made as metal coins or paper. A miner could draw scrip against pay he had already earned. The company store took it at full value, but the company would not trade it for cash. Other merchants nearby took scrip only at a discount of 10 to 30 percent. That meant a miner who spent $1 of scrip at another store got only 70 to 90 cents' worth of goods.

In 1922 researchers for the US Coal Commission, a government group that studied the coal industry, checked prices in coal towns. In southern West Virginia, company stores charged 4.2 percent more for food than independent stores. In Alabama they charged 7 percent more. The economist Price Fishback later studied these numbers. An economist is a scholar who studies how money, work and business fit together. He found that most companies did not let a miner's store debt run longer than two weeks.

A page by the West Virginia Mine Wars Museum describes scrip differently. It states that scrip "created a kind of debt bondage that kept coal miners and their families tied to their employer for almost everything they needed to survive." Debt bondage means being forced to keep working to pay off a debt. Fishback found small price gaps and short debts. The museum calls the system debt bondage.

In 1891, West Virginia lawmakers passed a law that let companies give out scrip only as pay for work already done or as an advance on wages. In 1925 they made it against the law to pass scrip from one person to another. Scrip disappeared when the coal industry collapsed in the 1950s.

The catalog under Jim Crow

Jim Crow is the name for the laws and customs in the South under which white lawmakers and officials kept Black people apart from white people in schools, railroad cars, waiting rooms, courtrooms and cemeteries, and at water fountains. White mobs enforced it with murder. Between 1877 and 1950, white mobs lynched more than 4,400 Black people, by the count of the Equal Justice Initiative. To lynch means for a mob to kill a person without any trial. Louis Hyman, a historian at Cornell University, argued in 2018 that mail-order catalogs helped Black farm families in the South get around Jim Crow at the store. His argument was reported by NPR, the *Washington Post* and America's Black Holocaust Museum.

According to Hyman, many Black farm families had to buy on credit, taking goods now and paying later, at a white-owned country store, often owned by the landlord whose land they farmed. The storekeeper set the prices and made Black customers wait until white customers were served. A catalog order cost the same national price for everyone, and no clerk decided who was served first. The family could also buy on the mail-order company's credit instead of the landlord's.

Hyman also says that some Southern storekeepers held bonfires to burn catalogs, and told white customers that Sears was owned by Black people to keep them from buying there. These are Hyman's claims.

Buying on time

In the 1920s, buying on installments, which means paying for goods a little at a time, spread from sewing machines to cars, radios, furniture and household machines. By the end of the 1920s, about 60 percent of cars and about 80 percent of radios were bought on installments, according to the reference site Encyclopedia.com. The number of cars registered in the United States grew from about 9 million in 1920 to nearly 27 million by 1929.

In 1924 members of the National Association of Finance Companies, a group of lending companies, adopted standard terms for car buyers. A buyer paid one-third of the price at the start for a new car and two-fifths for a used car. The buyer then had no more than twelve months to pay the rest.

Advertising on radio and television

The first paid radio advertisement went on the air on August 28, 1922, on the station WEAF in New York. The Queensboro Corporation paid $50 for about ten minutes of air time to promote the Hawthorne Court apartments in Jackson Heights, Queens.

Television stations were not allowed to sell advertising until officials of the Federal Communications Commission, the government office that licenses stations, gave licenses to 10 stations on May 2, 1941. The licenses let the stations sell advertising from July 1, 1941. Two years earlier, people at NBC had shown test advertisements for three companies. The first commercial allowed under the new licenses ran on the station WNBT in New York on July 1, 1941, before a Brooklyn Dodgers baseball game against the Philadelphia Phillies. For about ten seconds it showed the face of a Bulova watch over a map of the United States, while a voice said, "America runs on Bulova time." It cost Bulova $9: $4 for the air time and $5 in station charges. There were about 4,000 television sets in the New York area at the time.

Mary Frances Gerety wrote advertisements at N. W. Ayer & Son, the advertising agency. For the diamond company De Beers, she wrote the slogan "A Diamond Is Forever." Accounts of the slogan date it to 1947 or to 1949. In 1999 the magazine *Ad Age* named it the most memorable slogan of the 1900s.

Shopping under rationing

During the Second World War, officials of the US government's Office of Price Administration ran rationing. To ration means to limit how much of something each person may buy. Sugar, meat, cheese, fats, canned and other processed foods, shoes and gasoline were among the

rationed goods. At the start, each person could buy 26 pounds of sugar a year, about 8 ounces a week. Every person in the country, babies included, got a ration book full of stamps.

War Ration Book Two came into use on March 1, 1943. Its blue stamps bought processed foods, which are canned, dried or frozen foods. Its red stamps bought meat, cheese, fats and oils. Each person got 48 blue points and 64 red points a month, so a family of four had 192 blue points a month for processed food. Every cut of almost every kind of meat had its own point value.

At the store a shopper paid with stamps and with money together. The price could not go above the ceiling price, the highest price government officials allowed. Point values changed often. Newspaper editors printed them, radio announcers read them out and members of local ration boards posted them. By the end of the war, more than 100,000 volunteers were running the program through about 5,600 local boards.

Emilia Ruth Palmquist Lundberg

Who: A widowed mother of six in Jersey City who shopped for her family with ration books during the Second World War.

When and where: Jersey City, New Jersey, about 1942 to 1943.

Emilia Lundberg fed six children on a small, fixed income, and during the war she also had to count ration stamps. She was born in Göteborg, Sweden, in 1894. In 1930 her husband was killed in an explosion at the dry-cleaning plant where he was in charge. As her son Donald remembered it, his father left her with six children, no relatives to turn to and no money.

She raised the children on workmen's compensation of $100 a month. Workmen's compensation is money paid to a worker's family after the worker is hurt or killed on the job. The rent was $35 a month. Her oldest daughter, 16, moved to night school and took a job keeping accounts for $12 a week. Donald packed and delivered groceries at a store after school and on Saturdays for $5 a week.

Before the war, the family ate a roast on Sunday after church and potatoes and macaroni the rest of the week. Under rationing, everyone in the family had a ration book with stamps for meat and other goods. They took the books to the store and bought what the stamps allowed. The ration was counted for each person, so a large family got more in all than a small one. They bought meat for Sunday and ate macaroni, spaghetti and mashed potatoes the rest of the week. Shoes were rationed too. Each child had one good pair for school and one pair of sneakers for play.

> Emilia had a 1933 Plymouth. Donald remembered the family's gasoline ration as about a gallon and a half. When they told the ration board they were driving to visit his older brother, a soldier at Camp Kilmer in New Jersey, they got a coupon for about two more gallons. Donald described all of this in an interview for the Rutgers Oral History Archives in 2008, about 65 years later.

1950 to 2000

The first fully enclosed shopping mall in the United States opened in Minnesota in 1956. Plastic cards issued by banks let shoppers buy on credit in any store that took the card. Kmart, Target and Wal-Mart all opened their first stores in 1962. In 1974 a cashier in Troy, Ohio, made the first sale with a scanner that read a printed code on a package. By 2000, people could shop at home on television shopping channels, and from 1995 on a computer.

The enclosed mall

Southdale Center opened in Edina, Minnesota, on October 8, 1956. It was the first fully enclosed shopping mall in the United States with its own heating and cooling. A mall is a group of stores under one roof or around one walkway. It had 72 stores on two levels around a brightly lit central court. Its two biggest stores were the department stores Dayton's and Donaldson's.

The Dayton family owned department stores in Minneapolis. In 1952 they hired the architect Victor Gruen and his firm, Victor Gruen & Associates, to design the mall. Building began in 1954. Southdale cost $20 million.

> #### Victor Gruen
>
> **Who:** The architect who designed the first enclosed American mall and later rejected what developers built from his idea.
>
> **When and where:** Vienna, then New York and Minnesota. Southdale opened October 8, 1956.
>
> **Movie:** *The Gruen Effect: Victor Gruen and the Shopping Mall* (2009), a documentary by Anette Baldauf and Katharina Weingartner, about Gruen and the malls he started.
>
> Victor Gruen designed Southdale as the center of a new neighborhood, and developers copied only the mall. Gruen was a Jewish architect from Vienna, in Austria. In March 1938 the leaders of Nazi Germany, the Germany ruled by Adolf Hitler's Nazi Party, took

over Austria and made it part of Germany. The takeover was called the Anschluss. In the weeks after, Austrian Nazis and others beat, attacked and humiliated Jews. In Vienna, Nazis forced Jews to scrub the city's streets while crowds jeered at them. Soon Nazi officials put Austria's Jews under the same laws that already took away Jewish rights in Germany. Gruen fled Vienna that year. He reached New York on the ship *Statendam* with an architect's degree, eight dollars and no English.

One of his early jobs was a shop front on Fifth Avenue in New York, for Ludwig Lederer's leather-goods shop. Gruen designed its entrance as an arcade, a covered walkway, meant as a "customer trap" to draw people inside.

For Southdale, the Dayton company bought about 500 acres of land in Edina. Gruen's plan for the land around the mall had apartment buildings, houses, schools, a medical center, a park and a lake. He said he wanted "the Minneapolis downtown you would get if you started over and corrected all the mistakes." The medical center opened in 1965. The Daytons sold the rest of the land for housing.

In a speech in London in 1978, Gruen rejected the malls that American developers had built. He said he refused to pay alimony for those developments, and he used a rude word to describe them. Alimony is money that a person pays to a former husband or wife after a divorce. He went back to Vienna and objected to a shopping center built there.

Plastic at the counter

A credit card lets a person buy now and pay the bank or the card company later. A charge card is a card whose holder has to pay the whole bill every month. Diners Club, started in February 1950, was the first charge card that many different businesses accepted. It was made of cardboard. The first place it was used was Major's Cabin Grill, a restaurant in New York. The company's first publicity man, Matty Simmons, later admitted that the famous story of how the card began, with a founder who forgot his wallet, was made up for publicity.

In September 1958, officers of Bank of America mailed about 60,000 BankAmericards to people in Fresno, California, who had not asked for them. The cards were ready to use. Each cardholder got $300 to $500 of credit at once. Stores that took the card paid the bank 6 percent of each sale. The bank's officers had expected about 4 percent of cardholders to fall behind on paying. About 22 percent did. The bank's officers later licensed the card across the country, and in 1976 it was renamed Visa.

In 1970, members of Congress passed a law that banned mailing credit cards to people who had not asked for them.

Before 1974, lenders often turned women down for credit because they were women, or because they were married or single. Mortgage lenders, who lend money to buy houses, often counted only part of a married woman's pay, especially if she was young enough to have children. They were also more likely to turn down single women. Lawmakers in Congress passed the Equal Credit Opportunity Act in October 1974. Under it, lenders could no longer treat people differently because of their sex or whether they were married. Two years later, in March 1976, the lawmakers added more reasons lenders could not use: race, color, religion, national origin, which means the country a person or their family came from, age, and getting money from government aid programs.

1962: the discount stores

A discount store is a store that sells goods at prices below what other stores charge. Four discount chains began in 1962. The first Kmart store opened in Garden City, Michigan, on March 1, 1962, and reports said 4,000 customers waited in line on the first day. Target's first store followed on May 1, in Roseville, Minnesota. On July 2, Sam Walton opened the first Wal-Mart in Rogers, Arkansas. Woolco's first store opened that year too.

Kmart grew out of the S. S. Kresge chain of five-and-dime stores, which sold small goods for 5 and 10 cents, and Woolco out of F. W. Woolworth's company. Target grew out of the Dayton Company's department stores, run by the same Dayton family that had hired Victor Gruen to design Southdale.

> #### Sam Walton
>
> **Who:** The Arkansas storekeeper who put discount stores in small towns and built the largest retailer in the United States.
>
> **When and where:** Rogers, Arkansas, from July 2, 1962.
>
> **Movie:** *Wal-Mart: The High Cost of Low Price* (2005), a documentary by Robert Greenwald. It argues against the company and is not a life story of Walton.
>
> Sam Walton built Walmart, spelled Wal-Mart at first, by opening discount stores in small towns. The heads of the large chains had judged those towns too small to bother with. Before 1962 Walton ran Ben Franklin variety stores in Arkansas, which sold many kinds

of small, cheap goods. He bought goods in huge amounts and priced them below the stores nearby. Walmart became the largest retailer in the United States and the largest private employer, which means it had more workers than any other company.

Economists have measured what Walmart did to shoppers and to towns. Jerry Hausman of MIT and Ephraim Leibtag of the US Department of Agriculture reported in 2007 that shoppers gained a great deal from Walmart's low prices, most of all households with lower incomes.

David Neumark, Junfu Zhang and Stephen Ciccarella reported in 2008 that when a Walmart opened, the county around it lost about 150 retail jobs, or 2.7 percent. By their count, each Walmart worker replaced about 1.4 workers at other stores. Kenneth Stone, an economist at Iowa State University, has studied Walmart in Iowa since 1988. In a 2012 study, Stone and a co-author found that retail sales in Iowa towns with fewer than 2,500 people fell 30 percent in the years after Walmart stores opened in Iowa. That was about $1.5 billion. Towns of 3,000 to 20,000 people that got a Walmart saw their total retail sales rise.

The franchise

A franchise is a deal in which the owner of a business name and its way of working sells other people the right to run a business under that name, following the owner's rules. Roy Allen bought a recipe for root beer in 1919. He began selling A&W franchises in 1924, or in 1925 by some accounts. Histories of franchising often call A&W the first successful food franchise. J. Willard Marriott was one of its early franchise owners.

The Howard Johnson's restaurant business sold its first franchise to Reginald Sprague in 1935. By the end of 1936 there were 41 Howard Johnson's restaurants. By 1939 there were 107, with about $10.5 million in sales.

The barcode

The Universal Product Code, or UPC, is the barcode printed on packages in stores. A barcode is a pattern of printed stripes that a scanner at the checkout can read.

The people who planned the first scan chose a small pack of gum on purpose. They wanted to show that the code could be printed clearly on a package that size. The Smithsonian's National Museum of American History keeps one of the first ten scanners, a Spectra-Physics Model A.

Sharon Buchanan

Who: The supermarket cashier who made the first sale ever scanned with a barcode.
When and where: Marsh Supermarket, Troy, Ohio, 8:01 a.m., June 26, 1974.

Sharon Buchanan was the cashier at the first sale ever made with a barcode scanner. At 8:01 in the morning on June 26, 1974, she was working at the Marsh Supermarket in Troy, Ohio. The customer was Clyde Dawson, the head of research and development at Marsh. He bought a ten-pack of Wrigley's Juicy Fruit gum. Buchanan passed it over the scanner. The price was 67 cents.

Stamps, television selling and the end of the big catalog

In the 1960s and 1970s, about 80 percent of American households collected S&H Green Stamps. Trading stamps were small stamps that grocery stores, gas stations and other stores gave out with purchases. Shoppers pasted them into books. They traded full books for goods at a Green Stamps store or from a catalog. In the 1960s more S&H stamps were printed than US postage stamps, and about 35 million S&H catalogs went out each year.

The Home Shopping Network began with a radio station. In 1977 a company that advertised on Lowell "Bud" Paxson's radio station paid him in electric can openers instead of money. The station's host, Bob Circosta, sold them on the air for $9.95 each. In 1982 Paxson and Roy Speer started the Home Shopping Club on cable television in Pinellas County, Florida. It went national on July 1, 1985. Joe Segel founded QVC, another shopping channel, in 1986. It first went on the air that November, and the first thing it sold was a radio made to be used in the shower.

On January 25, 1993, Sears officials announced that they were closing the company's catalog business. They also said they would cut 50,000 jobs and close 113 stores. The last general catalog went out that spring. News reports said the catalog was 97 years old. Other accounts say 101 or 105 years, because they count from different starting dates.

Buying on a computer begins

On July 5, 1994, Jeff Bezos filed papers to start a company called Cadabra, Inc. He worked from a rented house with a garage in Bellevue, Washington. The company became Amazon. Amazon.com opened for orders on July 16, 1995. The first book it sold was *Fluid Concepts and Creative Analogies*, by Douglas Hofstadter. In its first week it took in about $12,000 in book orders.

Pierre Omidyar started a website called AuctionWeb, where people sold goods at auction to whoever offered the most money. He started it over Labor Day weekend, on September 3, 1995. It later became eBay. The first thing sold on it went for $14.83. According to eBay, it was a broken laser pointer. Some accounts say it was a broken printer.

2000 to Today

From April to June 2026, about one dollar in six of all American retail spending went to online sales, by the count of the US Census Bureau. Since 2005, members of Amazon Prime have paid a yearly fee for two-day shipping. Drivers carry the orders to people's doors, including on days of summer heat. Sellers now buy the right to show advertisements to one person at a time, chosen from records of what that person has done online.

How big online shopping is

Every three months, workers at the US Census Bureau publish a count of online sales. In 2025, online sales were 16.4 percent of all retail sales in the United States. In the second quarter of 2026, from April through June, they were 17.1 percent. That came to $340.2 billion in three months. It was 12.2 percent more than in the same months of 2025. The bureau's staff released those numbers on August 18, 2026. By those numbers, more than four dollars in five were still spent in stores.

Researchers at the Federal Reserve, the central bank of the United States, which acts as a bank for other banks, ask people to keep diaries of how they pay. In 2024, credit cards were the most-used way to pay in the United States, used for 35 percent of all payments. Cash was used for 14 percent.

> ### Jeff Bezos
>
> **Who:** The founder of Amazon, which began as an online bookstore and grew into a store selling books, music, movies and many other kinds of goods.
>
> **When and where:** Bellevue and Seattle, Washington, from July 1994.
>
> **Movie:** *Amazon Empire: The Rise and Reign of Jeff Bezos* (2020), a documentary by James Jacoby and Anya Bourg in the PBS series *Frontline*. It is an investigation that argues a case against Amazon's power.

Jeff Bezos left a job in New York in 1994 to sell books online. He was a vice president at D. E. Shaw, an investment company. In 1994 he read that use of the web had been growing by 2,300 percent a year that spring, and he quit. He and his wife, MacKenzie Bezos, moved from Manhattan to the Seattle area. They chose it because software engineers lived and worked there, at Microsoft and the University of Washington, and because of its taxes. Bezos studied which product would sell best online, and he chose books. Music and DVDs were the next goods Amazon added.

Amazon Prime began on February 2, 2005. According to Amazon's announcement, members paid $79 a year and got two-day shipping on their orders at no extra charge. By 2021, more than 200 million people around the world were members. In 2026 a year of Prime in the United States cost $139, or $14.99 a month, the same as since February 2022, according to the shopping news site dealnews.

Senate committee staff, drivers and a union have complained about how Amazon treats the people who pack and deliver its orders. In December 2024, the staff of a Senate committee led by Senator Bernie Sanders reported that in 2023 Amazon had recorded more than 30 percent more injuries at its warehouses than the average for the warehouse industry. A union is a group that workers form to bargain together with their employer. In June 2023, Amazon ended its contract with a delivery company two months after the company's drivers joined a union. The union and the company's owner said Amazon was punishing the drivers for it. Amazon's representatives said the contract ended over safety violations and missed insurance payments.

Malls empty out

Nobody keeps an official government count of malls, and the private counts disagree, because people define a mall in different ways. One industry count lists about 700 enclosed malls in 2023. A broader count, which includes open-air shopping centers, lists about 1,150 for 2024.

One company counts store closings every year. Researchers at Coresight Research, a company that studies stores, counted 7,325 store closings in the United States in 2024 and later raised that count to 8,825. They had predicted about 15,000 closings for 2025. Their count for 2025, published in January 2026, was 8,270 closings and 5,270 openings.

As shoppers moved online or to newer outdoor shopping centers, the anchor department stores of many malls closed. An anchor store is a big store that draws shoppers to the smaller shops around it. The smaller shops that had depended on the department stores' crowds lost

customers. Mall owners could not find new stores to fill the empty space. Owners and builders have turned some empty malls into apartments, clinics, colleges and warehouses.

Advertising aimed at one person

When a person visits a website, the company that runs the site can save small files and codes on the person's device that record what the person looked at. Companies called data brokers collect records like these and combine them with records from outside the internet, such as store purchases, warranty cards and property records. Then they sell what they have gathered, including the chance to show an advertisement to a chosen group of people.

In May 2014 the staff of the Federal Trade Commission, the government office that protects shoppers, published a report called *Data Brokers: A Call for Transparency and Accountability*. The commission's staff found that data brokers held "billions of data elements," meaning billions of separate facts, about nearly every American shopper. They gathered most of it without people knowing. The report describes how brokers attached offline records to the files in a person's web browser. That way the person could be followed from site to site and shown advertisements chosen for them. The commissioners asked Congress to pass a law letting people see the information held about them.

Website and app owners use money from this advertising to keep their services free to use. The advertisements can also show a person something they want to buy. And companies the person has never heard of buy and sell records of what the person reads and buys. As of 2026, members of Congress had passed no general federal privacy law. By June 29, 2026, lawmakers in 24 states had passed their own, according to the law firm Husch Blackwell.

Selling to children inside a game

Fortnite is a video game made by Epic Games that came out in 2017. It is free to play. Epic sells V-Bucks, game money that players buy with real money to get costumes and dance moves for their characters. By 2022, the game had more than 400 million players around the world, according to the Federal Trade Commission.

On December 19, 2022, officials of the Federal Trade Commission announced that Epic had agreed to pay $520 million. Of that, $275 million was a penalty under the Children's Online Privacy Protection Act. That law requires a company to get a parent's permission before it collects personal information from a child under 13. The commission's officials said Epic had collected personal information from children under 13 who played Fortnite without telling their parents or getting their permission. They also said Epic let children buy V-Bucks just by

pressing buttons, with no parent or card owner agreeing. The other $245 million went back to customers as refunds. The officials said Epic had used "dark patterns," confusing buttons and screens that led players into charges they did not mean to make. For example, Epic's game could charge a player who was only waking it from sleep mode. The officials cited "hundreds of millions of dollars in unauthorized charges," meaning charges that players had not agreed to. Lina Khan was the head of the commission at the time.

Payday loans

A payday loan is a small loan from a storefront lender that the borrower is supposed to pay back on the next payday. In April 2013, researchers at the Consumer Financial Protection Bureau, a government office that watches over lenders, published a study of these loans. They found that storefront payday lenders charged $10 to $20 for every $100 borrowed. The typical loan lasted 14 days. A borrower who took the typical $350 loan, with a fee of $15 for each $100, had to find more than $400 in two weeks. Counted as a yearly rate, the way the cost of a loan is measured, that fee comes to 391 percent a year.

They also found that nearly half of payday borrowers took out more than 10 loans in a year. Fourteen percent took out 20 or more. The typical borrower was in debt 199 days of the year, more than half of it.

Buying secondhand clothes

The staff of ThredUp, a company that sells used clothes online, publish a yearly report on the market for secondhand clothes. Because ThredUp sells used clothes, its report is a company's estimate, not a government count.

By ThredUp's 2025 report, the market for used clothes in the United States grew 14 percent in 2024, and online sales of used clothes grew 23 percent. In 2024, 58 percent of shoppers bought something secondhand, up from 52 percent in 2023. The firm GlobalData did the research for ThredUp's 2026 report, which found that in 2025 used clothing sales grew almost four times as fast as all clothing sales. GlobalData's researchers forecast that the US secondhand market will reach $78.8 billion by 2030.

The last step: heat in the delivery truck

The drivers who make fast delivery possible keep delivering in summer heat. In July 2023, the NPR reporter Danielle Kaye reported that injury records kept by OSHA, the government's workplace safety office, showed at least 40 UPS drivers taken to the hospital for heat illness since 2015.

José Cruz Rodriguez was 23. He died of heat illness during a UPS delivery shift in Waco, Texas, in August 2021, according to OSHA. Heat illness happens when the body gets too hot and cannot cool itself down. His family sued UPS for causing his death, and the case was settled.

Esteban Chavez Jr., a UPS driver for four years, died after he was found unconscious in his truck. It was June 25, 2022, the day after his 24th birthday, and he was on his route in Pasadena, California. The temperature that day reached the upper 90s. UPS trucks had no air conditioning then. His family said at least 20 minutes went by before anyone noticed him and called for help. The medical examiner, the doctor whose job is to find out why a person died, found that his heart stopped working. His family believes the heat caused it.

In June 2023, UPS managers and leaders of the Teamsters union, which represents UPS drivers, agreed that every small delivery truck UPS bought after January 1, 2024, would have air conditioning. The trucks would also get heat shields and fans.

The packages are packed in warehouses first. In December 2024, Senator Bernie Sanders released a report by staff of the Senate committee he led. These staff members work for the party that holds the most seats in the Senate. They found that in 2023 Amazon recorded more than 30 percent more injuries at its warehouses than the average for the warehouse industry. For seven years in a row, Amazon warehouse workers were nearly twice as likely to be hurt as workers at other warehouses. The report said Amazon had drawn up plans to lower injuries and chose not to use them because the plans would slow down work.

Renica Turner

Who: A driver who delivered Amazon packages in the California desert for a small delivery company, and who joined a union to push for protection from the heat.
When and where: Palmdale and Victorville, California, about 2022 to 2023.

Renica Turner delivered Amazon packages for a company called Battle Tested Strategies. It was one of about 3,000 small companies under contract to deliver Amazon's packages. Its vans were leased from Amazon, and its drivers worked out of an Amazon building in Palmdale, California.

In a July 2023 story by the NPR reporter Danielle Kaye, Turner described a day in Victorville, California, when the temperature reached 110 degrees. The van's air conditioning and fans were not working, she said. When she rolled the windows down, hot air came in. Her body began to tingle, and she thought she might pass out. She told the Amazon dispatcher, the worker who sends drivers out and keeps track of them. The

dispatcher gave her a 20-minute break. In her words, "They never sent no one out to help me with the rest of the route." The route was 300 packages, and she was expected to deliver 25 every hour. She finished it herself, feeling woozy and numb.

Amazon's representatives told NPR that its vans had working air conditioning and that any van without it was taken off the road at once. They also said the delivery companies were in charge of fixing the vans, and that Amazon had changed some routes the year before so drivers could take more breaks to cool down. The owner of Battle Tested Strategies, Johnathon Ervin, said Amazon regularly failed to fix broken air conditioning, sometimes for weeks or months.

In April 2023, Turner and 83 other drivers at the company joined the Teamsters union and bargained a contract with Battle Tested Strategies. NPR reported that they joined the union in large part to push for protection from the heat. In June 2023, Amazon ended its contract with the company. The union and the company's owner said Amazon was punishing the drivers for joining a union. Amazon's representatives said Amazon ended the contract over safety violations and missed insurance payments by the company. The drivers went on strike, which means they stopped working as a protest.

Lawyers for the National Labor Relations Board, the government office that enforces labor law, brought a case against Amazon over the drivers. The case turned on whether Amazon was a joint employer of the drivers, a company that shares an employer's legal duties toward workers another company hired. In April 2026, lawyers for the board settled the case with Amazon. A settlement is an agreement that ends a case. Each of the roughly 84 drivers who worked there from April to June 2023 would get two weeks of pay, about $250,000 in all. Under the settlement, Amazon did not admit that it was the drivers' employer. In late May 2026, G. Rebekah Ramirez, a judge who hears labor cases for the board, approved the settlement. The Teamsters objected and asked to appeal.

Chapter 19: Big Business and Its Power

Before 1500

No company existed in this land before 1500. A company is a group of people who put their money together to run a business and share what it earns. A corporation is a kind of company that goes on after its first owners are gone. To start one, people needed a written grant from a government.

Native nations did trade goods over long distances. Archaeologists have found copper from Lake Superior, shells from the Gulf of Mexico and turquoise from the Southwest hundreds of miles from their sources. People at Cahokia, in what is now Illinois, traded stone hoe blades that have turned up more than 400 miles away. The traders belonged to many different nations. None of them organized that trade as a company whose owners each held a part of it.

The 1500s

The Europeans who reached this coast in the 1500s came on voyages paid for by kings and queens. No chartered company traded on this coast during that century. At the same time, merchants in London were forming joint-stock companies. Companies of that kind later paid for the first lasting English colonies here.

The joint-stock company, an English idea

In the 1500s, merchants in London began forming joint-stock companies. In a joint-stock company, many investors each buy a share. A share is one part of the ownership. Each investor gets a part of the profit that matches the number of shares he owns. The money he paid in is called stock.

In 1555 the explorer Sebastian Cabot and a group of London merchants formed the Muscovy Company. The company held a monopoly on English trade with Russia. A monopoly is the right to be the only seller of something, or the only trader in a place. Earlier investors had

taken their money back after each voyage. The Muscovy Company kept its investors' money in the business from one voyage to the next. It was the first English joint-stock company to work that way.

On 11 September 1592, Sir Edward Osborne founded the Levant Company by joining two older companies, the Venice Company and the Turkey Company. Its merchants traded in the eastern Mediterranean Sea. The Levant Company's merchants did not trade in North America. On 31 December 1600 Queen Elizabeth I gave a charter to the East India Company of London. The Earl of Cumberland, a nobleman, and 218 other men had asked her for one. A charter is the written grant from a government that creates a company and lists its rights.

The 1600s

Investors in English companies paid for the first lasting English colonies in this land. The companies' officers sent the settlers who founded them. A king signed each company's charter. Investors bought shares in each company, hoping the colony would earn them a profit. The kings who signed the charters gave the companies land where Native nations already lived. The Virginia Company and the Massachusetts Bay Company both lost their charters.

Other companies made money by owning enslaved people and by shipping enslaved Africans across the ocean. The Dutch West India Company owned the enslaved men who dug the trench for a wall at New Amsterdam. The historian William Pettigrew judged that the Royal African Company, chartered in 1672, shipped more enslaved Africans to the Americas than any other single company or group in the whole history of the slave trade.

The Virginia Company, a colony run as a business

In 1606 King James I of England gave a charter to the Virginia Company of London. It allowed the company to start a colony in North America. The company's settlers founded Jamestown on 13 May 1607. They built it inside Tsenacomoco, the land of the Powhatan chiefdom. A chiefdom is a group of towns under one leading chief.

A share in the company cost 12 pounds and 10 shillings, and it lasted seven years. A shilling was a coin worth one twentieth of a pound. The first sale of shares may have raised as much as 10,000 pounds. In 1616 the company paid its shareholders in land alone.

Under a second charter, dated 23 May 1609, the king gave up some of his power over the company. From then on the investors elected a treasurer to run it. Under a third charter, dated 12 March 1612, the company's lands included the island of Bermuda, and the company could

run lotteries. A lottery is a game in which people buy tickets and a few tickets win prizes. By May 1620 lotteries had brought in 7,000 pounds of the company's 9,831 pounds in cash for the year. In February 1621 members of the House of Commons attacked the lotteries in a debate. The House of Commons is one of the two groups of lawmakers in England's Parliament. King James I banned the lotteries soon after.

Of the 4,270 people counted in Virginia from 1619 to 1622, only 1,240 were alive at the end. In 1619 about 700 settlers lived in the colony. Over the next three years the company shipped 3,570 more men, women and children there, for a total of 4,270. English settlers had been taking Powhatan land to grow tobacco. On 22 March 1622 an alliance of Virginia Indians led by Opechancanough attacked the English settlements. Opechancanough was the leading chief of the Powhatan. The attackers killed as many as 347 colonists.

Besides the 347 killed in the attack, 2,683 people were gone. An investor named Samuel Wrote asked what had happened to them. Encyclopedia Virginia's history of the company states that most of them died of disease.

In May 1623 King James I's advisers on his Privy Council, the king's inner council, set up a royal commission, a group of officials named to look into the company's business. On 24 May 1624 the king took away the company's charter. From then on Virginia was a royal colony, run by officials the king chose.

The first Africans known to reach English Virginia came in 1619, while the company ran the colony. Earlier that summer the crews of two privateer ships had attacked a Portuguese slave ship, the *São João Bautista*, off the coast of Campeche, in what is now Mexico. They seized 50 to 60 Africans from it. A privateer was a ship's captain with a government's permission to attack and rob enemy ships. One ship, the *White Lion*, had sailed from the Netherlands, and its captain, John Colyn Jope, carried Dutch papers giving him that permission.

In late August 1619 the *White Lion* landed "20. and odd" Africans, in the words of the colonist John Rolfe, at Point Comfort in Virginia. The other ship, the English *Treasurer*, arrived three or four days later with more of the stolen people. Its owners were Robert Rich, Lord Warwick, a nobleman, and Samuel Argall, Virginia's deputy governor. Governor George Yeardley and the merchant Abraham Peirsey bought the enslaved people from the *White Lion* and paid for them with food.

> **Sir Edwin Sandys**
>
> **Who:** The treasurer the Virginia Company's investors elected in 1619, the year its shipments of settlers grew.

When and where: London, 1619 to 1624.

The investors of the Virginia Company elected Sir Edwin Sandys their treasurer on 28 April 1619. From 1619 to 1622, most of the people counted in the company's colony died or were killed.

Under Sandys, the company's officers used a plan called the headright to draw settlers. They promised 50 acres of land for each person whose trip to Virginia someone paid for. The payer got the land, whether he paid for his own trip or for another person's. The settler then paid the company a quitrent of one shilling a year. A quitrent is a small yearly rent paid on land. The land the company handed out this way was Powhatan land.

Sandys and the company's officers shipped 3,570 more men, women and children to Virginia from 1619 to 1622. Of the 4,270 people counted in the colony in those years, 1,240 were still alive at the end. The historian Edmund S. Morgan studied these years in a book published in 1975. Encyclopedia Virginia's history of the company sums up what Morgan and later scholars showed: "any responsible monarch would have been obliged to stop the reckless shipment of his subjects to their deaths." A monarch is a king or a queen. Obliged means bound by duty, and subjects are the people a monarch rules. The king at the time was James I. He took the company's charter away in 1624.

The Dutch West India Company

On 3 June 1621, members of the States General, the lawmaking assembly of the Netherlands, gave a charter to the Dutch West India Company. For 24 years, no one else from the Netherlands could sail to or trade with the Americas. The same rule covered the coast of Africa from the Tropic of Cancer to the Cape of Good Hope. The Tropic of Cancer is a line on maps that circles the earth north of the equator. The Cape of Good Hope is near the southern tip of Africa.

In 1624 men working for the company built a trading post called Fort Orange, where Albany, New York, stands today. It was the first lasting Dutch settlement in New Netherland, the colony along the Hudson River. The upper Hudson was the country of the Mohican people. The company's settlers then moved onto Manhattan Island, the home of the Lenape people. Company officials said they bought Manhattan in 1626 for trade goods worth 60 guilders, which were Dutch coins. A guide to Lenape history from the Pratt Institute Libraries says the Dutch likely misunderstood what the Lenape meant by that exchange.

The company owned people as well as ships and forts. In 1653 enslaved men owned by the company dug the trench for a wall at New Amsterdam, the town on Manhattan. Three of them are known by name: Paulo d'Angola, Simon Congo and Anthony Portuguese. In 1644, after 18 or 19 years of forced work, the company's director and council had given these three, eight other men and their wives what the officials called "half-freedom." The men could own land. Their children stayed the company's property, and the men still had to pay the company a yearly fee of grain or beans and a hog. They also had to work for the company whenever it called them.

The Massachusetts Bay Company

The colony of Massachusetts was started by a company of investors, the Massachusetts Bay Company, and the company's leaders governed the colony under its charter. King Charles I signed the charter of the Massachusetts Bay Company in March 1629. In late August 1629, twelve men signed a paper called the Cambridge Agreement. Among them were John Winthrop, Richard Saltonstall and Thomas Dudley. They promised to sail to New England if the company's charter and its government moved there with them.

In 1630 Winthrop and about 1,000 Puritan settlers arrived at the Shawmut Peninsula. Puritans were English Protestants who wanted to "purify" the Church of England, the king's official church. The land around the peninsula belonged to the Massachusett people, whose leading chief was Chickataubut. According to the West End Museum in Boston, about 100,000 people had lived in the region. An epidemic from 1616 to 1618 had killed about 75,000 of them. An epidemic is a disease that spreads quickly through many people. Winthrop renamed the peninsula Boston. In 1633 Chickataubut agreed to a treaty with Winthrop that gave up his rights to the peninsula. A treaty is a written agreement between nations or their leaders. Chickataubut died of smallpox that same year.

On 23 October 1684 English judges cancelled the company's charter for three reasons. Colonists had traded with other countries against English trade laws. The colony's leaders had made their own coins, without the king's picture on them. The colony's lawmakers had passed laws against Quakers and against members of the Church of England. Quakers belong to a Christian group, also called the Society of Friends, that began in England in the 1600s.

The Hudson's Bay Company

King Charles II gave a charter to the Hudson's Bay Company on 2 May 1670. Prince Rupert, the king's cousin, had persuaded the king and a group of merchants and noblemen to back the company. The charter gave the company the only right to trade in all the lands whose rivers

flow into Hudson Bay. Those lands are in what is now Canada. In the charter they are called Rupert's Land.

The Hudson's Bay Company was an English company. In 1821 it took over the trading posts of its rival, the North West Company, in the Pacific Northwest. On 19 March 1825 the company's governor, George Simpson, and the trader Dr. John McLoughlin opened Fort Vancouver on the Columbia River, in what is now Washington state. Chinookan people had lived along that river for thousands of years. They called the place where the fort stood Skatcutxat, which means "Mud Turtles."

The Royal African Company

The Royal African Company was an English company whose investors made money from shipping enslaved Africans to the Americas. King Charles II gave it a charter in 1672, and his brother James, Duke of York, led it. Duke of York was James's royal title. It held the only English right to trade with West Africa. That trade included gold, silver and enslaved people. James later became King James II.

Between 1672 and 1731, ships that the company put money into carried 186,748 enslaved people on 652 voyages to English colonies in the Americas. Of those people, 16,077 died on the way. The count comes from the Trans-Atlantic Slave Trade Database, a record of known slave voyages. From 1680 to 1686, the company's ships carried about 5,000 people a year. Most of them went to English colonies in the Caribbean and to Virginia.

Thousands of the people the company shipped arrived with the company's initials branded on their chests. To brand a person means to press a red-hot metal stamp against the skin. The heat burns the letters into the flesh and leaves a raised scar for life. Many of the brands read DoY, for Duke of York, the company's leader. Others read RAC, for Royal African Company. The accounts of the branding name the company but not the men who pressed the hot stamps into people's skin.

The historian William Pettigrew wrote in his 2013 book *Freedom's Debt* that the company "shipped more enslaved African women, men and children to the Americas than any other single institution during the entire period of the transatlantic slave trade." An institution here means a company or any other organization. Transatlantic means across the Atlantic Ocean. He also wrote that its investors knew what the company did and meant to make money from it.

1700 to 1750

From 1700 to 1750 almost no business in the colonies was a corporation. The historian Robert E. Wright counts only 8 business corporations chartered in the colonies before independence. He writes, "Before the Revolution, American business corporations were few, small, and largely inconsequential." Inconsequential means unimportant. Under British rules, Wright writes, a charter cost a lot to get and gave its owners little in return. So most colonists in business chose other ways to organize.

Partners, and the trade in people

Many colonial businesses were partnerships. In a partnership, two or more men put their money together and shared the profits. Under the law of the time, each partner was liable for all of the firm's debts. Liable means that a person has to pay. If the firm failed, the people it owed could make any one partner pay all of it from his own property.

The Royal African Company lost its monopoly in practice in 1689, after King James II lost his throne. The company's own leaders admitted it that year. In 1698 members of the English Parliament passed a law that opened the African trade to every English merchant. Under that law any English merchant could carry enslaved people from Africa. He had to pay the company a fee of 10 percent on the goods he shipped out of Africa. The Royal African Company itself stopped trading in enslaved people in 1731.

Boston merchants bought and sold people. From 1719 to 1781 the *Boston Gazette*, a newspaper, ran about 2,300 advertisements for about 2,000 enslaved people. Charles Apthorp, a Boston merchant born in Britain, ran a firm that imported enslaved people and sold them along with other goods. By 1746 he was one of the richest men in Boston. In the 1730s and 1740s he placed advertisements in the *Boston Gazette* for "a parcel of likely negros just imported." A parcel meant a group. Sellers used likely as a word of praise. It meant fit for work, healthy and good-looking. Negro was a word used then for a Black person. In 1742 Apthorp offered a reward of five pounds for the return of "a negro man named Jack about 35 years old." Jack had escaped from his enslaver, Stephen Eastwick. Apthorp was also a business partner of Thomas Hancock, one of the richest merchants in New England.

> #### Thomas Hancock
>
> **Who:** A Boston merchant who built one of the largest fortunes in New England. With his partner Charles Apthorp, he rented out the ships that carried the Acadians away from their homeland in 1755.

When and where: Boston, from about 1724 until his death in 1764.

Thomas Hancock built one of the largest fortunes in New England. Part of his firm's business was carrying people whom British officials had forced from their homes. He was born in Lexington, Massachusetts, on 17 July 1703. At 13 or 14 (accounts differ), he was apprenticed to a bookseller in Boston. An apprentice works for a master for a set number of years to learn a trade. Hancock opened his own bookshop in 1723 or 1724. In 1730 he married Lydia Henchman. She was the daughter of Daniel Henchman, a Boston bookseller who was Hancock's business partner.

Hancock traded in many goods, and with different partners he made paper. His ships took codfish, whale oil, logwood and potash to other countries. Logwood is a tree whose wood gives a dye, and potash is a salt made from wood ashes. He sold rum and molasses to the crews of the fishing fleet off Newfoundland, and he controlled a group of fishing boats of his own.

Smuggling was part of the business too. Smuggling means moving goods in or out of a place in secret, against the law. Under English trade laws, colonial merchants could buy and sell only where those laws allowed. Hancock's ships carried tea and paper from Amsterdam to the West Indies. When his ships brought French molasses into Boston, he hid it.

Hancock's partner Charles Apthorp worked as a paymaster and agent for the British army and navy. A paymaster is the man who pays out an army's or a navy's money. Apthorp supplied goods and money to British forces in Nova Scotia and in Boston. In the autumn of 1755, British officials forced the Acadians out of Nova Scotia and took their houses and farms. The Acadians were French-speaking Catholic farm families. The officials who gave the orders were Governor Charles Lawrence of Nova Scotia and Governor William Shirley of Massachusetts.

Lawrence and Shirley hired about 24 sailing ships from the firm of Apthorp and Hancock to carry the Acadians away. They paid by the month, and they paid a fixed fee for each person carried. The partners charged 40 to 48 pounds a month for each ship. In Boston the partners' ships were rebuilt inside to hold two people for every ton of cargo the ship could carry. Some ships held 300 to 500 people. The historian Mark Peterson writes that the ships were "fitted out in the manner of slave ships." The ships carried the Acadians to British colonies along the Atlantic coast, among them Maryland and South Carolina.

> The ships that Apthorp and Hancock supplied were in poor condition. On board, Acadians went without enough food, caught diseases and died. The ships carried no passenger lists, so no record shows which Acadians died at sea or how many.
>
> In 1763 Hancock made his nephew John Hancock his equal partner. Thomas Hancock died of a stroke on 1 August 1764, as he entered the council chamber in Boston. He left property and money worth about 70,000 pounds.

1750 to 1800

In 1773 colonists in Boston destroyed tea that belonged to the East India Company of London. British lawmakers had just given that company the right to sell its tea straight to the colonies. After independence, American lawmakers began chartering companies of their own. Most of the charters went to banks, to insurance companies, to companies that piped water to towns, and to companies that built bridges, canals and toll roads. An insurance company takes a regular fee from people and pays them back if they suffer a loss, such as a fire. A toll is a fee that people pay to use a road or to cross a bridge. Robert E. Wright counts 319 business corporations chartered in the United States before 1801. Only 8 of them came from the colonial years, and 21 more from 1776 to 1789. The rest were chartered from 1790 to 1800.

The Tea Act and the East India Company

Members of the British Parliament passed the Tea Act on 10 May 1773. The East India Company of London, the company chartered in 1600, held about 17 million pounds of tea, by weight, that it could not sell. Under the Tea Act the company could ship tea straight to the American colonies. Its own agents could sell the tea there at a lower price. Under the Act, the tax on tea that members of Parliament had set in 1767 still had to be paid on the company's tea in the colonies. The Act added no new tax. The company's agents could sell tea more cheaply than colonial merchants, so the merchants who sold tea in the colonies lost business.

Ships carrying the company's tea reached Boston in late 1773. Thomas Hutchinson was the royal governor of Massachusetts. He refused to let the *Beaver*, the *Dartmouth* and the *Eleanor* leave the harbor until they had unloaded. On 16 December 1773, members of a protest group called the Sons of Liberty boarded the three ships. Some were dressed as Mohawk men. They

smashed open 340 chests of tea with axes and dumped them into Boston Harbor. The tea weighed more than 92,000 pounds, about 46 tons. Many accounts say 342 chests, but the company's own papers say 340.

In February 1774 the company's directors sent a bill to the Earl of Dartmouth, a British lord who was the minister in charge of the American colonies. They asked to be paid back for the tea. The bill came to 9,659 pounds, 6 shillings and 4 pence. A penny was a coin worth one twelfth of a shilling, and "pence" means more than one penny.

Americans start chartering companies

The Bank of North America was the first commercial bank in the United States. A commercial bank keeps people's money safe and lends money to merchants and businesses. Robert Morris planned the bank, and members of the Continental Congress approved his plan on 26 May 1781. The Continental Congress was the meeting of leaders from the 13 states that ran the country during the Revolution. Its members granted the charter on 31 December 1781. The bank opened on 7 January 1782 on Chestnut Street in Philadelphia.

Morris used a shipment of French silver worth $450,000, which had been sent to Congress, to start the bank. The bank then lent the money back to Congress. Ninety-nine Philadelphians and members of Congress bought shares.

Pennsylvania's lawmakers had given the bank a second charter of their own in 1782. In March 1785 members of the Pennsylvania assembly, the state's lawmakers, received petitions asking them to cancel that charter. A petition is a written request signed by many people. The bank's critics said its officers favored their friends, charged too much interest on loans, and had too much power over trade and politics. They pointed to the 14 percent dividends the bank paid its shareholders. A dividend is a share of the profits paid out to the owners. The lawmaker William Findley called the bank "a monopoly." That September the lawmakers voted to cancel the charter. In 1787 they gave the bank a narrower charter. It lasted 14 years, and under it the bank's capital, the money its owners put in, could be no more than $2 million. The bank could own no property beyond what its business needed.

Only 7 of the 319 corporations that Wright counts before 1801 were for making goods. From 1786 to 1798, lawmakers in the Northeast chartered 59 private companies to build toll bridges. The first was the Charles River Bridge in Boston. In its first six years, its investors earned an average of 10.5 percent a year on their money.

Getting a charter cost money. Wright found that people who wanted one paid for signatures and for help getting a bill passed by the lawmakers. Some paid lobbyists and bribes. A lobbyist is a person paid to persuade lawmakers. A bribe is money paid to someone in power to get them to do something.

In a corporation, each owner risks the money he paid for his shares. Limited liability is the rule that owners cannot also be made to pay the company's debts from their own property. The historians Oscar and Mary Handlin found only 16 early charters that spelled out a promise of limited liability. Wright argues that owners' risk was limited anyway. A company could not charge its shareholders more than the price of their shares.

Robert Morris

Who: The merchant who ran the country's finances near the end of the Revolution and planned its first commercial bank. He bought almost all of the Seneca Nation's remaining land in New York, and he was later locked in a prison for people who could not pay their debts.

When and where: Philadelphia, 1781 to 1801. Born 1734, died 1806.

Robert Morris ran the finances of the United States near the end of the Revolution, and later he went to prison for his debts. As Superintendent of Finance, the man the Continental Congress put in charge of its money, he wrote the charter of the Bank of North America. He used the bank to keep the value of the country's money steady and to keep the national government from running out of money.

After the war, Morris bought land with borrowed money. Starting in 1793, he and his partners John Nicholson and James Greenleaf bought thousands of building lots in the new District of Columbia. They also bought millions of acres in Pennsylvania, New York, Kentucky, Virginia, Georgia and the Carolinas.

Morris's land in western New York was Seneca land. From 20 August to 16 September 1797, his son Thomas Morris and his agent Charles Williamson met Seneca leaders at Geneseo, New York. Nearly 3,000 Seneca and other Haudenosaunee people came. The Haudenosaunee are a union of Native nations: the Mohawk, Oneida, Onondaga, Cayuga and Seneca, later joined by the Tuscarora. The Seneca leaders at Geneseo included Cornplanter, Red Jacket and Handsome Lake, along with the clan mothers. Clan mothers are women leaders who choose their clan's chiefs and can remove a chief who acts badly. At this meeting the Seneca leaders signed the Treaty of Big Tree. Under it they gave up almost all of their remaining land in New York, nearly 3.5 million acres. They kept 12 small pieces of land.

> Morris paid $100,000. Federal officials held the money and put it into shares of the Bank of the United States, which paid the Seneca up to $6,000 a year. Morris asked that the $100,000 go back to his own heirs, the family members who would inherit from him, if the Seneca nation should "become extinct," meaning if every Seneca died. The heads of the federal Treasury and State departments refused. Most of the land went on to the Holland Land Company.
>
> By 1797 Morris and Nicholson together owed their creditors about $12 million. A creditor is a person owed money. In February 1798 officers arrested Morris at his home. They took him to the Prune Street debtors' apartment, next to the Walnut Street Prison in Philadelphia. Morris was held there because he could not pay his debts. He stayed there about three and a half years.
>
> In 1800 members of Congress passed a bankruptcy law. Bankruptcy is a legal process for a person who cannot pay his debts. A court divides what he owns among the people he owes, and he is freed from the rest of the debt. Accounts differ about whether Morris's time in prison helped get that law passed. He was released under it in August or October 1801 (accounts differ). At his release, three bankruptcy commissioners, officials who handled his case, found that he himself owed $2,948,711.11.

1800 to 1850

Americans formed corporations by the thousands between 1800 and 1850. A corporation is a company that the law treats as one body. Its owners hold shares, which are parts of the ownership, and it goes on after its first owners are gone. A corporation needs a charter, the written grant from state lawmakers that creates it. At the start of the century, state lawmakers had to pass a special law for each charter. Under a Connecticut law of 1837, people could start a corporation for any lawful business by following set steps. Merchants in Boston used corporations to build cotton mills, and by 1850 their group controlled a fifth of the country's cotton cloth making. In 1819 the justices of the Supreme Court ruled that a state could not change a charter it had already granted. In the 1830s President Andrew Jackson fought the Second Bank of the United States, one of the largest companies in the country. Jackson blocked the renewal of its federal charter, and the charter ran out in 1836.

From special charter to general law

Before 1811, a group that wanted a corporation had to ask lawmakers to pass a special law just for them. On 22 March 1811, New York's lawmakers passed the first general incorporation law in the country. A general incorporation law lets any group form a corporation by following set steps, without a special vote.

The New York law covered only makers of goods. It named goods of wool, cotton or linen, and goods of iron, steel, copper, lead and similar metals. Any five or more people could form such a company. The charter lasted 20 years, and the company could raise no more than $100,000. In 1972 the historian Seavoy wrote in the *Business History Review* that the law was "essentially an emergency measure." Under two federal laws, the Embargo of 1807 and the Non-Intercourse Act of 1809, cloth from Europe had stopped coming in. An embargo is a government ban on trade, and non-intercourse here means no trade. New York's lawmakers wanted thread made at home so that families could weave their own cloth.

In 1837 Connecticut's lawmakers passed a law that let people incorporate, or form a corporation, for "any other lawful business." It was the first such law that did not list which trades were allowed or set a time limit on the corporation's life. Banks still needed a special act.

In some Southern states, lawmakers shut particular groups out of their general incorporation laws, most often people who were not white. The economic historian Eric Hilt describes these rules. In those states a Black American could not form a corporation under the general law.

The economic historians Richard Sylla and Robert E. Wright count 22,419 business corporations that state lawmakers created by special laws, one charter at a time, from 1790 to 1860. Together their charters allowed their owners to raise at least $4.5 billion. Several thousand more corporations formed under general laws.

Dartmouth College v. Woodward, 1819

In 1819 the justices of the Supreme Court ruled that a charter is a contract, and that a state cannot change it at will. The case was about a college's charter. Because the justices treated any charter as a contract, business corporations could rely on the same rule to protect their own charters.

King George III had granted Dartmouth College its charter in 1769. In 1815 the college's trustees, the board that ran it, removed its president, John Wheelock. Wheelock then persuaded the governor of New Hampshire to change the college's charter. In 1816 New Hampshire's lawmakers rewrote it. Under the new charter the governor chose trustees and a

state board could overrule them. The lawmakers also renamed the college Dartmouth University. The old trustees sued William Woodward, who served as secretary under the new plan.

Daniel Webster argued the trustees' case before the Supreme Court. He said, "It is, sir, as I have said, a small college, and yet there are those who love it!" Chief Justice John Marshall wrote the Court's decision and its reasons. He ruled that the 1769 charter was a contract. The Constitution states that no state may pass a law "impairing the obligation of contracts." Impairing means weakening. New Hampshire's lawmakers had broken that rule.

After the ruling, state lawmakers could not take back a charter that lawmakers had granted in an earlier year. Justice Joseph Story, in his own written opinion in the case, pointed to a way around this. Lawmakers could write into a charter, at the start, a power "to alter, modify, or repeal" it, which means to change it or cancel it. State lawmakers began writing such lines into new charters. Dartmouth College's own history of the case calls it a basis for the Constitution's protection of corporations. Supreme Court justices still cite it, among other places in their opinions in *Citizens United v. FEC*, a 2010 case about money spent on elections, and *Burwell v. Hobby Lobby*.

The Boston Associates and the mills

A group of Boston merchants, known today as the Boston Associates, built cotton mills with far more money behind them than their rivals had. In 1813 Francis Cabot Lowell, Patrick Tracy Jackson and Nathan Appleton organized the Boston Manufacturing Company. It started with $400,000 in capital, the money its owners put in. That was more than ten times the money behind the average cotton mill in Rhode Island. By 1820 the owners had put in $200,000 more. By 1850, the National Park Service counts, the Boston Associates controlled a fifth of the country's cotton cloth making.

In 1814 they built a mill at Waltham, on the Charles River. It was the first mill in the world to spin cotton into thread and weave it into cloth under one roof. Every step, from raw cotton to finished cloth, happened in one building. Within six years the mill ran 5,376 spindles and 175 power looms. A spindle is the rod that twists cotton fibers into thread, and a power loom is a weaving machine driven by water power. The mill used 450,000 pounds of cotton a year. A typical Rhode Island mill ran fewer than 1,000 spindles. By 1820 the Waltham mill used all the power the Charles River could give.

The same investors then built mills at Pawtucket Falls, on the Merrimack River. The falls were a fishing place of the Pennacook people. In the 1600s the Native towns of Pawtucket and Wamesit stood there, under the leaders Passaconaway and his son Wannalancet. On 1 March 1826 the mill village became a town named Lowell. It had 2,500 people in 1826 and 6,477 in 1830.

Enslaved people in the South grew the cotton the mills spun. The mills also made a cheap cloth that planters bought to clothe the people they enslaved. People at the time called it "negro cloth." Senator Charles Sumner of Massachusetts spoke of the tie between the mill owners and the slaveholders. He called it an "unholy union" between the lords of the loom and the lords of the lash. The lash is a whip.

Nicholas Biddle

Who: The president of the Second Bank of the United States, one of the largest companies in the country, during President Andrew Jackson's fight to end it.

When and where: Philadelphia, from 1822 or 1823 to 1839.

Nicholas Biddle ran the Second Bank of the United States while President Andrew Jackson fought to end its federal charter. President James Madison signed the bank's charter into law on 10 April 1816. The charter ran for 20 years. The bank had $35 million in capital, the money its owners put in. That was three and a half times the $10 million of the first national bank. The federal government owned a fifth of the bank's stock, its shares of ownership. The president chose 5 of its 25 directors, the board that ran the bank. The bank opened in Philadelphia in January 1817. The Federal Reserve's own history of the bank describes it as "one of the largest U.S. corporations."

Biddle became the bank's president in 1822 or 1823 (accounts differ). By the end of the 1820s the bank had 29 branches, by one count, and did about $70 million of business a year. Another count gives 25 branches. The Federal Reserve's history states that Biddle "was not above allowing the Bank to make loans to his friends while denying loans to those less friendly."

Andrew Jackson became president in 1829. That year he called the bank unconstitutional, which means against the Constitution, and he said it was corrupt. On 6 January 1832 members of Congress brought in bills to recharter the bank, which means to renew its charter, four years before it ran out. Thomas Cadwalader, a director of the bank and Biddle's close friend, had counted votes in Congress and advised asking early. Biddle agreed. Most accounts say he did so unwillingly, under pressure from the political leaders

> Henry Clay and Daniel Webster. Majorities in both houses of Congress voted yes: 28 to 20 in the Senate and 107 to 85 in the House. Jackson vetoed the bill, which means he refused to sign it. The bank's supporters could not get the two-thirds vote needed to pass the bill over his veto.
>
> Jackson won a second term in 1832. He then ordered the government's money moved out of the bank and into banks chartered by the states. By late 1833 most of it was gone. Biddle answered by cutting the bank's lending and by calling in loans, which means he told borrowers to pay back what they owed. He believed that the shortage of credit, or money to borrow, might turn people against Jackson. In April 1834 a majority of the House of Representatives voted against renewing the charter.
>
> The federal charter ran out in 1836. Pennsylvania's lawmakers chartered the bank again as a state bank. In 1839 the bank's officers suspended payment, which means they stopped handing out coins to people who brought in its paper notes. Biddle resigned that year.
>
> In 1841 the bank's stockholders, the people who owned its shares, chose a committee to look into its books. The committee members reported that Biddle had used the bank's money to buy cotton, tobacco and other crops and ship them to Europe. The bank closed for good on 4 April 1841.
>
> On 10 December 1841 a grand jury charged Biddle and two other bank officers, Samuel Jaudon and John Andrews, with a crime. A grand jury is a group of citizens who decide whether there is enough proof for a trial. The charge stated that the three men had cheated the stockholders out of $400,000 in 1836 and had tried to cover it up with false records in 1841. Biddle was arrested. Judges later dropped the charges. Biddle paid the bank's creditors, the people it owed money, with what was left of his own fortune. He faced lawsuits until he died in 1844. One suit asked for nearly $25 million. The histories of the bank do not name who brought it.

1850 to 1900

A few companies came to control whole industries between 1850 and 1900. In 1880 the capital of one railroad, the Pennsylvania, was larger than everything the federal government took in that year. John D. Rockefeller's Standard Oil refined 90 to 95 percent of the country's oil by 1880. By 1895 one company controlled about 98 percent of the country's sugar refining.

Members of Congress wrote the first federal rules for business in 1887 and 1890. In the 1890s the justices of the Supreme Court let the sugar trust stand under those rules, and federal lawyers used the second rule to get a court order against a railroad strike. When workers struck, owners and officials answered with armed guards, court orders and soldiers. Henry Clay Frick hired the Pinkerton guards who fought steelworkers at Homestead in 1892. Governor Robert Pattison sent the Pennsylvania National Guard there. In 1894 President Grover Cleveland sent federal troops against the Pullman strike.

The railroads

In 1880 the largest corporation in the country was a railroad. That year the Pennsylvania Railroad had 30,000 workers and $400 million in capital. It carried 10 percent of all the freight in the United States and 20 percent of the passengers. The federal government collected about $334 million in all in the year that ended on 30 June 1880, less than the railroad's capital. By 1882 the Pennsylvania was the largest corporation in the world.

Federal and state officials also gave the railroads land. A land grant is a gift of land from a government. From 1850 to 1871, federal officials granted about 129 to 131 million acres to railroad companies. State lawmakers granted about 51 million acres more. Counts of the federal grants differ by a few million acres.

The first federal grant went to the Illinois Central in 1851, under a law passed the year before. Of the 3.75 million acres in that law, nearly 2.6 million went to the Illinois Central.

The granted land came from land that federal officials had taken, or were taking, from Native nations. The Pacific Railroad Act of 1 July 1862 states: "The United States shall extinguish as rapidly as may be the Indian titles to all lands falling under the operation of this act." Indian titles meant the Native nations' rights to their own land. To extinguish them meant to end them. In that law, members of Congress told federal officials to end the Native nations' rights to the land along the railroad as fast as they could.

> #### John D. Rockefeller
>
> **Who:** The Cleveland businessman who built Standard Oil and set up the first large trust.
>
> **When and where:** Cleveland and New York, 1870 to 1911.
>
> **Movie:** *The Men Who Built America* (2012), a History Channel series about Rockefeller, Carnegie, J. P. Morgan and others. It is a docudrama: actors play the real people in scripted scenes.

John D. Rockefeller used secret deals with the railroads to take over nearly all of the country's oil refining. Refining is the work of cleaning crude oil from the ground and separating it into products that people can use.

On 10 January 1870 Rockefeller formed the Standard Oil Company in Ohio. His partners were his brother William Rockefeller, Samuel Andrews, Henry M. Flagler and Stephen V. Harkness. The company had $1,000,000 in capital. Its refineries in Cleveland could handle about 1,500 barrels of crude oil a day. All the refineries in Cleveland together handled about 10,000 to 12,000 barrels a day.

Rockefeller and his partners controlled 900 of the 2,000 shares of the South Improvement Company. Thomas A. Scott of the Pennsylvania Railroad had set it up late in 1871. It was a secret deal between a few refiners and the railroads. Under the deal, the railroads would charge $2.56 a barrel to carry crude oil to New York. South Improvement members got back $1.06 on every barrel they shipped. That payment was called a rebate. The members also got $1.06 in cash on every barrel that their rivals shipped. That payment was called a drawback. A rival refiner paid the full price, and part of what he paid went to his own competitors.

Oil producers in western Pennsylvania learned of the plan and fought it. They organized and raided the shipments of the scheme's members. They also asked Pennsylvania's lawmakers and Congress for help. On 2 April 1872 Pennsylvania officials suspended the South Improvement Company's charter. The company never shipped any oil.

While the scheme stood, in early 1872, Rockefeller bought out 21 or 22 of the 26 refiners in Cleveland. Accounts give both numbers. One account puts the buying between mid-February and mid-March. Ida Tarbell says it took three months. One refiner later testified that "our establishment was worth $150,000, and we sold it for about $65,000." That was about forty or forty-five cents for each dollar his business was worth. Rockefeller told the sellers, "Take Standard Oil Stock, and your family will never know want." In three months Standard Oil went from refining about 1,500 barrels a day to 10,000. According to Ida Tarbell, it then held more than a fifth of the country's refining capacity.

Rockefeller kept buying out rivals and making deals with railroads for lower rates. By 1880 Standard Oil refined 90 to 95 percent of all the oil produced in the United States.

What a trust was

A trust was a way to run many companies as one business, with one small group in charge. The Standard Oil Trust was the first large one. On 2 January 1882, the people who owned shares in Standard Oil signed the Standard Oil Trust Agreement. Accounts differ on how many signed: 41 in one count, and about 50 in Ida Tarbell's. They handed over their shares in about 40 companies to nine trustees. A trustee is a person who holds and manages property for others. Rockefeller was one of the nine, and the nine trustees themselves owned most of the stock. The trust was valued at about $70 million. In time the trustees ran some 40 corporations, 14 of them fully owned.

Owners in other industries copied the plan. Laws against such combinations of companies are still called antitrust laws.

In 1892 the justices of the Ohio Supreme Court ruled that the Standard Oil Trust was a monopoly that broke Ohio law. A monopoly is a business that has no real rivals, so it alone sells something. Rockefeller moved the property to companies in other states. Ida Tarbell later wrote of the trust, "You could argue its existence from its effects, but you could not prove it."

On 31 January 1890 James B. Duke's tobacco firm, W. Duke, Sons and Company of Durham, North Carolina, joined four other firms. Together they formed the American Tobacco Company. Duke had gone into the cigarette business in 1881. He leased new machines that rolled cigarettes, advertised heavily and bought up smaller rivals. The new company was the largest tobacco business in the world. In sugar, the American Sugar Refining Company controlled about 98 percent of the country's sugar refining by 1895.

Franklin Tarbell

Who: An independent oil producer in western Pennsylvania who fought Standard Oil from 1872 into the 1890s. He was the father of Ida Tarbell, the reporter who later investigated Standard Oil.

When and where: Oil Creek and Titusville, Pennsylvania, from 1859 until his death in 1905.

Franklin Tarbell joined the oil producers' fight against Standard Oil in 1872. In 1893 he had to mortgage his family's home to pay a ruined partner's debts. His daughter Ida Tarbell wrote about him in her memoir, published in 1939.

He was born in Oxford, New York, on 21 October 1829. In 1859 he was on his way home to Iowa when he heard about the oil well at Titusville, Pennsylvania. He guessed that oil men would need tanks to hold their oil. He believed he could build a wooden tank that held

500 barrels or more. He was told, "Show me a model that won't leak, and I'll give you an order." He made the model and got the order. He built the first large round wooden tank on Oil Creek, and he built tanks for ten years.

In 1867 he began to produce oil himself, on farms near Rouseville. In 1870 he moved his family into a new house he had built in Titusville. His daughter Ida was thirteen.

In 1872 the oil producers learned of the South Improvement scheme. Ida remembered her father coming home one night with a grim look on his face. He told the family that he and scores of other producers had signed a pledge. They would not sell oil to Standard Oil, the one company that had gained from the scheme. Ida was fifteen. She later wrote that in 1872 "there was born in me a hatred of privilege, privilege of any sort."

The fight between the independent producers and Standard Oil went on for twenty years. The producers waited for slow decisions from the Interstate Commerce Commission, the federal board set up in 1887 to watch over the railroads. Some of their businesses failed while they waited. Between 1891 and 1893, while Ida was living in Paris, one of her father's business partners lost everything in this fight and shot himself. Ida's memoir does not state the man's name. The partner left Franklin Tarbell owing money on notes, which are written promises to repay loans. To pay them, during the money panic of 1893, he mortgaged the family's home. A mortgage is a loan that a person gets by pledging a house. If the loan is not repaid, the lender can take the house.

Ida Tarbell spent most of five years investigating Standard Oil. According to a 2012 account in *Smithsonian* magazine, her father warned her that Rockefeller and Standard Oil could crush her, just as, in his view, they had crushed her home town of Titusville. Franklin Tarbell died in Titusville on 1 March 1905.

Andrew Carnegie

Who: The Pittsburgh steelmaker whose company owned each step of making steel, from the iron ore to the finished steel. His general manager broke the steelworkers' union at Homestead in 1892.

When and where: Pittsburgh, until he sold his company in 1901.

Movie: *Andrew Carnegie: The Richest Man in the World*, an American Experience documentary shown on PBS on 20 January 1997.

> Andrew Carnegie cut his costs and raised his profits by owning every step of making steel. This way of running a business is called vertical integration. It means that one company owns each stage of making a product, from the raw material to the finished goods.
>
> By 1888 Carnegie already owned 73.5 percent of Henry Clay Frick's coke company. Coke is a fuel made by baking coal, and steel makers burn it to melt iron ore. In the 1890s Carnegie leased newly found iron ore deposits in the Mesabi Range of Minnesota. The name Mesabi comes from the Ojibwe name for the range, Misaabe Wajiw, which means Big Man Mountain. It was Ojibwe country. In a treaty of 1854, Ojibwe bands gave up northeastern Minnesota to the United States. A treaty is a written agreement between nations. Federal officials wanted a vein of copper on the north shore of Lake Superior. In a treaty of 1855, Ojibwe bands gave up most of north-central Minnesota, where federal officials wanted land for logging and mining.
>
> Carnegie also bought ships on the Great Lakes to carry his ore. He bought a railroad and extended it to link his steel works to Lake Erie. He no longer had to buy coke, ore or shipping from other companies, and that cut his costs.
>
> By the end of the 1890s Carnegie Steel was the largest steel maker in the world. It made a quarter of all the steel produced in the United States. In 1900 it earned $40 million in profits.
>
> Carnegie was in Scotland in the summer of 1892. In the words of the encyclopedia Britannica, he gave his general manager, Henry Clay Frick, "carte blanche to break the union" at the Homestead works. Carte blanche means full freedom to act.

Homestead, 1892

In 1892 Henry Clay Frick broke the steelworkers' union at the Homestead works near Pittsburgh. He used a fence, a lockout and about 300 armed Pinkerton men. Frick was the general manager of Carnegie Steel. That year he became its chairman, and he owned 11 percent of it, as much as Carnegie's longtime partner Henry Phipps. The workers' union was the Amalgamated Association of Iron and Steel Workers, and its contract ran out on 1 July 1892.

Frick cut wages. He had a fence built around the plant, topped with barbed wire. The workers called it "Fort Frick." In late June he locked the workers out, which means he closed the plant to them. On 2 July he fired all 3,800 workers.

Frick signed a contract with William and Robert Pinkerton, who ran the Pinkerton National Detective Agency. They agreed to send 300 armed men, at five dollars a day for each man. The agency gathered 316 men in New York and Chicago. Some were Pinkerton regulars. Others had no jobs, some were criminals on the run, and a few were college students earning money for the summer. Their crates held 250 Winchester rifles and 300 pistols. Early on 6 July 1892, tugboats towed two barges carrying the men up the Monongahela River to the plant. A gun battle followed.

Accounts give different death counts. The encyclopedia Britannica lists at least 7 workers and 3 Pinkerton men killed in the battle and the days after it. The historian Leon Wolff counts about 9 strikers and 7 Pinkerton men dead from bullets, beatings, drowning and suicide. He writes that about 40 strikers and 20 Pinkerton men were shot. By the time the strike ended in November, he counts 35 men dead from the battle and the violence that followed.

Wolff names some of the dead. A Pinkerton guard named Klein died on the gangplank, shot through the head. Joseph Sotak went to help a wounded worker, Martin Murray, and was shot in the mouth and killed. A worker named Streigle was shot through the throat and died at once. Neither Wolff nor Britannica names the men who fired the shots that killed them.

After the battle, Frick asked Governor Robert Pattison of Pennsylvania for help. Pattison sent about 8,500 soldiers of the state National Guard. Another count gives 8,000. The soldiers took over the plant on 12 July. By 15 July Carnegie Steel's managers had the plant running again, with replacement workers. Many of them were Black men from the South. The union did not let Black workers join it. In November 1892 about 2,000 white workers attacked Black workers and their families, and gunfire badly wounded several people. The accounts do not say who fired. The union gave up on 21 November.

Officials charged scores of union leaders and workers with crimes. Almost all of them were acquitted, which means found not guilty.

Carnegie Steel's managers cut wages in all of Carnegie's mills by about half. A heater's helper, one of the workers who heated the steel, was paid by the ton of steel. He earned 4.85 cents a ton in February 1892 and 2.22 cents a ton in February 1894. The managers enforced the twelve-hour workday. The members of the union's advisory committee were blacklisted for life. A blacklist is a list of workers that employers agree never to hire. The historian Leon Wolff does not name the employers who kept the list.

Members of Congress investigated the use of private armed guards at Homestead, and Frick testified before them.

John W. Holway

Who: A 23-year-old medical student hired as a Pinkerton guard for the Homestead job.

When and where: Chicago to Homestead, Pennsylvania, July 1892.

Movie: *The River Ran Red* (1993), a documentary about the Homestead lockout, directed by Steffi Domike and Nicole Fauteux. It tells the story from the workers' side.

John W. Holway was hired to guard the Homestead works, and a crowd there kicked him and beat him with stones. He was 23 years old and studying to be a doctor. Henry Clay Frick had signed the contract for the guards with William and Robert Pinkerton. Holway was one of the college students who signed up with the Pinkerton agency for summer work at five dollars a day.

The agency's Chicago superintendent, the man in charge of its Chicago office, would not tell the men where they were going. He told them, "The element of danger which is usually found in such expeditions will be here entirely lacking." After dark, agency men put Holway and the other Chicago men on a train at the Lake Shore depot. Pinkerton detectives stood guard to stop anyone from getting off, even at the stops in Toledo and Cleveland. The thought struck Holway, Wolff writes, that he was "a sort of prisoner." He also had a feeling that there would be shooting.

On 6 July he was on the barges at Homestead. According to Wolff, he does not seem to have fired a shot all day. After the Pinkerton men surrendered, they walked to the town through a crowd that beat them. Three strikers knocked Holway down. One of them said, "You have killed two men this morning. I saw you!" As they pushed him up the hill, a stone hit him in the head.

Holway described what happened next under oath to the congressional committee. "I ran about half a mile, I suppose, but was rather weak and had had nothing to eat or drink, and my legs gave out, could not run any further, and some man got hold of me by the back of my coat, and about 20 or 30 men came up and kicked me and pounded me with stones." He said, "I thought I was about going and commenced to scream." About going meant about to die. Two or three strikers with rifles then ran up and kept the crowd off him.

The first federal rules, and how they were used

Members of Congress passed the first federal laws to control big business in 1887 and 1890. In the 1890s the justices of the Supreme Court let the sugar trust stand, and federal officials used the second law to break a railroad strike.

The Interstate Commerce Act became law on 4 February 1887. Under it, a five-member board called the Interstate Commerce Commission watched over the railroads. Interstate commerce means trade between states. The railroads became the first industry under federal regulation, which means rules made and enforced by the national government. The commission was the first federal regulatory board.

The Sherman Antitrust Act became law on 2 July 1890. It was named for Senator John Sherman of Ohio. Under it, every contract or combination "in restraint of trade" became illegal. That means any deal that blocks free buying and selling between the states. Trying to monopolize, or to become the only seller of something, also became a crime. A person found guilty could be fined $5,000 and sent to jail for a year. People harmed could sue for three times their losses. The law did not define the words "trust," "combination," "conspiracy" or "monopoly."

In 1895, in *United States v. E. C. Knight Co.*, the justices of the Supreme Court ruled on the sugar trust. The American Sugar Refining Company controlled about 98 percent of all sugar refining in the United States. The justices ruled that the company had not broken the law. They reasoned that making sugar was manufacturing, and that manufacturing was not trade.

In 1893, during a depression, managers of the Pullman Palace Car Company laid off more than 2,000 workers and cut wages by 25 percent. A depression is a long period when many businesses fail and many people lose their jobs. The company owned the town where its workers lived, and its managers did not lower the rents. Company president George M. Pullman refused to meet the workers' representatives. In 1894 between 125,000 and 250,000 railroad workers in 27 states joined a boycott of Pullman cars, refusing to handle trains that carried them.

That year federal officials used the Sherman Act against the workers. Edwin Walker was a special lawyer working for Attorney General Richard Olney. Walker claimed that the strike broke the Sherman Act. On 2 July 1894 federal judges William Woods and Peter S. Grosscup granted him an injunction. An injunction is a court order that tells people to stop doing something. Anyone who breaks it can be jailed. President Grover Cleveland used the injunction as his reason to send federal troops. The soldiers arrested boycotters and rioters and sometimes shot them, according to the Federal Judicial Center's history of the case. About 30 people were killed across the country during the strike.

1900 to 1950

Between 1895 and 1904, owners and bankers joined more than 1,800 manufacturing firms into 157 large corporations. Federal lawyers and judges then began to break some of the biggest apart. The largest, U.S. Steel, issued more than a billion dollars in stock in 1901. Stock is the shares, or parts of ownership, that a company sells to investors. Presidents Theodore Roosevelt and William Howard Taft had their lawyers sue the biggest combinations. In 1911 the justices of the Supreme Court ruled that Standard Oil and the American Tobacco Company had broken the law, and under court orders both were split apart.

Members of Congress passed two more antitrust laws in 1914. Antitrust laws are laws against trusts, which are giant combinations of companies run as one business, and against other deals that block competition. After the stock market crash of 1929, members of Congress passed a law in 1934 that made companies selling stock report their finances to the public. During the Second World War, federal officials gave about two-thirds of the value of their main war contracts to 100 companies.

The great merger movement and U.S. Steel

In a merger, two or more companies join into one. The 157 large combinations formed between 1895 and 1904, and more than 60 of them formed in 1899 alone. Naomi Lamoreaux, in her book *The Great Merger Movement in American Business*, names the causes. Factories cost a great deal to build, and industries grew fast after 1887. A depression is a long time when many businesses fail and many people lose their jobs. After the depression of 1893 began, rival owners cut their prices against each other in price wars. The owners had made agreements, called pools, to hold prices up. The price wars went on anyway.

Lamoreaux writes that "there was nothing natural or inevitable" about these combinations. Inevitable means certain to happen. Most of them used more money and work to make the same goods than the new rivals that soon appeared did, and in her words they "quickly lost their positions of market dominance," which means they lost their lead in their markets. The firms that built barriers against rivals, such as U.S. Steel through its control of iron ore, kept their lead longer.

U.S. Steel was set up as a corporation in New Jersey in February 1901. The banker J. P. Morgan put it together. Morgan bought Carnegie Steel for Andrew Carnegie's asking price of $480 million. Other companies went in with it, among them Federal Steel, National Steel, National

Tube and American Bridge. So did the Lake Superior Consolidated Iron Mines, whose ore came from Ojibwe land in Minnesota. Charles M. Schwab was president from 1901 to 1903, and Elbert H. Gary was chairman from 1901 to 1927.

The new company issued stock with a stated value of about $1.4 billion. Accounts give figures from $1.403 billion to $1.466 billion. It was the first company in the world with more than a billion dollars in stock. Government investigators at the federal Bureau of Corporations put the real value of what the company owned at about $682 million, about half the stock issued. Stock issued for more than the property behind it is called watered stock. According to the financial data firm Finaeon, when the shares first traded in 1901, buyers valued them at about $765 million in all. The market value of the stock did not pass $1 billion until 1916.

U.S. Steel made about two-thirds of all the steel in the United States at the start. Kenneth Warren, in his book *Big Steel*, counts 65.7 percent in 1901. Another count gives 67 percent in 1902. EBSCO's reference entry gives a lower figure for the start, 44.8 percent, which no other count matches. That year the company employed 168,000 people. By 1911 its share had fallen to between 40 and 50 percent, depending on who counts.

J.P. Morgan

Who: The Wall Street banker who put companies together, among them U.S. Steel in 1901 and the Northern Securities Company.

When and where: New York, 1901 to 1904.

J. P. Morgan was a banker on Wall Street, in New York City, who joined rival companies into single giant ones. Around 1900 he led a wave of these mergers.

In December 1900 Charles M. Schwab, then president of Carnegie Steel, gave a speech at the University Club. The speech led Morgan to the steel deal. Carnegie named a price of $480 million for his company, and Morgan accepted it at once. Morgan then formed U.S. Steel in 1901 and sat on its finance committee.

In 1901 Morgan and the railroad owner James J. Hill also formed the Northern Securities Company. It was a holding company, which is a company that owns controlling shares in other companies and does little else. Northern Securities controlled three railroads: the Great Northern, the Northern Pacific, and the Chicago, Burlington and Quincy. In 1902 President Theodore Roosevelt's Justice Department lawyers sued to break it up.

Ida Tarbell

Who: The reporter whose history of Standard Oil, built from court records and sworn testimony, showed how John D. Rockefeller built Standard Oil.

When and where: New York and the Pennsylvania oil region, 1900 to 1904.

Ida Tarbell spent most of five years, by her own count, tracing from public records how John D. Rockefeller built Standard Oil. Her family moved into Titusville in 1870, when she was 13. In 1872 her father, Franklin Tarbell, signed a pledge with other oil producers not to sell oil to Standard Oil. She began the work in 1900.

Tarbell read hundreds of thousands of documents from across the country. She used court records and depositions. A deposition is sworn testimony that is taken outside a courtroom and written down. She also interviewed employees and lawyers. The writer Mark Twain arranged for her to meet Henry H. Rogers, an officer of Standard Oil, and she interviewed him too.

Her *History of the Standard Oil Company* came out in 19 parts in *McClure's* magazine, from November 1902 to October 1904. In 1904 it was published as a book in two volumes.

In one part, Tarbell told the story of a Cleveland widow, Mrs. Backus, who sold her late husband's plant for making oil for machines to Rockefeller in 1878. Tarbell wrote that he paid her next to nothing. Rockefeller's biographer Ron Chernow gives a different account. He says the plant was out of date, that the widow asked for as much as $200,000, and that Rockefeller paid $79,000, which included $10,000 added on top. The two accounts of that sale do not agree. Chernow calls Rockefeller's buyouts of his Cleveland rivals in 1872 "one of the most shameful episodes in his career."

Rockefeller called Tarbell "That poisonous woman." He told his advisers, "Not a word about that misguided woman."

Theodore Roosevelt

Who: The president known as the trust-buster. Lawyers in his Justice Department won the Northern Securities case and brought 44 antitrust suits in seven and a half years.

When and where: Washington, 1901 to 1909.

Movie: *TR: The Story of Theodore Roosevelt*, an American Experience documentary first shown on PBS in October 1996.

> Theodore Roosevelt is known as the trust-buster, but the president after him brought more antitrust suits. In 1902 Roosevelt's Justice Department lawyers sued the Northern Securities Company, J. P. Morgan and James J. Hill's railroad holding company, under the Sherman Act. The Sherman Act is the federal law of 1890 against deals that block trade and against attempts to become the only seller of something.
>
> On 14 March 1904 the justices of the Supreme Court ruled 5 to 4 for the government and upheld the order to break the company up. Justice John M. Harlan wrote for the majority. Justice Oliver Wendell Holmes disagreed. He wrote, "Great cases like hard cases make bad law."
>
> Roosevelt's lawyers brought 44 antitrust suits in seven and a half years. William Howard Taft, the next president, had his lawyers bring more in four years. One count gives 75 and another gives 99. In 1911 Taft's lawyers sued U.S. Steel. Roosevelt then accused Taft of being unable to tell the good trusts from the bad ones.

Standard Oil and American Tobacco are broken up, 1911

In May 1911 the justices of the Supreme Court ruled against Standard Oil and the American Tobacco Company, and both companies were split apart. On 15 May they ruled that Standard Oil of New Jersey had broken the Sherman Act. Chief Justice Edward D. White wrote the court's decision and its reasons. He wrote that the Sherman Act banned only "unreasonable" limits on trade. This test is called the rule of reason. The justices gave the company six months to break itself up. Standard Oil was split into 34 separate companies.

Rockefeller was worth about $300 million in May 1911 and more than $900 million by the end of 1913. According to Chernow, Roosevelt said that Wall Street's prayer was now, "Oh Merciful Providence, give us another dissolution." Providence means God's care, and a dissolution is the breakup of a company. In 1916 newspaper headlines called Rockefeller the world's first billionaire. Companies that grew out of Standard Oil later became Exxon, Mobil and Chevron.

On 29 May 1911 the justices ruled against the American Tobacco Company. They found that James B. Duke, Benjamin N. Duke, George W. Watts, R. J. Reynolds and others had broken the Sherman Act "by seeking to monopolize practically all sectors of the tobacco industry." To monopolize means to become the only seller, with no real rivals. In November 1911 federal judges in New York divided the company's property among a new American Tobacco Company, Liggett and Myers, P. Lorillard, R. J. Reynolds and others. James B. Duke's tie to American Tobacco ended that year.

Two new laws, 1914

In 1914 members of Congress passed two laws that added to the Sherman Act. The second one named business practices the Sherman Act had left vague. President Woodrow Wilson signed the Federal Trade Commission Act on 26 September 1914. Under it, "unfair methods of competition" became illegal, and a new Federal Trade Commission had the power to make companies obey that rule. The commission opened on 16 March 1915.

Wilson signed the Clayton Antitrust Act on 15 October 1914. It banned several practices by name. One was price discrimination, which means charging different buyers different prices for the same goods. Others were deals that tied a buyer to one seller, mergers that cut down competition, and the same people sitting on the boards of competing companies. The Clayton Act also stated "that the labor of a human being is not a commodity or article of commerce." A commodity is a thing that is bought and sold. Under that section, federal lawyers and judges could no longer treat unions as illegal combinations. In 1894 they had used the Sherman Act that way against the railroad workers of the Pullman boycott.

Ludlow, 1914

At Ludlow, Colorado, on 20 April 1914, soldiers of the Colorado National Guard, the state's part-time army, burned the tent camp of striking coal miners. The mine owners were paying the Guard's costs. At least 19 people were killed, 13 of them women and children. Most of the strikers worked for the Colorado Fuel and Iron Company, whose main stockholder, the person who owned the most shares, was John D. Rockefeller Jr.

The miners struck in September 1913. In October men in a company armored car known as the "Death Special" fired on their tent camp at Forbes and killed one person. Governor Elias M. Ammons sent the Colorado National Guard.

On 20 April 1914 fighting broke out at the tent camp at Ludlow. Nobody knows who fired the first shot. Guardsmen set the tents on fire. Thirteen women and children had hidden in a pit dug under a tent, and they suffocated there. Suffocate means to die from lack of air. One guardsman and five miners were also killed. Guardsmen shot the strike leader Louis Tikas three times in the back. President Wilson sent the U.S. Army on 28 April. The strike ended in December 1914, and the union won none of its goals.

Leaded gasoline, 1924 to 1926

In the 1920s, three of the largest companies in the country kept selling a lead fuel additive after workers who made it died. Tetraethyl lead is a liquid made with lead. Researchers at General Motors added it to gasoline to stop engines from knocking. In August 1924 General Motors and Standard Oil of New Jersey formed the Ethyl Gasoline Corporation to sell it. DuPont made it.

Workers died at plants and a laboratory of all three companies. In October 1924, seven men died and 33 went to the hospital after working at Standard Oil's Bayway refinery in Elizabeth, New Jersey. A refinery is a plant that turns crude oil into fuel. Bill Kovarik, who wrote a history of leaded gasoline in 2005, gives those counts. Other accounts count five dead. Kovarik counts ten more dead at a DuPont plant and at least two dead at General Motors' laboratory in Dayton, Ohio. Poisoned workers at Bayway were "black and blue from uncontrolled muscle spasms." Some had to be tied into straitjackets, which are coats that hold a person's arms tight against the body.

On 20 May 1925 the Surgeon General, the head of the federal public health service, called a meeting about the additive. Frank Howard of Standard Oil said the industry could not give up "what has come to the industry like a gift from heaven." The companies kept selling it. Robert Kehoe, a scientist paid by the Ethyl company, then set out a theory of a "safe level" of lead that the companies relied on for decades.

Who controlled the corporations, 1932

In 1932 two writers showed that the 200 largest corporations outside banking held about half of the country's corporate wealth, and that hired managers, not owners, ran them. In their book *The Modern Corporation and Private Property*, Adolf Berle and Gardiner Means counted the 200 largest corporations outside banking. By 1930 those 200 held 49.2 percent of the country's corporate wealth. The scholar Gerald F. Davis later worked out that if that trend had continued, they would have held all of it by 1959.

Berle and Means also found that ownership of these companies was split among many scattered shareholders, the people who owned their shares, so the managers made the decisions.

The Securities and Exchange Commission, 1934

After the stock market crash of 1929, members of Congress passed a law that made companies selling stock report their finances to the public. President Franklin D. Roosevelt signed the Securities Exchange Act on 6 June 1934. Under it, the members of a new Securities and

Exchange Commission, or SEC, watched over the stock markets. The yearly and quarterly reports that such companies still file with the SEC began with this law.

Roosevelt made Joseph P. Kennedy the first chairman of the SEC in the summer of 1934. Accounts give June or 1 July. Kennedy had made money in the stock market using the same practices the new law banned. He had given, lent and raised money for Roosevelt's 1932 campaign. Newspaper writers said the choice was "like putting the fox in the hen house." In private, Roosevelt answered, "set a thief to catch a thief." Both sayings meant the same thing: Roosevelt had put a man who had used those practices in charge of stopping them. Kennedy resigned in September 1935.

Spies, guns and company police, 1936 to 1940

From 1936 to 1940, senators on a committee led by Senator Robert M. La Follette Jr. of Wisconsin held hearings on how employers fought unions. Witnesses told the senators that company managers had planted spies inside unions. Company managers had stored up weapons, among them submachine guns, rifles and tear gas. They had also hired their own police forces.

On Memorial Day, 30 May 1937, during a steel strike, several hundred men, women and children marched toward the Republic Steel plant in Chicago to support the strikers. Republic Steel's chairman was Tom M. Girdler. At the plant, 264 Chicago police threw tear gas at the marchers, fired their guns and beat them with clubs. The police killed 10 people and shot 40, and more than 90 people were hurt in all. The senators on the La Follette committee found that the police had used "excessive force."

Hawaii's Big Five

In Hawaii, five companies known as the Big Five controlled about 94 percent of the islands' sugar crop by 1920. They were C. Brewer and Company, Theo H. Davies and Company, H. Hackfeld and Company, Castle and Cooke, and Alexander and Baldwin. The historian Carol MacLennan gives the 94 percent figure. The same people sat on the boards of several of the firms, and together they controlled shipping, banking and stores in the islands. Four of the firms together owned nearly three-quarters of the Matson shipping line, which carried 80 percent of the cargo between the mainland and Hawaii.

In 1893 members of a group called the Committee of Safety organized the overthrow of the Hawaiian Kingdom. They pressed for the United States to annex the islands, which means to take them over. Some children of Big Five partners were members of that committee. The Big

Five's plantations stood on the land of Native Hawaiians, the Kanaka Maoli. From 1893 into the 1950s, the owners of the Big Five dominated Hawaii's economy and government.

War contracts, 1940 to 1944

During the Second World War, a small number of large companies received most of the government's war business. Robert Higgs, writing for the Independent Institute in 1995, gives the figures for prime contracts from 1940 to 1944. A prime contract is a contract made directly between the government and a company. The 100 companies with the most contract money received about two-thirds of the value of those contracts. The top 10 received about 30 percent. General Motors alone received nearly 8 percent.

Federal officials also paid for new factories and rented them to private companies. As of 30 June 1944, just 26 companies had the use of half the value of all those government-paid factories.

1950 to 2000

The largest American companies of these years had workers by the hundreds of thousands. General Motors was the largest private employer in the country in 1979. The Bell telephone system had about a million workers in the early 1980s. From the 1970s, business leaders organized to win influence in Washington, and by 1982 more than 2,400 firms had registered lobbyists there. A lobbyist is a person paid to persuade lawmakers.

Some companies kept selling products that studies linked to disease and death. In 1954 tobacco companies paid for advertisements in which they disputed studies linking smoking to lung cancer. In 1994 heads of tobacco companies told a House hearing that they did not believe nicotine is addictive. AT&T's leaders agreed with federal lawyers to split up the Bell System, and the split took effect in 1984. In 1999 federal lawyers won a ruling that Microsoft held a monopoly. In 2001 an appeals court agreed that Microsoft had broken the law to keep it.

General Motors

In the 1950s General Motors was the country's largest car maker, and in 1953 it sold more to the armed forces than any other company. In 1954 it sold 54 percent of new cars, by the Associated Press's count. The encyclopedia Britannica lists GM at 40 to 45 percent of all car sales through the 1950s and 1960s. In 1955 GM became the first company to earn more than a billion dollars in profit in one year. In the first three quarters of 1955 alone it made

$912,887,537 in profit. *TIME* magazine wrote, "Never before in history has one corporation made so much in so short a time." GM's workforce in the United States peaked at 618,365 in 1979. That made it the largest private employer in the country.

In January 1953 President Dwight D. Eisenhower chose GM's president, Charles E. Wilson, as Secretary of Defense. He gave up a salary of $600,000 a year for one of $22,000. Wilson owned 40,000 shares of GM stock, and GM sold more to the armed forces than any other company. As Secretary of Defense he could make decisions that helped or hurt GM, so at his hearing senators pressed him on that conflict. Senator Robert C. Hendrickson asked whether Wilson could make a decision that went strongly against GM's interest. Wilson answered, "Yes, sir, I could. I cannot conceive of one because, for years, I thought what was good for our country was good for General Motors, and vice versa." Vice versa means the other way around. People soon repeated his words as "What is good for General Motors is good for the country."

In 1965 Ralph Nader wrote a book called *Unsafe at Any Speed*. In it, Nader criticized the safety of GM's Corvair car. GM managers hired private detectives to look into Nader's private life. In 1966 GM's president, James M. Roche, apologized to a Senate committee. That same year members of Congress passed the National Traffic and Motor Vehicle Safety Act, the first federal rules for how cars must be built. Nader sued GM for invading his privacy and settled for $425,000. He used the money to start groups that work for consumers. GM stopped making the Corvair in 1969.

Eisenhower's warning, 1961

On 17 January 1961, in his farewell speech, President Dwight D. Eisenhower warned the country about the power of the arms makers and the armed forces together. He said, "in the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex." The councils of government are the places where leaders make decisions. Acquisition means getting, and unwarranted means without good reason. By the military-industrial complex he meant the ties between the armed forces and the companies that made their weapons. Those were the same kinds of large companies that had received most of the war contracts of 1940 to 1944.

The conglomerate

A conglomerate is one company that owns many businesses that have nothing to do with each other. Harold Geneen ran the company ITT from 1959 to 1977. In those years ITT bought between 250 and 350 companies, depending on the count, in more than 80 countries. They included the Sheraton hotel chain, Avis car rental, the Hartford insurance company and

Continental Baking, the maker of Wonder Bread. ITT's yearly sales grew from about $700 million to $17 billion, and it became the eleventh-largest corporation in the country. Geneen believed that good managers could make a success of any business.

In 1966 ITT's leaders tried to buy the ABC television network for $700 million, and federal antitrust officials stopped the deal. In Chile, officials under President Salvador Allende took over ITT's company there. ITT later admitted that it had given the CIA, the American spy agency, $350,000 for "political" purposes in Chile.

Business organizes in Washington

In the 1970s, heads of large companies built up their own political power in Washington. On 23 August 1971 the lawyer Lewis F. Powell Jr. sent a private memo to Eugene B. Sydnor Jr. of the U.S. Chamber of Commerce, a national group of businesses. Its title was "Attack On American Free Enterprise System." Powell wrote that critics of business now came from "the college campus, the pulpit, the media" and from politicians. The pulpit here means preachers in churches. He urged business leaders to keep "constant surveillance," or a close watch, on textbooks and television programs. On 21 October 1971, less than two months later, President Richard Nixon nominated Powell to the Supreme Court. The newspaper columnist Jack Anderson made the memo public in September 1972. That year the Chamber's leaders set up a 40-person working group on the memo. In late 1973 they approved plans for business to act in education, in communications, in politics and in the courts.

On 13 October 1972 three groups of company heads joined to form the Business Roundtable. Its founders included John D. Harper of Alcoa and Roger Blough, the retired head of U.S. Steel. They set out to fight the growing power of unions, especially construction unions.

Company heads opened offices in Washington and hired lobbyists. Corporations with public affairs offices in Washington went from 100 in 1968 to more than 500 in 1978. Firms with registered lobbyists went from 175 in 1971 to 2,445 in 1982. Companies also set up political action committees. A political action committee, or PAC, collects money and gives it to candidates. Officials of the Federal Election Commission counted 89 company PACs at the end of 1974, 294 in May 1976 and 1,206 at the end of 1980.

From 1978 to 1980 members of Congress voted to remove federal rules on three industries. President Jimmy Carter signed each law: for airlines on 24 October 1978, for banks on 31 March 1980 and for trucking on 1 July 1980.

Products that hurt people, and what the companies said

From 1954 to 1994, heads of tobacco companies publicly disputed the evidence that smoking causes disease and that nicotine is addictive. On 4 January 1954 the major American tobacco companies ran an advertisement called "A Frank Statement to Cigarette Smokers" in more than 400 newspapers. It reached about 43 million people. In it, the companies disputed new scientific studies that linked smoking cigarettes to lung cancer. The public relations firm Hill and Knowlton, a company paid to shape what the public thinks of its clients, designed it.

Addison Yeaman, the chief lawyer of the Brown and Williamson tobacco company, wrote a memo on 17 July 1963. In it he said that to protect its earnings, the industry must "either a) disprove the theory of causal relationship or b) discover the carcinogen or carcinogens...and demonstrate our ability to remove or neutralize them." A causal relationship here meant that smoking causes cancer. Disprove means to show that something is false. A carcinogen is a substance that causes cancer, and to neutralize something is to make it harmless.

At a hearing in the House of Representatives on 14 April 1994, Representative Ron Wyden asked seven tobacco company heads whether nicotine is addictive. William Campbell of Philip Morris answered, "I believe nicotine is not addictive, yes." James Johnston of R. J. Reynolds said cigarettes "clearly do not meet the classic definition of addiction." Joseph Taddeo of U.S. Tobacco said, "I don't believe that nicotine or our products are addictive."

Four cigarette makers, Philip Morris, R. J. Reynolds, Brown and Williamson and Lorillard, signed an agreement with the attorneys general of 46 states on 23 November 1998. An attorney general is a state's chief lawyer. The states had sued to get back what they spent treating sick smokers. The companies agreed to pay at least $206 billion over the first 25 years and to limit their advertising.

Asbestos is a mineral that separates into thin, strong fibers. Builders used it to fireproof and insulate buildings. When people breathe asbestos fibers in, the fibers can stay in the lungs for years. They scar the lungs and can cause asbestosis, a lung disease that brings shortness of breath, coughing and lasting lung damage. They can also cause mesothelioma, a cancer of the thin linings of the chest and belly. The illness can take 10 to 40 years or more to show. Johns-Manville was once the largest maker of asbestos products in the country. In 1981 it faced 9,300 lawsuits brought by 12,800 people who sued over illness from asbestos. In August 1982 the company's leaders filed for bankruptcy, a court process for a company that cannot pay its debts. The filing put all the injury lawsuits against the company on hold. By the end of 1988, a fund set up in the bankruptcy to pay injury claims had paid more than 12,600 claims, for almost $500 million in all.

On 3 December 1984 more than 40 tons of a poison gas called methyl isocyanate leaked from a pesticide plant in Bhopal, India, a factory that made poisons to kill insects. Union Carbide India Limited ran the plant. It was part of the American company Union Carbide. Union Carbide's leaders had first planned to close the plant, which was losing money. Instead they cut many jobs, including maintenance engineers, to run it for less, according to a report by France's environment ministry. The same report says that on 2 December 1984 the plant's senior managers ordered the cleaning of pipes that led to a machine meant to clean escaping gas. According to a 2005 medical review by Edward Broughton, a broken valve let about a ton of water used for cleaning pipes into a tank of the gas.

That gas-cleaning machine had been turned off. Broughton's review says that happened three weeks before the leak. The French report dates it to 23 October 1984, about six weeks before. The same report says the plant's cooling unit had been shut down since June 1984 to cut its use of electricity by 18 percent. Neither report names the people who turned off the machine or shut down the cooling unit.

The gas damaged people's eyes, causing redness and sores, and it filled their lungs with fluid. According to Britain's Health and Safety Executive, a government safety agency, the gas killed about 2,000 people in the first hours. Broughton's review gives about 3,800 dead at once, and 15,000 to 20,000 early deaths reported over the next twenty years. At first Union Carbide's leaders tried to keep the company free of legal blame. Later they said the company accepted "moral responsibility," and it paid $470 million to the government of India.

The Bell System is split, 1984

In the early 1980s AT&T's Bell System held about $150 billion in property and employed about a million people. Justice Department lawyers sued AT&T in 1974. In January 1982 AT&T's leaders and the Justice Department's lawyers agreed that AT&T would give up its local telephone companies. Judge Harold H. Greene approved the deal with changes, and the case was closed on 24 August 1982.

On 1 January 1984 the local companies became seven regional companies, called the Baby Bells. AT&T kept its long-distance service, its research center, Bell Labs, and its equipment maker, Western Electric. It kept $34 billion of the $149.5 billion in property it had held the day before, and it had 636,000 fewer workers.

Bill Gates

Who: The head of Microsoft when federal and state lawyers sued it for keeping an illegal monopoly on the software that runs personal computers.

When and where: Redmond, Washington, and Washington, D.C., 1998 to 2001.

Movie: *Inside Bill's Brain: Decoding Bill Gates* (2019), a Netflix series directed by Davis Guggenheim.

Bill Gates founded Microsoft and ran it as its chief executive until January 2000, so he was in charge when a federal judge found that it held an illegal monopoly. Microsoft made Windows, the operating system that ran most personal computers. An operating system is the main program that runs a computer and the other programs on it.

On 18 May 1998 lawyers for the Justice Department, the attorneys general of twenty states and the District of Columbia sued Microsoft. The main question in the case was whether Microsoft could bundle its web browser, Internet Explorer, with Windows. A web browser is the program people use to look at websites. To bundle it meant to build it into Windows, which made it harder for rival browsers such as Netscape Navigator to win users.

Gates answered the government lawyers' questions in a deposition that was filmed on videotape. A deposition is sworn testimony taken outside a courtroom. A person who was there called him "evasive and nonresponsive." According to *Businessweek* magazine, the government lawyers used snippets of emails to show that many of his denials were false.

On 5 November 1999 Judge Thomas Penfield Jackson found that Microsoft held a monopoly. On 7 June 2000 he ordered the company split into two, one for Windows and one for its other software. On 28 June 2001 seven judges of the federal appeals court upheld the finding that Microsoft had illegally kept its monopoly. They threw out the breakup order, partly because Jackson had talked about the case to reporters while it was still going on.

On 6 September 2001, Attorney General John Ashcroft announced that the Justice Department would no longer seek a breakup. On 1 November 2001 the government's lawyers settled with Microsoft. Microsoft's leaders agreed to share some of its technical information with other companies. They also accepted a panel of three investigators with full access to its systems.

Steve Young

Who: A Vlasic pickle executive who described what it was like to sell to Walmart.

When and where: The late 1990s to January 2001. His account was published in December 2003.

Movie: *Is Wal-Mart Good for America?* (FRONTLINE, PBS, 2004), a documentary about Walmart.

Steve Young watched Walmart's buyers push his company's pickles to a price that left almost no profit. He was vice president of grocery marketing for pickles at Vlasic. The reporter Charles Fishman told his story in *Fast Company* magazine in December 2003.

In the late 1990s a Walmart buyer saw Vlasic's gallon jar of pickles. The buyer began talking about it with Pat Hunn, the head of Vlasic's Walmart sales team. The jar went into every Walmart, about 3,000 stores, at $2.97. At that price Vlasic and Walmart each made a penny or two a jar, if that. Young said each store sold about 80 jars a week, which came to 240,000 gallons of pickles a week.

Walmart was 30 percent of Vlasic's business. Young says shoppers who used to buy Vlasic's pickle spears and chips at supermarkets bought the cheap gallon jar instead. He says Vlasic's profits from pickles fell by 25 percent or more.

Young says Vlasic asked to raise the price. He remembers the Walmart buyers' answer: "If you do that, all the other products of yours we buy, we'll stop buying." He called it "a clear threat." Hunn remembers the buyers saying, "We want the $2.97 gallon of pickles. If you don't do it, we'll see if someone else might." Later, Walmart's buyers let Vlasic shrink the jar to just over half a gallon, at $2.79. Vlasic filed for bankruptcy in January 2001. Everyone involved agrees the gallon jar was not a critical factor in that failure.

2000 to Today

In September 2026 three American companies, Nvidia, Apple and Alphabet, were each worth more than $4 trillion, according to the investment website The Motley Fool. In the same years federal lawyers took four of the largest technology companies to court over monopoly power. Walmart employed about 1.6 million people in the United States in 2026, by its own count. That is about 2.6 times General Motors' American workforce at its peak in 1979.

A federal jury convicted Enron's former chief executives of fraud in 2006. Lehman Brothers failed in 2008, and members of Congress set aside $700 billion that year to rescue banks and other companies. The four technology companies taken to court were Google, Meta, Amazon and Apple. By September 2026 judges had ruled twice that Google broke the law and once for Meta, and the Amazon and Apple cases had not come to trial.

How big, in numbers

A company's market value is the price of one share times the number of shares. It changes every day the stock market is open. On 29 October 2025 Nvidia became the first company worth $5 trillion, according to the business news network CNBC. On 7 September 2026, The Motley Fool listed the three most valuable companies in the world. Nvidia was worth about $5.6 trillion, Apple about $4.7 trillion and Alphabet about $4.1 trillion.

Walmart reported $713.2 billion in revenue, the money it took in, for the year that ended on 31 January 2026. Its 2026 annual report records about 2.1 million workers around the world, about 1.6 million of them in the United States. About 92 percent of its American workers were paid by the hour. At that time it had more than 10,900 stores in 19 countries. Amazon's yearly report to the government for 2025 states that it employed about 1,576,000 people at the end of that year. It also used independent contractors, who are paid for each job and are not employees, and temporary workers. Neither group is counted in that number.

Fraud and harm at the top

Courts found that leaders of several large companies of these years had deceived the public, and Purdue Pharma's leaders admitted it in guilty pleas. Enron was an energy company in Houston, Texas. On 2 December 2001 it filed for bankruptcy. Enron's workers had much of their retirement savings in Enron stock. At the end of 2000, 62 percent of the money in the company's retirement plan was in its own shares, according to the Congressional Research Service, which does research for Congress. The shares fell from more than $80 each in January 2001 to less than 70 cents in January 2002.

A lawsuit claimed that Enron had blocked its workers from moving their retirement money out of Enron stock while the price fell. On 25 May 2006 a federal jury in Houston convicted Enron's former chief executives, Kenneth L. Lay and Jeffrey K. Skilling, of conspiracy and fraud, according to the Justice Department. Conspiracy means planning a crime together with others. Fraud means lying or cheating to get money.

On 17 August 2006 federal Judge Gladys Kessler ruled that the major tobacco companies had broken the federal racketeering law. Racketeering here means running a business through a pattern of fraud. She found that the companies had "defrauded the American people by lying for decades about the health risks of smoking and their marketing to children." She wrote that they had "marketed and sold their lethal products with zeal, with deception, with a single-minded focus on their financial success, and without regard for the human tragedy or social costs that success exacted." Zeal means great eagerness, and exacted means took as its price. She ordered them to publish statements about the harm of smoking and about how addictive nicotine is.

Purdue Pharma made OxyContin, a pain pill. OxyContin is an opioid, a drug from the same family of chemicals as heroin. According to the federal Centers for Disease Control and Prevention, the first wave of opioid overdose deaths, from 1999, came from prescription opioids, after doctors wrote more opioid prescriptions in the 1990s. CDC researchers count about 806,000 Americans who died of opioid overdoses from 1999 to 2023, from all kinds of opioids.

In May 2007 the company pleaded guilty to misleading the public about the risk of becoming addicted to OxyContin, and it agreed to pay $600 million. Its president, Michael Friedman, its top lawyer, Howard R. Udell, and its former chief medical officer, Paul D. Goldenheim, also pleaded guilty. They admitted to misbranding, which means selling a drug with false or misleading claims about it, and together they paid $34.5 million. On 24 November 2020 the company pleaded guilty to three federal felonies, which are serious crimes. When Purdue pleaded guilty in 2020, no member of the Sackler family, which owned Purdue, was charged with a crime.

On 16 June 2025, 55 state and territorial attorneys general joined a $7.4 billion settlement with Purdue and the Sacklers, according to the New York attorney general's office. On 28 April 2026 federal Judge Madeline Cox Arleo sentenced Purdue to pay $5.5 billion, as CNBC and Reuters reported. She said she could not send Purdue's executives or owners to prison, because the Justice Department had charged only the company. More than 40 people spoke at the sentencing. Judge Arleo said, "Your government failed you." On 1 May 2026 New York's attorney general announced that Purdue had shut down. A new company, Knoa Pharma, took over, with no role for the Sacklers.

The 2008 rescue

In 2008 the investment bank Lehman Brothers failed, and members of Congress voted public money to rescue banks and other companies. On 15 September 2008 Lehman Brothers filed the largest bankruptcy in the country's history. It had about $639 billion in property and $619 billion in debts, according to the reference publisher EBSCO. Its chief executive was Richard S. Fuld Jr. Investigators later looked into whether Lehman's executives, Fuld among them, had moved money and raised their own pay just before the bankruptcy. EBSCO's entry states that Fuld "walked away with $480 million" but does not say over what years he received it.

In March 2010 Anton R. Valukas, an investigator named by the bankruptcy court, reported on deals that Lehman called Repo 105. Lehman's managers had used them to make the firm's books look stronger at the end of each quarter, the three-month periods for which companies report their results. In 2011 officials of the Securities and Exchange Commission reported that it would be hard to prove that Lehman had broken the law. No Lehman executive was charged with a crime.

On 3 October 2008 members of Congress passed the Emergency Economic Stabilization Act, which allowed up to $700 billion to rescue banks and other companies. Federal officials paid out $443.5 billion in all, and most of it was paid back. In December 2023 auditors at the Government Accountability Office, which checks federal spending for Congress, put the final cost at $31.1 billion. The Capital Purchase Program, which put money into banks, made a profit of $16.3 billion. The rescue of the insurance company AIG cost $15.2 billion, the loans to car makers cost $12.1 billion and the housing programs cost $31.4 billion. The car loans began with $13.4 billion that President George W. Bush announced in December 2008.

Antitrust returns

In the 2020s, government lawyers brought monopoly cases against four of the largest technology companies. By September 2026 they had won two cases against Google and lost one against Meta, and two more were waiting for trial.

Federal Judge Amit P. Mehta ruled on 5 August 2024 that Google had illegally kept monopolies in general internet search and in search advertising. On 2 September 2025 he refused to make Google sell its Chrome browser or its Android phone software. Then, on 5 December 2025, he ordered Google to share its search index and some user data with rival companies. A search index is the huge list of web pages that a search engine keeps. A committee of five technical experts was to oversee it. Google's lawyers appealed. In late July 2026 Justice Department lawyers filed a brief, a written argument, with the appeals court, according to the news service

Courthouse News. They asked the court to keep the ruling. They also asked it to ban Google's large payments to companies such as Apple. Those payments make Google the search engine that the companies' products use unless the user changes it.

In a second case, federal Judge Leonie Brinkema ruled in April 2025 that Google had illegally monopolized the tools that websites use to sell advertising space. On 16 September 2026 the court made public her opinion on what Google must do. She refused to make Google sell its advertising exchange, the online market where websites sell ad space to advertisers. She ordered new rules for how the tools work. The National Law Review reported the opinion in an article by a writer for Chamber of Progress, a group funded by the technology industry.

The Federal Trade Commission's case against Meta was about its purchases of Instagram in 2012 and WhatsApp in 2014. The trial began on 14 April 2025. On 18 November 2025 Judge James Boasberg ruled for Meta. He found that Meta did not hold a monopoly, because TikTok and YouTube competed with it. FTC lawyers appealed on 20 January 2026, and in August 2026 the appeals court had not yet set a date to hear the case.

FTC lawyers and 17 state attorneys general sued Amazon on 26 September 2023 for keeping an illegal monopoly. Judge John H. Chun set the trial for 29 March 2027. He will decide the case himself, without a jury. Apple was sued on 21 March 2024 by Justice Department lawyers and 16 state attorneys general, for monopolizing the market for smartphones. On 30 June 2025 Judge Julien Neals refused Apple's request to throw the case out.

Lina Khan

Who: A law student whose 2017 article argued that the people who enforce antitrust law were missing Amazon's kind of power, and who later led the Federal Trade Commission.
When and where: New Haven, Connecticut, and Washington, D.C., 2017 to 2025.

Lina Khan argued that the judges and officials who enforce antitrust law had stopped looking at the kind of power Amazon held, and she later ran the agency that sued Amazon. In 2017, while she was a student at Yale Law School, she published an article called "Amazon's Antitrust Paradox" in the *Yale Law Journal*. A paradox is something that seems to contradict itself. She argued that those judges and officials had come to judge competition mainly by whether prices went up. In her view, that test missed the power Amazon built by accepting losses while it spread into selling, delivery, cloud computing and publishing. Cloud computing means renting out computer storage and computing power over the internet. Amazon could use its place in one business to gain in another.

> On 15 June 2021 members of the Senate confirmed her to the Federal Trade Commission by a vote of 69 to 28. President Joe Biden chose her as the commission's chair, and she was sworn in the same day. At 32 she was the youngest chair in the agency's history, according to CNBC. Under her, FTC lawyers sued Amazon in 2023 and carried on the case against Meta.
>
> In 2023 Robert D. Atkinson and Michael R. Ward of the Information Technology and Innovation Foundation, a research group funded partly by technology companies, argued in a report that her 2017 analysis misread the economics of online markets. Khan served as chair until 20 January 2025, and she left the commission on 31 January 2025. The FTC lost the Meta case at trial in November 2025.

Corporate money in politics

Since 2010, corporations and unions have been able to spend without limit on elections, as long as they do not work directly with a candidate. On 21 January 2010, in *Citizens United v. Federal Election Commission*, the justices of the Supreme Court ruled 5 to 4 that "the Government may not suppress political speech based on the speaker's corporate identity." The case began with a film that a non-profit corporation had made to attack Hillary Clinton. Federal law had barred the group from advertising it close to the election. After the ruling, committees called super PACs could raise and spend unlimited sums. Researchers at the Brennan Center for Justice, a law and policy institute, count about $6.4 billion that super PACs spent on federal elections from 2010 to 2022. In the 2024 election they spent at least $2.7 billion. That year, spending by groups that do not have to name their donors passed $1 billion. Such spending is called dark money.

Companies and other groups also pay lobbyists. In 2025 organizations spent $5.08 billion on lobbying the federal government, according to OpenSecrets, a group that tracks money in politics. It was the first year above $5 billion. That year 15,768 organizations reported lobbying. The U.S. Chamber of Commerce spent the most, $72.1 million.

Working for a company without being employed by it

Some companies now pay people for work without hiring them as employees. Ride and delivery companies call their drivers independent contractors. An independent contractor is a worker who is paid for each job and is not counted as an employee. The federal law on the minimum wage and overtime pay, the Fair Labor Standards Act, covers employees. It does not cover independent contractors, according to the Department of Labor.

How many Americans do this kind of work depends on the question asked. Researchers at the Bureau of Labor Statistics, the federal agency that counts jobs, found 1.6 million people in May 2017 who found work through an app or a website. That was 1.0 percent of all workers. Researchers at the Pew Research Center, a research group, found in 2021 that 16 percent of American adults had ever earned money through an online job app, and 9 percent had done so in the past year.

PART 5

Power, Law, and War

Chapter 20: Government, Law, and Politics

Before 1500

Long before Europeans arrived, the Native nations here governed themselves, and they did it in different ways. Five nations in the Northeast joined in a league and lived under one law. Along the Rio Grande, each Pueblo town ran its own affairs. At Cahokia, on the Mississippi River, chiefs and officials led a city of thousands of people.

The Great Law of Peace

The Haudenosaunee are a league of Native nations whose homelands lie mainly in what is now New York State and the Great Lakes region. Their name means "people who build a house." Five nations joined first: the Mohawk, the Oneida, the Onondaga, the Cayuga and the Seneca. The Tuscarora joined in 1722, which made six. Each nation stayed a separate nation inside the league.

The law that joined them is called the Great Law of Peace. In the Haudenosaunee account, the five nations were once at war with each other. A man called the Peacemaker wanted to spread peace among them. He came to the house of an Onondaga leader named Hayo'wetha, often written Hiawatha. When the nations made peace, they pulled up a white pine tree and threw their weapons into the hole. Then they planted the tree again on top of the weapons and named it the Tree of Peace.

The Haudenosaunee kept the Great Law in memory and passed it on by speaking it. A full telling takes several days. They also wove belts of purple and white shell beads, called wampum. The patterns in the belts recorded the laws of the league, the stories told at ceremonies, and important dealings with other nations. The belts were presented at meetings of the Grand Council, the league's lawmaking body. The Haudenosaunee used wampum to keep these records, and never as money.

Accounts differ on when the league began. The dates people give run from about 1142 to the 1400s or 1500s. It was already in place before Europeans arrived.

The Grand Council and the clan mothers

The league's lawmaking body is the Grand Council, and it has fifty seats. Each seat belongs to a leader called a *hoyaneh*. The Onondaga hold fourteen seats, the Cayuga ten, the Mohawk nine, the Oneida nine and the Seneca eight. The Haudenosaunee count the Onondaga Nation as the league's capital. They say the council fire burns there, as the Peacemaker promised, and they call the Onondaga the "Keepers of the Central Fire." The Mohawk, in the east, are the "Keepers of the Eastern Door," and the Seneca, in the west, are the "Keepers of the Western Door." Council members are not paid, and they serve for life.

Before the council members make a decision or pass a law, every member must agree to it. This way of deciding is called consensus. Under it, no law passes while even one member is against it.

Women hold power in this government through the clan mothers. A clan is a large group of related families. The members of a clan choose a clan mother together, and she serves for life. The clan mothers choose the council members. A clan mother can also remove any *hoyaneh* who does not serve the good of his nation.

In 1988 members of both houses of Congress voted for a resolution about the league. A resolution is a written statement that lawmakers vote on. Representative Morris Udall put it forward. Its title states that it was meant "to acknowledge the contribution of the Iroquois Confederacy of Nations to the development of the U.S. Constitution." A confederacy is a league of nations or states. Iroquois is another name for the Haudenosaunee, and it is the more common one in English. The Constitution is the written plan for how the national government of the United States works.

Scholars disagree about how much the men who wrote the Constitution took from the Great Law. Bruce Johansen and Donald Grinde argue that the founders admired Native governments and borrowed ideas from them. The anthropologist Elisabeth Tooker, a scientist who studied human societies, argued the other side. She wrote that the founders took their models from European ideas and that the evidence of borrowing from the league is very thin.

The Pueblo towns

Groups of Spanish explorers began coming up the Rio Grande in 1540. They found farming peoples living in settled towns, which the Spanish called pueblos, the Spanish word for towns. The people of each town governed themselves. Each town had its own leaders, customs and language. No one leader or council ruled all the pueblos.

At Zuni, a council of priests held power over the town. One group of them, the bow priests, handled dealings with outsiders.

Cahokia, a city led by chiefs

Cahokia stood near the Mississippi River, east of where St. Louis is now. The city covered more than 4,000 acres. Its largest years came between about 1050 and 1150. Archaeologists are scientists who study the past by digging up what people left behind. Their estimates of how many people lived in Cahokia then run from 10,000 to 20,000, and some go higher. They disagree widely about the number.

Cahokia was a chiefdom, a society led by chiefs and by officials of high rank. The people built large mounds of earth with flat tops. Buildings for religious leaders and for other officials stood on top of the mounds. Other mounds held the graves of people of high rank.

The 1500s

The first governors of Florida and of New Mexico served the king of Spain. Pedro Menéndez de Avilés held his office in Florida by a contract with the king, who lived across the ocean in Spain. Juan de Oñate held his office in New Mexico by a contract with the viceroy, the official who ruled in the king's name from Mexico City. Menéndez used a Timucua council house as his first fort. Oñate made a Tewa town his first capital.

A governor for Florida, 1565

Pedro Menéndez de Avilés founded St. Augustine, in Florida, on September 8, 1565. King Philip II of Spain had ordered the voyage. Menéndez held the title of *adelantado*, a Spanish office that a man received by signing a contract with the king. He soon became Florida's first governor. St. Augustine is the oldest European settlement in the mainland United States where people have lived without a break since its founding.

Menéndez made his first settlement in the town led by Seloy, a chief of the Timucua people. About 800 colonists came with him, among them 26 women and an unknown number of Africans whom the Spanish held as slaves. Timucua council houses were usually round, built of thatch, and big enough to hold up to a thousand people. Seloy offered Menéndez his council house to use as a fort, and the Spanish used it as their first fort in Florida.

In 1573 officials of the king of Spain set rules for laying out new towns. The rules belong to a body of royal orders known as the Laws of the Indies. They required a town's streets to form a grid around a central square, or plaza. The main government buildings and the church were to face the plaza. St. Augustine's grid of streets was laid out in 1603, thirty-eight years after the town was founded.

A governor for New Mexico, 1598

Juan de Oñate made a contract with the viceroy in Mexico City. A viceroy is an official who rules a colony in the king's name. Oñate promised to settle New Mexico and govern it. In return he got loans, supplies and soldiers. He left the town of Santa Bárbara early in 1598 with 600 Spanish settlers and Native allies from Tlaxcala, in Mexico.

On the Rio Grande he set up his first capital at Ohkay Owingeh, a town of Tewa-speaking people. In 1598 the Spanish named the town San Juan de los Caballeros. In 1599 Oñate moved his capital across the river to a place called San Gabriel. The people of Ohkay Owingeh still live in their town.

In the autumn of 1598 Oñate went to the pueblos one by one. Through translators, he made the people of each pueblo swear loyalty to the king of Spain. He also placed a missionary in each one. A missionary is a priest sent to bring people into his religion. Oñate governed New Mexico until 1608.

The 1600s

Spanish judges in Mexico City put a former governor of New Mexico on trial in 1614. The English built Jamestown, in Virginia, in 1607, and twelve years later twenty-two elected men met there as the first elected assembly in English North America. The next year, forty-one men aboard the *Mayflower* signed an agreement to make laws for themselves and obey them. The colonists' own lawmakers decided who could vote, and they changed the rules many times. In 1662 Virginia's lawmakers passed a law that made every child born to an enslaved woman a slave as well.

The king's judges try New Mexico's governor, 1614

Royal judges in Mexico City tried Juan de Oñate, the former governor of New Mexico, in 1614. Officials of the king of Spain had brought 30 charges against him. The judges found him guilty of 12 and not guilty of 18. One of the twelve was using too much force against Acoma Pueblo.

In December 1598 Oñate's nephew Juan de Zaldívar came to Acoma with about thirty soldiers. He took some of them up the mesa, the flat-topped hill where the town stands, to demand food. In the Acoma people's own account, the soldiers raped an Acoma woman. Rape means forcing a person into sex. The Acoma killed Zaldívar and eleven to fourteen of his men. Accounts differ on the number.

In January 1599 Oñate sent Juan's brother, Vicente de Zaldívar, to Acoma with about seventy soldiers. Over two or three days of fighting, those soldiers killed Acoma men, women and children, and they burned much of the town. No one counted the dead at the time. Estimates run from about 300 to about 1,500, and the Pueblo nations' own leaders use the figure of about 800. PBS reports that about 200 people of Acoma survived, out of nearly 2,000. These figures come from different sources, and they do not fit together.

Afterward Oñate sentenced the Acoma men over twenty-five to have one foot cut off. He also sentenced them to be forced to work as slaves of the Spanish for twenty years. He sentenced younger men and boys from twelve up, and women and girls over twelve, to the same twenty years of forced work. He handed the old people to the Plains Apache as slaves. He took the children under twelve from their families and gave them to the friars, the Catholic religious brothers with his colony. On Oñate's order, about 70 of the girls were sent to convents in Mexico, as the National Park Service reports. A convent is a house where nuns live. The Park Service's account states that almost certainly none of the girls ever came home. Oñate also sentenced two Hopi men captured in the fighting to have their right hands cut off. Then he had them released to carry word of the punishment to their own people. The sentences are in the written record. Whether the feet were cut off is disputed. In the Acoma people's own account, Oñate had the right feet of 24 captive men cut off. The historians Marc Simmons and John Kessell doubt that it was done, and Kessell points out that no record describes a one-footed Acoma man.

Oñate was also found guilty of ordering his captains to kill two soldiers who had run away from the army, and of lying to the viceroys and the king about how rich the land was. The judges ordered him out of New Mexico for life. They also barred him from Mexico City. Accounts differ on how long: four years or five. The judges fined him 6,000 ducats in the money of Castile, in Spain.

The first General Assembly, 1619

The leaders of the Virginia Company of London, the business that ran the colony, put out a paper called the Great Charter in 1618. A charter is a written grant of rights and powers. Sir Thomas Smythe and Sir Edwin Sandys wrote it. It allowed the governor to "summon a General Assembly to legislate as appropriate." That meant the governor could call a meeting of men to make laws.

In the summer of 1619 Governor George Yeardley used that power. The colony had eleven settlements, and two elected men came from each one to speak and vote for it. They were called burgesses. A burgess was an elected member of the assembly. The twenty-two burgesses met with Yeardley and his council, the six men who advised him, from July 30 to August 4, 1619. They sat in the church at Jamestown, the only building on the island big enough to hold them all.

In six days the members set rules for how they would do business and protected colonists' claims to their land. They also made the Church of England the colony's official church. They passed laws about tobacco, gambling, behavior and dealings with Native nations.

Jamestown stood on land that belonged to the Paspahegh. They were one of twenty-eight to thirty-two groups, each with its own chief, that paid tribute to Powhatan. Tribute is a payment of goods to a more powerful ruler. Powhatan was the chief over all the other chiefs of Tsenacomoco. The anthropologist Helen C. Rountree estimates that about 15,000 people lived in Tsenacomoco, across about 6,000 square miles. The English built Jamestown on Paspahegh land in 1607 and stayed there without asking the Paspahegh's permission.

In 1624 the king's officials took away the Virginia Company's charter. Virginia became a royal colony in 1625, with a governor and council chosen by the king. No one in England had given the assembly permission to go on meeting, but the burgesses kept meeting. Whether the assembly had any legal right to meet stayed unclear until 1627. That year the king asked the General Assembly to help make rules for the tobacco trade. By asking, he treated the assembly as a lawful body, though no written order said it could meet.

> ### John Pory
>
> **Who:** The colony's secretary, who served as Speaker of the first elected assembly in English North America and wrote the record of what it did.
>
> **When and where:** Jamestown, Virginia, July 30 to August 4, 1619.

> John Pory wrote the record of the first meeting of Virginia's General Assembly. He called his report "The Proceedings of the First General Assembly, July 30, 1619." One copy of it survives, in the National Archives of the United Kingdom. Brent Tarter wrote about the missing copies on the Library of Virginia's blog in 2019. Any copies kept in Virginia, he wrote, would have been destroyed in one of the British raids on Richmond during the American Revolution. Most of the colony's records were destroyed in those raids.
>
> Pory was born in about 1572 at Thompson, in Norfolk, England. He studied at Gonville and Caius College, Cambridge, and earned his first degree in 1592 and a higher degree in 1595. He had also sat in the English Parliament, the group of lawmakers who made England's laws, so he knew how a lawmaking body ran its business.
>
> On December 2, 1618, the leaders of the Virginia Company made him secretary of the colony. He sailed from England in January 1619 with the governor, George Yeardley, and reached Jamestown on April 18. That summer Yeardley made him Speaker of the assembly, the officer who runs its meetings. Pory was not one of the elected burgesses. He ran the meetings because the governor appointed him.
>
> Pory left Virginia in the early summer of 1622 on a ship called the *Discovery*, after Christopher Davidson was made secretary in his place. He was buried at Sutton Saint Edmunds, in Lincolnshire, England. The history website of the Virginia House of Delegates gives the year of his death as 1636. Other reference books give 1633.

Plymouth and the Mayflower Compact, 1620

The *Mayflower* anchored off Cape Cod, in what is now Massachusetts, in November 1620. The passengers had permission, called a patent, to settle near the Hudson River. That land lay inside the Virginia Company's territory. Off Cape Cod they were outside it, so no one had given them the right to govern themselves there.

On November 11, 1620, forty-one men signed an agreement to keep order until a new patent came. It is known as the Mayflower Compact. The signers agreed to "covenant & combine our selves together into a Civill body politick." That meant they promised to form a government together. They also promised to make and obey "just & equall lawes." The women and children did not sign. Most of the servants did not sign either. The original paper has been lost.

The passengers founded Plymouth Colony. They settled at Patuxet, where a Wampanoag community had lived until "a sickness had killed most of them." Plymouth remained a separate colony from Massachusetts Bay until 1691.

Who could vote

The colonies' lawmakers decided who could vote, and in Virginia they changed the rules many times. No record says who voted for the first burgesses in 1619. In 1646 the members of the General Assembly let all freemen vote. A freeman was a man who was neither enslaved nor bound as a servant. In 1655 they allowed only heads of households to vote, and in 1656 they opened the vote to all freemen again. In 1670 they limited the vote to men who owned land or headed a household.

In 1676, during a revolt called Bacon's Rebellion, all freemen could vote again for a year. The Assembly's members put the limit back in 1677, after the revolt fell apart. In 1684 men who rented land for their whole lives could vote as well. In 1699 the members passed a law that barred women and anyone under twenty-one from voting.

Candidates in Virginia gave voters food and drink before and after an election. People called it treating. Virginia's lawmakers limited treating during the week of an election, so candidates had other people do the treating for them.

In Massachusetts Bay, the officers of the colony's company sat together as its lawmaking group, called the General Court. In May 1631 they ruled that only church members could become freemen, the men who could vote. To join a church, a person had to stand before the church members, tell how they had come to their faith, and be accepted. Most men in the colony could not pass that test. Women could not vote at all. Under a new charter from the king in 1691, men who owned property could vote whether or not they belonged to a church.

A Virginia law on the children of enslaved women, 1662

The members of Virginia's General Assembly passed a law about the children of enslaved women in December 1662. It states that "all children borne in this country shalbe held bond or free only according to the condition of the mother." Bond meant held in slavery. Under English law, whether a child was born free or bound depended on the father. Under the new Virginia law, a child born to an enslaved woman was enslaved, whoever the father was. Enslavers gained every such child as a worker they owned.

A town made to keep a school

In 1642 the lawmakers of Massachusetts Bay put the duty of teaching children on each household. Parents and masters had to try to teach their children and apprentices to "read the English tongue," or have someone else teach them. They also had to teach them the colony's capital laws, the laws whose penalty was death. An apprentice was a young person bound to a

master to learn a trade. If a household failed, the town's selectmen could fine it. The selectmen were the elected leaders of a town. They could also take the children away and place them with another master.

In 1647 the lawmakers passed a second law. Its opening words state that "that old deluder, Satan" wants to keep people from knowing the Scriptures, the Bible. A deluder is someone who tricks people. Once a town had fifty households, the people of the town had to appoint someone to teach reading and writing. The parents or the town paid that teacher. A town of one hundred families also had to set up a grammar school to prepare boys for the university.

Under the 1647 law, the penalty fell on the town rather than on the parents. If the people of a town went more than a year without doing what the law required, the town had to pay five pounds to the nearest school until they did it.

1700 to 1750

After 1680 the members of the elected assemblies in the colonies had the power to propose all of a colony's laws. They also decided how public money was spent. That gave them control over the pay of the governors the king appointed. Juries also used their power. In 1735 a New York jury refused to find a printer guilty, though the governor wanted him punished. In the same years, the men of Virginia's assembly took the vote away from every free Black man, every free man of mixed Black and white family, and every Native man in the colony.

The assemblies and the governor's pay

After 1680 the members of the colonial assemblies had the power to propose all of a colony's laws. In a royal colony, the king chose the governor and his council, and the colonists elected the assembly. By 1763 nine of the thirteen colonies that later rebelled had royal governors. The members of each colonial assembly decided how public money was spent, and they checked the spending. That gave them control over the salaries of the governor and of the colony's judges.

Officials in London tried to make the assemblies set fixed yearly salaries. They also wanted a fixed civil list, a set list of paid government posts. That list would have given each governor jobs to hand out to his supporters. The assembly members turned down every one of these attempts.

Virginia's burgesses take away the vote, 1723

In May 1723 the burgesses of Virginia's General Assembly passed a law about enslaved people accused of crimes punished by death. It also set punishments for plots and revolts, and rules to control Black and Native people, enslaved or free. One clause of it states that "no free negro, mullatto, or indian whatsoever, shall hereafter have any vote at the election of burgesses, or any other election whatsoever." Negro was a word used then for a Black person. Mulatto was a word used then for a person with both Black and white parents or ancestors. With that clause, the burgesses took the vote from every free Black man, every free man of mixed Black and white family, and every Native man in the colony.

A lawyer in London objected. Richard West advised the Board of Trade, the group of officials in London who oversaw the colonies. On January 10, 1724, he wrote: "I cannot see why one Freeman should be used worse than another meerly upon account of his complexion." Complexion meant skin color.

William Gooch, Virginia's lieutenant governor, an officer of the king one rank below the governor, defended the law. On May 18, 1736, he wrote that free Black people had been suspected of helping a planned revolt of enslaved people before the 1723 session. He said the law was meant "to make the free-Negros sensible that a distinction ought to be made between their offspring and the Descendants of an Englishman." Sensible here meant aware. The ban was still in force when Gooch defended it in 1736.

That same year, 1736, Virginia's lawmakers set a land test for voters. A man had to have owned 100 acres of unfarmed land, or 25 acres with a house on it, for at least a year.

The Zenger trial, 1735

In 1735 a jury in New York refused to find the printer John Peter Zenger guilty of seditious libel. Libel means printed words that harm someone's good name. Seditious libel was the crime of publishing written blame of any public official, of the law, or of anything the law set up. Under that law, it made no difference whether the printed words were true. The judge told the jury to decide only one question: whether Zenger had printed the newspaper. The jury decided more than that and found him not guilty.

The jurors set Zenger free, but the law stayed the same. The Historical Society of the New York Courts states that the case set no rule that later judges had to follow. A defense is a reason that can keep a person from being found guilty. In New York, the truth of the printed words did not become a defense in a libel case until April 6, 1805, seventy years later. That day the state's

lawmakers passed a law allowing truth as a defense when the words were printed "with good motive and for justifiable ends." In 1821 New York's leaders wrote the same rule into the state's second constitution.

John Peter Zenger

Who: A New York printer jailed for more than eight months for printing attacks on the governor, then found not guilty by a jury.

When and where: New York City, November 1734 to August 1735.

John Peter Zenger sat in jail from November 17, 1734, to August 5, 1735, more than eight months, for printing a newspaper that attacked the governor of New York. The trouble began in 1733. In a court case called *Cosby v. Van Dam*, the chief judge, Lewis Morris, wrote a dissent against Governor William Cosby. A dissent is a judge's written disagreement with the other judges. Cosby removed Morris from office. Morris's allies answered by starting a newspaper, the *New-York Weekly Journal*, and Zenger printed it. The first issue came out on November 5, 1733.

For many years the only paper in the colony had been the *New York Gazette*, started in 1725, which printed the governor's side. In the *Journal*, writers accused Cosby's government of tyranny, meaning cruel and unfair rule, with articles, jokes and mocking verses, issue after issue. Cosby offered a reward of fifty pounds to anyone who found out who wrote them. He also ordered copies of the paper burned in public by the hangman.

In January 1734 Chief Justice James De Lancey asked a grand jury to charge Zenger with a crime. A grand jury is a group of citizens who decide whether there is enough proof to charge a person with a crime. The grand jury refused. In October a second grand jury refused too. Its members said no one could tell who had written the pieces.

On November 17, 1734, the sheriff arrested Zenger and took him to the Old City Jail. De Lancey and another judge named Philipse, both allies of Cosby, had signed the order for his arrest. His bail, the money he had to pay to get out of jail until his trial, was £400. That was more money than he had, so he stayed in jail. His wife Anna and his apprentices kept printing the paper. Only one issue was missed.

On April 16, 1735, his lawyers, James Alexander and William Smith, argued that the court itself had not been set up lawfully. De Lancey struck both of their names off the list of lawyers allowed to practice. Zenger was left with no lawyer.

The trial took place on August 4, 1735, on the second floor of City Hall. Andrew Hamilton, a lawyer from Philadelphia, defended Zenger. Hamilton tried to show that what Zenger printed was true. De Lancey stopped him: "The law is clear that you cannot justify a libel." Hamilton then spoke to the jury. He told them they had "the right beyond all dispute to determine both the law and the fact." The jury found Zenger not guilty. He was let out of jail the next day.

Andrew Hamilton

Who: The Philadelphia lawyer who defended Zenger without pay and told the jury it could judge the law as well as the facts.

When and where: New York City, August 4, 1735. Philadelphia before and after.

Andrew Hamilton defended John Peter Zenger for free. He was a lawyer in Philadelphia, and the members of the Pennsylvania Assembly elected him their Speaker. He traveled to New York for the trial and worked on the case with another lawyer, John Chambers.

The judge would not let Hamilton prove that Zenger's words were true. So Hamilton built his defense on the power of the jury. He told the jurors that the case was "not of small or private concern." He called it "the cause of liberty." He argued that the law gave people "a right to liberty of both exposing and opposing arbitrary power," meaning power used without limits, "by speaking and writing truth." The jury found Zenger not guilty. The phrase "Philadelphia lawyer" entered American speech because of this case. Dictionaries define it as a very clever lawyer, skilled at the fine points of the law.

Back in Pennsylvania, Hamilton led the planning of the Pennsylvania State House and pushed to get it finished. The building is now called Independence Hall.

1750 to 1800

Between 1776 and 1791, leaders of the new country wrote down how it would be governed. They wrote a declaration of independence, a plan of government, a constitution to replace that plan, and a list of rights added to the constitution. The men who wrote the Constitution put clauses in it that protected slavery. They set no national rule on who could vote, so each state's lawmakers decided. In the 1790s the country's leaders split into the first two political parties.

In 1798 President John Adams signed a law that made it a crime to publish false and scandalous writing against the government. Federal judges sent people who criticized him to jail under it.

The Declaration of Independence, 1776

On July 2, 1776, the delegates to the Continental Congress voted for independence from Britain. The Continental Congress was the meeting of delegates from the thirteen colonies. Two days later, on July 4, they approved the Declaration of Independence, which gave their reasons.

Five men made up the committee that wrote the first version: Thomas Jefferson, John Adams, Benjamin Franklin, Robert R. Livingston and Roger Sherman. Jefferson did most of the writing. The delegates began signing the finished copy on August 2, 1776. In the end 56 men signed it. Livingston, who helped write it, never signed.

Who could vote in the new states

Leaders in many of the new states wrote state constitutions, each with its own rules for who could vote. The constitutions written in ten states between 1776 and 1790 stated that voters had to be "male" or "freemen." The election laws of five states contained no rule about sex.

New Jersey's constitution of 1776 gave the vote to "all inhabitants of this colony of full age, who are worth fifty pounds." That meant every adult living there who owned fifty pounds' worth of property could vote. It said nothing about sex or race. So unmarried women and free Black people who owned enough property could vote. Fifty pounds was about the price of three horses or eight cows in 1806.

In 1790 New Jersey's lawmakers passed an election law that said a voter must vote in the town where "he or she" lived. In 1797 they passed a law that did the same for the whole state. It also dropped the words "clear estate," an old legal phrase about the property a voter owned, from the property rule. With those words gone, it was easier for wives and widows to qualify. Then in 1798 the lawmakers passed a law that let only white male taxpayers vote for town officers. Property owners of any race or sex still voted for county, state and national offices.

The Articles of Confederation

Before the Constitution, the country's plan of government was the Articles of Confederation. The members of Congress approved it on November 15, 1777. It took effect on March 1, 1781, when Maryland's leaders approved it, the last of the thirteen states to do so.

Under the Articles, each state had one vote in Congress, whatever its size. Congress had no power to tax. It could not make rules for trade between the states. Any change to the Articles needed every state to agree.

The Constitutional Convention, 1787

In 1787 delegates from the states met in Philadelphia to write a new plan of government. The meeting was called for May 14, but too few delegates had arrived to begin until May 25. About 55 delegates took part. No delegates came from Rhode Island. The delegates worked until September 17, 1787, and 39 of them signed the finished Constitution.

The delegates settled how to share seats in Congress with a deal called the Connecticut Compromise. Every state got two senators, and the number of seats each state got in the House of Representatives depended on its population.

The delegates also had to decide whether enslaved people counted as part of a state's population. They agreed to count each enslaved person as three-fifths of a free person when working out a state's seats in the House. This rule is in Article I, Section 2. Under it, the states with the most enslaved people got extra seats in the House. Article II states that each state has as many electors, the people who pick the president, as it has senators and representatives. So those states also got extra votes for president. Under the law, the enslaved people being counted were property, with no rights at all, so none of them could vote.

Slavery and voting in the Constitution

Two other clauses of the Constitution dealt with slavery. Article I, Section 9 stated that Congress could not ban "the Migration or Importation of such Persons as any of the States now existing shall think proper to admit" before 1808. That meant members of Congress could not stop the shipping of enslaved Africans into the country for twenty years. Article V stated that no amendment could change that clause before 1808.

Article IV, Section 2 stated that a person "held to Service or Labour in one State" who escaped into another state "shall be delivered up on Claim of the Party to whom such Service or Labour may be due." That meant a person who escaped slavery into a free state still had to be handed back to the enslaver.

The Constitution set no national rule for who could vote. Article I, Section 2 stated that the voters for the House in each state must meet the same rules as the voters for the largest house of that state's own lawmaking body. So each state's lawmakers decided who could vote.

Ratification

The Constitution would take effect once nine states ratified it. To ratify means to approve formally. Under Article VII, a meeting of delegates in each state, called a convention, voted on it. From October 1787 to May 1788, Alexander Hamilton, James Madison and John Jay wrote 85 essays to persuade New Yorkers to vote for it. They signed them with a made-up name, Publius. The essays came out mainly in two New York newspapers, and they are known as *The Federalist*.

On June 21, 1788, New Hampshire's delegates made it the ninth state to ratify. The new government began on March 4, 1789. Delegates in North Carolina and Rhode Island approved the Constitution only after the first president took office. Rhode Island's lawmakers turned down eleven attempts to ratify it between September 1787 and January 1790. When Rhode Island's delegates finally voted on May 29, 1790, they approved it 34 to 32.

George Washington

Who: The first president, elected twice with every electoral vote, who chose to leave office after two terms.

When and where: Federal Hall, New York, April 30, 1789. Philadelphia, September 19, 1796.

George Washington is the only person ever elected president with every electoral vote. It happened twice, in 1789 and in 1792. The electoral votes are the votes cast by electors, the people each state chooses to pick the president. The votes for the first election were counted on April 6, 1789, more than a month late. Members of the new Congress could not reach New York in time because of a cold, snowy winter. Washington had all 69 votes.

On April 30, 1789, Washington swore the oath of office, the promise each new president makes, on the second-floor balcony of Federal Hall in New York. Robert R. Livingston, a New York judge whose title was chancellor, read him the oath while a crowd watched from the street. Then Washington went inside and read his first speech as president, called the first inaugural address, to both houses of Congress.

Nothing in the Constitution limited how many times a president could be elected. In 1796 Washington decided to stop after two terms. He announced it in a written message to the country, printed on September 19, 1796, in a Philadelphia newspaper. It is called his Farewell Address, though he never read it aloud. James Madison had written a first version in 1792. Alexander Hamilton did most of the writing in 1796. Washington made

changes to it himself. In it he told the country of "the resolution I have formed, to decline being considered among the number of those out of whom a choice is to be made." That meant he would not run again.

In the same address he warned "against the baneful effects of the spirit of party." Baneful means harmful. He also wrote that it was "our true policy to steer clear of permanent alliances with any portion of the foreign world."

For about 150 years the two-term limit stayed a habit, not a law. Franklin Roosevelt broke it when he won a third term in 1940 and a fourth in 1944. In 1947 members of Congress proposed writing a two-term limit into the Constitution. The 22nd Amendment, a change to the Constitution, took effect on February 27, 1951, when Minnesota's lawmakers made it the 36th state to approve it.

Washington was an enslaver. He owned 123 people at his plantation, Mount Vernon. He also managed 153 more who belonged to the estate of his wife Martha's first husband. An estate is the property a person leaves when they die. Under the law, Washington could not sell or free those 153. In his will, dated July 9, 1799, he freed his valet, or personal servant, William Lee at once. He ordered the other 122 people he owned to be freed after Martha died. Martha Washington freed them on January 1, 1801. The other 153 people went back to her first husband's estate. Martha's grandchildren, who inherited that estate, divided them among themselves, and in dividing them they split up families.

The custom of reading the Farewell Address aloud in Congress began on February 22, 1862, during the Civil War, after a thousand people in Philadelphia asked Congress to mark Washington's birthday. Since 1896 a senator has read it aloud in the Senate every year. It runs 7,641 words.

James Madison

Who: A delegate to the Constitutional Convention who first argued against a bill of rights, then wrote one and steered it through Congress.

When and where: Philadelphia and New York, 1787 to 1791. Born March 16, 1751. Died June 28, 1836.

James Madison introduced the amendments that became the Bill of Rights. An amendment is a change or addition to the Constitution. Madison had been the loudest voice against adding a list of rights. He had argued that the Constitution already limited

the government's powers. Then delegates in several states agreed to ratify only if the first Congress would consider the amendments they proposed. After that, Madison changed his position.

On June 8, 1789, Madison stood up in the House of Representatives and proposed his list. He told the House, "I think we should obtain the confidence of our fellow citizens, in proportion as we fortify the rights of the people against the encroachments of the government." To fortify means to make stronger. Encroachments means steps that go beyond what is allowed.

Madison wanted each change written into the body of the Constitution, in the place where it belonged. In August 1789 the House members followed Roger Sherman's plan instead. They voted to add the changes at the end, as separate amendments. That is why the Bill of Rights sits at the back of the Constitution.

The House members passed 17 amendments. The senators cut and combined them into 12. Members of Congress proposed those 12 amendments on September 25, 1789, and President Washington sent them to the states on October 2. By December 15, 1791, lawmakers in three-quarters of the states had ratified ten of them. Those ten are the Bill of Rights.

At the Constitutional Convention, Madison had backed the rule counting each enslaved person as three-fifths of a free person. In essay No. 54 of *The Federalist*, he defended it. He said enslaved people had a "mixed status as property and persons." He said many times that slavery went against the principles of a republic, a country governed by elected representatives. He never put forward a workable plan to end it.

Madison enslaved people all through these years. About 100 enslaved people worked at his plantation, Montpelier, at any one time, and nearly 300 over the life of the plantation. When he was short of money, he sold sixteen of them to his cousin William Taylor, who owned a sugar plantation and a cotton plantation in Louisiana. He freed no one in his will. He asked his wife, Dolley, not to sell the people he left her without their consent unless they misbehaved. She sold some of them and kept others enslaved.

Who could become a citizen, 1790

The first federal law on who could become a citizen allowed only a "free white person." Members of Congress passed it in 1790 and called it the Naturalization Act. Naturalization is the legal process by which a person born in another country becomes a citizen. The person also

had to be of good character, and had to have lived in the United States for two years and in the state for one. The person also had to swear an oath to support the Constitution. Part of that racial limit stayed in federal law until 1952.

The Fugitive Slave Act, 1793

In 1793 the members of Congress passed a law about "persons escaping from the service of their masters." President George Washington signed it on February 12, 1793. Under the law, an enslaver, "his agent or attorney" could "seize or arrest" a person in any state. He could take that person before a single federal judge, or a county, city or town magistrate. A magistrate is a local judge. If the enslaver swore to his claim, spoken or in writing, the judge could give him a certificate to take the person away.

The law provided no jury for the seized person. It stated nothing about letting that person give evidence. Anyone who blocked the seizure, rescued the person, or hid the person after being told of the claim had to pay the enslaver $500.

The first two parties

In the 1790s the country's leaders split into the first two political parties. A political party is a group of people who work together to win elections and run the government their way.

Alexander Hamilton and John Adams led the Federalists. They wanted a strong national government and an economy built on trade, manufacturing and banking, and they leaned toward Britain. Thomas Jefferson and James Madison led the Democratic-Republicans. They wanted more of the government's power left with the states, opposed a national bank, supported farming and leaned toward France. Washington warned against parties in his Farewell Address of 1796.

The Sedition Act, 1798

In 1798 members of Congress passed four laws, and President John Adams signed them. Three of them dealt with people from other countries. The fourth, signed on July 14, 1798, was the Sedition Act. Sedition means words or acts that stir people up against the government. Under it, a person committed a crime by writing or publishing "any false, scandalous and malicious writing" against the government. The punishment was a fine of up to $2,000 and up to two years in prison. The law ran out on March 3, 1801.

The only newspaper editors put on trial under the Sedition Act worked for Democratic-Republican papers. The National Constitution Center counts more than two dozen people found guilty, most of them publishers who opposed the government.

One of them was Matthew Lyon, a Democratic-Republican congressman from Vermont who had been born in Ireland. In a letter, he wrote that he saw the public good "swallowed up in a continual grasp for power, in an unbounded thirst for ridiculous pomp, foolish adulation, or selfish avarice." Pomp means showy display. Adulation means too much praise. Avarice means greed. He had also read aloud at campaign meetings a letter by the poet Joel Barlow that blamed Adams and the Senate for trouble with France.

On October 5, 1798, a federal grand jury in Vermont charged Lyon. A deputy marshal, a federal law officer, arrested him the next day. On October 9 he stood trial at Rutland before Justice William Paterson of the Supreme Court. Lyon defended himself. Paterson told the jury that its job had "nothing whatever to do with the constitutionality or unconstitutionality of the sedition law." Constitutionality means whether a law is allowed by the Constitution. The jury found Lyon guilty within an hour. Paterson sentenced him to four months in prison, a $1,000 fine and $60.96 in court costs.

Lyon was held in the jail at Vergennes. While he was there, the voters of his district elected him to Congress again. He was released on February 9, 1799.

Justice Samuel Chase sentenced another writer, James Callender, to nine months in prison and a $400 fine. After Jefferson became president, he pardoned Callender. To pardon means to officially forgive a crime. In 1804 the members of the House voted to impeach Chase, partly for how he ran Callender's trial. To impeach means to charge an official with wrongdoing in office, so that the Senate puts him on trial. The senators found him not guilty.

1800 to 1850

In 1803 the Supreme Court's justices struck down part of a law passed by Congress for the first time. From then on, American judges claimed the power to cancel laws that break the Constitution. In the same years, lawmakers in several states dropped the rule that a white man had to own property to vote. Lawmakers in some of those states took the vote away from Black men. The first national party convention met in 1831. President Andrew Jackson handed out government jobs to his supporters. He also signed a law that let him make treaties to push Native nations out of the East and send them west. By the end of his presidency, his officials had removed about 50,000 Native people from their homelands in the East.

John Marshall

Who: The Chief Justice who wrote that judges may refuse to follow a law that breaks the Constitution.

When and where: Washington, D.C., 1801 to 1835. *Marbury v. Madison* decided in February 1803.

John Marshall wrote the ruling in which the Supreme Court's justices first claimed the power to strike down a law passed by Congress. He was the Chief Justice, the head of the Supreme Court. President John Adams named Marshall for that post on January 20, 1801. Marshall took his seat on February 4, 1801. He held it for 34 years, until he died in Philadelphia on July 6, 1835. In that time he heard more than a thousand cases and wrote more than five hundred opinions. An opinion is a judge's written explanation of a ruling.

In 1801, in his last days in office, Adams appointed William Marbury a justice of the peace, a local judge, for Washington, D.C. The paper that gave Marbury the job, called a commission, was never delivered to him. The new Secretary of State, James Madison, refused to hand it over. The Secretary of State is the president's chief adviser on dealings with other countries. Marbury asked the Supreme Court for an order forcing Madison to deliver it.

In February 1803 Marshall and the other justices decided the case, called *Marbury v. Madison*. They said they could not give Marbury the order he asked for. A section of the Judiciary Act of 1789 said the Supreme Court could give such orders. The justices decided that the section went beyond what the Constitution allowed, so they refused to follow it. It was the first time the justices had declared a law passed by Congress and signed by the president unconstitutional, meaning that it broke the Constitution.

Marshall wrote: "It is emphatically the province and duty of the judicial department to say what the law is." The judicial department means the courts. Province here means proper job. A law that goes against the Constitution is void, which means it has no force, he wrote. And when the two conflict in a case, judges must follow the Constitution. This power is called judicial review. The justices did not declare another act of Congress unconstitutional until the *Dred Scott* case of 1857.

The Louisiana Purchase, 1803

On April 30, 1803, two American officials, Robert Livingston and James Monroe, signed a treaty, a written agreement between countries, with France. Under it the United States bought 828,000 square miles of land west of the Mississippi River. The price was $15 million, about 4 cents an acre. President Jefferson had sent Monroe to buy only New Orleans and the land to its east called West Florida, and to spend no more than $10 million.

The purchase raised a question about the Constitution. President Thomas Jefferson usually read the Constitution strictly, which means he held that the government could do only what the document said it could. He wondered whether the Constitution allowed the government to take on new land at all. In a letter in 1803 to Wilson Cary Nicholas, Jefferson wrote: "Our peculiar security is in possession of a written Constitution. Let us not make it a blank paper by construction." Peculiar here meant special. By construction he meant by stretching the meaning of its words. He wrote that he would rather ask the nation for more power than take it. He went ahead with the purchase anyway.

French officials sold France's claim to the land. Thousands of Native people, in dozens of nations, lived on it. They were not part of the sale. Article VI of the treaty states that the United States would carry out the treaties Spain had made with "the tribes and nations of Indians" there.

Ending the import of enslaved people, 1808

Under the Constitution, the members of Congress could not ban the shipping of enslaved Africans into the country before 1808. On March 2, 1807, President Jefferson signed a law that banned it from the first day allowed. The ban took effect on January 1, 1808. From then on, bringing enslaved people across the ocean into the United States was against federal law.

Who gained the vote and who lost it

Between 1807 and 1838, the lawmakers of several states rewrote their rules on voting. They let white men without property vote. In the same laws and constitutions, they shut out Black men. New Jersey's lawmakers also ended voting by women.

In 1807 New Jersey's lawmakers passed an election law that let all white male taxpayers vote and shut out everyone else. Women and free Black people in New Jersey who met the property test had voted since 1776. The new law ended that. The law's words gave its aim as a "uniform practice" across the state, meaning the same rules everywhere.

In 1821 the delegates who rewrote New York's constitution dropped the property test for white men. In the same document, they required a Black man to own property worth $250, free of debt, before he could vote. In 1825 only 298 of the nearly 6,000 free Black adults in New York met that test.

North Carolina's free Black men lost the vote in 1835. The delegates to the state's constitutional convention, a meeting of men chosen to rewrite the state constitution, took it away from them. Pennsylvania's convention delegates did the same in January 1838. They added the word "white" before "freemen," the men allowed to vote, in the section on who could vote.

Robert Purvis wrote a protest called the *Appeal of Forty Thousand Citizens, Threatened with Disfranchisement*. To disfranchise means to take away the vote. He read it aloud on March 14, 1838, at the First African Presbyterian Church in Philadelphia. Pennsylvania's voters approved the new constitution on October 9, 1838, by 113,971 votes to 112,759. Black men in Pennsylvania could not vote again until the Fifteenth Amendment in 1870. That change to the Constitution barred the states from denying a man the vote because of his race.

The first national party convention, 1831

Men who opposed the Freemasons, a secret society, formed the Anti-Masonic Party. In September 1831 the party's members met in Baltimore to choose their candidate for president. It was the first national nominating convention held by any party. A nominating convention is a meeting where a party's members choose its candidates. The Anti-Masons were also the first party to give voters a platform, a written list of what the party stood for. The delegates chose William Wirt. In the 1832 election he won only Vermont and its seven electoral votes, the votes that each state's electors cast to choose the president.

> ### Andrew Jackson
>
> **Who:** The president who signed the law to remove Native nations from the East, used the veto to fight the national bank, and gave government jobs to his supporters.
>
> **When and where:** Washington, D.C., 1829 to 1837.
>
> Andrew Jackson was the seventh president, from 1829 to 1837. On May 28, 1830, he signed the Indian Removal Act. The act allowed the president to make treaties with Native nations living east of the Mississippi River. Under those treaties the nations had to give up their eastern land and move west. The members of the House passed it on May 26, 1830, by 102 votes to 97, according to the House's own historians. The National Park Service gives the count as 101 to 97. The Senate vote was 28 to 19.

By the end of Jackson's presidency, his officials had made nearly 70 removal treaties. Federal officials removed about 50,000 Native people from the East to Indian Territory, land west of the Mississippi River that the government set aside for them. The Choctaw, starting in 1831, were the first of the southeastern nations to be forced out. The forced removal of the Muscogee, or Creek, began in 1836. Forcing the Seminole from their land took the government almost twenty years and $15 million. White settlers got about 25 million acres of the nations' eastern land, which federal officials opened to them. In 1838, a year after Jackson left office, United States Army troops and state militia forced more than 16,000 Cherokee people out of their homelands. Militia were part-time soldiers called up by a state. The soldiers held the Cherokee in camps and then sent them west. The journey is called the Trail of Tears. The National Archives puts the Cherokee dead at about 4,000. The National Park Service counts more than a thousand who died on the way and perhaps several thousand more who died from its effects.

Georgia's lawmakers had also passed a law about white people living on Cherokee land. It required any white person living in Cherokee territory after March 1, 1831, to get a license from Georgia's governor and to swear an oath to support Georgia's constitution and laws. Samuel Worcester, a Christian missionary, a man sent to spread his religion, lived on Cherokee land without that license. He was found guilty in a Georgia court and sentenced to four years of hard labor, forced heavy work, in the state prison.

In 1832 the justices of the Supreme Court decided *Worcester v. Georgia*. Chief Justice John Marshall wrote that Georgia's law was "void, and the judgment a nullity," meaning it had no force. Georgia's officials did not carry out the ruling. In April 1832 Jackson wrote to John Coffee that the Court's decision "has fell still born." Stillborn means born dead. Many schoolbooks quote Jackson saying, "John Marshall has made his decision, now let him enforce it." No record from his own time shows that he said it. The sentence first appears in a history book by Horace Greeley printed in 1864, about twenty years after Jackson died.

On July 10, 1832, Jackson vetoed a bill to renew the charter of the Second Bank of the United States, a national bank. The charter was the paper that gave the Bank the right to operate. A veto is a president's refusal to sign a bill into law. His veto message called the Bank "dangerous to the liberties of the people." He was the first president to make a veto the center of a major fight over the economy. He made the veto a part of his campaign in 1832 and won a second term.

> Jackson then moved the government's money out of the Bank. On March 28, 1834, the senators voted to censure him for it. To censure is to scold someone officially. It is the only time the Senate has censured a president. In January 1837, after Jackson's party won a majority, the senators voted to expunge the censure, which means to strike it from the record.
>
> Jackson also filled government jobs with his own supporters. He called this rotation in office. He argued that government work could be made "so plain and simple" that the jobs could pass around among men who deserved them. Senator William L. Marcy of New York gave the practice its nickname when he said "to the victor belong the spoils of the enemy." Spoils are the goods an army takes from the side it beats. The practice became known as the spoils system.

The fight over the school tax, 1834 and 1835

In 1834 Pennsylvania's lawmakers passed the Free Public School Act, a law for a statewide system of common schools paid for by taxes. A common school was a free public school open to the children of the town.

Many voters did not want to pay the tax. In 1835 petitions, written requests signed by thousands of them, reached the state's lawmakers, asking them to repeal, or cancel, the law. No one in the state Senate spoke against repeal, and few members of the House did.

On April 11, 1835, Thaddeus Stevens, a member of the Pennsylvania House, spoke against repeal. He said: "Many complain of the school tax, not so much on account of its amount, as because it is for the benefit of others and not themselves." He pointed out that a man "cheerfully pays the tax which is necessary to support and punish convicts." The same man, Stevens said, "loudly complains of that which goes to prevent his fellow being from becoming a criminal." After his speech, the lawmakers dropped the repeal, and the schools stayed. Stevens later called the speech the "crowning utility" of his life, the most useful thing he ever did.

1850 to 1900

Members of Congress passed three amendments to the Constitution between 1865 and 1870, and lawmakers in enough states approved them. Under them, slavery ended, everyone born in the country became a citizen, and no state could deny a citizen the vote because of race. In the 1870s and 1880s Black men in many Southern states voted and held office. Starting in 1890,

the delegates who rewrote Southern state constitutions added rules meant to stop Black men from voting. In Louisiana the number of Black men registered to vote fell from 130,344 in 1897 to 5,320 in 1900. The justices of the Supreme Court ruled that those rules were allowed. They also ruled that laws requiring Black and white people to be kept apart were allowed. In the same years, lawmakers in Washington passed the first laws to shut out immigrants by nationality, and to fill some government jobs by exam. Lawmakers in more and more states required children to go to school.

Laws that made children go to school

In 1852 the lawmakers of Massachusetts passed the first state law that required children to go to school. Children from 8 to 14 had to attend. The school committee in each town or city had to look into every case of a child who did not. A family that broke the law could be fined up to $20. By 1900, thirty-two states had a law like it. Mississippi's lawmakers were the last to pass one, in 1918. These laws worked alongside laws against child labor.

Dred Scott v. Sandford, 1857

Dred Scott, an enslaved man, sued in federal court. On March 6, 1857, the justices of the Supreme Court decided his case, *Dred Scott v. Sandford*, by a vote of 7 to 2. Chief Justice Roger B. Taney wrote the ruling. He wrote that a Black person whose ancestors were brought to the country and sold as slaves was not a citizen under the Constitution. So Scott had no right to sue in a federal court. Taney also wrote that Black people "had no rights which the white man was bound to respect."

Taney's ruling also said that Congress had no power to ban slavery in the federal territories, the lands that were not yet states. That made *Dred Scott* only the second time the justices had struck down a law passed by Congress. The first was *Marbury v. Madison* in 1803.

Secession, 1860

On December 20, 1860, in Charleston, the delegates of a South Carolina convention signed an ordinance of secession, a law declaring that their state was leaving the United States. Four days later the delegates approved a statement of their reasons. In it they wrote of "an increasing hostility on the part of the non-slaveholding States to the institution of slavery." They also wrote that the Northern states had joined to elect a man "whose opinions and purposes are hostile to slavery." The man they meant was Abraham Lincoln.

Abraham Lincoln

Who: The president who suspended a basic legal right during the Civil War, was told by the Chief Justice that he had no power to do it, and kept doing it.

When and where: Washington and Baltimore, April to July 1861.

Movie: *Lincoln* (2012), a film about the fight in January 1865 to get the House of Representatives to pass the Thirteenth Amendment. The film is about the amendment, not about habeas corpus.

In the first months of the Civil War, President Abraham Lincoln suspended the writ of habeas corpus. A writ is a written order from a court. Habeas corpus is a person's right to be brought before a judge, who decides whether the government may go on holding that person. When it is suspended, the government can hold a person without taking them before a judge at all. The Constitution allows the writ to be suspended "in Cases of Rebellion or Invasion." It does not say who may suspend it.

On April 25, 1861, Lincoln wrote to General Winfield Scott. Governor Hicks of Maryland had called the state's lawmakers to a special meeting, and they looked likely to vote to leave the United States. Lincoln told Scott to stop any effort to arm Maryland's people against the federal government. He approved "the most prompt, and efficient means." Those means included "the bombardment of their cities" and, "in the extremest necessity," suspending the writ. On April 27 he gave Scott the power to suspend it anywhere along the routes the army's troops used between Philadelphia and Washington. No federal official had suspended the writ since the War of 1812.

At two in the morning on May 25, 1861, federal soldiers entered the country house of John Merryman, a planter, or owner of a large farm, in Baltimore County, and woke him from his bed. They took him to Fort McHenry. General George Cadwalader held him there. The charge was that Merryman was an officer in a company of men who supported secession and had federal weapons. On May 26 Chief Justice Roger Taney, who also served as a judge in Maryland, ordered Cadwalader to bring Merryman to court. Cadwalader refused in a letter. He wrote that Lincoln had given officers the power to suspend the writ. A deputy marshal, an officer of the federal courts, carried Taney's next order to the gate of the fort, and a guard would not let him in.

On May 28, with a crowd gathered outside, Taney ruled in Baltimore that the president had no power to suspend the writ, under the Constitution or any law. He said Merryman must be freed at once. Taney issued no order to make that happen. He was 84 years old. He was also the judge who had written *Dred Scott*, so almost no one at the time saw him as neutral.

> On July 4, 1861, Lincoln explained himself to Congress. He said the power to suspend the writ had "purposely been exercised but very sparingly." Then he asked, "are all the laws, but one, to go unexecuted, and the government itself go to pieces, lest that one be violated?" Unexecuted means not carried out, and lest means for fear that. He argued that the men who wrote the Constitution could not have meant that "the danger should run its course, until Congress could be called together."
>
> Lincoln's officials went on arresting people and suspending the writ without a vote of Congress. On September 24, 1862, Lincoln suspended it across the whole country for anyone who resisted the draft, the law that made men serve in the army. In March 1863 the members of Congress passed a law that let the president suspend the writ for the rest of the war. With that law, members of Congress settled the dispute. No court settled it.
>
> On January 31, 1865, the members of the House passed the Thirteenth Amendment, the change to the Constitution that ended slavery, by 119 votes to 56. Lincoln signed the resolution, the paper sending the amendment to the states, the next day, though a president does not have to sign an amendment. Enough states had ratified it, or approved it, by December 6, 1865.

Land for colleges, 1862

On July 2, 1862, the Morrill Act became law. Senator Justin Morrill of Vermont put the bill forward. Under it, each state received 30,000 acres of federal land for each of its senators and representatives in Congress. The land was to pay for colleges that taught "agriculture and the mechanic arts," meaning farming and the skills of building and machines. More than 10 million acres of the land given out under the act had been taken from Native nations by United States officials, through treaties, agreements and seizure. Colleges paid for by these land gifts are called land-grant colleges. A second Morrill Act, in 1890, set a rule for each state. The state had to set up separate land-grant colleges for Black students, or show that its colleges did not turn students away because of race.

The Fourteenth and Fifteenth Amendments

Members of Congress approved the Fourteenth Amendment on June 13, 1866, and it became part of the Constitution on July 9, 1868. It states that "all persons born or naturalized in the United States" are citizens. Naturalized means made a citizen by a legal process. It also states

that no state may "deny to any person within its jurisdiction the equal protection of the laws." Within its jurisdiction means inside the area where its laws apply. Equal protection means a state has to apply its laws the same way to everyone.

Members of Congress passed the Fifteenth Amendment on February 26, 1869, and it was ratified on February 3, 1870. It states that the right of citizens to vote "shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude." Abridged means cut back. Previous condition of servitude means having once been enslaved. The amendment names race, color and past slavery. It says nothing about sex, so states could still keep women from voting.

New constitutions in the South

Reconstruction was the rebuilding of the Southern states' governments after the Civil War. Members of Congress passed laws for it called the Reconstruction Acts. Under those acts, a convention met in Charleston on January 14, 1868, to write a new constitution for South Carolina. Black men in South Carolina had voted for the first time in the election of its delegates. Three out of every five delegates were Black.

Article X of the constitution they wrote required a system of free public schools, "free and open to all the children and youths of the State, without regard to race or color." Schools were to be open at least six months a year. Once there were enough schools, children would have to attend for at least twenty-four months. For decades, state officials did not carry out Article X.

The Tweed Ring and Tammany Hall

In the 1860s and 1870s, William M. Tweed held several offices in New York City and New York State at once. He was a state senator from 1867 to 1871 and chaired the state Senate's finance committee. From 1868 he was the Grand Sachem, or head, of Tammany Hall. Tammany Hall was a political machine of the Democratic Party. A political machine is a party organization that wins votes by handing out jobs and favors. Through Tammany Hall, Tweed had great power in the Democratic Party.

Tweed and the men around him, called the Tweed Ring, stole money from the city in several ways. They sent the city bills for more than the work cost. Through printing and supply companies they controlled, Tweed's men billed the city too much for supplies. They ran up the cost of public buildings far past their budgets. A new county courthouse was expected to cost

half a million dollars. It ended up costing the city's taxpayers about $13 million. EBSCO Research Starters, a reference guide, gives modern estimates of what the ring stole: from $30 million to $200 million.

The cartoonist Thomas Nast attacked Tweed in the magazine *Harper's Weekly* from 1869. In July 1871 editors at *The New York Times* printed evidence from inside the city's accounts, after people who knew about the thefts passed it to the paper. In late 1873 a court found Tweed guilty and sentenced him to twelve years in prison and a fine of $12,750. He appealed, which means he asked a higher court to look at the case again, and the higher court cut his sentence to one year. He died of pneumonia in the Ludlow Street jail on April 12, 1878.

Minor v. Happersett: citizens without the vote

In October 1872 Virginia Minor, a citizen of Missouri, tried to register to vote in St. Louis. The registrar, the official who signed up voters, was Reese Happersett. He refused her because she was not a "male citizen." Minor sued. She argued that the Fourteenth Amendment made voting a right of every citizen.

The justices of the Supreme Court ruled against her, and none of them disagreed. They decided the case in their session that began in October 1874. The Chief Justice read the ruling. It states that "the Constitution of the United States does not confer the right of suffrage upon any one." Suffrage means the right to vote. Under the ruling, each state could keep the vote for men only.

The first laws against immigrants by nationality

The Page Act of 1875 was the first federal law to limit immigration. It barred Chinese laborers brought over under contract. In practice, officials used it to keep out most Chinese women too.

On May 6, 1882, President Chester A. Arthur signed the Chinese Exclusion Act. Under it, no Chinese laborer could come into the country for ten years. This was the first federal law to shut out a whole group of people because of their nationality. Members of Congress later renewed the act and widened it, and they did not repeal it until 1943.

Federal officials also took over the work of admitting immigrants. Officials of New York State had run the landing station at Castle Garden from 1855 to 1890. In 1892 the federal station at Ellis Island opened.

The election of 1876 and the end of Reconstruction

The presidential election of 1876 was between Rutherford B. Hayes, a Republican, and Samuel J. Tilden, a Democrat. The electoral votes of Florida, Louisiana, South Carolina and Oregon were in dispute. On January 18, 1877, Senator George Edmunds of Vermont proposed an Electoral Commission to settle the count. It had fifteen members: five representatives, five senators and five Supreme Court justices. Members of Congress passed the bill.

The commission's members voted 8 to 7, along party lines, to give every disputed electoral vote to Hayes. Hayes became president. On April 24, 1877, on his orders, federal troops left the Louisiana state house. It was the last state house in the South that federal troops had guarded. The Equal Justice Initiative, in its calendar *A History of Racial Injustice*, marks that withdrawal as the end of Reconstruction. Its calendar says the withdrawal opened the way for white supremacist rule to come back in the South with nothing to hold it back. White supremacy is the belief that white people should rule over everyone else.

Joseph Hayne Rainey

Who: A man born to enslaved parents, forced to work on Confederate defenses, who became the first Black member of the US House and the first to preside over it.

When and where: Georgetown, South Carolina, and Washington, D.C. Born June 21, 1832. Sworn in December 12, 1870. Died August 2, 1887.

Joseph Hayne Rainey was the first African American to serve in the House of Representatives. He was born on June 21, 1832, in Georgetown, South Carolina. His parents were enslaved. His father, Edward L. Rainey, worked as a barber and used his earnings to buy the family's freedom in the early 1840s.

The Confederacy was the group of Southern states that broke away from the United States and fought it in the Civil War. During the war, the Confederate army forced Rainey to work on the defenses of Charleston. He also worked as a steward, a ship's servant, on a Confederate ship that slipped through the blockade, the line of United States warships that tried to keep ships out of Southern ports. In 1862 he and his wife escaped to Bermuda. There he ran a barbershop and she ran a dress shop. They came home in 1866.

On October 19, 1870, Rainey won election to a full term in Congress with 63 percent of the vote. On November 8 he won a special election for the rest of the current term, with 86 percent. He was sworn in on December 12, 1870.

> On April 1, 1871, he spoke for the Ku Klux Klan Act. The Ku Klux Klan was a vigilante group, people who act outside the law, that attacked Black Americans and their white allies in the South. Klansmen whipped men, women and children, and they burned Black schools and churches. In July 1870 Klansmen killed six people, among them a schoolteacher, at Cross Plains, Alabama. Members of Congress gathered testimony that Klansmen in Alabama alone committed more than 100 murders between 1868 and 1871. Under the Ku Klux Klan Act, it became a federal crime to deny anyone the rights the Constitution protects. President Ulysses S. Grant signed it on April 20, 1871. Rainey said the Constitution owed "protection to the humblest citizen, without regard to rank."
>
> Rainey also supported the Civil Rights Act of 1875. He pressed for equal schooling, and he said "mixed schools," schools for Black and white children together, would "annihilate" prejudice. Annihilate means wipe out.
>
> On April 29, 1874, he led a meeting of the House from the Speaker's chair, the seat of the House's leader. He was the first African American to do so.
>
> On January 25, 1877, Rainey spoke against the Electoral Commission. He warned it could lead to "the election of a President by one man rather than by a majority of the people of the United States." Members of Congress passed the bill anyway.
>
> Rainey lost his seat in 1878, by 62 percent to 38, and left the House on March 3, 1879, after more than eight years. No Black member of Congress served longer than he had until the 1950s. He was the first of fourteen Black representatives who served during Reconstruction. After Reconstruction ended, the number of Black members of Congress fell to zero and stayed near zero for decades. Rainey worked for the Treasury Department in South Carolina and ran a banking business in Washington. He died in Georgetown on August 2, 1887.

The Pendleton Act, 1883

Since Andrew Jackson's time, presidents had handed out government jobs to their supporters. Then Charles Guiteau, a man who had wanted a government job and had not gotten one, killed President James A. Garfield. Chester A. Arthur became president after Garfield. Arthur had come up through New York machine politics.

On January 16, 1883, Arthur signed the Pendleton Act. Under it, some federal jobs went to people who passed a competitive exam, not to people who had worked for the winning party. At first the exam rules covered only about 10 percent of the government's 132,000 workers. The

other 90 percent were not covered.

Taking away the vote in Mississippi and Louisiana

The Fifteenth Amendment barred states from denying the vote because of race. In 1890 the delegates who wrote Mississippi's new constitution set out to stop Black men from voting without naming race. Senator J. Z. George led the convention. Its committee on voting included its one Black delegate, Isaiah Montgomery. The committee members agreed that their task was to take away Black men's votes.

The delegates added a poll tax, a tax of $2 a year that a man had to pay before he could vote. They required two years of living in the state and one in the county. A voter had to swear he had not committed certain crimes, crimes the committee believed Black men were more likely to commit. State officials printed the ballots, and only a man who could read could use them. A man who could not read could be read a section of the constitution. If he could explain it, he could vote. The registrar alone decided whether he had explained it well enough. The delegates put the new constitution into effect themselves, without a vote of the people.

In 1898 the justices of the Supreme Court heard *Williams v. Mississippi*. Williams was a Black man found guilty of murder. Jurors in Mississippi were chosen from the lists of voters. He argued that the voting rules in the 1890 constitution kept Black men off those lists, and so off his jury. On April 25, 1898, the justices ruled against him, and no justice disagreed. Justice Joseph McKenna wrote that the rules "do not on their face discriminate between the races, and it has not been shown that their actual administration was evil." He went on: "only that evil was possible under them." McKenna meant that the rules did not name any race, and no one had proved that officials used them unfairly, only that they could. Mississippi's voting rules stood until the Twenty-fourth Amendment of 1964.

Louisiana's delegates wrote a new constitution in 1898 and also put it into effect without a vote of the people. Their rules for voters were a poll tax of $1 a year, with receipts for two past years, a reading test given by parish registrars, a test of owning $300 in property, and a grandfather clause. The registrars were the officials who signed up voters in each parish, Louisiana's name for a county. The reading test had no fixed standard. Under the grandfather clause, a man who failed the tests could still register if his father or grandfather had voted in 1867, a year when formerly enslaved men could not vote in Louisiana. Thomas Semmes chaired the convention's committee on the courts. He said: "We met here to establish the supremacy of the white race, and the white race constitutes the Democratic Party of this State."

By the count of the Louisiana encyclopedia *64 Parishes*, 130,344 Black voters were registered in 1897. In 1898 there were 12,902. In 1900 there were 5,320, and in 1922 there were 598.

Plessy v. Ferguson, 1896

A Louisiana law required railroads to give Black and white passengers separate cars, or cars split by a partition. A person who broke the law could be fined $25 or jailed for 20 days. On May 18, 1896, the justices of the Supreme Court ruled 7 to 1 in *Plessy v. Ferguson* that the law was allowed. Justice Henry Billings Brown wrote the ruling. He called it a "fallacy," a mistake in reasoning, to believe that "the enforced separation of the two races stamps the colored race with a badge of inferiority." A badge of inferiority means a mark that one group is lower than another.

Justice John Marshall Harlan was the only justice who dissented, or disagreed. He wrote: "Our constitution is color-blind, and neither knows nor tolerates classes among citizens."

Born here, a citizen: Wong Kim Ark, 1898

Wong Kim Ark was born in San Francisco in 1873 to parents who had come from China. In August 1895 he came home from a trip to China on the ship *Coptic*. Officials refused to let him land, under the Chinese exclusion laws. On October 2, 1895, a writ of habeas corpus was filed on his behalf. On March 28, 1898, the justices of the Supreme Court ruled 6 to 2 that under the Fourteenth Amendment everyone born in the United States is a citizen, whatever their parents' nationality.

Cumming v. Richmond County, 1899

In June 1897 the members of the school board of Richmond County, Georgia, closed Ware High School, the county's high school for Black students. The board members said they could not afford a high school for 60 Black students while 300 Black children had no primary schooling. They kept paying for the high schools for white students.

J. W. Cumming, James S. Harper and John C. Ladeveze, Black taxpayers, sued. They asked the court to stop the board from spending public money on the white high schools until there was an equal school for their children. They also asked it to stop taxing them for schools their children could not attend.

The justices of the Supreme Court turned them down on December 18, 1899. The justices found no violation of the Fourteenth Amendment and treated the closing as a question of money, not of race. Justice John Marshall Harlan wrote the ruling. Three years earlier he had

been the one dissenter in *Plessy*. Here he wrote that "if it appeared that the board's refusal to maintain such a school was in fact an abuse of its discretion and in hostility to the colored population because of their race, different questions might have arisen." Discretion means the power to decide.

1900 to 1950

An amendment is a change to the Constitution. Between 1913 and 1920, members of Congress and state lawmakers added four of them. Under those four, Congress could tax incomes, voters chose their senators, alcohol was banned, and no state could deny women the vote. A fifth amendment ended the ban on alcohol in 1933. President Franklin Roosevelt was elected four times. The judges of the Supreme Court are called justices. They struck down parts of his New Deal, the set of laws he backed in the 1930s, and then he tried to add more justices to the Court. The justices ruled that a Virginia law was allowed, and under it doctors sterilized about 8,300 people. To sterilize a person is to operate on them so that they can never have children. The justices also held that the Army's orders forcing people of Japanese descent from their homes during World War II were justified. About 122,000 people were forced into camps under those orders. In big cities, the leaders of party organizations called political machines still traded jobs and favors for votes.

George Washington Plunkitt

Who: A New York machine politician who explained to a reporter, from a shoeshine stand at the New York County Court House, how he made his money and kept his votes.

When and where: The Fifteenth Assembly District, New York City. His talks were printed in 1905. He died in 1924.

George Washington Plunkitt was a district leader for Tammany Hall, the Democratic Party's political machine in New York City. A district leader was the party's boss in one part of the city. Plunkitt led Tammany's work in the Fifteenth Assembly District. He also served as a state senator and as a member of the state assembly, one of the two groups of lawmakers in New York State. He grew up poor. By the time he died in 1924, he was rich.

A newspaperman named William L. Riordon wrote down Plunkitt's talks and published them in 1905 as *Plunkitt of Tammany Hall*. The title page states that Plunkitt gave the talks "from His Rostrum." A rostrum is a speaker's stand, and his was the shoeshine stand

> at the New York County Court House. The book is not a word-for-word record. Riordon gathered and shaped what Plunkitt said.
>
> Plunkitt split graft into two kinds. Graft is money a person gets by using a public office. Dishonest graft, he said, meant blackmailing gamblers and squeezing money out of illegal businesses. To blackmail people is to make them pay money by threatening to tell their secrets. Honest graft meant learning where city officials planned to build something, buying the land first and then selling it to the city at a profit. "I ain't no looter," he said. "The looter hogs it. I never hogged." His summary of himself is cut into his gravestone: "I seen my opportunities and I took 'em."
>
> He also described the everyday work of a machine. When a building burned at night, Plunkitt and his captains, the party workers under him, came to the fire and found the families shelter and clothes on the spot. He knew employers across the city and got people jobs. His men found families in trouble before the charity groups did. He said he did it because those people remembered him on election day.

The food laws of 1906

On June 30, 1906, President Theodore Roosevelt signed two laws on the same day. The Pure Food and Drug Act banned selling food, drink or drugs across state lines if they were mislabeled or made impure. Harvey Wiley and the officials of his Bureau of Chemistry enforced it. In 1930 that office was renamed the Food and Drug Administration. The Meat Inspection Act required federal inspectors in meatpacking plants, set rules for cleanliness and banned false labels. The laws followed Upton Sinclair's book *The Jungle*, published in February 1906, and years of work by Wiley's team.

Two amendments in 1913

In 1894 members of Congress put a 2 percent tax on incomes over $4,000 into a tariff bill, a law setting taxes on goods brought in from other countries. The Supreme Court's justices struck the income tax down, 5 to 4. Members of Congress passed the Sixteenth Amendment on July 2, 1909. According to the National Archives, the conservatives who proposed it expected it never to be ratified. An amendment is ratified, or approved, when lawmakers or special meetings in three-quarters of the states have voted for it. The Sixteenth Amendment was ratified on February 3, 1913. Under it, Congress may tax incomes "without apportionment among the several States." That meant the money did not have to be divided among the states by population.

The Seventeenth Amendment was ratified on April 8, 1913, when Connecticut's lawmakers voted for it and completed the three-quarters needed. Before it, the lawmakers of each state chose that state's senators. After it, the voters chose them. Augustus Bacon of Georgia was the first senator elected by the voters under the new amendment, on July 15, 1913.

The grandfather clause struck down, 1915

Under a 1910 amendment to Oklahoma's constitution, Black men had to pass a reading test to vote, and white men were excused from it. The amendment excused anyone who could vote "on January 1st, 1866, or at any time prior thereto." It also excused any "lineal descendant" of such a person, meaning a child or grandchild. Almost no Black man could vote before 1866, so nearly all white men were excused and Black men had to take the test. A rule like this is called a grandfather clause, because it excused a man whose grandfather could vote.

Federal prosecutors, the government lawyers who bring criminal charges for the United States, charged two Oklahoma election officers, Frank Guinn and J. J. Beal, with keeping Black citizens from voting under this rule. The justices of the Supreme Court ruled against the 1866 clause in *Guinn v. United States* on June 21, 1915. They held that it was void, meaning it had no force, because it broke the Fifteenth Amendment. That amendment bars the United States and every state from denying a citizen the vote "on account of race, color, or previous condition of servitude." Chief Justice Edward White wrote the opinion, the Court's written explanation of its ruling.

Prohibition and repeal

Members of Congress passed the Eighteenth Amendment on December 18, 1917, and lawmakers in the states ratified it on January 16, 1919. It banned "the manufacture, sale, or transportation of intoxicating liquors," meaning alcoholic drinks. The ban began one year after ratification, in January 1920.

Fourteen years later, members of Congress voted to end the ban. They passed the Twenty-first Amendment on February 20, 1933. Its first section reads: "The eighteenth article of amendment to the Constitution of the United States is hereby repealed." To repeal a law is to cancel it. Members of Congress sent this amendment to special conventions, meetings held in each state to decide on it, and not to the state lawmakers. It was ratified on December 5, 1933. No other amendment repeals another, and no other was sent to state conventions.

The Nineteenth Amendment, 1920

Members of the House passed the Nineteenth Amendment on May 21, 1919, and senators passed it on June 4, 1919. On August 18, 1920, Tennessee's lawmakers ratified it. Their vote made Tennessee the thirty-sixth state to ratify, which was enough. Secretary of State Bainbridge Colby certified it, or officially declared it part of the Constitution, on August 26, 1920. Its words are: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex." Abridged means cut down. After it, no state could keep the vote for men only, as the justices had allowed in *Minor v. Happersett*.

Quotas, and citizenship for Native people, 1921 and 1924

In 1921 members of Congress passed the Emergency Quota Act, the first law with a set limit on how many immigrants could come. A quota is a fixed share. Under the act, the yearly limit for each nationality was 3 percent of the people born in that country who were living in the United States in 1910.

In 1924 members of Congress passed the Immigration Act, which set a lower limit. It was 2 percent of the people born in each country who were living in the United States in 1890, as the census of that year counted them. A census is a count of all the people in the country. Under the 1924 act, fewer immigrants could come from Southern and Eastern Europe than before, and nearly all immigrants from Asia were barred. The total was capped at about 165,000 a year.

On June 2, 1924, President Calvin Coolidge signed the Indian Citizenship Act. Under it, American Indians became citizens. It did not put them on the lists of voters, because each state's lawmakers wrote their own rules about who could vote. An Arizona law barred people "under guardianship" from voting. In 1928 the judges of the Arizona Supreme Court held that Native people on reservations were wards of the federal government, people under its guardianship. So, the judges held, the law kept them from voting. New Mexico's constitution shut out "Indians not taxed." In 1948 judges in both states ended these bans. On July 15 the Arizona Supreme Court overturned its own 1928 ruling in *Harrison v. Laveen*. Justice Levi Udall wrote that ruling. In August a federal court in New Mexico ruled in *Trujillo v. Garley* that the "Indians not taxed" rule broke the Constitution. In Utah, Native people could not vote until 1957, later than in any other state.

The anti-lynching bill, 1922

Lynching is murder by a mob, carried out without any trial. Members of Congress introduced bills to make lynching a federal crime, one the national government could charge. George Henry White introduced one on January 20, 1900. Representative Dyer introduced his bill on April 8, 1918. A later House report, House Report 117-251, names White's bill as the first in one place and Dyer's in another. Members of the House passed Dyer's bill on January 26, 1922. Senators opposed to it blocked it in the Senate, and it never became law. No federal anti-lynching law passed in this era.

Teapot Dome

In the Teapot Dome case, a member of the president's cabinet leased Navy oil land to two oil men who gave him money. The cabinet is the group of officials who head the big government departments. Albert B. Fall was Secretary of the Interior under President Warren G. Harding. Fall persuaded Harding to move the Navy's oil reserves, land kept for the Navy's future oil, to the Interior Department. Secretary of the Navy Edwin Denby carried out the transfer. Fall then leased, or rented out, the Teapot Dome reserve in Wyoming to Harry F. Sinclair's Mammoth Oil company. He leased the Elk Hills reserve in California to Edward Doheny's Pan-American Petroleum. Doheny gave Fall a $100,000 "loan" with no interest. Sinclair gave him about $300,000 in cash and government bonds, papers the government promises to pay back with interest.

In October 1923 the senators on the Public Lands Committee opened an investigation. Senator John B. Kendrick of Wyoming had called for it, and Senator Thomas J. Walsh of Montana led it for about two years. Walsh found Doheny's $100,000. In 1927 the justices of the Supreme Court ruled that the oil men had gotten the leases corruptly, meaning by dishonest deals. On October 25, 1929, a jury found Fall guilty of taking a bribe from Doheny. A bribe is money given to an official in return for a favor. A judge sentenced Fall to one year in prison and a $100,000 fine. He was the first person found guilty of a crime he committed while serving in a president's cabinet. Doheny was found not guilty of paying the same bribe. Sinclair went to jail for several months, for contempt of Congress and for having the jury in his case followed. Contempt of Congress is the crime of refusing to obey Congress or one of its committees.

School law: who decides, and who pays

Oregon's Compulsory Education Act of 1922 required parents to send children aged 8 to 16 to the public school in their district. Compulsory means required. The Society of the Sisters of the Holy Names of Jesus and Mary, which ran Catholic schools, sued Oregon's governor, Pierce,

over the law. A second case was brought for Hill Military Academy. The justices of the Supreme Court struck the law down in *Pierce v. Society of Sisters* on June 1, 1925. Justice James McReynolds wrote that it interfered with the liberty of parents to direct their children's education. He wrote: "The child is not the mere creature of the state." He meant that a child does not belong to the government, and that the people who raise a child have the right to guide the child's future. Under that ruling, state lawmakers may require a child to be educated, but they may not require every child to attend a government school. Private schools, church schools and, later, homeschooling are all legal because of it.

On March 21, 1925, Tennessee's governor, Austin Peay, signed the Butler Act. It made it unlawful to teach in the state's public schools "any theory that denies the story of Divine Creation of man as taught in the Bible, and to teach instead that man has descended from a lower order of animals." That meant a teacher could not teach evolution, the scientific idea that living things, people included, developed over a very long time from earlier forms. Civic leaders in Dayton, Tennessee, heard that the American Civil Liberties Union would pay for a court challenge to the law. They set up a test case, a trial arranged on purpose so that a court would rule on the law. They asked John T. Scopes, a football coach and science teacher, whether biology could be taught without evolution. He said it could not, because the state's own approved textbook included it. His trial opened in Dayton on July 10, 1925, before Judge John T. Raulston. On July 21 the jury found him guilty, and he was fined $100, the smallest fine the law allowed.

In January 1927 the judges of the Tennessee Supreme Court threw out his conviction. The state constitution required a jury, not a judge, to set any fine over $50, and Raulston had set the fine himself. So the judges never ruled on the Butler Act itself. It stayed in force until 1967.

In these years, most of the money for public schools was local money, raised in thousands of small school districts. The National Center for Education Statistics counted the shares. In the school year 1919-20, local money made up 83.2 percent of the money for public schools. By 1949-50 the local share had fallen to 57.3 percent. State money made up 39.8 percent that year, and federal money 2.9 percent. The number of school districts also fell, from 119,001 in 1937-38 to 83,718 in 1949-50, as small districts were merged into larger ones.

In June 1947 Governor Earl Warren of California signed the Anderson Bill. With it, California's lawmakers and governor became the first in the country to repeal their own state's law on segregated schools. Segregated schools kept children of different races apart.

Buck v. Bell, 1927

In 1924 Virginia's lawmakers passed a law that allowed state officials to sterilize people they judged "feeble-minded" and likely to have "socially inadequate offspring." Sterilization is an operation that makes a person unable ever to have children. "Feeble-minded" was a label officials put on people they judged to be slow to learn. Offspring means children. Aubrey Strode wrote the law and then defended it in court.

Carrie Buck was born on July 2, 1906, in Charlottesville. She was raised by foster parents, the Dobbs family. In 1923 she became pregnant. By her own account, as Encyclopedia Virginia reports it, Clarence Garland, the foster parents' nephew, raped her. Rape means forcing a person into sex. Her foster parents believed the pregnancy showed promiscuity, meaning sex with many partners, and so showed that she was "feebleminded." On January 23, 1924, they asked a court to have her committed to a state institution, meaning sent there to live by a court's order.

Her case went to a trial court under Judge Bennett T. Gordon on November 18, 1924, then to Virginia's Supreme Court of Appeals on November 12, 1925, and then to the Supreme Court. On May 2, 1927, the justices ruled 8 to 1 that Virginia's law was allowed. Justice Oliver Wendell Holmes wrote the opinion. It includes the sentence "Three generations of imbeciles are enough." Imbecile was another insulting label for a person judged slow to learn. Justice Pierce Butler dissented, meaning he disagreed with the ruling, without writing an opinion.

She had been sent to the Virginia State Colony for Epileptics and Feebleminded, a state home for people who had seizures or were judged slow to learn. Dr. Albert Priddy ran it. He picked her for the operation, and on September 10, 1924, the colony's board approved it. Carrie Buck did not agree to it. Near the end of her life she said she "kicked against it," and she told the historian Paul Lombardo, "They done me wrong. They done us all wrong." On October 19, 1927, Dr. John H. Bell performed the operation on Carrie Buck. It is called a salpingectomy. He cut her fallopian tubes, the tubes that carry eggs to the womb, so that she could never become pregnant again. Between 1927 and 1972, doctors in Virginia sterilized about 8,300 people under the law. Encyclopedia Virginia names the two main operations: a vasectomy for men, which cuts the tubes that carry sperm, and a salpingectomy for women. It does not say which operation was done on each person. Virginia's lawmakers repealed the law in 1974. On May 2, 2002, Governor Mark Warner apologized for the state's program. No later group of justices has overruled *Buck v. Bell*, or cancelled it with a new ruling.

Franklin D. Roosevelt

Who: The president who lost key cases in the Supreme Court, tried to add justices to it, and was elected four times.

When and where: Washington, D.C., 1933 to 1945. His plan for the courts went to Congress on February 5, 1937.

Franklin D. Roosevelt tried to change the size of the Supreme Court after its justices struck down one of his laws. On May 27, 1935, in *Schechter Poultry Corp. v. United States*, the justices struck down part of the National Industrial Recovery Act. That part let the president approve "codes of fair competition," which were rules for whole industries. The justices held that members of Congress had given the president powers that Congress had no right to give away. They also held that the poultry business in the case was not trade between the states, so Congress could not make rules for it.

On February 5, 1937, Roosevelt sent Congress a plan to reorganize the federal courts. Under the plan, the president could name one new justice to the Supreme Court for each justice over the age of 70, up to six more. The Court could have grown from nine justices to fifteen.

On March 29, 1937, in *West Coast Hotel Co. v. Parrish*, the justices ruled that Washington State's minimum wage for women and minors was allowed. A minimum wage is the lowest pay the law allows, and minors are young people who are not yet adults. Soon after, they ruled that other New Deal laws were allowed too. Many people at the time believed that Roosevelt's plan had changed the justices' votes. As the historian William Leuchtenburg describes it, they believed the justices, and Justice Owen Roberts above all, had "crossed over." The legal historians G. Edward White and Barry Cushman argue against that. Court papers show that Roberts had already voted for the Washington law at the justices' private meeting on December 19, 1936, weeks before Roosevelt sent his plan to Congress.

On June 14, 1937, the members of the Senate Judiciary Committee told the Senate to reject the plan. They called it "needless, futile, and utterly dangerous." On July 22, 1937, the senators rejected it, 70 to 20. According to the Federal Judicial Center, Roosevelt lost a great deal of political support for proposing it.

George Washington had served two terms, and presidents after him had kept that custom. Roosevelt was elected four times, in 1932, 1936, 1940 and 1944.

> On June 25, 1941, he signed Executive Order 8802. An executive order is a written order from the president to the officials under him. It states: "There shall be no discrimination in the employment of workers in defense industries and in Government, because of race, creed, color, or national origin." Discrimination means treating people worse because of who they are. A creed is a religion. With the order, Roosevelt created the Committee on Fair Employment Practice. After the war, members of Congress refused to make that committee permanent.
>
> On February 19, 1942, Roosevelt signed Executive Order 9066. It let the Secretary of War and military commanders mark off military areas and shut "any or all persons" out of them. Lieutenant General John L. DeWitt, commander of the Army's Western Defense Command, used it to force people of Japanese descent from their homes. He issued Public Proclamation No. 4, an official public order, on March 29, 1942. Over six months, under his orders, about 122,000 men, women and children were forced into assembly centers, which were short-term holding places. From there they were forced into ten camps in remote parts of six western states and Arkansas. Nearly 70,000 of them were American citizens, by the count of the National Archives. None was charged with a crime, and none had any way to appeal.

The courts and the camps

A federal court in San Francisco found Fred Korematsu guilty of breaking the military's exclusion orders, the orders that shut people of Japanese descent out of the military areas. It gave him five years of probation, a time when a person found guilty lives under a court's watch instead of in prison. On December 18, 1944, in *Korematsu v. United States*, the justices of the Supreme Court let his conviction stand, 6 to 3. They held that forcing citizens out of their homes in wartime was justified. On the same day, in *Ex parte Endo*, all the justices agreed that federal officials could not hold a citizen whom they admitted was loyal. According to the National Archives, that ruling "paved the way for the end of mass confinement."

In the 1980s federal judges threw out the convictions of Korematsu and others. Judge Marilyn Hall Patel vacated, or cancelled, Korematsu's conviction on November 10, 1983. In the Civil Liberties Act of 1988, members of Congress apologized for the imprisonment and voted to pay $20,000 to each person who had been held.

Poll taxes and the white primary

Under Georgia law, a voter owed a poll tax of $1 a year, and officials let no one vote who had not paid it. People under 21 or over 60, blind people, and women who did not register to vote did not have to pay. A poll tax kept anyone who could not pay it from voting. In 1890 the delegates who wrote Mississippi's constitution had added one as part of their plan to stop Black men from voting. Nolan Breedlove sued Georgia's tax collector, T. Earl Suttles. All the justices of the Supreme Court ruled that the tax was allowed, in *Breedlove v. Suttles* on December 6, 1937. Justice Pierce Butler wrote that "the equal protection clause does not require absolute equality." The equal protection clause is the part of the Fourteenth Amendment that requires states to treat people equally under the law.

In Texas, the Democratic Party was the only party that won elections, so its primary was the election that counted. A primary is the election in which a party chooses its candidates. On May 24, 1932, the leaders of the Texas Democratic Party voted that only "white citizens" could be members. The election judges of precinct 48 in Harris County refused Lonnie Smith, a Black voter, a ballot in the primary. A precinct is one small voting area. Smith sued one of those judges, a man named Allwright, and the others. In *Smith v. Allwright*, decided on April 3, 1944, the justices held that the party's leaders were acting for the state when they ran the primary. Keeping Black voters out of it therefore broke the Fifteenth Amendment. Justice Stanley Reed wrote the opinion. Justice Owen Roberts dissented.

1948: the armed forces, refugees and conventions on television

On July 26, 1948, President Harry Truman signed Executive Order 9981. It states: "There shall be equality of treatment and opportunity for all persons in the armed forces without regard to race, color, religion or national origin." By about 1953 Black and white troops served together in nearly all the armed services.

The Displaced Persons Act of 1948 was the first American law for refugees, people forced from their home countries. It first allowed 200,000 Europeans who had lost their homes in the war to come to the United States. Members of Congress raised the number later. Between 1948 and 1952 about 350,000 to 400,000 people came in under it.

In 1948 both major parties held their national conventions in Philadelphia, and television networks broadcast them. A national convention is a large meeting of a party. Delegates, the people each state's party sends, choose the party's candidate for president there. They also write its platform, the list of positions it stands for. The National Constitution Center puts the television audience at as many as 10 million viewers on the East Coast. On July 12, 1948, after a

speech by Hubert Humphrey, the Democratic delegates added a civil rights plank to their platform. A plank is one position in a platform. Civil rights are the rights every citizen has to equal treatment under the law. Two Southern delegations walked out on live television. On July 17, Southern delegates met in Birmingham, Alabama, and formed the States' Rights Democratic Party, called the Dixiecrats. They chose Strom Thurmond, the governor of South Carolina, as their candidate. Their platform stated, "We stand for the segregation of the races." Segregation means keeping people of different races apart. Thurmond won four states and 39 electoral votes. Electoral votes are the votes for president cast by electors, the people chosen in each state for that job.

1950 to 2000

From 1954 to 1977, the justices of the Supreme Court decided cases on schools, on how votes and voting districts were counted, and on how police question people they arrest. In 1964 and 1965, members of Congress passed two laws. One banned segregation in public places. Under the other, officials in some states and counties had to ask federal officials before changing any voting rule. Five amendments were added to the Constitution between 1951 and 1971. In 1974 President Richard Nixon resigned before members of the House could vote to impeach him. To impeach a president is to charge him formally with wrongdoing, which leads to a trial in the Senate. In 1998 the members of the House impeached President Bill Clinton, and the senators found him not guilty.

Five amendments, 1951 to 1971

Each of the five amendments added between 1951 and 1971 governs who holds office or who votes.

Since the Twenty-second Amendment was ratified on February 27, 1951, "No person shall be elected to the office of the President more than twice." Before it, Washington's two terms had been a custom, and Franklin Roosevelt had broken it.

The District of Columbia, the capital city, got electors in presidential elections through the Twenty-third Amendment, ratified on March 29, 1961. The District got no senators and no voting member of the House.

Ratified on January 23, 1964, the Twenty-fourth Amendment bans poll taxes only in elections for president, vice president, senator and representative. A state could still charge a poll tax in its own elections. Then, on March 24, 1966, in *Harper v. Virginia State Board of Elections*, the

justices of the Supreme Court struck down state poll taxes too. Virginia's constitution had set a poll tax of up to $1.50 a year. Justice William O. Douglas wrote that making "the affluence of the voter or payment of any fee an electoral standard" breaks the Equal Protection Clause. Affluence means wealth.

The Twenty-fifth Amendment was ratified on February 10, 1967. It states what happens when a president dies, resigns or is removed. It also sets out a way to fill an empty vice presidency: the president names someone, and the members of both houses of Congress vote to confirm, or approve, the choice.

Eighteen-year-olds got the vote under the Twenty-sixth Amendment. It was ratified on July 1, 1971, faster than any other amendment.

Brown v. Board of Education and all deliberate speed

On May 17, 1954, in *Brown v. Board of Education*, the justices of the Supreme Court held that segregated public schools broke the Constitution. The ruling did not state how or when to end segregation.

A year later, on May 31, 1955, they decided a second case, often called *Brown* II. Chief Justice Earl Warren wrote for a unanimous Court, meaning every justice agreed. The justices sent the cases back to federal district judges, the judges of the lowest federal courts. They told school boards to make "a prompt and reasonable start toward full compliance." Compliance means obeying the ruling. They ordered the judges to admit the children who had sued to public schools "on a racially nondiscriminatory basis with all deliberate speed." A racially nondiscriminatory basis meant that no child could be turned away because of race. Deliberate means careful and unhurried, so under those words school boards could move slowly. The order set no date. School board members who moved slowly were not clearly breaking it.

> #### Thurgood Marshall
>
> **Who:** The lawyer who won 29 of the 32 cases he argued in the Supreme Court and later became its first Black justice.
>
> **When and where:** Baltimore, New York and Washington, D.C. Born 1908. Died 1993.
>
> Thurgood Marshall held four jobs in the American legal system. He ran the Legal Defense and Educational Fund of the NAACP, the National Association for the Advancement of Colored People. Colored was a word used then for Black people. Then he was a federal appeals judge, then Solicitor General, the officer who argues the government's own cases in the Supreme Court, and then a justice of the Supreme Court. He was the first Black

justice. He was born in Baltimore, Maryland, on July 2, 1908. He wanted to study law at the University of Maryland, and officials at the law school turned him away because he was Black. He went to Howard University's law school instead and graduated first in his class in 1933. One of his first cases, *Murray v. Pearson*, ended with Maryland's judges ordering that same law school to admit Black students. The Maryland Court of Appeals ruled in the case on January 15, 1936.

From 1940 to 1961 he ran the NAACP Legal Defense and Educational Fund, a law office whose lawyers took civil rights cases to court. The NAACP's own history says he argued 32 cases in the Supreme Court in those years and won 29. The *New York Times* counted his record another way when he died. It said he argued 32 cases in the Supreme Court before he became a justice, 14 as a private lawyer and 18 as Solicitor General, and won 29. His NAACP cases included *Smith v. Allwright* in 1944, *Morgan v. Virginia* in 1946 on segregated buses between states, *Sweatt v. Painter* in 1950 on the University of Texas law school, and *Brown v. Board of Education* in 1954.

On October 5, 1961, President John F. Kennedy made Marshall a judge of the United States Court of Appeals for the Second Circuit, a court that hears appeals from trial courts. He did it by recess appointment, which means a president fills the seat while the Senate is away. A recess appointment ends unless the senators confirm it. Southern senators opposed Marshall, and the senators did not confirm him until September 11, 1962, eleven months later.

On August 23, 1965, he left that court to become Solicitor General of the United States. The National Park Service says he won 14 of the 19 cases he argued in that job. The two counts of his cases as Solicitor General differ by one: 18 in the *Times*, 19 by the Park Service.

President Lyndon Johnson nominated him, or named him, to the Supreme Court on June 13, 1967, for the seat Tom C. Clark had left. The senators confirmed him on August 30, 1967. He took the oath as a justice on October 2, 1967. He took senior status, which meant he stopped full-time work on the Court, on October 1, 1991. He died on January 24, 1993.

After his death, Chief Justice William Rehnquist said most justices are remembered for their work on the Court. "Justice Marshall, however, is unique because his contributions to constitutional law before becoming a member of the Court were so significant."

Prayer and the Bible in public schools, 1962 and 1963

The members of the New York State Board of Regents, the officials who oversaw the state's schools, wrote a prayer for public school children to say each morning. It read: "Almighty God, we acknowledge our dependence upon Thee, and we beg Thy blessings upon us, our parents, our teachers and our Country." No child had to say it. On June 25, 1962, in *Engel v. Vitale*, the justices of the Supreme Court held the prayer unconstitutional anyway, 6 to 1. Unconstitutional means against the Constitution. The justices ruled against the prayer because government officials had written it. The prayer was short and a child could stay silent, and the justices held that neither fact changed the ruling. Justice Hugo Black wrote that the First Amendment's ban on establishing a religion, meaning setting up an official religion, "must at least mean that in this country it is no part of the business of government to compose official prayers for any group."

The justices decided two more cases together in *Abington School District v. Schempp* on June 17, 1963. In Pennsylvania's public schools, the school day opened with Bible readings. In the Baltimore city schools, children said the Lord's Prayer together. The justices struck down both. Justice Tom Clark wrote the opinion, and Justice Potter Stewart was the only one to dissent.

One person, one vote

Under Georgia's county unit system for statewide elections, the candidate who won a county got all of that county's unit votes. So a vote in a small rural county counted many times as much as a vote in a city. The justices struck the system down, 8 to 1, in *Gray v. Sanders* on March 18, 1963. Justice William O. Douglas wrote: "The conception of political equality from the Declaration of Independence, to Lincoln's Gettysburg Address, to the Fifteenth, Seventeenth, and Nineteenth Amendments can mean only one thing." He ended the sentence with the words "one person, one vote."

On June 15, 1964, in *Reynolds v. Sims*, the justices applied the same rule to the lawmaking bodies of the states. Alabama's lawmakers had not redrawn the lines of the state's legislative districts, the areas that elect the state's lawmakers, since 1901. They still used the 1900 census. By 1960, 25.1 percent of Alabamians could elect a majority of the state senate. In the worst case, one senate district had about 41 times as many people as another. Chief Justice Earl Warren wrote the opinion. Under it, districts had to hold about equal numbers of people, and lawmakers in almost every state had to redraw their districts.

Lyndon B. Johnson

Who: A Senate leader who kept count of how each senator would vote, then a president who used the same skill on civil rights laws.

When and where: Texas and Washington, D.C., 1948 to 1969.

Lyndon Johnson reached the Senate in 1948 by 87 votes, out of nearly a million cast. That was his final margin over Coke Stevenson in the Texas Democratic runoff, a second election between the top two candidates in the party's primary. A landslide is a win by a huge margin. For the rest of his life people called him "Landslide Lyndon."

On the night of the runoff, Johnson seemed to have lost. Six days after the polls closed, an election judge named Luis Salas reported 202 more votes from Precinct 13 in Jim Wells County. Of them, 200 were for Johnson and 2 for Stevenson. He had changed the total on the tally sheet from 765 to 965. The added names were in alphabetical order, in the same ink and the same handwriting. Some of the people listed said they had not voted that day. The members of the state party's executive committee voted 29 to 28 to declare Johnson the winner. A federal judge, T. Whitfield Davidson, blocked that result. Then Supreme Court Justice Hugo Black, acting alone, ruled for Johnson. He ruled aloud on September 28, 1948, and in writing the next day. Johnson's name went on the ballot. In 1977 Salas told a reporter, James Mangan of the Associated Press, that the local political boss, George B. Parr, had ordered about 200 votes added. No court ever ruled that the votes were forged, and Johnson was never charged.

Johnson became his party's whip in the Senate in 1951. The whip counts votes and keeps party members in line. In 1953 he became its minority leader, the leader of the smaller party, and from 1955 to 1961 he was majority leader, the leader of the larger party. At 45, still in his first term, he was the youngest party leader the Senate had ever had. The Senate's historians describe how he worked on other senators. He stood close to a senator's face and pulled "clippings, memos, statistics" out of his pockets. The Senate's historians list the tones he used on other senators: begging, accusing, coaxing, high spirits, scorn, tears, complaint and "the hint of threat."

In 1957 he pushed through the first civil rights law since Reconstruction, the years after the Civil War. He wanted it passed, but he feared a long filibuster would split his party. A filibuster is a way of blocking a bill by talking on and on so that no vote can happen. To get the bill through, he took out its main enforcement sections. Members of Congress passed it without them. According to the Senate's own history, very little changed because of it.

> As president, Johnson signed the Civil Rights Act on July 2, 1964. On April 11, 1965, he signed the Elementary and Secondary Education Act, and he said, "no law I have signed or will ever sign means more to the future of America." On August 6, 1965, he signed the Voting Rights Act. It included the kind of enforcement tools that the 1957 law had been passed without. Federal examiners could register voters themselves, and some states had to ask federal officials before changing any voting rule.

How the civil rights laws passed

Southern senators led by Richard Russell of Georgia tried to block the Civil Rights Act of 1964 with a filibuster. They held the Senate floor, meaning they kept talking so that no vote could happen, for 60 working days, including seven Saturdays. On June 10, 1964, the senators voted 71 to 29 for cloture, the motion that ends debate. It was the first time senators had ever cut off debate on a civil rights bill. Senator Clair Engle of California had a brain tumor and could not speak. He raised his weakened arm and pointed to his eye to vote aye, which means yes. The senators passed the bill 73 to 27 on June 19.

The act has ten parts, called titles. Title II bans segregation in places that serve the public. Its words are: "All persons shall be entitled to the full and equal enjoyment of the goods, services, facilities, and privileges ... of any place of public accommodation ... without discrimination or segregation." Title VI bans discrimination in any program paid for with federal money. Later, federal officials used Title VI to cut off money to school districts that stayed segregated. Title VII bans discrimination in jobs. In Title VII, members of Congress also created the Equal Employment Opportunity Commission.

Section 4 of the Voting Rights Act of 1965 contains a formula for which places were covered. A state or county was covered if it had used a literacy test, a reading test for voters, or a similar device on November 1, 1964. It also had to have fewer than half of its voting-age people registered or voting in the 1964 presidential election. Under Section 5, officials in every covered place had to get permission before changing any voting rule at all. The permission had to come from the Attorney General, the head of the Justice Department, or from a federal court in Washington. By the end of 1965, a quarter of a million new Black voters had been registered, one-third of them by federal examiners, according to the National Archives.

Federal money for schools, 1965

On April 11, 1965, Johnson signed the Elementary and Secondary Education Act outside the former Junction Elementary School near Stonewall, Texas. Elementary and secondary schools are the schools for children from first grade through high school. Junction Elementary was the one-room school where he had started at the age of four. His first teacher, Kate Deadrich Loney, sat beside him. The printed law and the LBJ Library both give the date as April 11. The National Center for Education Statistics gives April 12.

Under Title I of the act, federal officials send money to school districts according to how many children in them come from families with low incomes. The money comes with conditions the districts have to meet. In the 2015 budget year, about $14.3 billion went out under Title I, according to the National Center for Education Statistics in 2019.

Immigration law after 1965

In 1965 members of Congress passed the Immigration and Nationality Act. Under it, the national quotas set in the 1920s ended, and officials admitted immigrants on the basis of family ties and skills. The act also set the first cap on immigration from the Americas. The Refugee Act of 1980 set out a permanent system for admitting refugees. The Immigration Reform and Control Act became law on November 6, 1986. Under it, about 2.7 million people who had lived in the country for years without permission got legal status, meaning the right to stay. The act also set penalties for employers who hired workers without permission to work.

Miranda v. Arizona, 1966

On March 13, 1963, police arrested Ernesto Miranda at his home in Phoenix, Arizona. They questioned him in a police interrogation room, a room for questioning suspects. After about two hours he signed a written confession. At his trial the officers admitted that no one had told him he could have a lawyer with him. An Arizona court found him guilty of kidnapping and rape.
