Four Ways to Read This Book 8

The History in Ten Paragraphs 10

Part 1: The Land and Its First Peoples

1 Exploration and Discovery about 110 min 16

2 Native Nations about 100 min 98

3 Land and Environment about 95 min 179

Part 2: Coming, Moving, Settling

4 Immigration to America about 100 min 255

5 Migration Across America about 75 min 332

6 City Building about 90 min 394

7 Home and Family Life about 60 min 459

Part 3: Making and Building

8 Technology about 85 min 511

9 Science about 95 min 580

10 Energy about 75 min 660

11 Transportation about 75 min 720

12 Landmarks about 75 min 782

13 The Elements about 85 min 843

Part 4: Work, Food, and Money

14 Work and Workers about 85 min 910

15 Food and Farming about 75 min 985

16 Economy about 80 min 1048

17 Money about 70 min 1111

18 Marketplace and Consumer Life about 75 min 1169
19 Big Business and Its Power about 95 min 1232

Part 5: Power, Law, and War

20 Government, Law, and Politics about 140 min 1303
21 Crime, Police, and Justice about 140 min 1405
22 War and the Military about 130 min 1498
23 America and the World about 90 min 1596

Part 6: Freedom and Fairness

24 Slavery and Freedom about 110 min 1665
25 Rights and Movements about 280 min 1754

Part 7: Health and Safety

26 Health, Disease, and Medicine about 115 min 1945
27 Disasters and Rescue about 130 min 2031
28 Drugs and Alcohol about 110 min 2119

Part 8: Faith, Learning, and News

29 Religion about 200 min 2202
30 School and Education about 225 min 2344
31 News and Communication about 125 min 2499

Part 9: Culture and Play

32 Art about 155 min 2597
33 Music about 135 min 2712
34 Storytelling Evolution about 125 min 2813
35 Styles about 100 min 2907
36 Sports and Play about 125 min 2980
37 Holidays about 95 min 3074

How This Book Works

This book is a history of the United States in 37 chapters, each about one subject. Every chapter is divided into the same ten eras in the same order: before 1500, the 1500s, the 1600s, 1700 to 1750, 1750 to 1800, 1800 to 1850, 1850 to 1900, 1900 to 1950, 1950 to 2000, and 2000 to today. That makes the book a grid, 37 subjects by 10 eras, and you can read down one subject or across one era.

Each chapter includes these signposts:

- **The card** at the top lists the chapter's point in one sentence, a true story, what to watch for, three questions, a section to read when you have five minutes, and the sections you can skip.
- **The first bold line of each era** states how long the era takes to read.
- **"By [year]" lines**, in the longest eras only, state where things stand partway through.
- **The end of a long era** states the one thing to remember from it, often with a few dates, and what comes next.
- **Boxes with a person's name at the top** contain many of the main stories, each built from the records.
- **The closing** at the end states the answers to the three questions, five dates to keep, one thing still not known, a place to visit and the next chapter.
- **A hard word** is explained the first time it appears in a chapter, and the glossary at the back lists them all.

Every fact in this book comes from a record someone made: a letter, a court paper, a count, a photograph, bones in the ground, or a story a nation kept. "How We Know What Happened," at the back, describes how historians check those records and what happens when two records state different things.

Before You Start

This book is long. It contains about 830,000 words, which take about 69 hours to read at 200 words a minute.

The order does not matter. Start with any chapter, or with any era inside one. A hard word is explained the first time it appears in a chapter, so if you start in the middle and meet a word you do not know, look it up in the glossary at the back.

Skipping is fine. The card at the top of each chapter lists the sections you can skip, and the chapter still makes sense without them. Read the boxes with a person's name at the top, because they contain many of the main stories.

When a page feels heavy, stop at the next bold line. The end of each long era states the one thing to remember from it. Read that line, then come back later or go to another chapter.

Four Ways to Read This Book

The times below are at 200 words a minute. That is a quick reader's pace, and many readers take longer, which is fine. Each chapter's card states that chapter's time, and the first bold line of each era states the era's.

1. Straight through

Read the 37 chapters in order, from Exploration and Discovery to Holidays. That takes about 69 hours. The shortest chapter, Home and Family Life, takes about 1 hour. The longest, Rights and Movements, takes about 4 hours 40 minutes. Most take between 1 hour 15 minutes and 2 hours 20 minutes.

2. One subject

Pick one chapter from the contents and read it start to finish. Every chapter includes all ten eras, so you follow one subject from before 1500 to today. In some chapters the first era starts thousands of years ago.

3. One era, every subject

Pick one of the ten eras and read that era in every chapter, in the order of the contents. That gives you the whole country in one stretch of time: what people were eating, building, singing and fighting over in the same years.

- Before 1500: about 2 hours 15 minutes
- The 1500s: about 2 hours 30 minutes
- The 1600s: about 5 hours
- 1700 to 1750: about 3 hours 30 minutes
- 1750 to 1800: about 5 hours 30 minutes
- 1800 to 1850: about 7 hours 30 minutes
- 1850 to 1900: about 10 hours 30 minutes
- 1900 to 1950: about 11 hours 30 minutes
- 1950 to 2000: about 10 hours 15 minutes
- 2000 to today: about 8 hours 45 minutes

4. The short road

Read "The History in Ten Paragraphs," which comes next. Then read the card at the top of each chapter and the closing at its end. The 37 cards take about 1 hour, and the 37 closings take about 1 hour 5 minutes. Reading the sections listed under "Five minutes?" on the cards adds about 1 hour 30 minutes. The whole short road takes about 3 hours 45 minutes, and it reaches every subject in the book.

The History in Ten Paragraphs

The ten paragraphs below, one for each era, state the main line of the country's history. Every fact here is told in full in one of the 37 chapters.

Before 1500

People were living in North America at least 21,000 years ago. The oldest sign found so far is a set of human footprints at White Sands, New Mexico. Some scientists questioned their age in 2021, and two other kinds of tests gave the same age in 2023. Estimates of how many people lived here before 1492 run from about 1 million to about 18 million. Cahokia, in what is now Illinois, was the largest city north of Mexico by about 1050. Norse sailors, the people often called Vikings, camped in Newfoundland around the year 1000, the first known visit from Europe. Christopher Columbus reached the Bahamas in 1492, but he never set foot in what is now the United States.

The 1500s

Spanish soldiers, and the diseases that traveled ahead of them, reached what is now the United States. Juan Ponce de León led the first European expedition to Florida that anyone wrote down, in 1513. Hernando de Soto's expedition crossed the Southeast from 1539 to 1543. Smallpox and other diseases from Europe spread along Native trade routes ahead of the newcomers and killed large shares of whole communities. Pedro Menéndez de Avilés founded St. Augustine, Florida, in 1565. In January 1599 Juan de Oñate's soldiers stormed and burned Acoma Pueblo, in New Mexico. Oñate sentenced the survivors over age 12 to twenty years of forced work, and he had one foot cut off each man over 25.

The 1600s

English colonists settled the Atlantic coast, and by the end of the century their farms ran on slavery. Colonists built Jamestown, Virginia, in 1607, and they made the colony pay by growing tobacco. The crew of an English ship, the *White Lion*, landed about 20 captive Africans at Point Comfort, Virginia, in late August 1619. The *Mayflower*'s passengers founded Plymouth in 1620. Judges in Virginia sentenced John Punch, an African who had run away, to serve for life in 1640. Far to the west, Pueblo people rose up together in 1680 and drove the Spanish out of New Mexico. By 1700 enslaved Africans outnumbered white indentured servants, people bound to work for years to pay for their crossing, on Virginia's tobacco farms.

1700 to 1750

The colonies grew on the work of people who were not free, and those people fought back. Between half and two-thirds of the white people who came from the 1630s to the Revolution came as indentured servants. About 20 enslaved men led by a man called Jemmy seized weapons at the Stono River in South Carolina in September 1739 and marched toward Spanish Florida. The rebels killed about 25 white colonists. The militia, armed colonists called up to fight, killed 35 to 50 of the rebels, and colonists set the rebels' heads on stakes along the roads. Philadelphia, the largest town, had about 13,000 people by 1750.

1750 to 1800

A new country came out of these years, and its founders wrote slavery into its constitution. British forces beat the French in a war for the continent that ended in 1763. Members of the Continental Congress adopted the Declaration of Independence on July 4, 1776. After the war for independence, American and British diplomats, the officials who spoke for their countries, agreed in 1783 that the new country's western border would be the Mississippi River. They invited no Native nation to the talks. Delegates in Philadelphia wrote the Constitution in 1787. Under it, each enslaved person counted as three fifths of a free person in deciding how many seats each state got in Congress. Census takers counted 697,681 enslaved people in 1790, in the first census, the government's count of everyone in the country.

1800 to 1850

The country grew west by purchase, by treaty and by force, and slavery grew with it. American diplomats agreed in 1803 to pay France $15 million for Louisiana, a huge stretch of land west of the Mississippi River. President Andrew Jackson signed the Indian Removal Act in 1830, and under it soldiers drove more than 16,000 Cherokee people west in 1838 and 1839. More than 4,000 of them died of cold, hunger and disease by the usual count, and one scientist who studies the size of populations puts the Cherokee losses at 8,000 or more. American armies won a war with Mexico that ended in 1848, and Mexico's leaders gave up more than 525,000 square miles, California among them. The same year, women met at Seneca Falls, New York, and signed a declaration of women's rights. Nearly 4 million people were enslaved by 1860.

1850 to 1900

Slavery ended in a war, and then the country spread west across Native land. Confederate soldiers, who fought for the Southern slave states whose leaders had broken away from the country, fired on Fort Sumter in April 1861. Settlers took up 270 million acres under the Homestead Act of 1862, much of it land that US officials had taken from Native nations. About 620,000 soldiers died in the Civil War by the usual count. Slavery ended with the 13th Amendment, a change to the Constitution, in December 1865, except as punishment for a crime. Soldiers of the 7th Cavalry killed between 250 and 300 Lakota people at Wounded Knee in December 1890. In 1896 the Supreme Court justices ruled in *Plessy v. Ferguson* that separating people by race was lawful.

1900 to 1950

Americans fought in two world wars in these fifty years and lived through hard times between them. Members of Congress declared war on Germany in April 1917. Under the 19th Amendment, from 1920, no state may deny a citizen the vote because of sex. Stock prices crashed in October 1929, and in the Great Depression of the 1930s about one worker in four had no job. Japanese pilots attacked Pearl Harbor, in Hawaii, on December 7, 1941, and more than 2,400 people were killed or missing. Army officers then removed about 120,000 people with Japanese family roots from the West Coast to camps. More than 400,000 Americans died in the war. A US bomber crew dropped an atomic bomb on Hiroshima, in Japan, on August 6, 1945, and between 90,000 and 166,000 people there died from it within four months.

1950 to 2000

Black Americans forced changes in the law, and American astronauts flew to the Moon. In 1954 the Supreme Court justices ruled that separate schools by race were unlawful. After police in Montgomery, Alabama, arrested Rosa Parks in December 1955 for refusing to give up her bus seat, most of the city's Black people stayed off its buses for a year, until federal judges ended the rule that kept Black riders apart from white riders. The Soviet Union, a large country ruled from Moscow, was the main rival of the United States for most of these years, and its engineers launched the first satellite in 1957. President Johnson signed the Civil Rights Act in 1964 and the Voting Rights Act in 1965. Neil Armstrong and Buzz Aldrin walked on the Moon on July 20, 1969. The Soviet Union broke apart in December 1991.

2000 to today

These years began with an attack and two long wars, and then came a pandemic, a disease that spread around the world. Hijackers flew airliners into the World Trade Center and the Pentagon on September 11, 2001, and killed nearly 3,000 people. American forces fought in Afghanistan for twenty years. They invaded Iraq in 2003, after American leaders said Iraq had nuclear, chemical or biological weapons, and none were found. In 2015 the Supreme Court justices ruled that same-sex couples could marry in every state. A Minneapolis police officer murdered George Floyd in May 2020. A crowd attacked the Capitol on January 6, 2021, while members of Congress counted the official votes from each state for president. By September 2026, COVID-19 had killed more than 1.2 million people in the United States.

PART 1

The Land and Its First Peoples

Chapter 1: Exploration and Discovery

CHAPTER 1 OF 37 · EXPLORATION AND DISCOVERY · 10 ERAS · ABOUT 110 MINUTES

Almost every place in this chapter was already somebody's home when the explorers arrived, and the people who lived there often showed them the way.

In the South Dakota Cultural Heritage Center there is a lead plate six inches by eight. One side has Latin words stamped into it that name King Louis XV of France. On the other side somebody scratched a date, March 30, 1743, and the names of four Frenchmen. Two of them were brothers, the sons of a fur trader, and they had just crossed the northern Great Plains with two Mandan guides. They buried the plate beside the Missouri River. It stayed in the ground for 170 years, until 1913.

This chapter describes the explorers in order, from the footprints at White Sands to the four astronauts who flew around the Moon in April 2026. For the first eight eras, watch for two things. Watch who shows the way: Hopi guides to the Grand Canyon, a Crow map to South Pass, an Ojibwe guide to the source of the Mississippi, four Inuit men at the North Pole. And watch what the explorers do to the people they meet. Some traded with them and were fed by them. Others took captives, burned towns and killed. After 1950 the only places left were the deepest ocean and space, where nobody had ever lived.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How do we know people were living here at least 21,000 years ago?
2. What did the explorers do to the people whose land they crossed?
3. Which famous "firsts" are still in doubt?

Five minutes? Read "Four captains along the coast, 1497 to 1542" in The 1500s.

Can skip: "The first recorded climb of Pikes Peak, 1820", "Alaska, 1867 to 1885", "1898: islands in two oceans", "Mapping the sea floor". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

The first people to explore this land came from Asia during the last ice age. At that time a strip of dry land joined Siberia to Alaska. Human footprints at White Sands, in New Mexico, show that people were here at least 21,000 years ago, and probably about 23,000 years ago. Over thousands of years their descendants spread across the whole continent, into its deserts, mountains, forests, coasts and plains.

Hundreds of Native nations lived here by 1500, speaking many different languages. Nobody knows how many people lived north of Mexico at that time. Estimates run from about 1 million to about 18 million.

How old are the footprints at White Sands?

The footprints at White Sands National Park, in New Mexico, are at least 21,000 years old and probably about 23,000. Scientists dated seeds of a water plant found in the layers just above and just below the prints. Tests on the seeds gave ages of about 21,000 and about 23,000 years.

For a long time scientists had thought people first arrived only about 13,500 to 16,000 years ago. When the seed dates came out in 2021, some scientists questioned them. A water plant can take in old carbon from the rock around it, and that can make its seeds test older than they are.

The second test. In 2023 a team led by Jeff Pigati, a scientist who studies rocks and the earth at the US Geological Survey, tested two other things from the same layers. They dated pollen from pine trees and other trees that grow cones. They also measured how long grains of quartz sand had been buried out of the sunlight.

Tests on the pollen gave about 21,000 to 23,000 years, and tests on the quartz gave at least 21,500 years. Every method put the footprints at about 21,000 to 23,000 years old. The park's own web page on the footprints states that people have lived in North America "for at least 23,000 years."

Trade routes and Pacific voyaging

Native people knew routes across the continent long before any European arrived. Traders carried copper from Lake Superior, shells from the Gulf of Mexico, turquoise from the Southwest and obsidian, a natural glass formed by volcanoes, from the West. Archaeologists, the scientists who dig up and study the things people left behind, have found each of these goods hundreds of miles from where it came from.

The people of Cahokia, a city on the Mississippi River near present-day St. Louis, controlled a hard stone called Mill Creek chert, which could be shaped into tools. Hoe blades made of it turn up more than 400 miles away.

Polynesian sailors, the people of the many islands of the central and southern Pacific, crossed thousands of miles of open ocean to reach the Hawaiian Islands. The archaeologist Patrick Kirch reviewed 150 years of study and put their first arrival and settlement between about the years 1000 and 1200. Older studies had put it between about the years 300 and 750. Scientists still argue about the exact century.

Leif Erikson

Who: A Norse sailor from Greenland, son of Erik the Red, who led one of the first European voyages to North America.

When and where: About the year 1000, and a Norse camp dated to 1021. L'Anse aux Meadows, Newfoundland, Canada.

A storm on the sun in the year 993 dates the Norse camp.

Norse sailors from Greenland, the people often called Vikings, reached North America about 500 years before Columbus. Two sagas, old stories written down in Iceland, tell what happened: the *Saga of the Greenlanders* and the *Saga of Erik the Red*. They say that Leif Erikson, son of Erik the Red, reached a land he called Vinland.

The sagas also describe the people the Norse met there, whom the Norse called Skraelings. According to the sagas, the two groups traded and also fought, and the fights led the Norse to leave. The sagas give the people no other name, and no record shows which Native nation they belonged to.

Finding the camp. A local man, George Decker, led the Norwegian explorer Helge Ingstad to some old mounds near the village of L'Anse aux Meadows in 1960. People there called the place the "old Indian camp." Helge Ingstad and the archaeologist Anne Stine Ingstad dug there for seven seasons, from 1961 to 1968. They found a Norse camp.

Dating it. A storm on the sun in the year 993 left a mark in the rings of trees growing on Earth. In 2021 scientists found that mark in pieces of wood at the camp that had been cut with metal blades, and they counted the rings out to the bark. The Norse cut those trees down in 1021. That is 471 years before Columbus reached the Bahamas.

Estimates of how long the Norse stayed run from a few years to about twenty. Another account says the camp was only a place to repair boats. Native people had lived on the same spot long before the Norse came.

Five earlier groups had lived there, the oldest about 6,000 years ago. A Native people that archaeologists call the Dorset lived there about 300 years before the Norse.

KNOWN:	Norse people cut trees at L'Anse aux Meadows in 1021.
NOT KNOWN:	which place in the sagas the camp was. One answer is Leif's own camp, and another is a second place the sagas call Hop. Nothing dug up at the site has settled it.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 14 MINUTES

This era starts a few years early, in 1492, with Christopher Columbus's first voyage across the Atlantic. In the century after it, European sailors mapped the Atlantic and Gulf coasts, and Spanish armies marched far inland. Every place they reached was already the home of a Native nation. Native guides showed several of them the way, including the way to the Grand Canyon. The explorers also took people captive, seized stored food and attacked towns whose people refused to let them in.

Spanish colonists built St. Augustine, in Florida, inside a Timucua town in 1565.

Christopher Columbus

Who: A sea captain from Genoa, in Italy, who sailed west for Spain looking for a sea route to Asia.

When and where: Four voyages from 1492 to 1504, to the Bahamas, the Caribbean islands and the coasts of Central and South America.

A lookout on the *Pinta* saw land at about 2 in the morning.

Christopher Columbus crossed the Atlantic four times, and he never set foot in what is now the United States. He sailed for the king and queen of Spain, and he believed that by sailing west he could reach Asia.

The lookout was Rodrigo de Triana, and the date was October 12, 1492. The land he saw was an island in the Bahamas. Its people, the Lucayan Taino, called it Guanahani. Columbus named it San Salvador. On that first voyage he took Taino people captive and carried them to Spain to show the king and queen.

The tribute. Columbus's soldiers made war on the Taino of Hispaniola, an island in the Caribbean, in 1494 and 1495. They fought until the Taino surrendered and agreed to pay a tribute, a payment that a conquered people are forced to hand over. Columbus set the rule.

In the Cibao, the part of the island with the gold mines, every Taino aged 14 or older had to bring in a hawk's bell, a small round bell, full of gold dust every six months. A priest named Bartolomé de las Casas wrote that the Spaniards cut off the hands of people who failed to pay. How often Spaniards did this is still argued over.

Sold as slaves. Columbus's men rounded up about 1,500 Taino in February 1495. They shipped about 500 of the strongest to Spain to be sold as slaves, and about 200 of them died on the voyage. Some accounts give 1,600 and 550. Within a few decades most of the Taino on Hispaniola were dead. Spanish soldiers made war on them, Spanish colonists forced them to work, and many died of disease. Counts of how many Taino lived there when Columbus arrived do not agree.

Arrested. The Spanish rulers sent an investigator, Francisco de Bobadilla, to Hispaniola in 1500. Bobadilla arrested Columbus and sent him back to Spain in chains. Bobadilla took statements from 23 witnesses and wrote them into a report. It records that Columbus punished a man who stole corn by having his ears and nose cut off. Then Columbus sold the man as a slave. The report was found again in 2005 in an archive, a building that stores old papers, in the Spanish city of Valladolid.

Columbus died in Valladolid on May 20, 1506. He never said in public that he had reached a new continent. What he believed in private is not settled. The name "America" came from another Italian sailor, Amerigo Vespucci. Vespucci wrote in 1503 that the lands across the Atlantic were a new continent. In 1507 a German mapmaker, Martin Waldseemuller, printed a world map that named the new land America.

Four captains along the coast, 1497 to 1542

Cabot, 1497. John Cabot was an Italian, born Giovanni Caboto, who sailed for King Henry VII of England. His small ship, the *Matthew*, reached the coast of North America on June 24, 1497, with a crew of 18 to 20 men. Where he landed is disputed. Some accounts say Newfoundland and others say Cape Breton Island. Cabot went ashore only once, and he went no farther inland than a crossbow could shoot. King Henry gave him 10 pounds in English money, which was about two years' pay for a laborer.

Ponce de León, 1513. Juan Ponce de León sailed from Puerto Rico in March 1513 with three ships and 65 people. Among them were two free Africans, one of them a man named Juan Garrido, and two enslaved Native people. Ponce de León named the land La Florida. His was the first European expedition to Florida that anyone wrote down. A map made in 1502, called the Cantino map, already shows a shape like Florida, so Spanish slave raiders may have reached it first without leaving a record.

On the Gulf coast the Calusa people of southwest Florida refused to trade. Calusa warriors in canoes drove his ships away. In the fights that followed, his men captured eight Calusa, four men and four women.

Ponce de León came back in 1521 to build a colony on Calusa land. Calusa warriors fought the newcomers, and they wounded him. He died of the wound in Cuba that July. A popular story says that he was searching for a Fountain of Youth. No writing from his own time supports that story, and his contract with the Spanish king says nothing about a fountain.

Verrazzano, 1524. Giovanni da Verrazzano, an Italian sailing for the king of France, followed the Atlantic coast from Florida to what is now New Brunswick, in Canada, in 1524. In New York Bay he met about 30 canoes of Lenape people. In Narragansett Bay, Wampanoag and Narragansett people visited him. Verrazzano wrote to the French king about the voyage himself.

In his letter he described what about twenty of his men did on the peninsula now called Delmarva, south of New York Bay. They found an old woman, a young woman and some children hiding in the grass. He wrote: "We took the boy from the old woman to carry back to France." His men wanted to take the young woman too, he wrote, "but it was impossible to take her to the sea because of the loud cries she uttered."

So his men kidnapped the boy, and they left the young woman behind only because she screamed. The boy was about eight years old. The letter does not give his name or his people, and no known record tells what happened to him in France.

Cartier, 1534. The Frenchman Jacques Cartier explored the St. Lawrence River, in present-day Canada, from 1534 to 1542. In the winter of 1535 to 1536, Native people at the town of Stadacona gave his men a medicine made from evergreen trees, which saved them from scurvy. These people are now called the St. Lawrence Iroquoians. Scurvy is a disease caused by a severe lack of vitamin C, which comes from fresh food. It makes people weak, damages their gums and makes them bleed under the skin.

Cartier kidnapped Donnacona, an Iroquoian chief, in 1536, along with Donnacona's two sons and seven other people. The French never brought any of them home.

Cabeza de Vaca and Estevanico

Who: Two of the four survivors of a Spanish expedition who crossed the Southwest on foot. Álvar Núñez Cabeza de Vaca was a Spanish member of the expedition. Estevanico was an enslaved African man.

When and where: 1528 to 1539. Florida, Texas, the Southwest and northern Mexico.

Four men out of an army of 600 walked from Texas to Mexico City.

Two of the four were Álvar Núñez Cabeza de Vaca and a man the Spanish called Estevanico, or Esteban. The four walked from the coast of Texas to Mexico City between 1534 and 1536.

The army belonged to Pánfilo de Narváez. It left Spain in June 1527 with about 600 men. In April 1528 Narváez landed near Tampa Bay, in Florida, with 300 men. They took over a town of the Apalachee people. Apalachee warriors attacked them there, at first 200 at once, shooting burning arrows into the houses the Spaniards had taken.

Many of the men also fell sick, and many were starving. By September only 242 of them were still alive. By then the survivors had built rafts to try to reach Mexico by sea. In November 1528 a storm washed about 80 of them onto Galveston Island, off the coast of Texas.

Estevanico was born about the year 1500 in Azemmour, in Morocco, in North Africa. Cabeza de Vaca described him as a Black man who spoke Arabic. In 1522 a Spanish nobleman, Andrés Dorantes, bought him as a slave. Dorantes and Estevanico were both on the Narváez expedition, and both lived through it.

On the Texas coast, Native people held the survivors as slaves for years. These people are now called Coahuiltecan. In 1534 the last four escaped: Cabeza de Vaca, Dorantes, Alonso del Castillo Maldonado and Estevanico. They walked west. Along the way they worked as healers among the nations they met. In July 1536 they reached Mexico City. Cabeza de Vaca published an account of the journey in 1542.

After the journey the Spanish viceroy in Mexico, Antonio de Mendoza, bought Estevanico from Dorantes or received him as a gift. A viceroy is the king's governor of a colony. Some evidence suggests that Mendoza freed him.

The last journey. Mendoza sent a friar named Marcos de Niza north in 1539 to look for seven rich cities that people called Cibola, with Estevanico as his guide. A friar is a member of a Catholic religious order. They left Culiacán, in northern Mexico, on March 7, 1539. Estevanico went ahead of the friar with Native guides from Sonora, in northern Mexico.

People of Hawikuh, a Zuni town, killed him when he got there. One Spanish account says he was "shot through with arrows." The Spanish accounts disagree about why. Francisco Vázquez de Coronado, who led a Spanish army to Hawikuh the next year, wrote in 1540 that the people of the town killed Estevanico because he had "killed and assaulted their women." Pedro de Castañeda, who marched with Coronado and wrote an account of the march in the 1560s, wrote that they killed him because he demanded turquoise and women.

Estevanico was not the first African to explore North America. Juan Garrido, a free African who sailed with Ponce de León to Florida in 1513, came before him.

Armies inland: de Soto and Coronado, 1539 to 1542

Two Spanish armies marched deep into the continent between 1539 and 1542.

Hernando de Soto landed in Florida in May 1539 with 620 men and 220 horses. For three years he marched through the Southeast, and his soldiers took the stored food of the towns they passed through. From October 1539 to March 1540 his army lived in Anhaica, the capital of the Apalachee people, where Tallahassee stands today. There his men ate the Apalachee's stored food.

Hostages. De Soto seized dozens of men, women and children to carry his army's supplies. To get his army through, he took local leaders hostage, holding them prisoner so that their people would let the army pass safely. One was the leader of the Coosa people, whom de Soto held until the army had passed the Coosa towns. At a town called Hymahi, de Soto's men took all the food. A National Park Service history states that de Soto burned at least one person from the town to death. He did it while questioning people about a town farther on, called Cofitachequi.

Mabila. De Soto's army reached Mabila on October 18, 1540. The town was most likely in the southern part of present-day Alabama, and it was surrounded by a palisade, a wall of tall upright logs. Its leader was a man the Spanish called Tascalusa. A Spanish officer, Baltasar de Gallegos, decided that a leading man of Mabila had not shown him respect. Rodrigo Ranjel, de Soto's secretary, wrote that Gallegos cut off the man's arm "with a slash."

Then a battle began. De Soto's men fought for about nine hours and set the town on fire with people still inside. One of the expedition's own record keepers wrote: "We killed them all either with fire or the sword." The counts of the dead do not agree. A National Park Service history gives about 2,000 people of Mabila killed and over 200 Spanish. Reports from the University of Alabama give thousands of people of Mabila killed, and about 20 Spanish killed and 250 wounded. The site of Mabila has never been found.

De Soto died of fever beside the Mississippi River on May 21, 1542. His men sank his body in the river. They did not want the nations they had fought to learn that he could die. The survivors reached Mexico in September 1543.

Coronado. Francisco Vázquez de Coronado left Compostela, in Mexico, in February 1540. He led about 400 European soldiers, 1,300 to 2,000 Native allies from Mexico and four friars. They were looking for cities of gold.

Close to starving, they reached the Zuni town of Hawikuh in July 1540 and demanded to be let in. The Zuni had drawn lines of sacred cornmeal on the ground and warned the Spaniards not to cross them. When the Spaniards crossed, the Zuni shot arrows. Coronado's men attacked the town, and the Zuni left it after a short fight.

Coronado sent out scouting parties from there. Pedro de Tovar's men forced their way into a Hopi town whose people had refused to let them in. Hopi guides then led García López de Cárdenas and his men to the South Rim of the Grand Canyon. They were the first Europeans to see it.

The Tiguex war. The army camped along the Rio Grande among the Tiguex pueblos in the winter of 1540 to 1541. A pueblo is a town of connected houses built of stone or dried mud. Coronado's men took over the pueblo of Coofor, near present-day Bernalillo, New Mexico, and forced its people out.

A National Park Service history states that the fighting began after "a Spanish soldier assaulted a Pueblo woman, wife to a Tiguex man." Pedro de Castañeda, who was on the march, wrote down what happened about twenty years later. A Spaniard told the woman's husband to hold his horse, went up into the house, and raped her or tried to rape her. Rape means forcing a person to have sex.

Castañeda would not name the man. A later witness, Juan de Contreras, named him in testimony as Juan de Villegas, a soldier on horseback. The husband and the town's leaders came to complain and pointed out the horse. The soldier denied it, and nobody punished him.

In the war that followed, Coronado's soldiers killed hundreds of Tiguex people and burned their villages. At a pueblo called Arenal, the defenders made the sign of peace. Two Spaniards, Pablo de Melgosa and Diego López, answered

with the same sign. The defenders put down their weapons, and the Spaniards promised not to punish them.

Arenal. Spanish soldiers then took the captives to Cárdenas's tent. Coronado had ordered Cárdenas not to take any of them alive. Cárdenas had 200 stakes set up to burn the captives alive.

When the soldiers began tying them to the stakes and burning them, about a hundred men in the tent fought back. Spanish soldiers on foot attacked the tent, and horsemen chased down the men who ran. Castañeda wrote that not one of them was left alive, except a few who hid. Those few spread the news that the Spaniards did not keep their promises of peace. Coronado's men also made Tiguex women and children slaves.

Quivira. A Native guide the Spanish called "the Turk," probably a Wichita or Pawnee man, led the army out onto the Great Plains in the spring of 1541. He told them of a rich land called Quivira. At Quivira, in present-day central Kansas, Coronado found the grass houses of Wichita towns and no gold. Before he left, Coronado ordered the Turk garroted. That means he was strangled to death with a cord or an iron collar that was tightened around his neck. The army went back to Mexico in 1542.

Spanish officials later charged Coronado and Cárdenas with crimes against Native people on the march. Coronado's friends sat on the court in Mexico that heard his case, and they cleared him. Members of the Council of the Indies, the king's council in Spain for the American colonies, found Cárdenas guilty.

St. Augustine, 1565

Pedro Menéndez de Avilés and about 800 colonists landed on the coast of Florida in September 1565. The colonists included 26 women and an unknown number of enslaved Africans. They settled at the town of a Timucua chief named Seloy. They used Seloy's council house, the building where the town's leaders met, as their first fort. That same month Menéndez's men destroyed Fort Caroline, a French settlement nearby in Timucua country. At Matanzas Inlet they killed more than a hundred Frenchmen who had surrendered.

The Timucua soon wanted the Spaniards gone from their town. Timucua warriors shot flaming arrows at the fort in 1566. Nine months after they arrived, the Spaniards moved their settlement across the bay to Anastasia Island.

BY 1600

If you remember one thing: Sailors mapped the coasts, and the two Spanish armies that marched inland took the stored food of the towns they passed and killed people who fought back and people who had surrendered.

- 1492: Columbus reaches the Bahamas. He never sees the mainland of what is now the United States.
- 1540: Hopi guides lead Cárdenas's men to the Grand Canyon. That winter Coronado's soldiers burn the Tiguex captives at Arenal.
- 1565: Spanish colonists build St. Augustine inside the Timucua town of Seloy.

Next: In 1609 a Frenchman, Samuel de Champlain, went to war beside his Wendat, Algonquin and Montagnais allies.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 7 MINUTES

European colonists built small settlements far apart from each other in the 1600s. The Spanish had held St. Augustine, in Florida, since 1565. English colonists built James Fort, at Jamestown in Virginia, in 1607, and the Spanish governor Pedro de Peralta founded Santa Fe, in New Mexico, in about 1610. French colonists settled on the St. Lawrence River, in present-day Canada. On Manhattan Island, the homeland of the Lenape people, Dutch colonists built New Amsterdam. The land between these settlements was the home of Native nations.

The explorers of this century traveled by water, in ships and in canoes. Native guides and hosts told several of them where the rivers went.

Champlain and the lake, 1609

Samuel de Champlain, a Frenchman, explored the coast of New England as far south as Cape Cod in 1605 and 1606. In 1608 he founded Quebec, on the St. Lawrence River in present-day Canada. That first winter, 16 of his 25 men died of scurvy.

Champlain went south in June 1609 with two other Frenchmen and a party of Wendat, Algonquin and Montagnais warriors. The Wendat are also called the Huron. They took him to the lake now named for him, between present-day New York and Vermont. In late July, at Ticonderoga, they met a party of Haudenosaunee men. The Haudenosaunee are also called the Iroquois. In the fight that followed, according to the historian Marcel Trudel, Champlain killed two of the Haudenosaunee men.

Henry Hudson

Who: An English sea captain hired by the Dutch East India Company to look for a sea route to Asia.

When and where: 1609 to 1611. The Hudson River in New York, then Hudson Bay in Canada.

The ship's mate wrote down every killing on the river.

Henry Hudson sailed the Dutch ship *Half Moon* up a river in what is now New York in September 1609. The Lenape called it Muhheakantuck, and the Mohicans called it Mahicannittuk. Today it is called the Hudson River. Hudson was not the first European in its harbor. Verrazzano had been there in 1524. The Lenape and Munsee people lived along the lower river, and the Mohicans lived along the upper river.

Hudson's mate, the officer just below the captain, was Robert Juet, and he kept a journal of the voyage. It records what happened on the river. Two canoes carrying 26 men attacked the ship's small boat on September 6. An arrow hit a sailor named John Colman in the throat and killed him. Two other sailors were hurt.

Three days later the crew seized two Native men who had come aboard. They dressed them in red coats to keep them on the ship. On the morning of September 15 the two men climbed out through a port, a small opening in the ship's side, and swam away. Once the ship was under sail, Juet wrote, "they called to us in scorn."

The way back. On the way back down the river, Hudson's crew killed about 10 to 12 Native men. Juet's journal records each of these killings, on October 1 and 2.

A man in a canoe climbed in through the cabin window on October 1. He took a pillow, two shirts and two belts for carrying bullets. The ship's mate shot him in the chest and killed him. Another man swam up and grabbed the side of the ship's small boat. The ship's cook cut off one of the man's hands with a sword, and the man drowned.

The next day, men in two canoes shot arrows at the ship. The crew fired their guns and killed two or three of them. About a hundred men on a point of land shot at the ship too. Juet fired a small cannon at them and killed two. He fired again at a canoe with nine or ten men in it and killed one, and the crew shot three or four more.

Then the ship anchored off the shore that Juet called "Manna-hata." Juet did not write down which nation the dead men belonged to.

The mutiny. Hudson sailed for England on his next voyage, in a ship called the *Discovery*. He searched for a northern sea passage in the great bay in Canada now named for him. The crew spent the winter in James Bay. In June 1611 most of the crew mutinied, which means they rose up against their captain. They put Hudson, his teenage son John and seven sick or loyal men into a small open boat and sailed away. No European saw any of them again.

A survivor, Abacuk Pricket, named Henry Greene and Robert Juet as the leaders. The men Pricket blamed were already dead and could not answer him, so his story cannot be checked. Only eight of the thirteen mutineers lived to reach England. English courts put some of them on trial, and none was punished.

Marquette and Jolliet

Who: Jacques Marquette, a French Jesuit priest, and Louis Jolliet, a fur trader born near Quebec. The Jesuits are a group of priests within the Catholic Church.

When and where: May to August 1673. From St. Ignace, Michigan, down the Mississippi River to the mouth of the Arkansas River.

They turned back 435 miles short of the Gulf.

Jacques Marquette and Louis Jolliet paddled down the Mississippi River in 1673 far enough to learn that it flows to the Gulf of Mexico and not to the Pacific Ocean. Native people had told them about the river first. Illinois people had described it to Marquette and invited him to visit.

The two men left St. Ignace, in present-day Michigan, on May 17, 1673. They had two canoes and five paddlers of French and Native ancestry. On the river, Michigamea warriors almost attacked them. The town's elders stopped the attack and fed the travelers. Farther south the Quapaw people hosted them for two nights near the mouth of the Arkansas River.

They turned back on July 17, about 435 miles from the Gulf. They feared the Spanish. They had also been told that the nations farther south were well armed and would attack anyone who got in the way of their trade.

On the way home they took a shorter route up the Illinois River, which their Native hosts told them about. In August they reached the mission of St. Francis Xavier, a church post where priests worked to turn Native people to the Catholic faith, at Green Bay in present-day Wisconsin.

Near Montreal, Jolliet's canoe tipped over in the Lachine Rapids, and his notes were lost. Marquette's account became the main record of the journey. Marquette died of dysentery on May 18, 1675, in present-day Michigan. Dysentery is an infection of the gut that causes severe, bloody diarrhea.

Robert de La Salle

Who: A French fur trader and explorer who claimed the whole Mississippi River valley for the king of France.

When and where: 1682 to 1687. The lower Mississippi River and the coast of Texas.

One of his own men shot him from an ambush in Texas.

Robert de La Salle was the first European known to follow the Mississippi River all the way down to the sea. In February 1682 his party came down the Illinois River to the Mississippi, built canoes there, and paddled down to the Gulf of Mexico. On the way, his men built a small fort near present-day Memphis, Tennessee.

The claim. At the mouth of the river, on April 9, 1682, La Salle claimed the whole Mississippi River basin for France. A river basin is all the land whose rain drains into one river. He named it Louisiana, after King Louis XIV. Many Native nations lived in that basin. La Salle left every one of them out of his claim. In 1803 French officials sold the claim that began that day to the United States.

The lost colony. La Salle sailed from France in July 1684 with four ships and 300 colonists to build a colony at the river's mouth. The ships sailed past the river's mouth and landed at Matagorda Bay, in Texas, on the land of the Karankawa people. Before they got there, Spanish sea raiders in the Caribbean had seized one ship with its load of supplies and tools.

In Matagorda Bay a second ship ran onto a sandbar and stuck there. The commander of the third, the escort ship, sailed it back to France. That left only *La Belle*, and it later ran aground in the bay. The colonists built their settlement on Garcitas Creek, near present-day Victoria, Texas.

One of La Salle's own men, Pierre Duhaut, killed him from an ambush on March 19, 1687, near present-day Navasota, Texas. Jean L'Archeveque had drawn La Salle into talking with him so that Duhaut could strike. Later a third member of the party shot Duhaut. In 1688 Karankawa-

speaking people killed the 20 adults still at the colony and took five children captive. The wreck of *La Belle* was found in Matagorda Bay in 1995.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 4 MINUTES

Men of the Russian navy reached the coast of Alaska in 1741, and four Frenchmen, two of them sons of a fur trader, crossed the northern Great Plains in 1742 and 1743 with Mandan guides. They may have been the first Europeans to do so. English colonists did little exploring beyond the Appalachian Mountains between 1700 and 1750. The journeys into country that no European had mapped came from outside the English colonies.

Vitus Bering

Who: A Danish-born officer in the Russian navy who led the Russian voyage that reached Alaska in 1741.

When and where: 1728 and 1741. The Bering Strait and the coast of Alaska.

In 1991 scientists dug up Bering's bones to learn how he died.

Vitus Bering led the Russian voyage that reached Alaska in 1741. On his first voyage, in August 1728, he sailed north through the narrow strip of sea between Asia and North America. It is now called the Bering Strait.

Before the second voyage, Native people in Kamchatka, in eastern Siberia, killed several Russians under Bering's command. Bering sent a group of armed men north to find the killers, with orders not to use force if they could avoid it. The armed men killed several Koryak people in the settlement of Utkolotsk and made the rest slaves.

The Russians tortured Koryak people, hurting them on purpose to make them give up the killers. The naturalist on the voyage, Georg Steller, was horrified to see it. A naturalist is a scientist who studies plants and

animals. The report of what Steller saw does not say how the Russians tortured them.

Alaska. Bering commanded the ship *St. Peter* in 1741. On July 16 his crew sighted Mount Saint Elias on the Alaska coast, and they landed briefly at or near Kayak Island. That coast was Native land. Steller described animals that European scientists had not recorded before, among them a bird now called Steller's jay and a sea animal now called Steller's sea cow.

Bering's second ship, the *St. Paul*, was under the command of Aleksei Chirikov. On July 15, 1741, Chirikov's crew sighted land in southeast Alaska, the homeland of the Tlingit people. Two days later he sent an officer, Abram Dementiev, and 10 armed men ashore in a boat to look for a safe place to anchor. After a week they had not come back. Chirikov sent another officer, Saveliev, and a few men in his second, smaller boat. They did not come back either.

Fifteen men lost. With no boats left, Chirikov could not search for them or land, and on July 27 he sailed west without them.

NOT KNOWN: what happened to the 15 men. People living on that shore may have killed them, they may have drowned in the strong tides along that coast, or, as one study argues, they went to live among the Tlingit.

Bering's death. On the way home, scurvy spread through the crew of the *St. Peter*. The ship was wrecked on an island near Kamchatka, now called Bering Island. Bering died there on December 19, 1741. About 28 of his men also died. At the time, people blamed scurvy for all of these deaths. A team of Russian and Danish scientists dug up Bering's remains in 1991 and studied his teeth and bones. They concluded that his own death was more likely caused by heart failure.

The lead plate: the La Verendrye brothers on the northern Plains, 1742 to 1743

Two French brothers and two companions buried a lead plate beside the Missouri River on March 30, 1743, at the fort of a nation the French called the Little Cherry People. The plate is six by eight inches. One side has words in Latin stamped into it that name King Louis XV, the brothers' father and the year 1741. On the other side someone scratched the date and the names of the men who placed it. The plate was found at Pierre, South Dakota, in 1913. It is kept in the South Dakota Cultural Heritage Center.

Their father, Pierre La Verendrye, was a French fur trader in what is now Canada. Two of his sons and two other Frenchmen left Fort La Reine, at present-day Portage la Prairie, Manitoba, on April 29, 1742. The son who kept the journal was known by the French title the Chevalier, which means knight. He was most likely Louis-Joseph La Verendrye. They reached the Mandan towns on the upper Missouri River on May 19 and waited there two months. On July 23 they set out west with two Mandan guides.

For months they traveled with Plains nations that the French called the Horse People, the Bow People and the Little Cherry People. Which modern nations these were is not agreed. The Bow People may have been Pawnee, and the Little Cherry People were probably Arikara.

Some of the nations they met were at war. The Horse People told the brothers that two years before, a nation the French called the Snake People had destroyed seventeen of the Horse People's villages. The Snake People had killed the men and the old women and taken the young women to sell. Which nation the Snake People were is not certain.

The brothers may have been the first Europeans to see the Rocky Mountains, probably in what is now Wyoming. Their journal is hard to follow, so nobody knows their route for certain. It lay in French archives until it was found in 1851.

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 8 MINUTES

American and British diplomats signed a peace treaty in Paris on September 3, 1783. Diplomats are officials who speak for their countries, and a treaty is a written agreement between them. In the treaty the diplomats agreed that the western border of the new United States would be the Mississippi River. Native nations lived on the land between the Appalachian Mountains and that river. The diplomats did not invite them to the talks.

Before and after that treaty, colonists from Virginia and North Carolina pushed through the Appalachians into Kentucky, which the Shawnee used as a hunting ground. In the Pacific, three voyages reached places no European was known to have reached before. Spanish scouts saw San Francisco Bay in 1769. The British navy captain James Cook reached the Hawaiian Islands in 1778. In 1792 an American fur trader, Robert Gray, sailed into the mouth of the Columbia River.

Daniel Boone

Who: A hunter who marked Boone's Trace, later called the Wilderness Road, through the Cumberland Gap into Kentucky.
When and where: 1767 to 1778. The Appalachian Mountains and Kentucky.

The Shawnee took his skins and told him never to come back.

Daniel Boone marked the road that colonists used to cross the Appalachian Mountains into Kentucky. He and his brother Squire first crossed into Kentucky in 1767. In May 1769 Boone set out with five other men on a hunting and trapping trip that lasted two years. One of them, John Findley, had told him about the Cumberland Gap, a low pass through the Appalachians. Native nations had used the gap long before any colonist, and in 1750 a Virginia doctor named Thomas Walker had told colonists about it.

Kentucky was the hunting ground of the Shawnee. The Cherokee and the Haudenosaunee also claimed it. In a treaty signed at Fort Stanwix in 1768, Haudenosaunee leaders gave up their claim to Kentucky to the British. The Shawnee did not sign that treaty. In 1769 Native men chased away Joseph Martin and the men at the fort he had built near the gap for people who claimed land there.

A Shawnee party caught Boone and his brother-in-law, John Stewart, on December 22, 1769. The Shawnee took all their skins and told them to leave and never come back.

The attack of 1773. Boone led his family and about 50 other people toward Kentucky in 1773 to settle there. On October 9 a small group left the main party to get supplies. It included Boone's oldest son, James, several white men and two enslaved Black men named Charles and Adam. A band of Delaware, Shawnee and Cherokee men attacked them. The historian John Mack Faragher writes that the band had decided "to send a message of their opposition to settlement."

The attackers shot James Boone, who was 16 or 17, and Henry Russell through the hips so they could not run. The historians Michael Lofaro and Nancy O'Malley describe what the attackers did next. They tortured the two young men, slashing them with knives and tearing out their fingernails and toenails. Then they killed them. They captured Charles. Adam hid in a pile of driftwood and saw what happened. The families turned back.

Virginians fought the Shawnee in 1774 in a war called Dunmore's War. After the Virginians won a battle at Point Pleasant, Shawnee leaders gave up their claims to Kentucky. Then Richard Henderson, a judge from North Carolina, hired Boone to help start a colony in Kentucky, which Henderson called Transylvania.

The sale. Boone invited leaders of Cherokee towns to a meeting at Sycamore Shoals in March 1775, where Henderson bought the Cherokee claim to Kentucky. Three Cherokee leaders, Attakullakulla, Oconostota and Sewanooko, signed the deed, the paper that handed over the land. It is dated March 17. It covered about 20 million acres. Henderson paid in trade goods, which one estimate values at about 10,000 British pounds.

The sale broke the law. A British royal order of 1763 and the laws of Virginia and North Carolina all forbade private buyers to buy Native land. A Cherokee leader named Dragging Canoe refused to agree to the sale. He warned that Kentucky "is bloody ground, and will be dark and difficult to settle."

The road. Boone then led a work party that cut a trail through the Cumberland Gap into central Kentucky. It was later called the Wilderness Road. The work party included Sam, an enslaved Black man, and other enslaved workers. Near present-day Richmond, Kentucky, Native men attacked the camp and killed Sam and his owner. Boone built a settlement called Boonesborough on the Kentucky River.

The girls in the canoe. Three teenage girls were floating in a canoe on the Kentucky River outside Boonesborough on July 14, 1776. Two Cherokee and three Shawnee warriors, led by the Cherokee Hanging

> Maw, captured them. The girls were Boone's daughter Jemima and Elizabeth and Frances Callaway. Boone's men caught up two days later, as the warriors were building a fire for breakfast, and freed the girls. In 1778 Shawnee warriors captured Boone himself. He lived among the Shawnee for months before he escaped.

Who saw San Francisco Bay first? The Pacific, 1769 to 1792

California, 1769. Scouts under a Spanish sergeant, José Francisco Ortega, were the first Europeans known to see San Francisco Bay. A Spanish official, José de Gálvez, had sent an expedition north from San Diego in 1769 to survey California and to claim it for Spain. Native nations already lived there. The commander was Gaspar de Portolá. His party of 74 men included soldiers, an engineer, two friars and Christian Native men from Baja California. They walked past Monterey Bay without recognizing it.

In early November 1769 Ortega led a group of scouts over Montara Mountain, south of present-day San Francisco. A huge bay blocked their way north. Portolá, their commander, was not with the scouting party.

Portolá and his officers agreed to turn back on November 11. Members of the expedition reported that most of their meetings with Native people along the way were peaceful, and that people gave the Spaniards directions and food. On November 30 about a dozen Rumsen people brought the starving soldiers pinole, which is flour made from ground seeds.

Hawaii, 1778. The British navy captain James Cook reached the Hawaiian Islands on January 18, 1778. He and his crews were the first Europeans known to see them. They landed at Waimea, on the island of Kauai, and on Niihau. While Cook's men were ashore collecting supplies, one of them, John Williamson, shot and killed a Hawaiian man. Cook's crews were also the first Europeans to bring some diseases to the islands.

Cook came back in late November 1778. At Kealakekua Bay, on the island of Hawaii, about 10,000 people and 1,000 canoes met the ships, and the high chief Kalaniopuu welcomed him.

Cook's death. Hawaiians took one of the ships' boats on February 13, 1779. The next day Cook went ashore to kidnap Kalaniopuu and hold him until the boat was returned. Crowds gathered. Cook fired a warning shot, then shot one Hawaiian man dead. In the fight that followed, Hawaiians killed Cook and four marines, the soldiers who served on his ships. Cook's men killed seventeen Hawaiians. The accounts of Cook's last moments contradict each other.

The Columbia, 1792. Robert Gray was a sea captain from Rhode Island. In 1787 a group of Boston merchants sent him and another captain, John Kendrick, to the Pacific Northwest. The two were to buy sea otter furs and sell them in China. In 1790 Gray finished the first voyage by an American ship around the world.

On his first trip, in August 1788, his men fought the Tillamook people at Tillamook Bay, in Oregon. On August 16 Marcus Lopez, Gray's Black cabin boy and cook from the Cape Verde Islands, saw that a Tillamook man had taken his cutlass, a short curved sword. Lopez chased the man. Armed Tillamook men surrounded Lopez and killed him. Gray named the bay Murderer's Harbor.

Gray attacked Native villages along the coast in 1792, both before and after he found the Columbia. In April 1792 he ordered his men to destroy Opitsaht, a Nuu-chah-nulth village of about 200 houses on Vancouver Island, in present-day Canada. The village was empty at the time. One of his officers, John Boit, called it "a fine village, the Work of Ages," and wrote that Gray "had let his passions go too far."

In May he ordered an attack on another Nuu-chah-nulth village, and his men killed seven people and took their sea otter furs.

The river. Gray's crew found a safe channel over the sandbars at the mouth of a large river, where Chinook and Clatsop people lived. It was the evening of May 11, 1792. His ship, the *Columbia Rediviva*, sailed in. Gray named the river the Columbia, after his ship. He was the first navigator known to enter it who was not Native.

Gray fired on a group of Chinook people at Grays Harbor, in present-day Washington State, later in 1792, and killed 20. Back in Clayoquot Sound, near Opitsaht, a war canoe came toward his ship at night, and Gray killed or

wounded at least 25 of the men in it. In 2005 Gray's descendants formally apologized for the destruction of Opitsaht.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 27 MINUTES

The deal. American diplomats in Paris, the officials who spoke for their country, agreed to pay France $15 million for the right to take Louisiana from the Native nations who lived on most of it. The date was April 30, 1803. American officials could now take that land by a treaty, a written agreement between nations, or by war, and no European government could claim it ahead of them.

Louisiana covered about 828,000 square miles, most of the Mississippi's river basin west of the river. French officials controlled only a small part of it. Americans call the deal the Louisiana Purchase, and with it the land the United States claimed nearly doubled.

Over the next fifty years Army officers, fur trappers and a Navy squadron, a group of warships, crossed and mapped lands where Native nations already lived. Native guides showed several of them the way.

Crow people drew a map that showed trappers the way over South Pass. Two men who had run away from Spanish missions, church settlements run by Catholic priests, led a party across the Mojave Desert. An Ojibwe guide led an American to the source of the Mississippi. Some of these explorers killed the people whose land they crossed.

Meriwether Lewis and William Clark

Who: Two Army officers sent by President Thomas Jefferson to cross the Louisiana Purchase to the Pacific Ocean.

When and where: May 1804 to September 1806. From near St. Louis up the Missouri River, over the Rocky Mountains and down the Columbia River to the Pacific coast of Oregon.

Movie: *The Far Horizons* (1955). It invents a romance between Sacagawea and Clark, and a rivalry between the captains.

Every man but York came home to double pay and 320 acres.

Meriwether Lewis and William Clark led an Army expedition from near St. Louis, through the new Louisiana Purchase and beyond it, to the Pacific Ocean and back. President Thomas Jefferson gave them written orders. They were to find "the most direct & practicable water communication across this continent for the purpose of commerce." Jefferson wanted a river route that traders could use to cross the continent. Members of Congress voted $2,324 for supplies.

Jefferson also ordered them to tell the Native nations they met that their land now belonged to the United States. They were to say that the president in Washington, whom they called "their great father," now ruled over them. Lewis and Clark carried silver peace medals with Jefferson's face on them. They carried an air rifle to show off American weapons.

The doctrine of discovery. American officials used the expedition's maps, medals and flags as legal steps to claim each nation's land. They relied on a rule in American law called the doctrine of discovery. Under it, a land that no European had known before belonged to the European government whose explorers found it first, and no other European government could claim it. No one asked the Native nations who already lived there. La Salle had made the same kind of claim for France in 1682. When American diplomats bought Louisiana, they bought France's claim.

The journey. Clark and about 30 men left Camp Dubois, in Illinois, near St. Louis, on May 14, 1804. Lewis joined them at St. Charles, Missouri. In all the party had as many as 45 members, among them York, a man Clark held as a slave. Sergeant Charles Floyd died on August 20, 1804, probably of appendicitis, an infection of a small part of the gut. He was the only member of the party to die on the journey.

Near present-day Fort Pierre, South Dakota, Lakota chiefs, among them Black Buffalo, stopped the boats on September 25, 1804, and demanded gifts before they would let them pass. Lakota warriors took hold of a boat and an oar. Lewis ordered his men to show their guns, and Clark drew his sword. Black Buffalo ordered his warriors back, and nobody was killed. In his journal Clark called the Lakota the "vilest miscreants," meaning the worst villains, and in the same line he used an insulting word for Native people.

The party spent the winter of 1804 to 1805 at Fort Mandan, beside the Mandan and Hidatsa towns in present-day North Dakota. There Lewis and Clark, the expedition's two captains, hired a French-Canadian trader, Toussaint Charbonneau. They also met Sacagawea, a young Shoshone woman he held as his wife.

In the spring they went on up the Missouri to the streams where it begins. They crossed the Continental Divide at Lemhi Pass. The Continental Divide is the line of high ground that separates rivers flowing east from rivers flowing west. They crossed the Bitterroot Mountains at Lolo Pass and then went down the Clearwater, Snake and Columbia rivers by canoe. They found no water route across the continent. What they found instead was a trail that Native people used.

They first saw the Pacific on November 7, 1805. On November 24 Clark wrote down every member's choice for a place to spend the winter, including the choices of York and of Sacagawea. Accounts differ about whether this counts as a vote. The party built Fort Clatsop near present-day Astoria, Oregon. Food ran short that winter, and they had too little money to buy enough food from the Native nations nearby.

On the way home the party split up. Lewis took three men: George Drouillard and the brothers Joseph and Reubin Field. On the night of July 26, 1806, the four camped with some Blackfeet men on the Two Medicine River in present-day Montana.

The only killings. At dawn the Blackfeet men took the Americans' guns and tried to drive off their horses. Reubin Field stabbed one of the Blackfeet men to death. Lewis shot another man in the belly. The National Park Service says two or three Blackfeet were killed. Lewis wrote down no names for them. He left a peace medal around the neck of a dead man "that they might be informed who we were." It was the only fight on the expedition in which anyone was killed.

The expedition reached St. Louis on September 23, 1806. The captains had met more than 70 Native nations and drawn about 140 maps. Every man in the party except York received double pay and 320 acres of land.

Sacagawea

Who: A Lemhi Shoshone woman who interpreted for Lewis and Clark while carrying her baby son.
When and where: 1805 to 1806. From Fort Mandan in North Dakota to the Pacific and back.

Her brother turned out to be the Shoshone leader with the horses.

Sacagawea spoke for the expedition with her own Shoshone people. She was its interpreter, the person who put one language into another. She was born about 1788 near present-day Salmon, Idaho, among the Lemhi Shoshone. Most accounts say she was Shoshone. A Hidatsa account written in 2021, *Our Story of Eagle Woman*, states that she was Hidatsa by birth.

Hidatsa raiders captured her and several other children in 1800, when she was about 12. The raiders killed four Shoshone men, four women and several boys. She was held at a Hidatsa village in present-day North

Dakota. When she was about 13, Toussaint Charbonneau, a French-Canadian trader, took her as his wife. She did not agree to it. Accounts say he either bought her and another Shoshone girl, Otter Woman, from the Hidatsa, or won Sacagawea gambling. Records of the expedition describe Charbonneau as her husband and her owner.

Her son, Jean Baptiste, was born at Fort Mandan on February 11, 1805. Lewis gave her crushed rattlesnake rattle to speed the birth. She carried her son on the whole journey.

The party met a band of Shoshone in August 1805. Its leader, Cameahwait, turned out to be her brother. Sacagawea interpreted, and the Shoshone traded horses to the party for the crossing of the mountains. She also met a woman who had been taken prisoner at the same time as she was.

She was mainly the expedition's interpreter, not its guide. On the way home she did show the way in country she knew. On July 13, 1806, she told Clark to cross into the valley of the Yellowstone River through the pass now called Bozeman Pass, in Montana. Clark wrote that she "has been of great service to me as a pilot through this Country."

In the journals the men called her "the wife of our interpreter" and "the Snake woman." Snake was their name for the Shoshone. They also called her by an insulting word for a Native woman.

Her death. A clerk at a fur post on the Missouri River, John Luttig, wrote that "the wife of Charbonneau" died of a fever on December 20, 1812, at about age 25. The post was in present-day South Dakota. The next year William Clark became the legal guardian of her son and her daughter, Lizette, which meant the law made him responsible for the children. That is the strongest record, and most accounts accept it.

KNOWN:	a clerk wrote down her death in December 1812, and Clark took legal charge of her children in 1813.
DISPUTED:	Shoshone tradition holds that she lived until 1884 and died on the Wind River Reservation in Wyoming, land the US government had set aside for the Shoshone. The Hidatsa account also disputes the 1812 record.

York

Who: A Black man held as a slave by William Clark, who took him on the Lewis and Clark expedition.

When and where: 1804 to about 1815. The journey to the Pacific, then Kentucky.

He asked Clark for his freedom, and Clark had him whipped.

York crossed the continent with Lewis and Clark as a slave, and he came home still a slave. He was born into slavery in Caroline County, Virginia. His parents, Old York and Rose, were enslaved by John Clark III. In 1799 William Clark inherited York under his father's will. Before the expedition York married a woman who was enslaved by a different owner, near Louisville, Kentucky.

On the journey York hunted with a gun. Enslaved men were usually not allowed to carry one. On November 24, 1805, Clark wrote down York's choice for the winter camp alongside everyone else's.

After the expedition every other man received double pay and 320 acres of land. York received nothing. He asked Clark for his freedom because of his services on the journey. He also asked to be hired out near his wife in Louisville, or to be sold to someone there. Clark refused, and he wanted York hired out to "a Severe Master."

In 1808 Clark wrote that York had "Such a notion about freedom and his emence Services." He meant that York believed his great services on the journey had earned him his freedom. Clark did not agree. In July 1809

Clark whipped York, giving him what Clark called "a Severe trouncing," and had him put in jail.

Clark rented York out to work for other people as a wagon driver in Louisville. The last record of him in that work is from 1815. In 1811 his wife's owner planned to move to Natchez, Mississippi, far to the south, and York probably never saw her again. The National Park Service states that York was freed sometime after 1815. No paper freeing him has been found. Nobody knows for certain when or how he died.

President Bill Clinton made York an honorary sergeant in the US Army in 2001.

Zebulon Pike

Who: A US Army lieutenant sent to explore the northern and southern edges of the Louisiana Purchase.
When and where: 1805 to 1807. Minnesota, then Colorado, New Mexico and northern Mexico.

Spanish soldiers arrested him and took his papers.

Zebulon Pike led two Army expeditions to the edges of the Louisiana Purchase. His commander, General James Wilkinson, sent him out. Pike left St. Louis on August 9, 1805, to find where the Mississippi River begins. On September 21, 1805, at the mouth of the Minnesota River, he bought land from the Dakota people for a future Army fort. He named Cass Lake, in present-day Minnesota, as the river's source, but the true source is a lake farther up. An Ojibwe guide showed it to an American in 1832.

Wilkinson sent him west in 1806 to find where the Arkansas and Red rivers begin, near the Spanish lands of New Mexico and Texas. In November 1806 Pike's men tried to climb the tall peak in present-day Colorado that later took his name. They turned back in snow up to their waists. They had gone almost two days without food.

Pike's party crossed into Spanish land. No one knows whether he got lost or went there on purpose. On February 26, 1807, Spanish soldiers arrested Pike and some of his men. The soldiers took them to Santa Fe and then to Chihuahua, in Mexico. There the Spanish commander, Nemesio Salcedo, questioned Pike and took his papers. Spanish officials released Pike at the Louisiana border on July 1, 1807. Accounts still differ about whether Pike was an explorer or a spy for Wilkinson.

Pike was killed on April 27, 1813, in the War of 1812, during an American attack on the town of York, now Toronto, in Canada. By then he was a general. As British soldiers pulled back, they blew up their store of gunpowder, and the blast killed Pike and 37 other American soldiers.

John Colter

Who: A soldier of the Lewis and Clark expedition who stayed in the mountains to trap.
When and where: 1806 to 1809. Montana and Wyoming.

He ran five miles naked with the Blackfeet behind him.

John Colter walked alone through the country that is now Yellowstone National Park in the winter of 1807 to 1808. He was the first person of European descent known to see it. He had been a member of the Lewis and Clark expedition. On August 13, 1806, at the Mandan towns, the captains let him leave early to guide two trappers back up the Missouri River.

Colter joined a fur party led by the trader Manuel Lisa in 1807. In October 1807 Lisa sent him out alone to find the Crow people and ask them to trade. That winter Colter walked more than 500 miles through the country that is now Yellowstone and Grand Teton national parks. He came back in March or April 1808. Few people believed his reports of hot springs, and they called the place "Colter's Hell."

Colter fought beside Flathead and Crow men against the Blackfeet in 1808, and he was wounded in the leg. Many retellings blame Lewis's fight of 1806 for the Blackfeet's anger at Americans, and that link is disputed.

The run. He and another trapper, John Potts, were paddling a canoe on the Jefferson River, in present-day Montana, in 1808 or 1809. Several hundred Blackfeet men ordered them ashore. Colter came ashore, and the Blackfeet took his weapons and stripped him naked. Potts refused to come ashore. Blackfeet men shot and wounded him. He shot one of them, and then they killed him with arrows.

The Blackfeet told Colter to run, and they chased him. He ran about five miles to the Madison River. He killed the one man who caught up with him, using the man's own spear. Then he hid in a beaver lodge and walked for eleven days to a trading fort. All of this comes from Colter's own telling, as other people retold it later.

Colter died of jaundice, an illness that turns the skin and eyes yellow. One record gives the date as May 7, 1812, and another gives November 22, 1813.

BY 1810: Lewis and Clark were home with about 140 maps, Pike was back from Mexico, and few people believed Colter's reports of hot springs in the Yellowstone country.

The first recorded climb of Pikes Peak, 1820

Three men from an Army expedition led by Major Stephen Long reached the top of the mountain now called Pikes Peak on July 14, 1820. One of them was Edwin James, a 22-year-old naturalist, a scientist who studies plants and animals. It is the first recorded climb to the top. The Ute people call the mountain Tava-kaavi. Their tradition says that Ute ancestors were the first to climb it. Long called the high plains a "Great American Desert."

Trappers and the fur trade, 1822 to 1840

Two fur traders, William Ashley and Andrew Henry, put an advertisement in a St. Louis newspaper in 1822. They wanted one hundred "enterprising young men," meaning bold young men ready for hard work, to go up the Missouri River to its source and work there for one, two or three years. They paid $200 a year. The men who answered became known as Ashley's Hundred. Jedediah Smith, Jim Bridger and Hugh Glass were among the men who joined Ashley's company.

The Arikara fight. Ashley's boats reached the towns of the Arikara people on the Missouri River, in present-day South Dakota, in late May 1823, to buy horses. The Arikara were angry after a fight with men of another fur company, and they wanted a trading post of their own. On June 2, 1823, Arikara men attacked Ashley's party. Records give two counts of Ashley's men killed, 12 and 13.

In August an Army officer, Henry Leavenworth, led about 230 soldiers against the Arikara towns. About 750 Lakota and Yankton warriors and about 50 trappers went with him. His men fired cannon at the towns. Leavenworth and the Arikara then agreed to a peace, and the Arikara left their towns at night. Men of the Missouri Fur Company then burned one of the towns. No reliable count of the Arikara killed has survived.

The rendezvous. The trappers met every summer from 1825 to 1840 at a gathering they called the rendezvous, in the mountains of present-day Wyoming, Utah or Idaho. The word is French for a meeting. There the

trappers sold their furs and bought supplies for the next year. Native people came too, and so did the Native wives and children of many trappers.

The source of the Mississippi. An Ojibwe guide named Ozaawindib led Henry Rowe Schoolcraft to the true source of the Mississippi River in 1832. Schoolcraft was an Indian agent, a US official who dealt with Native nations, at Sault Ste. Marie, in Michigan. The source was a lake that the Ojibwe called Elk Lake. Schoolcraft renamed it Lake Itasca. He made up the name from pieces of the Latin words for "truth" and "head."

Hugh Glass

Who: A fur trapper who crawled and walked about 200 miles to safety after a grizzly bear attack.

When and where: 1823. Northwestern South Dakota.

Movie: *The Revenant* (2015), a film based on his story. An earlier film, *Man in the Wilderness* (1971), is based on it too.

He let maggots eat the dead flesh in his wounds.

Hugh Glass crawled and walked about 200 miles to safety after a grizzly bear tore the flesh from his body. The two men left to care for him had taken his gun and gone. In 1823 he joined Ashley's fur company, and he was shot in the leg in the Arikara attack of June 2. A letter he wrote to the parents of John Gardner, a trapper killed that day, still survives.

Late that summer, near the forks of the Grand River in present-day South Dakota, Glass surprised a mother grizzly with two cubs. The bear bit him and slashed him with her claws. Another trapper later said she had "torn the flesh from the lower part of the body, and from the lower limbs," and torn his neck badly. His leg was broken. The cuts on his back were so deep that his ribs showed through.

Andrew Henry, the leader of the party, asked for two men to stay with Glass until he died and then bury him. John Fitzgerald and a man written down as "Bridges" stayed. They dug a grave. Then they left, taking Glass's

rifle and knife, and told the others he was dead. Whether "Bridges" was Jim Bridger is still argued. Bridger later denied it.

Glass set his own broken leg and wrapped himself in the bear's hide. He crawled and walked about 200 miles to Fort Kiowa on the Missouri River, and part of the way he floated on a raft down the Cheyenne River. The journey took six weeks.

He left the maggots in his wounds so that they would eat the dead flesh and keep the wounds from turning to gangrene. Gangrene is the rotting of dead flesh in a living body. Glass later found "Bridges" and forgave him. Fitzgerald had joined the Army, and Glass got his rifle back.

The story was first printed in 1825, in a Philadelphia magazine called *The Port Folio*. A writer named James Hall wrote it, and other accounts dispute parts of it. No diary by Glass tells the story. It comes from other people's later retellings. In early 1833 Arikara warriors killed Glass and two other trappers, Edward Rose and Hilain Menard, on the Yellowstone River.

Jedediah Smith

Who: A fur trapper from New York who led the first party of US citizens known to reach California over land.

When and where: 1823 to 1831. The Rocky Mountains, California and Oregon.

A grizzly tore off his scalp and one ear.

Jedediah Smith led the first party of US citizens known to reach California over land. He answered Ashley's advertisement in 1822. In the autumn of 1823, in the Black Hills region, a grizzly bear broke his ribs and took his head in its mouth. Smith told another trapper, Jim Clyman, how to sew his scalp and ear back on, and Clyman did. Afterward Smith wore his hair long to hide the scar.

The map. Crow people drew a map in sand and on a buffalo hide in 1824, in the Wind River valley of present-day Wyoming, to show Smith's men the way west. With the map, Smith's men crossed South Pass, a crossing of the Rocky Mountains in present-day Wyoming. The Crow already used the pass. A trader named Robert Stuart had crossed it in 1812, but few Americans learned of his crossing. Smith's party made the pass known to Americans.

California. Smith led 15 men southwest toward California in August 1826. Mojave people near present-day Needles, California, sheltered them. Two men who had run away from the Spanish missions guided them west across the Mojave Desert. On November 27, 1826, they reached Mission San Gabriel. California then belonged to Mexico.

The Mexican governor, José María Echeandía, arrested Smith as a suspected spy and held him for about two weeks. In 1827 Smith's party became the first US citizens known to cross the Sierra Nevada mountains going east, and then the Great Basin, a huge dry region between the Sierra Nevada and the Rocky Mountains.

Smith came back in August 1827 with 18 men and two French-Canadian women. As they crossed the Colorado River, Mojave men attacked them. Trappers from Taos, in New Mexico, had fought the Mojave, and the Mojave were set on revenge. They killed ten of Smith's men, among them Silas Gobel, and took the two women captive. Smith's men shot and killed two Mojave men.

The Umpqua. In 1828 Smith led his men north from California along the Pacific coast, looking for the Columbia River and a way back to the Rocky Mountains. On July 11 an Umpqua man took an axe from their camp on the Umpqua River, in present-day Oregon. Smith and another man tied a cord around the Umpqua man's neck while the rest of the party held their guns ready.

Umpqua men attacked the camp on July 14, while Smith and two others were away. They killed 15 of Smith's men. One man, Arthur Black, escaped.

In 1831 Smith and his partners set out from St. Louis with a wagon train to trade in Santa Fe. On May 27 Smith left the wagon train on the Santa Fe Trail to look for water near the Cimarron River, in present-day Kansas. He did not come back. Weeks later his partners learned that Comanche men had killed him. His body was never found.

Jim Bridger

Who: A trapper and guide from Virginia who never learned to read or write.

When and where: 1823 to 1881. Wyoming, Utah and Montana.

He reached the Great Salt Lake in a buffalo-hide boat.

Jim Bridger was one of the first two men who were not Native known to reach the Great Salt Lake. He was born in Richmond, Virginia, in 1804. His parents died when he was 13, and he never learned to read or write. In 1823, at 19, he joined Ashley's trappers.

His boat was a bull boat, a boat made of buffalo hide, and he floated it down the Bear River to the lake in the fall of 1824. A French-Canadian trader, Etienne Provost, reached the lake at about the same time. In October 1824 Shoshone men attacked Provost's party at the Jordan River and killed eight of his men. The Shoshone, the Ute and other nations already lived around the lake.

Bridger and his partner Louis Vasquez built Fort Bridger in 1843, a trading post on the Oregon Trail in present-day Wyoming. In 1850 Bridger found a crossing of the mountains now called Bridger Pass. He later worked as a scout for the Army. By 1875 he was blind, and he died on July 17, 1881. Whether he was the "Bridges" who left Hugh Glass in 1823 is still argued. Bridger denied it.

Charles Wilkes

Who: A US Navy lieutenant who led a large exploring voyage of six ships paid for by the US government.

When and where: August 1838 to June 1842. The Pacific islands, Antarctica and the Pacific Northwest.

His men burned villages in Fiji and brought home 60,000 specimens.

Charles Wilkes commanded the United States Exploring Expedition, a Navy exploring voyage paid for by the US government. W. John Kress, a plant scientist at the Smithsonian Institution, calls it the first American exploring expedition to other parts of the world. Members of Congress approved it in May 1836. Wilkes was only a lieutenant, and he got the command in April 1838 after more senior officers turned it down.

He left Virginia on August 18, 1838, with six ships and nearly 350 men. They included naturalists, a mineralogist, who studies rocks, and a scholar of languages. One ship, the *Sea Gull*, went missing off South America in 1839.

Antarctica. Two officers on the ship *Peacock* sighted mountain peaks in the far south on January 16, 1840. The ships followed the coast. In February Wilkes wrote that they had "discovered the Antarctic Continent." His crews charted about 1,500 miles of that coast, which is now called Wilkes Land. French and British ships were exploring the same waters that year.

Fiji. Wilkes's men burned villages and killed Fijians in the Fiji Islands in 1840. On July 12 Wilkes had his men burn the villages of Solevu and Tye after people from Solevu took one of his boats. An officer, William Hudson, took a Fijian chief named Vendovi prisoner by first taking his brothers prisoner. Americans blamed Vendovi for killing American sailors in 1834.

Vendovi died in the Navy hospital in New York soon after the ships came home in June 1842. The expedition's surgeons cut off his head, and his skull became part of the first collections of the Smithsonian Institution. In December 2025 his remains were returned to his home district of Rewa, in Fiji, and buried in the chiefs' burial ground at Lomanikoro.

Off Malolo Island, later in July 1840, Lieutenant Joseph Underwood held the son of a village chief hostage while he bargained for food. The young man jumped from the boat, and the Americans fired over his head. Fighting began. Fijians killed Underwood and Wilkes's nephew, Midshipman Wilkes Henry. The Americans killed about ten Fijians that day. Accounts disagree over whether the escape or the shot started the fight.

The next day Wilkes landed about 70 men on Malolo. He ordered them to kill the men, to burn the villages and to "spare only the women and the children." His men burned the villages of Sualib and Arro and killed between 74 and 104 Fijians. In 1841 men from the *Peacock* fought about 700 islanders on Drummond's Island, in the Gilbert Islands, killed twelve and burned two villages.

Home. Wilkes's ships mapped Puget Sound, in present-day Washington State, in 1841, and his men mapped more than 800 miles of Oregon. The *Peacock* was wrecked on the sandbar at the mouth of the Columbia. The expedition came home to New York on June 10, 1842. It had sailed about 87,000 miles and lost two ships and 28 men.

It brought back more than 60,000 plant and bird specimens, which helped start the collections of the Smithsonian Institution in Washington. It also brought 254 live plants, which started what became the US Botanic Garden.

Back home, Navy officers tried Wilkes in a court-martial, a trial held by the military. They cleared him of losing the *Peacock* and of mistreating his officers. They found him guilty of illegally punishing sailors in his squadron.

His punishments had included flogging, which means beating a man's bare back with a whip. Navies of that time used a whip of nine knotted cords, called a cat-o'-nine-tails, which was made to tear the skin and cause great pain. One charge named flogging round the fleet, a sentence under which a sailor was whipped aboard each ship of the squadron in turn.

John C. Frémont

Who: An Army mapmaker, later known as "the Pathfinder," whose reports and maps guided thousands of travelers west.

When and where: 1842 to 1849. The Oregon Trail, the Great Basin, the Sierra Nevada, California and Oregon.

Kit Carson called what they did on the Sacramento River "a perfect butchery."

John C. Frémont led four expeditions to map the West, and on the third one his men killed at least 120 Wintu people in California. In 1841 he married Jessie Benton, the daughter of Senator Thomas Hart Benton of Missouri. Benton got the government to pay for Frémont's expeditions. A mountain man, a trapper who lived in the western mountains, named Kit Carson guided him. Frémont and Jessie wrote the report of the first expedition together.

The maps. Frémont led 25 men up the Platte River to South Pass in 1842. In 1843 and 1844 he went on to the Columbia River with almost 40 men and a cannon. Then he turned south and, in winter, crossed the Sierra Nevada into California. He was one of the first Americans to see Lake Tahoe. He showed that no river drains the Great Basin to the sea.

Members of the Senate and of the House each ordered 10,000 copies of his report on this trip. In 1846 members of the Senate had seven maps from his work printed. Thousands of American travelers heading west used them as a guide.

The Sacramento River, 1846. Frémont set out again in 1845 with an armed party of about 60 men. Officials of the War Department secretly told him to act as a soldier if war with Mexico began.

Some settlers claimed on April 5, 1846, that Native people were about to attack them. Frémont's party attacked a camp of Wintu people on the Sacramento River, near present-day Redding, California. Most of the people in the camp were women and children, and they were trapped against the river. One of Frémont's men, Thomas Breckenridge, wrote that "the order was given to ask no quarter and to give none." That meant no one would be spared, even people who tried to surrender.

Frémont's men fired their rifles in volleys, then charged with swords and pistols. Men on horseback chased and killed people who ran. Riflemen shot people who were swimming in the river. The men who were there gave counts of the dead from 120 to 800 or more. Breckenridge counted 120 to 150, and Thomas Martin, another of Frémont's men, counted over 175. An eyewitness, William Isaac Tustin, said at least 600 to 700 were killed on land and 200 or more in the water.

Kit Carson, who took part, later called it "a perfect butchery." None of Frémont's men was killed or wounded. Nobody was ever charged.

After that, Frémont's men shot Native people on sight. Breckenridge said the men "had orders while in camp or on the move to shoot Indians on sight." On the night of May 9, 1846, Klamath men attacked Frémont's camp and killed two or three of his party.

Three days later Kit Carson led an attack on Dokdokwas, a Klamath village at the mouth of the Williamson River, in present-day Oregon, and killed at least 14 people. The people of Dokdokwas may have had nothing to do with the first attack. Nobody was charged for these killings either. In June 1846 Frémont joined a revolt by American settlers against Mexican rule in California, the start of his part in the war with Mexico.

The San Juans. Frémont tried to find a route for a railroad through the San Juan Mountains of Colorado in the winter of 1848 to 1849. By December 12, 1848, the party needed ninety minutes to move 300 yards, and the mules had begun to die. In the end ten of the men died. Some of the starving survivors partly ate at least one of the bodies. Ute warriors later killed two of the men, Benjamin Kern and "Old Bill" Williams, when they went back for the party's gear.

Members of the new Republican Party made Frémont their first candidate for president in 1856. He died in 1890.

BY 1850

If you remember one thing: The Army officers and trappers of these fifty years crossed and mapped the West with Native guides, and some of them killed the people whose land they crossed.

In 1803: American diplomats had just bought France's claim to Louisiana, and Lewis and Clark had not yet left St. Louis.

In 1850: South Pass, the Great Salt Lake, the source of the Mississippi, the Yellowstone country and the Great Basin were known to Americans, and thousands of travelers were heading west with Frémont's maps.

Next: Jim Beckwourth, a Black trapper born into slavery, lived for years with the Crow before he found his pass through the Sierra Nevada in 1850.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 13 MINUTES

After the Civil War members of Congress paid for four survey teams, groups sent to measure and map the western lands in detail, and other Americans pushed into Alaska and the Arctic. Native nations lived on the land the surveyors mapped. One survey leader, an Army officer, had written orders to count them and to choose places for Army forts.

Secretary of State William Seward agreed in 1867 to buy Alaska from Russia, and in 1885 an Army officer crossed part of its interior.

The official in charge of the census, the government's count of everyone in the country, wrote in 1890 that there could "hardly be said to be a frontier line" left between settled and unsettled land. American explorers had already turned toward the North Pole. Two of their voyages ended with most of the men dead.

Jim Beckwourth

Who: A Black fur trapper, born into slavery, who lived with the Crow and found a low pass through the Sierra Nevada.

When and where: 1824 to 1866. The Rocky Mountains, California and Colorado.

Marysville owed him for the trail and never paid.

Jim Beckwourth found the lowest pass through the Sierra Nevada mountains in California, and it is now named for him.

He was born into slavery in Frederick County, Virginia, in 1798 or 1800. His father, Jennings Beckwith, was a white planter who held Beckwourth's mother, a Black woman, as a slave. By law he owned her, and she could not refuse him. His father freed him in papers filed in court in 1824, 1825 and 1826.

Beckwourth joined Ashley's fur company in 1824. For eight or nine years he lived with a band of Crow people, who named him "Bull's Robe." He married the daughter of a chief and rose from warrior to chief. His own book says he became the Crow's highest war chief. Other accounts suggest his fur company planned his stay so that it could win the Crow people's trade.

Beckwourth found the pass in 1850. At 5,221 feet above sea level, it is the lowest crossing of the Sierra Nevada in California. In 1851 he improved an old Native path over it into a trail that ran down to the town of Marysville. It saved gold seekers and settlers about 150 miles and kept them off steep passes such as Donner Pass.

By Beckwourth's own account, the merchants of Marysville had promised to pay him for the trail. When he came to collect in 1851, two large fires had burned the town, and its leaders were unable to pay him. In 1996 Marysville named its largest park Beckwourth Riverfront Park, to recognize the debt the town still owed him.

Beckwourth told the story of his life to a writer, Thomas Bonner, in the winter of 1854 to 1855. The book came out in 1856. Bonner never paid Beckwourth his half of the money. How much of the book is true is disputed.

Sand Creek. Colonel John Chivington hired Beckwourth as a scout in 1864. Beckwourth and about a dozen other scouts guided Chivington's soldiers to a camp of Cheyenne and Arapaho people at Sand Creek, in Colorado. The commander of a nearby Army fort had told the Cheyenne they would be safe there, and the camp was flying an American flag.

The soldiers attacked the camp on November 29, 1864. Counts of the dead run from about 70 to about 230. National Park Service counts give about 230 killed, most of them women, children and old people, and another estimate gives 70 to 163 Cheyenne. Soldiers cut scalps and other parts from the bodies of the dead.

Beckwourth spoke out in anger against the attack, and he later testified about it. Because he had guided the soldiers there, the Cheyenne refused to trade with him.

He died in a Crow village in Montana in 1866. Jim Bridger and a newspaper editor, William Byers, said the Crow poisoned him. Modern accounts name severe high blood pressure as the more likely cause.

The Great Surveys of the West, 1867 to 1879

King. Clarence King, a geologist, a scientist who studies rocks and the earth, began a survey in 1867 along the 40th parallel, from eastern California to Wyoming. A parallel is an east-west line on a map. In 1872 King's team found a field in Colorado where diamonds had supposedly been found, and showed that the diamond field was a fake.

Hayden and Yellowstone. Members of Congress gave Ferdinand Hayden $40,000 in 1871 to survey the Yellowstone country. His party of 32 included the photographer William Henry Jackson and the painter Thomas Moran. The railroad banker Jay Cooke arranged for Moran to go. Cooke wanted to make Yellowstone known to help the Northern Pacific Railroad.

Jackson took the first known photographs of Yellowstone's waterfalls. Jackson's photographs, Moran's paintings and the survey's work helped persuade members of Congress to make Yellowstone a public park. President Ulysses S. Grant signed the law on March 1, 1872.

A band of Mountain Shoshone called the Tukudika had lived in the Yellowstone country for thousands of years. In the fall of 1879 the park's superintendent, Philetus Norris, found a camp the Tukudika had recently left.

He asked the US Indian agent at Fort Washakie for help. The agent sent a party of Shoshone men, who moved the Tukudika out of their homeland to the Wind River Reservation, in Wyoming. A National Park Service history states that the Tukudika "were forcibly removed to reservations," which means they were made to go whether they wanted to or not.

Wheeler. Army Lieutenant George Wheeler mapped the land west of the 100th meridian from 1872 to 1879. A meridian is a north-south line on a map, and the 100th meridian runs through the Great Plains. Under his orders, each inch of his maps was to stand for eight miles of land.

He was also to "discover the numbers, habits, and disposition of Indians in the section" and to "select sites for future military installations." That meant counting the Native people, learning how they lived and whether they were friendly, and picking places for Army forts.

Members of Congress ended the Wheeler, King and Powell surveys in 1879 and moved their work into a new agency, the US Geological Survey. Clarence King was its first director.

Alaska, 1867 to 1885

Two cents an acre. Secretary of State William Seward and a Russian diplomat, Eduard de Stoeckl, signed a treaty at 4 in the morning on March 30, 1867. Under it, Seward agreed to pay $7.2 million for Alaska, about 2 cents an acre, for 586,412 square miles, and de Stoeckl agreed for Russia to sell it. Most reactions in the United States were positive. Some opponents called it "Seward's Folly" or "Seward's Icebox."

Seward's own figures counted about 8,000 Native people under Russian rule and about 50,000 more living beyond it. Neither Seward nor the Russian officials asked any of them.

Across Alaska on foot. Army Lieutenant Henry Allen set out in the spring of 1885 to cross Alaska with two soldiers, Sergeant Cady Robertson and Private Fred Fickett, and $2,000. They went up the Copper River. At the Native village of Taral a prospector, John Bremner, joined them. A prospector is a person who searches for gold or other minerals. Local Native people showed them how to build and use boats made of animal skins. The men ate rotten meat full of worms.

They crossed the Alaska Range by a pass that Allen named Miles Pass and went down the Tanana River and up the Koyukuk, about 1,500 miles in all. Two of the men got scurvy, a disease caused by a severe lack of vitamin C, which comes from fresh food.

John Wesley Powell

Who: A Civil War officer who had lost an arm and who led the first recorded boat journey by white men through the whole Grand Canyon.

When and where: May to August 1869. The Green and Colorado rivers in Wyoming, Utah and Arizona.

Movie: *Ten Who Dared* (1960), a Disney film about the expedition.

He ran the Grand Canyon with one arm and four wooden boats.

John Wesley Powell led the first recorded boat trip by white men through the whole Grand Canyon, in 1869. At the Battle of Shiloh, in April 1862, he was giving the order to fire when a rifle bullet hit his right arm. He lost the arm below the elbow. The raw nerve endings hurt him for the rest of his life. He went back to the Army and fought at Vicksburg.

Powell and nine other men set out from Green River, in Wyoming Territory, on May 24, 1869, in four wooden boats. At a rapid they named Disaster Falls they wrecked and lost one boat, the *No Name*. They named other places along the way, among them Flaming Gorge and Glen Canyon. One man, Frank Goodman, left the trip in July.

The three who left. Three men, Oramel Howland, his brother Seneca Howland and William Dunn, left the river on August 28. They were afraid of the rapids ahead, and they climbed out of the canyon. They were never seen again.

Shivwits Paiute men later told Powell's interpreter that they had killed the three by mistake. The Shivwits said they had taken them for prospectors who had raped and killed a Shivwits woman. Rape means forcing a person to have sex. Other accounts say Mormon settlers from Toquerville, Utah, killed them instead. Mormons are members of the Church of Jesus Christ of Latter-day Saints.

NOT KNOWN: which account is true.

> Powell and five men reached the Mormon settlement of St. Thomas, Nevada, on August 30, 1869. They had traveled almost 930 miles in 98 days. They were the first white men recorded passing through the whole canyon. Paiute people and other Native nations had lived along it long before them.
>
> Powell went down the river a second time in 1871 and 1872. From 1881 to 1894 he led the US Geological Survey.

Toward the North Pole, 1879 to 1898

The Jeannette. Twenty of the 33 men on the *Jeannette* died on the voyage, among them its captain, Navy Lieutenant George De Long. In 1879 De Long sailed the ship north through the Bering Strait. James Gordon Bennett Jr., the owner of the *New York Herald* newspaper, paid for the voyage. De Long hoped to find an open sea around the North Pole.

Ice trapped the ship for nearly two years and crushed it on June 13, 1881. The men dragged their boats across the ice and then sailed for the Lena River in Siberia. One boat, under Lieutenant Charles Chipp, was lost with all eight men in it.

De Long and the men in his boat landed in the river's delta, the low, wet land where a river splits into many channels near the sea. They starved there. His last journal entry, on October 30, 1881, lists the dead and ends "Mr Collins dying." Thirteen men came home. The voyage proved that there is no open sea at the pole.

Greely. Only six of the 25 men Army Lieutenant Adolphus Greely took to the far north came home, and Greely ordered one of the others shot. In 1881 Greely took his men to Ellesmere Island, in Canada's far north. They were to record the weather as part of the First International Polar Year, when scientists from several countries studied the far north and far south at the same time.

Two of his men, Lieutenant James Lockwood and Sergeant David Brainard, set a new record for the farthest north anyone had reached. Two dog drivers from Greenland, Jens Edward and Thorlip Frederik Christiansen, went with them. Both were Inuit, the Native people of the far north.

Supply ships failed to reach the party in 1882 and again in 1883. The men spent their last winter at Cape Sabine with about 40 days of food. Private Charles B. Henry stole food again and again.

Greely wrote an order on June 6, 1884: "Private Henry will be shot to-day." The order warned that Henry was stronger than any two of the other men. Three men, David Brainard, Francis Long and Julius Fredericks, shot him at 2 in the afternoon. On Greely's order, two of their guns held bullets and one held a blank, a cartridge with no bullet in it.

When rescue ships arrived on June 22, 1884, seven men were still alive. One died soon after, so six of the 25 lived to go home. Apart from Henry, the dead died of hunger, cold and drowning. In August 1884 doctors examined the body of one dead officer, Lieutenant Frederick Kislingbury, and found flesh cut from the bones. The survivors said they knew nothing about anyone eating the dead.

The six Inuit. Robert Peary was a Navy officer who later led expeditions toward the pole. In 1894 he reached the Cape York meteorite in northern Greenland. A meteorite is a rock that falls to Earth from space. Inuit people had relied on it to make tools. Peary took it.

In 1896 Franz Boas, a scientist at the American Museum of Natural History in New York, asked Peary to bring an Inuk, one of the Inuit, to the museum. The next year Peary deceived six Inuit into sailing with him to New York. He promised they could go home within a year with tools, weapons and gifts, and he did not keep that promise. The six arrived in September 1897. Staff at the museum kept them in its basement, and 20,000 people paid to look at them.

All six had tuberculosis, a lung disease that spreads through the air, by November 1. Four died in a New York hospital in 1898: Qisuk on February 17, Atangana and Nuktaq that spring, and a girl, Aviaq, on May 24. Qisuk's son, Minik, born about 1890, survived.

The fake burial. The museum's scientific staff wanted to keep Qisuk's body for study. Boas had the staff hold a fake burial. They filled a coffin with stones, laid a stuffed shape covered with a cloth on top, and buried it so that Minik would believe his father had been buried. Boas later said the ceremony was meant to comfort the boy.

Museum staff sent Qisuk's body to the estate of the museum's building manager, William Wallace, where Wallace had a workshop for cleaning skeletons. There the flesh was stripped from Qisuk's bones. The records do not name who did that work. Museum staff later put the skeleton on display in the museum. Wallace adopted Minik.

Of the two who lived, a young man named Uisaakassak demanded to go home to Greenland. He sailed home on the ship *Windward* in July 1898. Minik stayed in the United States. About 1906 New York newspapers reported that his father's skeleton was on display, and Minik learned it from his classmates. He died in the flu epidemic of 1918. In 1993 a Canadian writer, Kenn Harper, got the remains of Qisuk and the three others returned to Greenland, where they were buried at Qaanaaq.

1898: islands in two oceans

Eight years after the census official wrote that the frontier line was gone, President William McKinley, members of Congress and American diplomats took control of islands in the Pacific Ocean and the Caribbean Sea. Among them were the Hawaiian Islands, which James Cook had reached in 1778. Members of Congress voted to annex the Republic of Hawaii, which means to take it over as part of the United States. McKinley signed their resolution on July 7, 1898. Hawaii's former ruler, Queen Lili‘uokalani, protested to Congress.

After a war between Spain and the United States, diplomats from the two countries signed a treaty in Paris on December 10, 1898. Under the treaty, Spanish officials gave up Cuba and handed Puerto Rico, Guam and the Philippines to the United States. American officials agreed to pay Spain $20 million for the Philippines.

BY 1900

If you remember one thing: Survey teams mapped the West on land where Native nations lived. In the Arctic most of the men on two American voyages died, mainly of hunger and cold, and four of the Inuit whom Peary brought to New York died there.

One number: six. Of the 25 men Greely took to Ellesmere Island in 1881, six came home. The *Jeannette* did a little better, 13 men out of 33.

Next: Matthew Henson, a Black sailor from Maryland, worked beside Robert Peary for more than twenty years and made seven Arctic voyages with him.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 10 MINUTES

Many American explorers of the years 1900 to 1950 worked far from home. Some traveled by dog sled toward the North Pole. Pilots flew toward both poles and across the Atlantic Ocean. Teams from Yale University and from a New York museum dug in the mountains of Peru and the Gobi Desert of Mongolia.

Two of the explorers' claims are still argued over. One is whether Robert Peary's party reached the North Pole in 1909, and the other is whether Richard Byrd flew over it in 1926.

In some of the places these explorers went, local people led the way. Inuit men, women and children joined Peary's last expedition to the North Pole. The Inuit are the Native people of the far north, from Alaska to Greenland. Four Inuit men were in the small party that Peary said reached the pole, and a local man led Hiram Bingham up to Machu Picchu.

Matthew Henson (with Robert Peary)

Who: A Black sailor and explorer from Maryland who was Robert Peary's navigator and dog-sled driver on seven Arctic voyages.
When and where: 1887 to 1909. Northern Greenland and the Arctic Ocean.

Henson said he reached the spot before Peary did.

Matthew Henson went with Robert Peary on the 1909 journey that Peary claimed reached the North Pole. Members of Congress thanked Peary in 1911. Most of Henson's honors came after 1937, more than 25 years after the journey.

Henson was born in Charles County, Maryland, in 1866. His parents were sharecroppers, farmers who worked someone else's land for a share of the crop. They had been free before the Civil War. In 1867 the family left southern Maryland to escape attacks by the Ku Klux Klan, a group of white men who used violence to terrorize Black people.

At 12 Henson went to sea as a cabin boy. The ship's captain, a man named Childs, taught him to read and write. In November 1887 Henson was working in a clothing store in Washington, D.C., when he met Robert Peary, a Navy officer. Peary hired him as his helper on a trip to measure and map land in Nicaragua, where people were planning a canal. Their first Arctic trip together was in 1891 and 1892, and by 1909 they had made seven Arctic voyages.

Henson traded with the Inuit and learned their language. They called him Mahri-Pahluk. He is remembered as the only member of the expedition who was not Inuit and became skilled at driving and training dog teams the Inuit way. He was also Peary's navigator, the person who worked out where they were and which way to go.

The last expedition. Peary's ship, the *Roosevelt*, left New York in July 1908. Inuit men, women and children from Cape York, in Greenland, joined the expedition. In February 1909 the sled parties set out across the

frozen Arctic Ocean. There were 7 expedition members, 19 Inuit, 140 dogs and 28 sleds.

They carried supplies forward in relays. One party hauled loads part of the way and left them, and the next party carried them on. By the end Peary could no longer walk, and he rode on a sled. He sent Henson ahead as a scout.

Peary said that his party had reached the North Pole on April 6, 1909. The last group was six men: Peary, Henson and four Inuit men named Ootah, Egingwah, Seegloo and Ooqueah. Henson later said that he was the first of the party to reach the spot they believed was the pole.

The claim. The claim is disputed. Frederick Cook, who had been the doctor on Peary's trip of 1891 to 1892, said he had reached the pole in 1908, a year before Peary. Members of a National Geographic Society committee backed Peary. In 1989 the British explorer Wally Herbert studied Peary's records for the National Geographic Society. He concluded that the records were unreliable. They showed the party moving faster than seemed possible. Herbert found that the party may have stopped 30 to 60 miles short of the pole.

Honors, late. Members of Congress voted Peary their formal thanks in 1911, and he was promoted to rear admiral, one of the highest ranks in the Navy.

Henson published a book in 1912 called *A Negro Explorer at the North Pole*. "Negro" was the common word for a Black person at that time. He became the first African American life member of the Explorers Club, a society of explorers, in 1937, and he received a medal for the Peary expedition in 1944. Presidents Harry Truman and Dwight Eisenhower welcomed him to the White House.

He died on March 9, 1955. In 1988 he and his wife were buried again at Arlington National Cemetery. The National Geographic Society gave him its Hubbard Medal in 2000. In 2021 the International Astronomical

Union, the scientists' group that names places in space, named a crater on the Moon after him.

Hiram Bingham

Who: A Yale history teacher, not a trained archaeologist, who made the Inca site of Machu Picchu famous.
When and where: 1911 to 1915. The Andes Mountains of Peru.

Somebody had already written "A. Lizarraga 1902" on a wall.

Hiram Bingham reached Machu Picchu in 1911 and later made it famous around the world, though people had known the place long before he arrived. He taught South American history at Yale University. He was not trained as an archaeologist, a scientist who studies the past by digging up what people left behind. In 1911 he led an expedition from Yale to Peru to look for the last capital of the Inca. The Inca ruled an empire in the Andes Mountains before the Spanish arrived.

A local man named Melchor Arteaga led Bingham up to Machu Picchu on July 24, 1911. The people living in the valley next to it already knew the ruins. Explorers from the Peruvian city of Cusco are said to have reached it in 1901. One of them, Agustin Lizarraga, wrote "A. Lizarraga 1902" in charcoal on a wall there, and Bingham found the writing. A map from 1874 already shows the site. Bingham later wrote about the ruins as if he had found them himself.

Bingham guessed that Machu Picchu was the Incas' last capital, and he called it the "Lost City." The last capital was really Vilcabamba, which Bingham also visited without recognizing it.

Bingham's team dug up about 40,000 objects at Machu Picchu, among them mummies, bones and pottery. They shipped them to Yale under an order from Peru's government. Peruvian officials said the objects had only been lent. Yale and Peruvian officials agreed in 2007 on what to do with them, and Yale officials began sending the objects back in 2012.

Roy Chapman Andrews

Who: A naturalist from Wisconsin who started as a janitor at the American Museum of Natural History and later ran it.

When and where: 1922 to 1928. The Gobi Desert of Mongolia.

His team found nests full of dinosaur eggs on July 13, 1923.

From 1922 to 1928 Roy Chapman Andrews led the American Museum of Natural History's expeditions into the Gobi Desert of Mongolia. His teams went by car from Peking, in China, the city now called Beijing. He was looking for the remains of the earliest humans. His teams found none.

They found other fossils instead. Fossils are the remains of living things from long ago, turned to stone or pressed into rock. In 1922 they found the bones of a giant relative of the rhinoceros that had no horn. In 1923 they found the first nests of dinosaur eggs known to science. Scientists first thought the eggs came from a dinosaur called *Protoceratops*. In 1995 scientists showed that they belonged to a meat-eating dinosaur called *Oviraptor*.

Chinese officials seized what the expedition had found in 1928. They later gave the finds back. In 1934 Andrews became director of the museum.

Richard Byrd

Who: A US Navy pilot who led flights and expeditions to both poles.
When and where: 1926 to 1935. The Arctic and Antarctica.
Movie: *With Byrd at the South Pole* (1930), a documentary film of the trip.

His diary holds navigation readings that somebody erased.

Richard Byrd led the first flight to the South Pole, in 1929. His claim to have flown over the North Pole three years earlier is disputed. Byrd became a Navy pilot in 1918.

The North Pole claim. Byrd and the pilot Floyd Bennett flew a three-engine plane, the *Josephine Ford*, toward the North Pole on May 9, 1926. Members of Congress voted both men the Medal of Honor for the flight. Most researchers who have studied the flight believe the plane could not carry enough fuel to fly as far as Byrd said. In 1958 another pilot, Bernt Balchen, said that Bennett had told him they never reached the pole.

Byrd's diary was made public in 1996. Its erased navigation readings differ from his official report, and the records do not say who erased them. The historian Dennis Rawlins concluded that Byrd flew about 80 percent of the way and turned back because of an oil leak. Other researchers defend Byrd's claim.

The South Pole. In Antarctica, Byrd built a base camp called Little America on the Ross Ice Shelf, a huge sheet of ice floating on the sea. On November 28, 1929, Byrd, the pilot Bernt Balchen, the radio operator Harold June and the photographer Ashley McKinley took off for the South Pole. They flew there and back in 18 hours and 41 minutes. To make the plane light enough to climb onto the high ice of the Antarctic Plateau, they threw supplies out.

Alone. Byrd spent five months alone in a weather hut called Advance Base on his second expedition, in 1934. Fumes from a badly vented stove, one that did not let its smoke out properly, gave him carbon monoxide

poisoning. Carbon monoxide is a gas with no smell that stops the blood from carrying oxygen. He nearly died. Men from the base camp reached him on their third try. Byrd died in 1957.

Charles Lindbergh

Who: An airmail pilot who made the first solo nonstop flight across the Atlantic Ocean.

When and where: May 20 to 21, 1927. From Garden City, New York, to Paris, France.

He flew alone for 33 hours and 30 minutes.

Charles Lindbergh, an airmail pilot, became the first person to fly alone and without stopping across the Atlantic Ocean in May 1927. Workers at Ryan Airlines, a company in San Diego, built his single-engine plane, the *Spirit of St. Louis*.

Lindbergh took off from Roosevelt Field, in Garden City, New York, on May 20, 1927. He landed at Le Bourget airfield outside Paris the next day, after about 3,600 miles. He won the $25,000 Orteig Prize, which had been offered for the first nonstop flight between New York and Paris.

Two British fliers, John Alcock and Arthur Brown, had made the first nonstop flight across the Atlantic eight years earlier. They flew from St. John's, Newfoundland, to Clifden, Ireland, on June 14 and 15, 1919, in under sixteen hours. Lindbergh was the first to make the crossing alone.

Amelia Earhart

Who: The first woman to fly alone and nonstop across the Atlantic Ocean.

When and where: 1932, Newfoundland to Northern Ireland, and 1937, the central Pacific Ocean.

The *Itasca* heard her clearly, and she could not hear the ship.

Five years after Lindbergh, Amelia Earhart made the same kind of crossing, alone and without stopping, the first woman to do it. In 1928 she had crossed the Atlantic by air as a passenger, the first woman to do so.

She took off alone from Harbour Grace, in Newfoundland, on May 20, 1932, when she was 34. She flew through strong winds and ice, and her engine had problems. After 14 hours and 56 minutes she landed in a pasture near the city of Derry, in Northern Ireland. Members of Congress voted her the Distinguished Flying Cross, a medal for bravery or great skill in flying.

Around the world. Earhart set out in 1937 to be the first woman to fly around the world. Her route ran about 29,000 miles, near the equator. The navigator Fred Noonan flew with her. On June 29 they reached Lae, in New Guinea, with about 7,000 miles to go.

They took off for Howland Island, a tiny island in the Pacific, on July 2, 1937. A Coast Guard ship, the *Itasca*, waited there to guide them in by radio. The crew of the *Itasca* heard her clearly, but she could not hear the ship. The ship's radio direction finder could not lock onto her signal to show which way it came from.

At 7:58 in the morning she radioed that she could not hear the *Itasca*. Earhart and Noonan were never found. She was declared legally dead on January 5, 1939.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 13 MINUTES

After 1950 the places no person had ever seen were the deepest parts of the ocean and space beyond the Earth. The Soviet Union, a large country ruled from Moscow, was the main rival of the United States in those years. On October 4, 1957, Soviet engineers launched Sputnik, the first satellite to circle the Earth. A satellite is an object that travels in a path around a planet.

The next year members of Congress passed a law that set up NASA, the US space agency. Soviet and American crews then flew into space, one flight after another. Between 1969 and 1972 twelve American astronauts walked on the Moon.

Three American astronauts died in a fire on the launch pad in 1967. Seven died when the space shuttle *Challenger* broke apart in 1986. A space shuttle was a spacecraft that rode rockets up into space and landed on a runway when it came back. In the ocean, two men reached the deepest point on Earth in 1960, and scientists found living things around hot springs on the sea floor in 1977.

Don Walsh

Who: A US Navy lieutenant who, with the Swiss scientist Jacques Piccard, made the first dive to the deepest point in the ocean.

When and where: January 23, 1960. The Challenger Deep in the Mariana Trench, near Guam in the Pacific Ocean.

Below 30,000 feet a window pane cracked and the craft shook.

Navy Lieutenant Don Walsh and the Swiss ocean scientist Jacques Piccard reached the bottom of the deepest known place in the ocean on January 23, 1960. It is called the Challenger Deep, and it lies in the Mariana Trench, near the island of Guam in the Pacific. No craft of any kind, with people or without, had been there before.

They went down in the *Trieste*, a deep-diving craft called a bathyscaphe. Piccard's father, Auguste Piccard, had designed it, and it was built in Italy in 1953. The US Navy bought it. The trip down took 4 hours and 47 minutes. The pane that cracked was one of the outer window panes, and the two men went on to the bottom.

At the time they measured the depth as 37,799 feet. The figure was later corrected to 35,814 feet, which is almost seven miles. Newer measurements give between 35,797 and 36,070 feet. The two men stayed on the bottom for twenty minutes, in a cabin that was 45 degrees Fahrenheit.

Walsh and Piccard reported seeing flatfish on the bottom. Scientists now doubt it, because fish are not known to live deeper than about 26,000 to 28,000 feet. Walsh later said they could have been mistaken.

Into space, 1957 to 1972

NASA. NASA was set up on July 29, 1958, under a law called the National Aeronautics and Space Act. NASA's staff began work on October 1, 1958. Its full name is the National Aeronautics and Space Administration.

The first people in space. A Soviet cosmonaut, Yuri Gagarin, circled the Earth once on April 12, 1961, the first person to travel into space. Cosmonaut is the Russian word for an astronaut. Three weeks later, on May 5, 1961, Alan Shepard became the first American in space. His flight lasted 15 minutes. It went up into space and came straight back down without circling the Earth.

President John F. Kennedy asked Congress on May 25, 1961, to set the goal, "before this decade is out, of landing a man on the Moon and returning him safely to the Earth." The Moon program was called Apollo. At its peak 400,000 people worked on it, and it cost $25.4 billion.

John Glenn circled the Earth three times on February 20, 1962, in 4 hours and 55 minutes, in a capsule called *Friendship 7*. He was the first American to orbit the Earth, which means to travel all the way around it. Two Soviet cosmonauts had orbited before him.

Apollo 1. Three astronauts died in a fire during a practice countdown on the launch pad in Florida on January 27, 1967. They were Gus Grissom, Ed White and Roger Chaffee, the crew of Apollo 1. An electric spark set nylon material on fire inside a cabin filled with pure oxygen. The hatch opened inward, and the pressure inside the cabin held it shut. It took workers on the launch pad five minutes to open all three layers of the hatch.

The fire melted the men's suits and air hoses. Doctors who examined their bodies found that the main cause of death was carbon monoxide gas from the fire, which had stopped their hearts. All three also had third-degree burns, burns that destroy the skin all the way through. Most of the burns happened after the men had died.

The Moon. The crew of Apollo 8 became the first people to orbit the Moon in December 1968. Between December 1968 and December 1972, 24 astronauts flew around the Moon. Six Apollo crews landed on it, and twelve men walked

on it. The last landing was Apollo 17, in December 1972. No one has walked on the Moon since.

Katherine Johnson

Who: A Black mathematician from West Virginia who calculated the flight paths of the first American spaceflights.
When and where: From 1953. The Langley laboratory in Hampton, Virginia.
Movie: *Hidden Figures* (2016). The actor Taraji P. Henson plays Johnson.

Glenn refused to fly until she had checked the machines' numbers.

Katherine Johnson worked out the flight path of the first American spaceflight, in 1961, and checked the numbers for the first American flight around the Earth, in 1962. She was born in White Sulphur Springs, West Virginia, in 1918. Her county had no public high school for Black students.

Her family sent her to one on the campus of West Virginia State College, and she started there at the age of ten. Later she was one of three Black students chosen to be the first to attend the graduate school of West Virginia University.

"Colored Computers." The Langley laboratory, in Hampton, Virginia, hired her in June 1953. The laboratory belonged to NACA, the government agency that came before NASA. Her job title was "computer." At that time a computer was a person who did long calculations by hand.

Segregation means keeping people apart by race. Virginia's lawmakers had passed segregation laws, and federal workplaces had segregation rules of their own. Under them, Johnson and the other Black women computers had to work, eat and use restrooms apart from white workers. The sign on their office read "Colored Computers." "Colored" was a word for Black people used at that time.

Johnson calculated the path and the launch time for Alan Shepard's flight in 1961. For John Glenn's flight in 1962, NASA officials used electronic computers for the first time to plan the orbit. Glenn asked for Johnson by name to check the machines' numbers. He refused to fly until she had checked them. She later worked on the paths that let Apollo spacecraft meet each other in space.

President Barack Obama gave her the Presidential Medal of Freedom in 2015. Members of Congress awarded her the Congressional Gold Medal in 2019. She died on February 24, 2020, at the age of 101.

Apollo 11 crew

Who: Neil Armstrong, Buzz Aldrin and Michael Collins, the crew of the first spacecraft to land people on the Moon.

When and where: July 16 to 24, 1969. From Florida to the Moon's Sea of Tranquility and back to the Pacific Ocean.

About one in five people on Earth watched the first step live.

Neil Armstrong and Buzz Aldrin became the first people to land on the Moon on July 20, 1969. A Saturn V rocket had launched them and Michael Collins from Kennedy Space Center, in Florida, on July 16.

Armstrong and Aldrin flew the lunar module, a small landing craft named *Eagle*, down to a flat plain called the Sea of Tranquility. Collins stayed in orbit around the Moon in the command module, *Columbia*, the part of the spacecraft that would carry all three men home. About six hours after landing, Armstrong stepped out onto the Moon. Aldrin followed him 19 minutes later. An estimated 600 million people watched Armstrong's first steps live on television, and another count gives 650 million.

The two men collected 47.5 pounds of rock and soil and spent more than 21 hours on the Moon's surface. The three astronauts splashed down safely in the Pacific Ocean on July 24, 1969.

Apollo 13 crew

Who: Jim Lovell, Jack Swigert and Fred Haise, a Moon-landing crew whose spacecraft was badly damaged by an explosion.

When and where: April 11 to 17, 1970. Between the Earth and the Moon.

Movie: *Apollo 13* (1995), based on Lovell's book about the flight, *Lost Moon*.

An oxygen tank exploded two days out, and they came home anyway.

The crew of Apollo 13 survived an explosion on the way to the Moon by living in their small landing craft. They were Jim Lovell, the commander, Jack Swigert and Fred Haise. Swigert had taken the place of Ken Mattingly, who had been exposed to German measles, an illness that spreads from person to person.

The spacecraft launched on April 11, 1970. Two days later the crew stirred one of the oxygen tanks, a routine job. Damaged insulation on the wires inside the tank caught fire, and the tank exploded. The oxygen in both of the main spacecraft's tanks escaped into space.

After the explosion, mission controllers cancelled the Moon landing and worked to bring the crew home alive. The three men shut down the main spacecraft to save it for the trip back down through the atmosphere, the layer of air around the Earth.

They moved into the small lunar module, *Aquarius*, and lived in it on the way home. It was cold and wet inside, and they ran short of drinking water. The air had to be cleared of carbon dioxide, the gas people breathe out. The crew and the engineers on the ground worked out a way to make the main spacecraft's carbon dioxide filters fit the lunar module.

The crew swung around the Moon and headed home. They splashed down safely in the South Pacific on April 17, 1970. Members of the review board later blamed the way the tank had been tested before the flight, and the Teflon plastic inside it.

Sylvia Earle

Who: A marine biologist from New Jersey who set a deep-diving record and led the first all-woman team to live underwater.

When and where: 1970 to 1992. The Virgin Islands and the waters off Hawaii.

She walked the sea floor 1,250 feet down, with no line up.

Sylvia Earle holds the women's record for the deepest dive to the sea floor. She became a marine biologist, a scientist who studies life in the sea. In 1969 she asked to join the Tektite project, which let scientists live in a laboratory under the sea. She had already spent more than 1,000 hours underwater doing research. The government officials running the project turned her down, because they did not want men and women living together in the laboratory.

So in 1970 Earle led the first all-woman team of aquanauts, people who live and work underwater. They lived in a laboratory 50 feet below the surface off the Virgin Islands.

She put on a hard diving suit in 1979 that kept the water pressure away from her body. With no line connecting her to the surface, she dived to the sea floor off Oahu, Hawaii, 1,250 feet down. That women's depth record still stands. From 1990 to 1992 she was the first woman to be chief scientist of NOAA, the US government's ocean and weather agency.

Robert Ballard

Who: A Navy oceanographer and sea-floor geologist from Kansas.

When and where: 1977 to 1989. The Pacific floor near the Galápagos Islands and the North Atlantic.

First he had to look at two sunken Navy submarines in secret.

Robert Ballard helped find living things where scientists had expected none, and later he found the wreck of the *Titanic*. He became an oceanographer, a scientist who studies the ocean, and he worked at the Woods Hole Oceanographic Institution.

Ballard was a diver in 1977 on an expedition that used the submarine *Alvin* on the sea floor near the Galápagos Islands, in the Pacific. Its members found hot springs on the sea floor. Groups of living things surrounded them. They got their energy from chemicals in the water from the springs, not from sunlight. All the scientists on board were geologists, scientists who study rocks and the Earth, because they had been certain there would be no life to study.

The Titanic. Ballard asked the Navy in 1982 to pay for a search for the *Titanic*. He planned to use a new camera robot called *Argo*, which a ship could tow along the sea floor. The Navy's leaders agreed, on one condition. First he had to use *Argo* to look in secret at the wrecks of two Navy nuclear submarines, the *Thresher* and the *Scorpion*. Both had sunk in the 1960s.

After that work, in 1985, Ballard and a French team found the wreck of the *Titanic*. In June 1989 he found the wreck of the *Bismarck*, a battleship of Nazi Germany that sank in the North Atlantic in May 1941.

Sally Ride and Mae Jemison

Who: The first American woman in space and the first African American woman in space.

When and where: 1983 and 1992, aboard the space shuttles *Challenger* and *Endeavour*.

Reporters sent more than 500 requests to interview Ride.

Sally Ride became the first American woman in space in 1983, and Mae Jemison became the first African American woman in space in 1992. Ride was a physicist from California, a scientist who studies matter and energy. She joined NASA in 1978. On June 18, 1983, she flew on the space shuttle *Challenger*. She was the third woman in space. The first had been Valentina Tereshkova of the Soviet Union, in 1963. At 32 Ride was the youngest American astronaut to fly.

On the flight Ride worked the shuttle's robot arm. Two months later, on August 30, 1983, Guion Bluford became the first African American in space.

Ride later served on the Rogers Commission, which investigated the *Challenger* explosion in 1986, and on the Columbia Accident Investigation Board, which investigated the loss of the shuttle *Columbia* in 2003. She was the only person to serve on both. She died in 2012. Her obituary, the published notice of her death, named Tam O'Shaughnessy as her partner of 27 years. Ride had kept the relationship private while she was alive. She is the first astronaut known to have been LGBTQ, which stands for lesbian, gay, bisexual, transgender or queer.

Jemison. Mae Jemison was born in Decatur, Alabama, in 1956 and grew up in Chicago. She studied chemical engineering at Stanford University and then became a doctor. From 1983 to 1985 she worked as a doctor in Liberia and Sierra Leone, in West Africa. She went there with the Peace Corps, a US government program that sends volunteers to work in other countries. She joined NASA in 1987. From September 12 to 20, 1992, she flew aboard the space shuttle *Endeavour*.

The Challenger explosion, 1986

The space shuttle *Challenger* broke apart 73 seconds after it lifted off on January 28, 1986. All seven people on board died. They were the commander, Dick Scobee, the pilot, Michael Smith, and Ellison Onizuka, Judith Resnik, Ronald McNair, Gregory Jarvis and Christa McAuliffe, a schoolteacher. Many schools watched the launch live because a teacher was on board.

The shuttle broke apart because rubber rings, called O-rings, failed in a joint of one of its booster rockets. The rings sealed the joint so that hot gas could not escape. The record cold that morning had made them stiff. Test results going back to 1977 had shown that these seals were flawed. Two engineers at the Morton Thiokol company, Allan McDonald and Roger Boisjoly, had warned against launching in the cold. NASA managers ignored their warnings.

Several of the crew are thought to have survived the breakup itself. Someone switched on the emergency air supply of the pilot, Michael Smith. The crew cabin then fell and struck the ocean.

BY 2000

If you remember one thing: Between 1950 and 2000 people reached the bottom of the ocean and walked on the Moon, and ten American astronauts died on the launch pad or on the way up.

One question this era leaves open: whether people would ever go back to the Moon. Nobody has walked on it since Apollo 17 came home in December 1972. The next era states the answer.

Next: A second space shuttle, *Columbia*, was lost in 2003, seventeen years after *Challenger*.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 6 MINUTES

Since 2000, robot spacecraft steered from Earth have explored Mars and the outer solar system. Rovers, robot vehicles, drive across Mars, and probes, robot spacecraft sent to study faraway places, have flown past Pluto and out beyond the planets. People have lived on the International Space Station, a laboratory that circles the Earth, without a break since November 2, 2000.

On Earth, most of the ocean floor has still not been mapped. In April 2026 an international mapping project reported that 28.7 percent had been mapped. That same month four astronauts flew around the Moon, the first people to travel there since 1972.

The loss of Columbia, 2003

The space shuttle *Columbia* broke apart over Texas and Louisiana on February 1, 2003, as it was coming back down through the atmosphere. All seven astronauts on board died. They were the commander, Rick Husband, the pilot, William McCool, and Michael Anderson, Kalpana Chawla, David Brown, Laurel Clark and Ilan Ramon, the first astronaut from Israel.

During the launch, a piece of foam from the shuttle's big fuel tank had broken off and hit the left wing. It damaged the panels that protected the wing from the heat of coming back through the atmosphere. Foam had struck shuttles before, on 65 of the 79 earlier launches that had been photographed.

While *Columbia* was in orbit, a team of engineers asked several times for pictures of the wing, taken by military satellites or telescopes. The mission's management team said it had no need for the pictures, and Linda Ham, the mission manager, cancelled the request.

Robots to Mars and beyond

NASA's rover *Curiosity* landed in Gale crater on Mars in August 2012. In March 2013 NASA scientists reported what a rock it drilled showed: water had once filled that place, at the end of a river or in a lake, and tiny living things could have lived in it. Nothing in the rock showed that any did. *Curiosity* was still working in September 2026.

The rover *Perseverance* landed in Jezero Crater in February 2021. The mission's planners chose the crater because an ancient river once flowed into it and left a delta, a fan of mud and sand. *Perseverance* drills rock samples and stores them so that a later mission could bring them to Earth. In July 2024 it found a rock that shows a possible chemical sign of ancient life.

Perseverance carried a helicopter named *Ingenuity*, the first aircraft to fly on another planet. It was built for five flights and made 72 over nearly three years, until its rotor blades broke in January 2024.

The probe *New Horizons* left Earth in January 2006. On July 14, 2015, it became the first spacecraft to visit Pluto, passing 7,800 miles above it. In 2019 it flew past an object called Arrokoth, about 4 billion miles from the Sun.

Two older probes, *Voyager 1* and *Voyager 2*, were launched in 1977. In 2012 *Voyager 1* became the first spacecraft to reach interstellar space, the space between the stars, which begins beyond the stream of particles that blows out from the Sun. *Voyager 2* followed in 2018. *Voyager 1* is the most distant object people have ever made.

Both Voyagers get their power from plutonium, a radioactive metal that gives off heat, and their power drops a little every year. In April 2026 NASA engineers switched off one of *Voyager 1*'s instruments to save power. Two of its science instruments still work.

The James Webb Space Telescope was launched on December 25, 2021, from French Guiana, in South America. It cost just under $10 billion. It was built to see light that left the first galaxies, about 180 million years after the universe began. A galaxy is a huge group of billions of stars.

James Cameron

Who: A Canadian film director who dove alone to the deepest point in the ocean.

When and where: March 26, 2012. The Challenger Deep in the Mariana Trench, in the western Pacific Ocean.

He spent about three hours alone at the bottom of the ocean.

James Cameron, a film director from Canada, became the first person to dive alone to the Challenger Deep, the deepest point in the ocean, on March 26, 2012. He piloted a small deep-diving craft, the *Deepsea Challenger*, to the bottom alone. The craft was built in Sydney, Australia, with the National Geographic Society.

The trip down took 2 hours and 37 minutes, about twice as fast as the *Trieste* in 1960. The deepest reading on the dive was 35,787 feet. No one before him had stayed on the bottom so long. A problem with the craft's hydraulic system made it hard to use the equipment for collecting samples. The hydraulic system used fluid under pressure to move the equipment.

Cameron's was the second dive with people on board to reach the Challenger Deep, 52 years after Don Walsh and Jacques Piccard. He was the third person to go there, after Walsh and Piccard. The *Deepsea Challenger* was later given to the Woods Hole Oceanographic Institution, where Robert Ballard had worked.

Mapping the sea floor

In an international project called Seabed 2030, people from many countries are working to map the whole floor of the ocean. On April 28, 2026, staff of the International Hydrographic Organization, a group of countries that work together on sea charts, published the project's latest total. The project's leaders reported that 28.7 percent of the ocean floor had been mapped. Almost five million square kilometers, about 1.9 million square miles, had been added in the year before. In June 2025 the project had reported 27.3 percent.

Artemis II crew

Who: Reid Wiseman, Victor Glover and Christina Koch of NASA and Jeremy Hansen of Canada, the first people to travel to the Moon since 1972.

When and where: April 1 to 10, 2026. From Florida around the Moon and back to the Pacific Ocean off San Diego.

They flew 252,756 miles from Earth, farther than any people before them.

Four astronauts flew around the Moon in April 2026, the first people to go there in more than 50 years. They were the commander, Reid Wiseman, the pilot, Victor Glover, and Christina Koch of NASA, and Jeremy Hansen of the Canadian Space Agency. They launched on April 1, 2026. It was the first flight with a crew for NASA's Orion spacecraft and its SLS rocket. SLS stands for Space Launch System. The crew circled around the Moon but did not land.

According to NASA's announcement of April 10, 2026, their farthest point broke the record of 248,655 miles set by the crew of Apollo 13 in 1970. A web page of the Smithsonian's National Air and Space Museum states that Koch became the first woman to travel that far from Earth. Glover became the first Black man and Hansen the first Canadian to do so.

Koch had already spent 328 days in orbit on the International Space Station, ending in February 2020. It was the longest single spaceflight by a woman up to that time.

Some experts outside NASA objected to flying this mission without a redesigned heat shield. After Orion's test flight without a crew in November 2022, NASA engineers found that its heat shield had worn away in ways they had not expected. The heat shield protects the spacecraft from the heat of coming back through the atmosphere. NASA's leaders kept the same shield for Artemis II and changed the path the spacecraft would take on the way down.

The crew splashed down safely in the Pacific Ocean off San Diego at 5:07 p.m. Pacific time on April 10, 2026, after a trip of nearly ten days.

THE THREE QUESTIONS, ANSWERED

1. **How do we know people were living here at least 21,000 years ago?** Human footprints at White Sands, in New Mexico, lie between layers of seeds, pollen and quartz sand, and three different tests date those layers to about 21,000 to 23,000 years ago.
2. **What did the explorers do to the people whose land they crossed?** Some traded with them and were fed by them. Others took captives, from the 500 Taino Columbus's men shipped to Spain to the six Inuit Peary brought to New York, and some killed: de Soto's men at Mabila, Coronado's at Arenal, Frémont's on the Sacramento River.
3. **Which famous "firsts" are still in doubt?** Peary's North Pole in 1909 and Byrd's flight over it in 1926. Wally Herbert found Peary's records unreliable, and most researchers think Byrd's plane could not carry enough fuel. Older firsts are in doubt too: Spanish slave raiders may have reached Florida before Ponce de León, Ute tradition says Ute ancestors climbed Pikes Peak before Long's men,

and nobody knows whether the Norse camp in Newfoundland was Leif's own.

What changed: For thousands of years almost every place an explorer reached was already somebody's home, and after 1950 the only places left were the deep ocean and space, where nobody had ever lived.

FIVE DATES TO KEEP

1021: Norse sailors cut trees at L'Anse aux Meadows, in Newfoundland.

1540: Hopi guides lead Spanish soldiers to the rim of the Grand Canyon.

1806: Lewis and Clark reach St. Louis with about 140 maps.

1909: Peary says his party has reached the North Pole.

1969: Armstrong and Aldrin walk on the Moon.

> **NOT KNOWN:** Nobody knows how many people lived north of Mexico in 1500, and the estimates run from about 1 million to about 18 million.

Where to go: The La Verendrye lead plate from 1743 is kept in the South Dakota Cultural Heritage Center.

Next: Chapter 2, Native Nations, which describes what happened to the nations whose land the explorers in this chapter crossed, from the nations' side.

Chapter 2: Native Nations

CHAPTER 2 OF 37 · NATIVE NATIONS · 10 ERAS · ABOUT 100 MINUTES

Native nations were governments long before the United States existed, and through every war, treaty and law aimed at ending them, 574 of them still govern themselves today.

The Haudenosaunee (hoe-dee-no-SHOW-nee), five nations that had joined together under one council, recorded their first agreement with the Dutch on a belt of shell beads. It is called the Two Row Wampum, or Guswenta. Two purple rows of beads run along a white background. They stand for two boats traveling the same river side by side, with neither one steering the other. Haudenosaunee tradition dates the agreement to 1613.

This chapter follows the nations through ten eras. It starts before 1500, with cities and confederacies, groups of nations acting together, and ends in today's courtrooms and classrooms. Watch for the nations acting as governments. Their leaders make alliances, sign treaties, write constitutions, go to war and go to court. Against them, United States officials and soldiers take most of the nations' land, through removal at gunpoint, massacres and allotment, the cutting of a nation's shared land into private pieces. Officials also take children from their homes and send them to boarding schools. After 1950 the story turns. Nations win back schools, fishing rights and, in 2020, a reservation that five Supreme Court justices said had never ended.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did Native nations govern themselves and deal with other nations before the United States existed?

2. What did United States officials and soldiers do to take the nations' land and break the nations up?
3. How did Native nations hold on to their governments, their languages and some of their land?

Five minutes? Read "Removal and the Trail of Tears" in 1800 to 1850.

Can skip: "Comanche power" and "Treaty councils" in 1700 to 1750, and "Ironworkers from Kahnawake" in 1900 to 1950. The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

The nations of this land governed themselves, traded and made war and peace for thousands of years before any ship came from Europe. At Celilo Falls, on the Columbia River, archaeologists, the scientists who dig up and study old camps and tools, date the first signs of people to at least 10,000 years ago. Some accounts say 15,000. In those thousands of years, some peoples built cities and later left them.

When Europeans first arrived, people in what are now the United States and Canada spoke more than 300 languages. That is the count of Lyle Campbell, a scholar who studies languages, in Britannica. He sorts them into 57 families of related languages, and 20 of those families were found only in California. The nations built towns and carried goods hundreds of miles to trade. They made agreements with other nations and fought wars against them.

Nobody knows how many people lived here before 1500. Scholars have used different methods and reached different answers. Their estimates for North America north of Mexico run from about 1 million to about 18 million, and no number is settled.

Cities and kingdoms

People built Cahokia, the largest city north of Mexico, near where St. Louis, Missouri, stands today. They lived there from about 700 to about 1400. The city was biggest around 1100, when roughly 10,000 to 20,000 people lived in it. London had about as many people at the same date. Some estimates put as many as 50,000 in the country around the city.

Why they left. Cahokia's people had scattered by about 1350, and by about 1400 nobody lived there. Why they left is still argued. The causes put forward are drought, floods, and running short of the wood and food its people needed. No single cause is settled.

Ancestral Puebloan people, the ancestors of today's Pueblo peoples (*pueblo* is the Spanish word for town), built large stone buildings called great houses in Chaco Canyon, in what is now New Mexico. After long droughts, people began leaving Chaco around 1140, and by 1200 most of them had gone. They moved into the Pueblo communities of the Southwest.

The Calusa of southwest Florida built a kingdom without farming. Fish and shellfish fed about 20,000 people. Their capital, Calos, stood on mounds of shell at Mound Key. The Calusa kept live fish in pens with walls of shell, called watercourts. Scientists have dated the watercourts to between 1300 and 1400.

The Calusa also collected tribute, regular payments in goods, from other groups. Those groups lived along the coast from south of Tampa Bay down to the Florida Keys.

Traders carried turquoise, seashells, copper and obsidian, a black volcanic glass that chips to a sharp edge, hundreds of miles from nation to nation. Native trails crossed the continent, and later newcomers traveled along them.

The ancestors of the Navajo (Diné) and the Apache moved south toward the Southwest from what is now western Canada and eastern Alaska. Accounts differ about when they arrived. Some date the arrival to the 1200s, and others put it in the 1400s or as late as about 1525.

How did five warring nations become one?

Five nations that had been fighting one another, the Mohawk, the Oneida, the Onondaga, the Cayuga and the Seneca, accepted an agreement called the Great Law of Peace, or Gayanesshagowa. Under it they formed one confederacy, the Haudenosaunee, a group of nations that keep their own governments but act together on matters they share. The five nations came together under one Grand Council.

According to Haudenosaunee tradition, two men brought the five warring nations together under the Great Law. They were the Peacemaker and Hiawatha. The Haudenosaunee kept the law in memory and recited it aloud. Instead of writing it on paper, they recorded it on wampum belts, shell beads woven into patterns in which each pattern stands for the terms of an agreement.

Scholars disagree about when the Confederacy began. Barbara Mann and Jerry Fields date the founding to 1142, from an eclipse of the sun described in the founding tradition. Most other estimates place the founding between the middle 1100s and the late 1400s, and many favor the middle or late 1400s.

Writers for the Library of Congress describe the Haudenosaunee Confederacy as one of the oldest democracies, governments in which the people have a say, still existing in the world.

Few records of single persons survive from these centuries.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 10 MINUTES

Spanish armies marched inland in the 1500s, and the diseases they carried reached many Native towns before the soldiers did. These expeditions were large armed groups traveling into country new to them. The diseases spread ahead of them and behind them. A town could lose many of its people before any European arrived there, and the diseases killed large shares of whole communities. Some writers call these deaths the Great Dying.

No one can give a single death toll, because the number of people living here at the start is not known. A death toll worked out from the lowest estimate, about 1 million, and one worked out from the highest, about 18 million, differ by millions of people.

United States census takers, the officials who count the people of the country, counted about 250,000 Native people in 1900. Even the lowest estimate for 1500, about 1 million, is four times that count. Disease killed many of the missing people. Over the four centuries after 1500, soldiers, settlers and militias killed many others in wars and massacres and while forcing whole nations off their land.

The entradas

Spanish leaders called their armed expeditions into the north entradas. Hernando de Soto led one across the Southeast from 1539 to 1543. Francisco Vázquez de Coronado led another across the Southwest and the southern Plains from 1540 to 1542, with more than 300 armed Europeans and at least 1,200 Native allies.

De Soto sailed from Havana in May 1539 and landed in Florida with more than 620 men and 220 horses. For four years his men marched through the chiefdoms of the Mississippians, the town-building peoples of the Mississippi Valley and the Southeast in these centuries. Each chiefdom was a group of towns under a single ruler.

What de Soto's men did. They attacked the people of the towns on their route and forced people to work for the expedition. At the town of Hymahi, de Soto took all of the town's food. Later he burned at least one of its people to death while he questioned them about another town, Cofitachequi. His men also carried disease with them.

De Soto died of a fever in the spring of 1542, and the survivors of his expedition reached Mexico on September 10, 1543. His men were the first Europeans to see those chiefdoms, and almost the last. In the decades after they attacked the towns, forced the people to work and spread disease among them, the chiefdoms broke apart. Over the century that followed, the survivors regrouped and took in refugees, people who had fled their own towns. They formed the new nations and confederacies of the Southeast.

Spanish colonists also brought horses back to North America. Horses had lived here long before, but they had died out thousands of years earlier. Christopher Columbus carried horses on his second voyage, in 1493, and Spanish colonists brought more to the mainland through the 1500s. Coronado's expedition brought horses in 1540, and Juan de Oñate's colonists brought them to New Mexico in 1598.

Paquiquineo (Don Luís)

Who: A young man from the Chesapeake Bay country who came home with a Spanish mission in 1570 and then led an attack on it.

When and where: Left the Chesapeake in 1561. Landed back on the James River in September 1570.

He met the king of Spain, then spent nine years getting home.

Paquiquineo left the Chesapeake Bay country on a Spanish ship in 1561, as a young man. The Spanish records do not settle whether he went willingly or was taken.

He appeared before King Philip II in Spain. In Mexico City he was baptized, made a member of the Christian church in a ceremony. He was given the name of the viceroy, the man who governed the colony for the king: Don Luís de Velasco.

He came home in September 1570. He landed on the James River as guide and translator for a small Jesuit mission, a group of priests from the Jesuit order of the Catholic church, with helpers, sent to turn people to Christianity. Father Juan Bautista de Segura led this mission.

Back among his people. Paquiquineo soon left the priests. A Jesuit's letter of 1572 states that he slept in their hut no more than two nights and then went to live with his brothers, a day and a half's journey away. One of the priests wrote that the people there had lived through six years of drought and famine, a long shortage of food. The priests were trading copper and tin to other villages for corn.

Paquiquineo led an attack on the mission in February 1571, and the attackers killed the missionaries. They spared the altar boy, Alonso de Olmos, who helped the priests at church services. The Spanish records do not state why Paquiquineo attacked. The anthropologist Seth Mallios argues that the priests' trading for corn broke his people's rules of gift-giving and insulted them.

The Spanish answer. Pedro Menéndez de Avilés, the Spanish governor of Florida, sent soldiers to the James River in August 1572. They captured some of Paquiquineo's people in a fight. The Spanish found several of the captives guilty of killing the missionaries and hanged them from the yardarms, the crossbeams on the masts, of their ship. The Spanish records do not give the names of the men they hanged.

The Powhatan people returned Alonso de Olmos to the Spanish. The soldiers did not find Paquiquineo. Spanish officials sent no more missions to the Chesapeake. English colonists landed at Jamestown, in the same country, 36 years after the mission, in 1607.

NOT KNOWN: what became of Paquiquineo. European records after 1572 do not include him, and no story passed down by word of mouth that can be checked describes him.

Acoma, 1598 and 1599

Juan de Oñate led Spanish colonists north from Mexico in 1598 and founded a colony in New Mexico, the country of the Pueblo nations. Acoma Pueblo, the town of the Acoma people, stands on a mesa, a hill with a flat top and steep sides.

The paper. Before any fighting, Oñate had gathered the Acoma elders for a ceremony in which they promised to obey the king of Spain. The Spanish wrote it down as the "Act of Obedience and Vassalage by the Indians of Acoma." (A vassal is a person bound to obey a ruler.) From then on the Spanish treated the Acoma as subjects of the king of Spain, bound by Spanish law. Spanish officials later used that paper to argue that their war on Acoma was legal.

Oñate's nephew Juan de Zaldívar came to Acoma in December 1598 with about thirty soldiers. He took some of them up the mesa to demand food. In the Acoma people's own account, as reporters for the Rio Grande Sun newspaper told it in 2019, the soldiers raped an Acoma woman, forcing her into sex.

The All Pueblo Council of Governors is a council of the leaders of the Pueblo nations. In a public statement in October 2023, its leaders said that the soldiers "had demanded food and supplies, assaulted an Acoma woman, and forced allegiance to the Spanish crown," which means the soldiers made the Acoma promise loyalty to the king of Spain. Then the Acoma killed Zaldívar and eleven to fourteen of his men. Accounts differ on the number.

Oñate opened a formal inquiry, an official hearing to find out what had happened, on December 28. He questioned the survivors of Zaldívar's party. He asked the Franciscan friars with him, Catholic religious brothers of the Franciscan order, whether a war against Acoma would be just. The friars answered that he "possessed both the authority and sufficient cause," which meant he had the right to make war and a good enough reason.

The attack. Juan de Zaldívar's brother Vicente led about seventy soldiers up the mesa in January 1599. Over two or three days of fighting, his soldiers killed Acoma men, women and children. They took the town and burned much of it.

Nobody counted the dead. The only detailed written story of the fighting by someone who was there is a long poem published in 1610 by Gaspar Pérez de Villagrá, a captain who rode with the expedition. He wrote it to praise the expedition.

Estimates of the dead run from about 300 to about 1,500. The figure given most often is about 800 Acoma men, women and children, and it is the figure the leaders of the All Pueblo Council of Governors use today. The National Park Service's figure is about 1,500.

Vicente de Zaldívar's soldiers captured about 500 Acoma men, women and children. One record gives the number put on trial as 507. Oñate tried them at Santo Domingo Pueblo, though some accounts place the trial at San Juan Pueblo.

The sentences. Oñate passed sentence on February 12, 1599. He sentenced men over twenty-five to have one foot cut off and to be forced to work for the Spanish without pay for twenty years. Males from twelve to twenty-five, and females over twelve, got the same twenty years of forced work. He sentenced the old people to be handed over as slaves to the Plains Apache.

Oñate sentenced two Hopi men captured in the fighting to have their right hands cut off. Then he had them released to carry word of the punishment to their own people.

Oñate declared the Acoma children under twelve innocent. He still ordered them taken from their parents and handed to the friars. On Oñate's order, Acoma girls under twelve were sent south along the road to Mexico, to convents there, houses of nuns, women who have promised their lives to the Catholic church. Neither the National Park Service's account nor the Pueblo council's statement names the men who took the girls.

How many. The two accounts differ on the number. The National Park Service's account records about seventy girls. The Pueblo council's 2023 statement records sixty children taken to Mexico and states that none of them returned. The National Park Service's account states that almost certainly none ever came home. According to PBS, some scholars believe the children were later sold as slaves.

The feet. Oñate's sentence is in the written record. Whether anyone carried out the cutting of feet is disputed. Acoma people have passed down their own account since 1599: Oñate had the right feet of 24 captive men cut off. The New York Times reported that account in 1998. Two historians who worked for years in these records doubt that the feet were cut off. Marc Simmons first wrote that they were, and he later came to doubt it. John Kessell notes that no record describes a one-footed Acoma man.

Spanish officials charged Oñate with thirty crimes. Accounts date the charges to 1612 or 1613 and the judges' decision to 1614. The judges found him guilty of twelve, among them using too much force against Acoma. They banished him from New Mexico for life, ordering him never to return. They also barred him from Mexico City for four years (PBS gives five) and fined him 6,000 ducats, Spanish gold coins.

Oñate had rebuilt a fortune in his family's mines at Zacatecas. Rebecca Carlson, who wrote about his trial in a 2008 university paper, calls the fine unimportant to him. He spent years working to have the decision undone.

Accounts differ on whether the king ever pardoned him, which means officially forgave him. Carlson writes that he was pardoned in 1623. Other accounts say the proof of a pardon is unclear.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 12 MINUTES

Native nations still held nearly the whole continent through the 1600s. Along the eastern coast, the European settlements were a thin strip. Those settlers needed food and trade from the nations around them, and they stayed only as long as those nations let them. In New Mexico, Spanish colonists had ruled the Pueblo nations by force since 1598. Native leaders chose which newcomers to deal with, the Dutch, the French, the English or the Spanish, and used each group's rivalry with the others to bargain.

Haudenosaunee leaders made alliances with the newcomers and recorded them on wampum belts. In New England, English colonists fought two wars against coastal nations, the Pequot War of 1636 to 1638 and Metacom's war of 1675 and 1676. In the Southwest in 1680, the people of the Pueblo nations rose together and drove the Spanish off their land. They kept the Spanish out for twelve years.

Who ruled the land where Jamestown stood?

Wahunsenacawh ruled the country where English colonists founded Jamestown in 1607. He had inherited rule over six tribes in eastern Virginia and built them into a group of more than thirty tribes that paid him tribute. His country was called Tsenacommacah. The English called him "the Powhatan." His own title was mamanatowick, or paramount chief, a chief whom other chiefs answer to.

About 15,000 people lived in his country, spread across some 10,000 square miles between the James River and the Potomac. Each tribe there was a people with its own leader, called a weroance, and each weroance paid tribute to Wahunsenacawh.

Wampum diplomacy and the Covenant Chain

Haudenosaunee diplomats, the people who spoke for their nations with other nations, recorded agreements on wampum belts. Speakers kept the words of each agreement in memory, and the pattern of the belt recorded its terms.

The Two Row Wampum, Guswenta, records the Haudenosaunee account of their first agreement with the Dutch: two boats side by side on one river, neither one steering the other. A paper document dated 1613, the year Haudenosaunee tradition gives for the agreement, also exists, and accounts differ about whether it is genuine.

The Haudenosaunee alliance with the English colonies was called the Covenant Chain, from covenant, a serious promise. The oldest surviving record of the Silver Covenant Chain dates from 1677. That year Haudenosaunee leaders and the New York governor, Edmund Andros, made the alliance official at Albany.

Polishing the chain. Silver tarnishes, turning dark over time, so a silver chain has to be polished to stay bright. Haudenosaunee and English leaders "polished" the Covenant Chain again and again. They renewed the alliance at councils, with speeches and wampum.

The coastal wars

In Connecticut, English colonists and their Mohegan and Narragansett allies fought the Pequot from 1636 to 1638. The war began with the killing of two English traders. Pequot men killed one trader and his crew in 1634. In 1636 people from Block Island, who were not Pequot, killed the other. The leaders of Massachusetts Bay sent 90 soldiers in answer, and the soldiers burned the Block Island villages and then a Pequot village.

Mystic. An English-led force set fire to the walled Pequot town at Mystic before dawn on May 26, 1637. In under an hour they killed hundreds of people, most of them elders, women and children.

The English colonists and their Mohegan and Narragansett allies ended the war with the Treaty of Hartford of 1638, a treaty being a formal written agreement between nations. In it the winners declared that the Pequot nation no longer existed and made it illegal to use the name Pequot. Under the treaty, they took Pequot survivors for themselves or sold them into slavery. The Mashantucket Pequot Tribal Nation is in Connecticut today.

Sold overseas. Colonists had already begun selling captives during the war. Captain William Peirce sailed the ship *Desire* out of Boston in July 1637 with seventeen Pequot captives, fifteen of them children. Governor John Winthrop of Massachusetts wrote, "We sent fifteen of the boys and two of the women to Bermuda, by Mr. Pierce." Peirce sold them in the Caribbean.

Metacom, the Wampanoag sachem, or leader of the nation, led a coalition of nations, a group that agreed to act together, against the New England colonies. His coalition fought the colonists from 1675 to 1676, nearly forty years after the Pequot War.

The war began in June 1675, just after a hanging at Plymouth. A jury of English colonists there had found three Wampanoag men guilty of murdering John Sassamon, a Christian Native man. By report, Sassamon had warned Plymouth's governor that Metacom's men planned an attack. Plymouth officials hanged two of the three men on June 8 and shot the third a month later.

The toll. About 9,000 people died in all, and estimates put Native deaths at roughly half of all the Native people in New England. By one estimate, about two of every three of the dead were Native people, and many of them starved. For the size of the population, writers for Britannica and other histories call it the bloodiest war in American history.

The men who governed the Massachusetts colony ordered on October 13, 1675, that Native people from the praying towns, villages of Native people who had become Christians, be taken to Deer Island in Boston Harbor and kept there. The colonists feared these people would turn against the English and join Metacom. Colonists took the people of Natick to the island first.

Deer Island. The National Park Service puts the number held there at about 500 to 1,100, most of them women and children. They had too little food and shelter through a freezing winter. The two accounts of the deaths differ. The National Park Service says that very few of them survived. The Partnership of Historic Bostons, a Boston history group, says that more than half of them died over the winter.

Colonists released the survivors in May 1676. An unknown number had been smuggled off the island and sold as slaves in the West Indies or in Tangier, in North Africa. No surviving record names the men who voted for the island prison, and the National Park Service's account does not name the men who sold the captives. Every year, descendants of the nations in the war hold a gathering on Deer Island to remember them.

Inland, from the middle to the late 1600s, Haudenosaunee warriors fought the Beaver Wars against nations to the west and north. They fought for control of the fur trade, the trade in animal furs with Europeans. More than 1,000 Seneca and Mohawk warriors attacked the two main towns of the Wendat, also called the Huron, in 1649. The warriors destroyed the Wendat nation as a single people.

Some Wendat survivors fled to Quebec, and others went to the Neutral nation. Haudenosaunee warriors defeated the Neutral in 1651. They absorbed the Erie in 1657, taking the Erie survivors into the Haudenosaunee nations. By 1675,

the writers of the Canadian Encyclopedia say, they had absorbed the Susquehannock to the south and moved west into the Ohio Valley.

Metacom (King Philip)

Who: Wampanoag sachem, son of Massasoit, who led the coalition war of 1675 and 1676 against the New England colonies. The English called him King Philip.

When and where: Southern New England. Killed at Mount Hope, August 12, 1676.

"Philip's boy goes now to be sold," a minister wrote in 1677.

Metacom's father, Massasoit, had made an arrangement with the Plymouth colonists in 1621. In 1675 Metacom took a coalition of nations to war against the New England colonies. The company of the Plymouth captain Benjamin Church captured Metacom's wife and his nine-year-old son in early August 1676.

Mount Hope. A Native man named Alderman, who was serving with Church's company, shot Metacom dead at Mount Hope on August 12, 1676. Church wrote his own account of what came next. He ordered that "not one of his bones should be buried," because Metacom had left English dead unburied. Church told a Native man he called his "old Indian Executioner" to cut off Metacom's head and to quarter his body, cutting it into four pieces.

Church gave the head and one of Metacom's hands to Alderman, who showed the hand to colonists who paid him to see it. Plymouth's leaders paid Church's men thirty shillings, a sum in English money, for each enemy they had killed or captured, and they paid the same for Metacom's head. At Plymouth the head was set on a pole. Church's book does not say who put it there. By the account of a later editor of Church's book, it stayed there for more than 24 years.

The boy. The leaders of Plymouth Colony asked ministers what to do with Metacom's son. Two ministers, Samuel Arnold and John Cotton, wrote on September 7, 1676, that the children of such enemies could be put to death. Cotton wrote the line about "Philip's boy" in a letter in March 1677. The boy and his mother were sold into slavery. Cotton's letter does not say who sold them. Most accounts say the two were sent to Bermuda, and others say they were sent to the West Indies.

Colonial leaders sold hundreds of other captives into slavery to pay what the war had cost the colonies. The selling began early in the war. On August 4, 1675, the men of Plymouth's council of war ruled that 112 Native men, women and children held at Plymouth were "to be sold," and they named the colony's treasurer to sell them.

A month later the council condemned 57 more people to slavery for life. Church wrote that these people had surrendered because of promises made to them, and that about 160 in all were "sold, and transported out of the Country."

The Pueblo Revolt

The people of the Pueblo nations along the Rio Grande drove the Spanish out of New Mexico in 1680. They had lived under Spanish rule since Juan de Oñate founded the colony in 1598.

The arrests. The Spanish governor, Juan Francisco Treviño, ordered 47 Pueblo religious leaders arrested in 1675. The Spanish called their religious practice sorcery, using magic to do harm. Spanish officials sentenced four of the leaders to be hanged. Three were hanged, and the fourth killed himself. Spanish officials whipped the others in public and put them in prison. Pueblo people went to Santa Fe and demanded that the prisoners be freed, and the Spanish let them go. One of the freed leaders was Po'pay.

The people of many separate towns rose against the Spanish on the same day, August 10, 1680. They spoke Tewa, Tiwa, Towa, Tano, Keres and other languages, and the Zuni and the Hopi also promised to help. Pueblo fighters besieged Santa Fe, surrounding the town and cutting it off. They took the town and drove the Spanish out of New Mexico. In the rising they killed 401 settlers and 21 Franciscan friars. The Pueblo fighters let most of the Spanish leave, and the Spanish went south.

The Pueblos governed themselves for the next twelve years, through drought, raids and famine, a long shortage of food. Diego de Vargas led Spanish forces back into New Mexico in 1692 to retake it, and Pueblo fighters kept up armed resistance for years after that. Writers of the EBSCO Research Starters history guide call the Pueblo Revolt the most successful uprising by Native people against European rule in North America.

The horses left behind. When the Spanish went south out of New Mexico in 1680, they left their horses. An estimated 1,500 or more horses passed into Native hands at once. Writers for the Smithsonian's National Museum of the American Indian call it the largest single transfer of horses. According to the traditional account, Native people then traded horses west and north along Native trade routes. The horses reached the Ute, the Navajo, the Apache, the Comanche, the Kiowa, the Shoshone and the nations of the northern Plains.

A newer finding. A team led by William Taylor published a study in the journal *Science* in 2023, and its findings do not fit this account. Lakota, Comanche and Pawnee people were among the study's writers, and other Native partners worked on it too. The team used radiocarbon dating on the remains of horses from Wyoming, Kansas and New Mexico. Radiocarbon dating measures a form of carbon that breaks down at a steady rate, so the amount left shows how old a bone is.

The horses had been ridden and had eaten corn that people fed them. They had also worn bridles, straps around a horse's head used to steer it. They were there by the early 1600s, decades before the revolt. Native oral histories, accounts passed down by telling, had said the same thing.

KNOWN:	Plains nations had horses by the 1700s.
NOT KNOWN:	whether most of their horses came from the Spanish herds left in 1680 or had spread north decades earlier.

Po'pay (Popé)

Who: A Tewa religious leader from Ohkay Owingeh who organized the 1680 rising across dozens of towns and several languages.
When and where: New Mexico, August 1680.

Knotted cords counted down the days to the rising.

Po'pay had to get the people of dozens of towns to rise on a single day, and the people of those towns did not all speak the same language.

Pueblo accounts say that runners carried knotted cords from town to town. The knots on each cord marked the days left until the rising. Po'pay set the rising for August 11, by one account, or August 13, by another.

The runners. The Spanish captured two of the runners, Pedro Omtua and Nicolás Catua of Tesuque Pueblo, on August 9. Spanish officials tortured them, hurting them on purpose to force them to explain the

knotted cords. The Smithsonian's account of the runners does not say how they were hurt. Later the Spanish hanged them. No surviving record names the men who did it.

When Po'pay learned that the runners had been caught, he ordered the rising to begin early. It began on August 10, 1680.

A statue of Po'pay stands in the United States Capitol. It is one of New Mexico's two statues in the Capitol's Statuary Hall collection, which holds statues of two people from each state's history.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 4 MINUTES

Haudenosaunee leaders bargained with French and British officials for fifty years, because both sides wanted Native allies. Native nations also went on making their own agreements with one another.

The Haudenosaunee accepted the Tuscarora as a member nation in these years, after South Carolina forces had defeated the Tuscarora and colonists had taken their land in North Carolina. On the southern Plains, the Comanche built the strongest power in the region on horses and trade.

The printed speeches of the Onondaga speaker Canasatego, from these years, are among the best records of Native diplomacy, the work of dealing with other nations through talks and agreements, from that century.

Staying neutral

About 1,300 delegates, people sent to speak for their nations, came from more than thirty nations to meet at Montreal on August 4, 1701. There they made peace with the leaders of New France, the French colony in what is now Canada. As part of the same peace, the Haudenosaunee promised to stay neutral. That meant they would fight for neither France nor Britain.

For half a century, Haudenosaunee leaders used their neutrality to bargain with both sides.

How did the Five Nations become six?

The Five Nations of the Haudenosaunee became six after the Tuscarora lost a war, and their land, in North Carolina. The Tuscarora moved north and asked to join them.

The war. More than 400 Swiss and German settlers, led by Baron Christoph von Graffenried, founded the town of New Bern, North Carolina, on Tuscarora land in 1710. They pushed the people of the Native town of Chattoka off the spot where the Neuse and Trent rivers meet. Slave raiders were also capturing Tuscarora people to sell them as slaves. The State Library of North Carolina's history of the war does not name the raiders.

Tuscarora fighters struck back on September 22, 1711, in attacks they had planned together. The war lasted until 1713. South Carolina colonial forces, with Native allies of their own, defeated the Tuscarora. By that library's count, 1,400 Tuscarora were dead and 1,000 had been captured and enslaved.

About 1,500 Tuscarora survivors then moved north, roughly 500 miles. They asked the Five Nations of the Haudenosaunee to sponsor them, which meant to speak for them and accept them. The Oneida took them in. In 1722 the whole Tuscarora nation became the sixth nation of the Haudenosaunee Confederacy. Since then the Confederacy has had six member nations, and it is also known as the Six Nations.

Comanche power

The Comanche moved onto the southern Plains in the early 1700s and became the most powerful nation there. Comanchería, the country they controlled, later covered about 240,000 square miles. That is twenty-four times the size of Wahunsenacawh's country in Virginia.

The Comanche built their power on horses. They bred, trained and traded horses, and they controlled the horse trade from the southern Plains to the northern Plains. In the 1740s they traded bison robes and horses to French traders for guns, which were better than the weapons the Comanche could get from the Spanish. Comanche fighters also raided other peoples, making quick attacks to seize goods, horses or people. Comanche leaders made agreements with other nations as well as fighting them.

Treaty councils

At treaty councils, Native leaders and colonial officials met to bargain and make agreements. Speakers on both sides made speeches and exchanged wampum.

At Lancaster, Pennsylvania, in June and July of 1744, colonial officials paid the Haudenosaunee to give up their claims to the Shenandoah Valley.

Canasatego

Who: Onondaga leader and the Haudenosaunee's speaker at treaty councils, whose 1744 speech on union Benjamin Franklin printed.

When and where: Lancaster, Pennsylvania, June and July 1744. He gave the union speech on July 4, 1744.

On July 4, 1744, he told the colonies to unite.

Canasatego spoke for the Haudenosaunee Confederacy at treaty councils with colonial officials. He closed the council at Lancaster by advising the colonies to unite, as his own nations had done centuries earlier: "We heartily recommend Union and a good Agreement between you our Brethren… you, as well as we, will become the stronger."

Benjamin Franklin printed the minutes of the council, the written record of what was said there, including the speech.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 8 MINUTES

French and British armies fought their wars on Native land after 1750. Then the leaders, soldiers and settlers of a new country, the United States, moved onto that land and fought the nations for it.

When British forces beat the French in 1763, Native nations lost the second empire they had bargained with against Britain. Then the colonists went to war with Britain in the American Revolution. The Haudenosaunee nations took different sides in that war, and their Confederacy split for the first time in centuries. During the war, in 1778, United States officials signed their first treaty with a Native nation. In 1791 fighters from a confederacy of nations in the Ohio Country destroyed a United States army.

Pontiac and the Line

French and British commanders both needed Native allies in the French and Indian War, which lasted from 1754 to 1763. A loose confederacy of nations from the Great Lakes, the Illinois Country and the Ohio Country rose against the British in 1763. Under the Odawa leader Pontiac, their fighters took or besieged British forts across the west. Pontiac lifted his siege of Detroit in October 1763, but the fighting went on until 1766.

Fort Pitt. British officers at Fort Pitt tried to give smallpox, a disease that spreads from person to person and can kill, to the Native fighters around them in 1763. Delaware, Shawnee and Mingo fighters had besieged the fort, where Pittsburgh stands today, and smallpox had broken out among the British soldiers inside.

The blankets. The fort's commander, Captain Simeon Ecuyer, and the trader William Trent gave two Delaware men, Turtle's Heart and Mamaltee, two blankets and a handkerchief from the fort's smallpox hospital on June 24, 1763. Trent wrote in his journal, "I hope it will have the desired effect." In July

the British commander in North America, General Jeffery Amherst, asked Colonel Henry Bouquet in a letter whether smallpox could be sent among the nations at war. Bouquet answered that he would try to spread it with blankets.

Whether it worked. A month after the June meeting, Trent saw the two Delaware men again, and they showed no sign of smallpox. A man named Gershom Hicks later said that about 100 Native people died of smallpox between the spring of 1763 and April 1764. The historian Elizabeth Fenn writes that no one can know whether the attempt to spread smallpox worked.

The Line. British officials answered the war by drawing a line. They issued the Royal Proclamation, an official public announcement of an order, on October 7, 1763. In it they forbade colonists to settle west of the Appalachian Mountains, and they set aside the land beyond for the Native nations. Colonists were angry about the line and crossed it anyway. Writers for Encyclopedia Virginia call the Proclamation a foundation of later treaty law, the set of rules for agreements between governments.

Paxton. While the war went on, settlers in Pennsylvania attacked Native people who were not fighting in it. Armed settlers from Paxton Township killed the twenty Conestoga people who lived in a small town near Lancaster in December 1763. The Conestoga were unarmed. Fifty-seven men came at daybreak on December 14 and found three men, two women and a boy at home. They shot them, stabbed them and killed them with hatchets.

One of the dead was Shehaes, a very old man who had helped make a treaty with William Penn in 1701. They killed him in his bed. The attackers scalped all six, cutting away the skin and hair from the top of each head, and burned the huts.

The workhouse. To keep them safe, Lancaster's officials put the other fourteen Conestoga in the town workhouse, a building where poor people were made to work. Franklin called it "a strong Building." On December 27 about fifty men broke down the workhouse door and killed all fourteen with guns and hatchets, children a year old among them.

The Paxton men claimed the Conestoga had hidden enemy spies. The historian Michael Goode writes that the charge was made up. British soldiers stationed nearby did nothing to stop the killings, and no one was ever put on trial for them. Benjamin Franklin wrote down the names of the dead in 1764.

The Revolution splits the Haudenosaunee

Under the Great Law, the Five Nations, and then the Six, had stayed united for centuries. In the American Revolution they split. The Oneida and the Tuscarora sided with the Americans. The Mohawk, the Seneca, the Cayuga and the Onondaga fought with the British. Many of them fought under the Mohawk leader Joseph Brant, whose own name was Thayendanegea. At the Battle of Oriskany, on August 6, 1777, Haudenosaunee men fought on both sides.

George Washington ordered an expedition into Seneca and Cayuga country in 1779. In his written orders, he directed "the total destruction and devastation of their settlements." From July 31 to October 15, General John Sullivan's soldiers burned more than forty Seneca and Cayuga towns and the crops in their fields. Thousands of people fled to the British at Fort Niagara. That winter many of them starved or froze to death there.

Seneca chiefs spoke to Washington directly in 1790. "When your army entered the country of the Six Nations, we called you the Town-destroyer," they said. They told him that "to this day, when that name is heard, our women look behind them and turn pale." The name was older than the burning of their towns. Washington had been given the name Conotocaurius, Town Destroyer, in 1753, and his great-grandfather had been given it before him.

The treaty system begins

United States officials signed their country's first treaty with a Native nation at Fort Pitt on September 17, 1778. The Lenape leaders White Eyes, John Kill Buck Jr. and Pipe signed for their nation, which the treaty calls the Delaware. In the treaty, the American officials recognized Lenape sovereignty, the right of a nation to govern itself. They also asked the Lenape to let American troops cross their land safely.

A fourteenth state. The negotiators raised the idea of a Native fourteenth state, which would join the thirteen and send its own representatives to Congress. No one in Congress ever acted on that idea.

In all, United States officials and Native leaders made 374 treaties that were formally approved, or ratified. The last of them date from the 1860s. The National Archives holds all 374, and its archivists, the people who keep its records, have put every one online. Each of the 374 is an agreement between the United States and a Native nation.

The Northwest Confederacy

North of the Ohio River, the nations built a confederacy to defend their country. Its leaders included Little Turtle of the Miami, Blue Jacket of the Shawnee and Buckongahelas of the Lenape.

About a thousand confederacy fighters fought the army of General Arthur St. Clair on November 4, 1791. About 930 of his soldiers began the fight, and the confederacy's fighters destroyed his army. Counts of the soldiers they killed run from more than 630 to more than 650, and counts of the wounded from 264 to more than 270. Of every 100 soldiers who fought, about 97 were killed or wounded. No battle in the history of the United States Army has had a higher share.

Native casualties, the killed and wounded together, were roughly 100. St. Clair's defeat is still the largest defeat Native forces have ever given a United States army, larger than the Battle of the Little Bighorn, fought 85 years later. After the defeat, members of Congress held the first investigation by Congress in the country's history.

Anthony Wayne led a legion, an army unit of 3,300 men, against the confederacy in 1794. Wayne's legion defeated the confederacy at Fallen Timbers, near where Toledo, Ohio, stands today, on August 20, 1794. The confederacy's leaders had lost the war. At Greenville, on August 3, 1795, they signed a treaty with Wayne, who signed for the United States, and in it they signed away most of Ohio and part of Indiana.

Little Turtle (Mishikinaakwa)

Who: Miami war leader who co-led the confederacy that destroyed St. Clair's army in 1791, then decided the war could not be won and argued for peace.

When and where: The Wabash and Maumee country, in present-day Indiana and Ohio, in the 1780s and 1790s.

He beat two American armies, then argued for peace.

A year before St. Clair's defeat, in 1790, warriors led by Little Turtle beat another American army, under General Josiah Harmar.

After the confederacy lost at Fallen Timbers in 1794, Little Turtle decided that the war could not be won. He signed at Greenville the next year and spent his last years arguing against more war with the United States.

At his urging, members of Congress passed a law in 1802 that let the president stop traders from selling liquor to Native nations. War Department officials then banned traders from bringing alcohol onto Native land, but they did little to enforce the ban.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 10 MINUTES

East of the Mississippi River, Native leaders tried several ways to keep their nations' land. North of the Ohio River, people from many nations joined a confederacy and fought American armies. In the Southeast, Cherokee leaders wrote a constitution, a written plan for their government and its basic laws, and took their fight to court. In Florida, Seminole fighters went to war against removal.

Two Shawnee brothers, Tecumseh and Tenskwatawa, built the northern confederacy around one idea. Tecumseh said that the land belonged to all the nations together, so no single nation could sell any part of it. Soldiers under the American commander William Henry Harrison burned the confederacy's center in 1811, and American soldiers killed Tecumseh in battle in 1813.

The Cherokee changed their nation fast in the eleven years from 1821 to 1832. Sequoyah showed a way to write the Cherokee language in 1821. Cherokee leaders approved their constitution, with three branches of government, in 1827, and the nation began printing a newspaper the next year. Then, in 1832, Chief Justice John Marshall, the head of the Supreme Court of the United States, wrote the court's ruling in the Cherokee Nation's favor.

Members of Congress passed the Indian Removal Act in 1830. Under it, United States soldiers forced the nations of the Southeast out of their homes and moved them west. In the Cherokee removal alone, soldiers held about 16,000 people in stockades, pens fenced with upright logs, and more than 4,000 of them died of cold, hunger and disease. In the West, the people of those nations built their governments again.

Tecumseh and Tenskwatawa

A Shawnee man named Tenskwatawa began preaching around 1805 that Native people should return to Native ways of living. People called him the Prophet. His brother Tecumseh took the movement to other nations and asked them to join it. In 1808 the brothers built a town on the Wabash River as the center of a confederacy of many nations. The town was called Prophetstown.

William Henry Harrison, an American governor, was buying Native land through treaties. Native leaders signed the Treaty of Fort Wayne with him in 1809 and sold him land.

At Vincennes. Tecumseh answered Harrison at Vincennes in August 1810. The land, he said, "never was divided, but belongs to all for the use of each." He added, "No part has a right to sell, even to each other, much less to strangers." He called the latest sale "bad," because "it was made by a part only." By that argument, the Fort Wayne sale counted for nothing, and so did every sale made by one nation alone.

Harrison marched about a thousand men to Prophetstown on November 7, 1811, while Tecumseh was away asking more nations to join the confederacy, and fought the people there. The fight became known as the Battle of Tippecanoe. On the next day, November 8, Harrison burned the town.

Fighters from the confederacy fought on beside the British in the War of 1812. They fought the Battle of the Thames at Moraviantown, in the British colony of Upper Canada, on October 5, 1813. Their British ally, Major General Henry Procter, left the battlefield in the middle of the fight. British army officers later put Procter on trial for his failures in that campaign. American soldiers killed Tecumseh in the battle. After his death the confederacy broke apart.

Tecumseh

Who: Shawnee leader who went from nation to nation arguing that Native land belonged to all the nations together, so no single nation could sell it.

When and where: the Wabash River country and the South, 1805 to 1813. Killed in battle at the Thames, October 5, 1813.

Movie: *We Shall Remain: Tecumseh's Vision* (PBS, 2009), a documentary about him and his brother.

He carried his argument to a Creek council of 5,000 people.

Tecumseh arrived at the yearly great council of the Creek Nation at Tuckabatchee in October 1811. More than 5,000 Creek people had gathered there. He asked them to join the confederacy of the northern nations.

The Creek leader Big Warrior refused to join him, because he was afraid of losing the support of the United States.

Tecumseh was still away in the South a month later, when Harrison marched on Prophetstown.

How did the Cherokee learn to read in a few years?

A Cherokee man named Sequoyah showed a syllabary he had made in 1821, a set of 86 written characters in which each character stands for a whole syllable, not a single sound. Within a few years most Cherokee people could read and write it. Writers at the website History.com state that by the 1830s a larger share of Cherokee people could read than of the white settlers around them.

Cherokee leaders set up a capital at New Echota in 1825. Two years later they approved a written constitution, modeled on the United States Constitution, with three branches of government. Officials of the state of Georgia answered by declaring the Cherokee government abolished, ended by law.

The Cherokee began printing the *Cherokee Phoenix*, the first Native American newspaper, in 1828. They printed it in Cherokee and in English.

Sequoyah

Who: Cherokee silversmith who could not read or write any language, and made a way to write his own. He is the only person in recorded history known to have created a writing system alone, without first being able to read and write another language.

When and where: born in Taskigi, Tennessee, about 1770. First showed his syllabary in 1821. Died 1843 in Mexico.

He could not read any language, and he wrote one down.

Sequoyah could not read or write English or any other language. He worked on the problem for about twelve years before he showed his syllabary in 1821.

Seven years later, half of what the nation's newspaper, the *Cherokee Phoenix*, printed was in his characters. He died in 1843, in Mexico.

NOT KNOWN: the year he was born. The years given for it run from 1770 to 1778, and the Library of Congress lists 1770 with a question mark.

Removal and the Trail of Tears

President Andrew Jackson signed the Indian Removal Act into law on May 28, 1830. Under it, the president could give Native nations land west of the Mississippi River in exchange for their land in the East. Cherokee leaders took their fight with Georgia to the courts.

The court case. Georgia's lawmakers had made it a crime for a white person to live in the Cherokee Nation without a license from the state. Samuel Worcester, a missionary who translated parts of the Bible into Cherokee, refused to leave. Georgia guards arrested him and other missionaries in July 1831. They were tried in Georgia that September, and each was sentenced to four years in prison at hard labor, which means forced hard work. The New Georgia Encyclopedia's account of the case does not name the judge.

Chief Justice John Marshall ruled in *Worcester v. Georgia*, in 1832, that the laws of Georgia had no force inside the Cherokee Nation, which was under the protection of the United States. That ruling is still one of the foundations of tribal sovereignty law, the law about a Native nation's right to govern itself. Georgia's officials ignored it. Worcester stayed in prison until January 1833, when he accepted a pardon, an order forgiving the crime, from Georgia's governor.

The treaty. Three years after the ruling, in late 1835, a small group of Cherokee men who favored moving signed the Treaty of New Echota with United States officials. The signers gave up all of the nation's land east of the Mississippi for $5 million. Members of the Senate approved the treaty in May 1836, and United States officials treated it as an agreement by the whole nation to move west.

The roundup. President Martin Van Buren sent General Winfield Scott with about 7,000 soldiers in May 1838 to round up the Cherokee people who had not moved west. Georgia's militia, its citizen soldiers, joined them. In 1838 and 1839, soldiers came to Cherokee houses in the Southeast and took families out at gunpoint, often with no time to pack. They held about 16,000 Cherokee people in stockades in Tennessee and Alabama.

Then the soldiers forced them to go to Indian Territory, in what is now Oklahoma. More than 4,000 of them died of cold, hunger and disease, about one in every four of the people the soldiers had held.

How many died. That figure is the traditional estimate, and the counts differ. The National Park Service counts more than a thousand deaths on the trip itself, and perhaps several thousand more from what the removal did to people afterward. Russell Thornton, a scholar at the University of Minnesota, wrote in 1984 that the number of deaths "may have been twice" the traditional figure.

The Cherokee named the removal *Nunna daul Tsuny*, the Trail Where We Cried. In English it is called the Trail of Tears.

United States officials and soldiers forced all five of the large southeastern nations to move to Indian Territory: the Cherokee, the Muscogee (Creek), the Choctaw, the Chickasaw and the Seminole. They removed more than 14,000 Choctaw people from 1831 to 1833, and hundreds died. They removed more than 14,500 Creek people in 1836 and 1837. Several hundred Creek people died on the way, and about 3,200 died after they arrived, of disease, hunger and cold.

Rebuilding. In Indian Territory, the people of those nations rebuilt their governments, their courts, their newspapers and their schools.

Rebecca Neugin

Who: a Cherokee woman who was about three years old when soldiers took her family out of their home in Georgia in 1838.

When and where: Georgia to Indian Territory, 1838 and 1839. Interviewed in 1932.

Ninety-four years later, she told a historian what she remembered.

Soldiers took Rebecca Neugin's family out of their home in Georgia in 1838, when Rebecca was about three years old. The soldiers held the family in a camp in Tennessee, and in September 1838 the family set out west. Rebecca and the smaller children rode in a wagon, while her mother, her father and her older brother Dick walked the whole way.

The historian Grant Foreman interviewed her in 1932, when she was about 97 years old, and she told him what she remembered of the journey. She was one of the last people still alive who had been on it. She died on July 15, 1932.

The Seminole resistance

In Florida many Seminole people refused to leave, and United States soldiers fought them in the Second Seminole War, from 1835 to 1842. It was the longest war between United States forces and a Native nation east of the Mississippi, and the one that cost the most. National Park Service writers give its cost in a count. For every Seminole person soldiers killed, they forced four out of Florida. For every four forced out, three soldiers died and United States officials spent $32,000.

General Thomas Jesup lured the Seminole war leader Osceola to a talk on October 21, 1837, under a white flag of truce, a sign that both sides promise not to attack or seize anyone while they talk. Osceola came in under the flag, and Jesup had him seized. Many people in the United States protested the trick in public at the time. Osceola died a prisoner at Fort Moultrie, South Carolina, on January 30, 1838.

Most of the fighting stopped in 1842. A few hundred Seminole people never surrendered and stayed in the Everglades. Their descendants belong to two tribes today. Federal officials, the officials of the national government, recognized the Seminole Tribe of Florida in 1957 and the Miccosukee Tribe in 1962, accepting each tribe as a nation with its own government. Leaders of both tribes point out that the Seminole were never conquered.

Osceola

Who: Seminole war leader in the fight against removal from Florida.

When and where: Florida. Seized by General Thomas Jesup under a flag of truce, October 21, 1837. Died a prisoner at Fort Moultrie, South Carolina, January 30, 1838.

He was born Billy Powell, in a Creek town in Alabama.

Osceola was born in 1804 in the Creek town of Talisi, in what is now Alabama. His name at birth was Billy Powell.

He died a prisoner at Fort Moultrie three months after Jesup seized him. Frederick Weedon, the army doctor there, cut off Osceola's head before the burial and put it on display in his drug store.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 22 MINUTES

United States officials and soldiers forced one Native nation after another onto reservations, pieces of land set aside for each nation in a treaty or by an order, between 1850 and 1900. Soldiers and officials held the people there, and officials and settlers took the rest of each nation's country.

United States soldiers killed hundreds of Native people at a time in these years. Army officers hanged 38 Dakota men together at Mankato, Minnesota, in 1862. At Bear River in 1863 soldiers killed an estimated 250 to 500 Shoshone people, and at Sand Creek in 1864 about 230 Cheyenne and Arapaho people, most of them women, children and elders.

Cavalry, soldiers on horseback, killed about 177 Piikani people on the Marias River in 1870, by the best estimate. Soldiers at Wounded Knee in 1890 killed between 250 and 300 Lakota people.

Hunters killed off the bison herds that fed the Plains nations, and army officers encouraged the killing. Navajo leaders signed a treaty in 1868 in which United States officials agreed to let their people go home. Members of Congress stopped making treaties with Native nations in 1871. Lakota, Cheyenne and Arapaho fighters beat George Custer's soldiers at the Little Bighorn in 1876, and the next year the Nez Perce fled toward Canada with the army behind them.

An Army officer named Richard Henry Pratt opened the first federal boarding school for Native children built far from the reservations in 1879. Federal officials used Pratt's school as the model for many more. Pratt stated his aim in his own words: "Kill the Indian in him, and save the man." Federal investigators later counted at least 973 children who died at the federal boarding schools.

Members of Congress passed a law in 1887 under which federal officials cut nations' shared land into private pieces. The officials opened what was left over to white settlers.

The wars, from the nations' side

The Dakota War. In Minnesota in 1862, United States officials failed to deliver the food and the payments that they had promised the Dakota in treaties. Dakota fighters went to war, and the war lasted six weeks.

The trials. Afterward, army officers sitting as military commissions, courts run by the army, tried 392 Dakota men. Some of the trials took less than five minutes. The men had no defense lawyers and no interpreters, the people who translate between two languages. The officers on the commissions sentenced 303 of the men to death by hanging.

President Abraham Lincoln and his lawyers read the trial records. Lincoln looked first for men found guilty of rape, forcing a person into sex, and found two. Then he added men found to have taken part in killing people who were not soldiers. He cut the list of men to be executed down to 39. One of the 39 was reprieved, which means his execution was called off.

Mankato. Army officers hanged 38 Dakota men together at Mankato on December 26, 1862, while about 4,000 people watched. It is the largest mass execution, the most people put to death at one time, in United States history. Captain William Duley cut the rope. Several members of his family had been killed in a Dakota attack on the Lake Shetek settlement.

The bodies were put in a shallow grave on a sandbar. The Minnesota Historical Society's account does not say who buried them. Before morning, doctors had dug up most of the bodies to use for medical study.

Hanged by mistake. Two of the 38 men were hanged by mistake, by the Minnesota Historical Society's account. The first was Wicaŋȟ˘pi Wastedaŋpi. He went by Caske, a common name that means first-born son. Dakota families gave it to a first-born boy, so many men had it. When the name Caske was called for another man on the list, Wicaŋȟ˘pi Wastedaŋpi stepped forward. He was hanged in that man's place.

The second was Wasicuŋ, a young white man whom the Dakota had adopted as a child. The commission had found him not guilty at his trial.

Bear River. A month after the hangings, soldiers attacked a Shoshone camp far to the west. Colonel Patrick Edward Connor led them against a winter camp of Northwestern Shoshone people on the Bear River, near what is now Preston, Idaho, on January 29, 1863. Connor had announced that he would take no prisoners. His soldiers killed an estimated 250 to 500 Shoshone people. Afterward army leaders promoted Connor to brigadier general, a higher rank.

The Long Walk. Far to the south, in 1863 and 1864, United States soldiers marched about 8,500 Navajo people more than 300 miles to Bosque Redondo and held them there. This forced march is known as the Long Walk. Thousands of the Navajo died while soldiers held them at Bosque Redondo. In 1868 Navajo leaders negotiated a treaty in which United States officials agreed to let the survivors go home. The Navajo were one of the very few removed nations who got their homeland back.

Sand Creek. Colonel John Chivington led about 675 volunteer soldiers against Black Kettle's Cheyenne and Arapaho camp at Sand Creek in Colorado on November 29, 1864. The camp was flying a United States flag and a white flag.

Earlier that month Major Scott Anthony, the commander at nearby Fort Lyon, had told Black Kettle's people to camp at Sand Creek. In his report of November 16 he wrote that he told them "no war would be waged against them." That promise was to hold until his own commander decided what to do. When Chivington arrived, Anthony agreed to the attack.

The attack lasted eight hours. The soldiers killed about 230 people, most of them women, children and elders.

Captain Silas Soule, one of the officers there, refused to let his men fire. He wrote to his mother that he saw "a Massacre of three hundred Indians mostly women and children." In another letter he wrote that it was "hard to see little children on their knees have their brains beat out." Soldiers cut scalps and other body parts from the dead.

Members of a committee of Congress later wrote, using an old word for cowardly and cruel, that Chivington "deliberately planned and executed a foul and dastardly massacre." Chivington left the army and was never put on trial,

and no officer or soldier was punished.

A man shot Soule dead on a Denver street in April 1865, about two months after Soule spoke against Chivington before investigators. No one was ever punished for killing him. National Park Service staff look after the place of the massacre today as the Sand Creek Massacre National Historic Site.

Red Cloud's War. Gold was found in Montana in 1863, and the Bozeman Trail was opened as a road for white settlers to reach it. The trail ran through Lakota country, and the Lakota had never given permission for it. When soldiers built forts along it to protect the settlers, Lakota fighters went to war, from 1866 to 1868. The war is named for the Lakota leader Red Cloud.

After the war, United States officials and Lakota leaders signed the Treaty of Fort Laramie in 1868. In it, the officials agreed to close the Bozeman Trail. They also set up the Great Sioux Reservation "for the absolute and undisturbed use" of the Lakota. It covered all of what is now South Dakota west of the Missouri River, including the Black Hills.

The Marias River. Major Eugene Baker's cavalry came to a camp of Piikani (Piegan Blackfeet) people on the Marias River in Montana on January 23, 1870. His scout, Joe Kipp, told him it was the camp of Heavy Runner's band, a group of families who lived and traveled together, and that the band was at peace with the United States. By one account, Baker answered, "That makes no difference, one band or another of them, they are all Piegans and we will attack them."

By the best estimate, Baker's soldiers killed 37 men, 90 women and 50 children. The army's own count was 173 dead, and the National Parks Conservation Association's figure is more than 200. Neither Baker nor any of his men was ever punished.

Gold in the Black Hills. Members of an expedition led by George Custer announced in 1874 that there was gold in the Black Hills, inside the reservation promised to the Lakota in 1868. Federal officials ignored their own treaty. In December 1875 they ordered the winter camps that were off the reservation to come onto it by January 31, 1876. When the camps did not come in, the officials sent the army.

The Little Bighorn. George Custer led part of the 7th Cavalry, an army unit of soldiers on horseback, on June 25, 1876. He attacked a camp where Lakota, Cheyenne and Arapaho people had gathered as allies, meaning they had agreed to fight on the same side. The camp stood by the Little Bighorn River, also called the Greasy Grass. Fighters from the camp killed Custer and about 200 of the soldiers with him in about an hour. Those soldiers made up five companies, smaller units of the 7th Cavalry.

Crazy Horse. The Lakota leader Crazy Horse, who had led fighters at the Little Bighorn, surrendered on May 6, 1877, less than a year after the battle. Soldiers were arresting him at Fort Robinson on September 5, 1877. A Lakota man named Little Big Man jumped on his back and held him, and a soldier on guard stabbed him with a bayonet, a blade fixed to the end of a rifle. Crazy Horse died of the wound.

Who stabbed him. Most accounts say a soldier on guard stabbed him. The name most often given is Private William Gentles, but only one witness named him, so who the soldier was is disputed. Little Big Man later told a different story, in which Crazy Horse was cut by his own knife.

The last surrender. In the Southwest, Geronimo, of the Chiricahua Apache, surrendered on September 4, 1886. He was the last Native leader to formally surrender to the United States. United States officials then held the Chiricahua people as prisoners of war, people an army holds after capturing them in a war, for 27 years.

BY 1886: Geronimo had surrendered, the last Native leader to do so, and United States officials held most Native nations on reservations. The Black Hills, promised to the Lakota in 1868, had been taken after the gold strike.

Sitting Bull

Who: Hunkpapa Lakota leader and holy man. The camp that fought at the Greasy Grass gathered around him.

When and where: the northern Plains. Canada from 1877 to 1881. Killed by Indian police at Standing Rock, December 15, 1890.

Movie: *Sitting Bull: A Stone in My Heart* (2006), a documentary built from his own recorded words.

Buffalo Bill's show paid him fifty dollars a week.

The camp on the Greasy Grass in June 1876 formed around Sitting Bull, and Crazy Horse was one of its battle leaders.

Sitting Bull took his people north into Canada in 1877. Hunters were killing off the bison, and by 1881 there were not enough left to feed his people. He surrendered at Fort Buford in July of that year.

He signed a contract with Buffalo Bill's Wild West, a traveling show, at the Standing Rock Agency on June 6, 1885. The show paid him fifty dollars a week for a four-month season, and only he could sell his own photographs and autographs.

Indian police, Native men who worked as police for the agency that ran the reservation, came to arrest him at Standing Rock on December 15, 1890. Indian agents, the federal officials who ran the reservations, were alarmed by the Ghost Dance, a new religious dance spreading across the reservations. The policemen killed Sitting Bull.

Chief Joseph

Who: Nez Perce leader in the flight of 1877, when his people fled toward Canada with the United States Army behind them.

When and where: the Wallowa Valley of Oregon to the Bear Paw Mountains of Montana, 1877. Surrendered October 5, 1877, forty miles from Canada.

Movie: *I Will Fight No More Forever* (1975, television film).

They stopped forty miles short of Canada.

Joseph's band of the Nez Perce lived in the Wallowa Valley of northeastern Oregon. General Oliver O. Howard told the Nez Perce chiefs in 1877 that their people had 30 days to move onto the reservation in Idaho, or the army would move them by force. That year about 750 Nez Perce people fled with the army behind them. Only about 200 of them were fighters, and the rest were families.

They traveled about 1,170 miles, the National Park Service's figure for the trail. Some accounts state a longer distance, up to about 1,700 miles.

They surrendered on October 5, 1877, at the foot of the Bear Paw Mountains in Montana, forty miles short of the Canadian border. Lieutenant C. E. S. Wood recorded Joseph's words at the surrender: "From where the sun now stands I will fight no more forever."

The promise. Colonel Nelson Miles had promised Joseph that his people would be taken back to the reservation in Idaho. General William Tecumseh Sherman, the commanding general of the army, overruled the promise, cancelling it. He wanted the Nez Perce punished as an example to other nations and never allowed to go home. "I believed General Miles, or I never would have surrendered," Joseph said afterward.

United States officials sent his people to Kansas, then to Indian Territory. There, many of them were sick and short of supplies, and their number fell from 410 to 391. Two hundred sixty-eight Nez Perce people left Indian

> Territory for the Northwest in May 1885. Officials sent Joseph to the Colville reservation in Washington, and he died there, at Nespelem, in 1904. Officials never allowed him back to the Wallowa Valley.

The bison, and the end of treaties

There were roughly 30 million bison on the Plains in the early 1800s. One count in 1884 found 325, about one bison left for every 90,000 there had been. By 1900 there were fewer than a thousand.

Railroads carried hunters into the herds' country. Hunters made hide hunting into a large business, killing bison for their skins. Disease and drought killed others. Army officers encouraged the killing, because the herds were the Plains nations' food and the base of how they made a living, and the bison were part of their religion.

Members of Congress stopped making treaties with Native nations in 1871. They did it with a rider, a short passage attached to a spending bill called the Indian Appropriations Act. Treaties already made stayed in force. After 1871, United States officials dealt with Native nations through acts of Congress and orders from the president instead of treaties.

How did the nations lose 90 million acres?

Native nations lost about 90 million acres between 1887 and 1934 through allotment, the cutting of land that a whole nation owned together into private pieces. Federal officials carried it out.

Members of Congress passed the Dawes Act, also called the General Allotment Act, in 1887. Under it, federal officials divided nations' land into separate parcels, or pieces. The head of a family got 160 acres, a single adult or an orphan got 80 acres, and each other child got 40 acres. On land fit only for grazing animals, each person got twice as much. Officials called everything left over "surplus," meaning extra, and opened it to white settlers.

The land Native nations held fell from about 138 million acres in 1887 to 48 million in 1934. The lost land was about two-thirds of all the land Native nations still had in 1887. The Meriam Report, a federal study published in 1928, states the figures as 137 million and 47 million acres. The loss is about the same by either count.

Allotment went on until members of Congress ended it in 1934.

The boarding schools

Richard Henry Pratt, an Army officer, opened the Carlisle Indian Industrial School at Carlisle, Pennsylvania, on November 1, 1879. It was the first federal boarding school for Native children built far from the reservations. Federal officials used Carlisle as the model for the schools that followed.

Pratt stated the purpose himself. In 1892 he spoke to a national conference of charities in Denver. He said that "all the Indian there is in the race should be dead. Kill the Indian in him, and save the man." People often quote the line in a shorter form, "kill the Indian, save the man." Pratt's recorded words are the longer ones, printed in the conference's official report.

Members of Congress passed two laws to get the children into the schools. In 1891 they gave the Commissioner of Indian Affairs, the federal official in charge of Native affairs, the power to make and enforce rules forcing Native children to attend school. In 1893 they let federal officials hold back rations, clothing and annuity payments from parents who would not send their children. These were the food, goods and yearly payments that United States officials had promised a nation in its treaties.

Some Indian agents, the federal officials in charge of the reservations, sent reservation police to seize children. Some families sent their children willingly, hoping the schooling would help them. Many families had no real choice.

Arrival. When a child arrived, staff at school after school cut the child's hair and replaced the child's clothes with a uniform. They gave the child an English name and forbade the child to speak the language of home. Staff punished children for speaking their own languages. The federal investigation of the schools and survivors' own accounts document the punishments: beatings, solitary confinement, which means locking a child away alone, withholding food, and washing children's mouths out with soap.

Children spent half of each school day doing unpaid work that kept the school running. Pratt also ran what he called the outing system. Under it, he sent students to live and work with white families, in the summers and during school terms.

The count. Investigators at the United States Department of the Interior studied the schools and published their findings in 2022 and again on July 30, 2024. They counted 417 federal Indian boarding schools in 37 states and territories, open between 1819 and 1969. Their first report, in 2022, listed 408. They also found more than a thousand other places that had similar aims.

At least 973 children died at the federal schools. The investigators found at least 74 marked and unmarked burial sites at 65 of the schools. The report states that its count of the dead is low.

Children kept their languages by speaking them where the staff could not hear. At these schools, children made friends with children from other nations. Those friendships were one of the starting points of the Native organizing of the next century. Some students, Zitkala-Ša among them, used the reading and writing they learned at the schools to argue against the schools.

Sarah Winnemucca

Who: Northern Paiute writer, interpreter, and lecturer who argued her people's case in front of audiences across the East.

When and where: Nevada, and the lecture halls of the East, in the 1870s and 1880s.

"My people were only given one week to get ready in."

Sarah Winnemucca was working as an interpreter when she learned, just before Christmas 1878, that President Rutherford B. Hayes had ordered her people taken to the Yakama reservation under an army guard. She wrote the line about the one week. Officials were punishing the whole group because a few Paiute men had fought in the Bannock War of 1878.

United States officials forced about 550 Northern Paiute men, women and children to move 350 miles north in 1879, from the Malheur reservation in Oregon to the Yakama reservation. The march took nearly a month through snow and over two mountain ranges. The officials in charge made some of the men walk in leg irons, chains locked around the ankles.

Five children, one woman and an old man died on the road. Their bodies were left beside it because the ground was too cold to dig graves. The Oregon Historical Society's account of the march does not say who decided to leave them. The historian Sally Zanjani estimated that more than one fifth of the group died far from home after they were sent away, mostly of hunger and disease.

Schurz's promise. Winnemucca went east and gave lectures about what officials had done to her people. She met with Secretary of the Interior Carl Schurz in Washington in 1880. He gave her a written promise that the Paiute could go back to Malheur, and then he broke it. Her people never returned there. President Chester Arthur ended the Malheur reservation in 1882 and 1883, and white settlers could then claim its land.

She published *Life Among the Piutes: Their Wrongs and Claims* in 1883. It is the first known autobiography, a book a person writes about their own life, by a Native American woman. She was also the first Native woman known to hold a United States copyright, the legal right to control who copies and sells a piece of writing. In 1884 she asked Congress to give her people back their reservation.

She opened a school of her own for Paiute children near Lovelock, Nevada, in the mid-1880s. Accounts of her life give the year as 1884 or 1885. Staff at the government boarding schools forbade children to speak their own languages, but at her school Winnemucca taught in both Paiute and English. The school ran out of money and closed within a few years.

Zitkala-Ša

Who: Yankton Dakota writer, musician, and organizer, taken as a child to a boarding school in Indiana.

When and where: the Yankton reservation, South Dakota, and Washington, D.C. Born February 22, 1876. Died January 26, 1938.

An interpreter promised her all the red apples she wanted.

Zitkala-Ša wrote about how she left home in her essay "The Big Red Apples." She was in her eighth year, in March, when two white missionaries came to her village on the Yankton reservation. Her mother told her they had come "to take away Indian boys and girls to the East." A young white interpreter told the girl she could pick all the red apples she wanted and ride on "the iron horse," a train. "I had never seen a train, and he knew it," she wrote.

She begged to go. Her mother warned her, "Their words are sweet, but, my child, their deeds are bitter." Then her mother agreed. The missionaries took the girl to White's Indiana Manual Labor Institute. The essay does not name them.

The editors of the *Atlantic Monthly*, a magazine, published a set of her essays about her own life in 1900. One of them was "The School Days of an Indian Girl." In the essays she described her time at the school and criticized it. She was working at Carlisle when she published them. They appeared again in her book *American Indian Stories* in 1921.

She helped start the National Council of American Indians in 1926 and led it until she died in 1938.

The Ghost Dance and Wounded Knee

A Northern Paiute man named Wovoka, from the Walker Lake country of Nevada, had a vision on January 1, 1889. It came during a solar eclipse, when the moon blocked the sun. He taught that if people lived rightly and danced a round dance, in which people move in a circle, the dead would return and the world would be made whole.

On reservations where people were hungry, they took up the dance, which became known as the Ghost Dance. Indian agents who were frightened by it called it the start of an uprising, an armed revolt. Newspaper writers printed stories that said the same.

Indian police killed Sitting Bull at Standing Rock on December 15, 1890, while they were trying to arrest him.

Wounded Knee. Soldiers of the 7th Cavalry under Colonel James W. Forsyth were disarming Spotted Elk's band, also called Big Foot's band, at Wounded Knee Creek on December 29, 1890, taking away the people's weapons. During the disarming, a rifle belonging to Black Coyote, a deaf man, went off. By some accounts he fired first, and by others a soldier tried to grab his gun and it went off. The soldiers opened fire.

They fired carbines, which are short rifles, and four Hotchkiss guns, small cannon set on a hill above the camp. The soldiers killed between 250 and 300 Lakota people. The killing is known as the Wounded Knee Massacre.

A burial party put 146 of the dead in one grave at the site in early January 1891. They were 84 men and boys, 44 women and 18 children. Others died later of their wounds, and some bodies were never found, so no count gives the women and children among all the dead.

Twenty-five soldiers also died. Writers for Britannica and History.com say that most of those soldiers were hit by their own side's fire. Twenty soldiers of the 7th Cavalry received the Medal of Honor, the top award the United States military gives for bravery in battle, for what they did that day. Some of the medal statements praise soldiers for driving out "Sioux Indians" who were hiding in a ravine, a narrow, steep valley.

BY 1900

If you remember one thing: In these fifty years United States soldiers and officials took most of the land the nations still held, forced the people onto reservations and began taking their children to boarding schools.

One number: about 250,000. That is how many Native people census takers counted in 1900, the lowest number on record. Even the lowest estimate for 1500, about 1 million, is four times as many.

Next: In the next fifty years Native people built national organizations of their own, while the boarding schools stayed open.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 11 MINUTES

Native leaders founded national organizations of their own in these fifty years, the Society of American Indians in 1911 and the National Congress of American Indians in 1944. Federal boarding schools stayed open the whole time.

In Oklahoma in the early 1920s, killers murdered dozens of Osage people for their shares of the nation's oil money, in the years called the Reign of Terror.

Members of Congress made Native people citizens in 1924 and ended allotment, the cutting of nations' shared land into private pieces, in 1934. Native men fought for the United States in both world wars, and some of them sent messages in Choctaw and Navajo.

Organizing

A group of Native doctors, lawyers and writers met in Columbus, Ohio, on October 12, 1911, and founded the Society of American Indians. It was the first national Native rights organization that Native people built and ran themselves. Its leaders included Dr. Charles Eastman, who was Santee Dakota, and Dr. Carlos Montezuma, who was Yavapai-Apache. Zitkala-Ša edited its journal.

Many of the members had gone through the boarding schools, and some of them used that schooling to argue against federal Indian policy. The Society lasted from 1911 to 1923.

Twelve men and one woman founded the Alaska Native Brotherhood at Sitka in 1912. They wanted citizenship for Alaska Natives. The Alaska Native Sisterhood began in 1915. For the next fifty years, these two groups were the only civil rights organizations Alaska Natives had, the only groups working for their right as citizens to equal treatment under the law.

Eighty delegates from more than fifty tribes and associations met in Denver on November 16, 1944, and founded the National Congress of American Indians. Native nations still use it as one of their main ways to act together.

Ironworkers from Kahnawake

Mohawk men from Kahnawake had worked on structural iron, the metal frames that hold up bridges and tall buildings, since the 1880s. Kahnawake crews worked on the riveting gangs that put up the Empire State Building in New York in 1930 and 1931. A riveting gang joined the steel beams together with hot metal pins called rivets.

Kahnawake ironworkers kept building towers in Manhattan for generations. One of them, Harold McComber, is the subject of *High Steel*. Don Owen directed that documentary film for the National Film Board of Canada in 1965.

The Osage and the Reign of Terror

Osage people in Oklahoma earned so much from oil in the 1920s that they were among the wealthiest people in the world, counted per person. White guardians and some of the men who married Osage women stole that money, and killers murdered Osage people to get it.

Osage leaders under Chief James Bigheart won their own terms in the Osage Allotment Act, which members of Congress passed in 1906. Under the Dawes Act, federal officials had given the head of a family 160 acres, single people and children less, and opened the rest of a nation's land to white settlers. The Osage divided all of their reservation among their own people instead, 657 acres each for 2,229 people, about four times a family head's 160 acres.

Headrights. The Osage kept the minerals under the ground as shared property. Oil companies paid royalties, which are payments for the oil they took out. Each Osage member got an equal share of that money. The share was called a headright.

Members of Congress passed a guardianship law in 1921. Under it, judges in local courts appointed white guardians over the money of many Osage adults. The guardian, not the Osage owner, controlled the money. Guardians stole from the people whose money they controlled. Some of the men who married Osage women stole from their wives.

Osage headright holders died in murders and in suspicious deaths, deaths that might have been murders, between about 1920 and 1925. These years are known as the Reign of Terror. Counts of the dead disagree. Osage Nation officials count more than sixty. Writers at the Oklahoma Historical Society count about 24, and FBI writers say at least two dozen.

The investigation. Members of the Osage Tribal Council asked the federal government to send detectives in 1923. Agents of the new Bureau of Investigation, which later became the FBI, took the case. They proved that William Hale, a cattle rancher whom people called "the King of the Osage Hills," had ordered the murders of Anna Brown and members of her family so that he could inherit their oil rights, getting them after they died. Hale's nephew, Ernest Burkhart, was married to Anna's sister Mollie.

The killings. Anna Brown was shot on Hale's orders in May 1921. Two months later her mother, Lizzie Q. Kyle, died, and poison was suspected. In January 1923 Hale had Anna's cousin Henry Roan killed for insurance money. In March 1923 a bomb blew up the house of Anna's sister Rita Smith, killing Rita, her husband Bill and their servant, Nettie Brookshire.

Who went to prison. Burkhart pleaded guilty in 1926 and was sentenced to life in prison. Hale was found guilty in 1929 and sent to prison for life. Two other men, Kelsie Morrison and John Ramsey, were also sentenced to life. Hale, Ramsey and Burkhart were all later let out on parole, which means freed early under watch.

Citizenship and the end of allotment

Under the Indian Citizenship Act, which became law on June 2, 1924, every Native person born in the United States became a citizen. In some states they still could not vote, because each state's lawmakers wrote that state's voting rules. The Library of Congress records that officials in some states kept Native people from voting until 1957.

A federal survey called the Meriam Report came out in 1928. Its full title was *The Problem of Indian Administration*. It records that under allotment, tribal land had fallen from 137 million acres to 47 million. It also records the poverty and disease Native people lived with after that loss.

The Meriam Report's writers condemned the boarding schools in detail, judging them wrong and showing why. One of the things they condemned was the half-day system, under which school staff made children spend half of every school day on unpaid work that kept the schools running.

The Indian Reorganization Act became law on June 18, 1934. It was written while John Collier was Commissioner of Indian Affairs, the federal official in charge of dealings with Native nations, a job he held from 1933 to 1945. In the act, members of Congress ended allotment and extended the protections on land held in trust, land the United States holds on behalf of a Native nation or person.

Members of Congress also allowed up to $2,000,000 a year in the act for buying land for Native people. Nations could now write constitutions and set up their own governments. After 1934 federal officials began to recognize the governments that nations set up under the act. For the forty-seven years before, since 1887, federal officials had used allotment to break nations up into single landowners.

The schools stay open

Federal boarding schools kept running after 1900. The federal investigators counted the schools that ran between 1819 and 1969, and some kept going after that. Enrollment, the number of children in the schools, kept climbing for decades and reached its peak of about 60,000 children in 1973.

Collier and the officials under him moved toward day schools, where children went home at night, in the 1930s. They allowed some teaching in Native languages, and they closed some boarding schools. Federal officials still took tens of thousands of children from their homes to the schools every year.

One of those children was Chester Nez, a Navajo boy at the Fort Defiance boarding school, who later helped build the Marines' code in Navajo.

Why could no enemy read the code?

Code talkers were Native soldiers who sent military messages in their own languages, which the enemy could not understand. The first code talkers were Choctaw.

American soldiers were fighting in the Meuse-Argonne campaign, a long series of battles in France, in the autumn of 1918. German soldiers were tapping American telephone lines. They were also capturing about one in four runners, the soldiers who carried messages on foot. Choctaw soldiers of the 36th Division began passing orders in Choctaw.

They sent the first secure messages, ones the Germans could not read, on October 26, 1918. When Choctaw had no word for a piece of equipment, the men made one up. A machine gun became "little gun shoot fast."

In the Second World War, Marine Corps officers had Navajo speakers do the same work. Twenty-nine Navajo recruits arrived in San Diego on May 5, 1942, and built the code. Between 350 and 420 Navajo served as code talkers, in all six Marine divisions in the Pacific. At Iwo Jima, Major Howard Connor was the 5th Division's signal officer, in charge of its messages. He said: "Were it not for the Navajos, the Marines would never have taken Iwo Jima."

No enemy ever broke the code. It stayed classified, meaning officially secret, until 1968. The original twenty-nine received the Congressional Gold Medal, a medal that members of Congress vote to give, on July 26, 2001, and the code talkers who came after them received silver medals.

Jim Thorpe

Who: Sac and Fox athlete and Carlisle student, the first Native American to win an Olympic gold medal.

When and where: Stockholm, July 1912. Olympic officials took his medals in 1913 and named him the sole champion again in 2022.

Movie: *Jim Thorpe – All-American* (1951)

Olympic officials took his gold medals over two dollars a game.

Jim Thorpe was a citizen of the Sac and Fox Nation and a student at the Carlisle Indian Industrial School, the federal boarding school in Pennsylvania. There he was twice named a football All-American, one of the best college football players in the country.

He won the pentathlon, a contest of five track and field events, on July 7, and the decathlon, a contest of ten, on July 15, at the Stockholm Olympics in 1912. His decathlon score stood as the world record until 1927.

Olympic officials took both medals back in 1913. Thorpe had played minor-league baseball in 1909 and 1910 for a reported two dollars a game, up to $35 a week. The Olympic rules of the time allowed only amateurs, athletes who are not paid to play.

Restored. Officials of the International Olympic Committee named him co-champion in October 1982, sharing the titles with Hugo Wieslander in the decathlon and Ferdinand Bie in the pentathlon. On July 15, 2022, 110 years to the day after his decathlon win, they named him the sole champion of both events.

Ira Hayes

Who: Akimel O'odham (Pima) Marine from the Gila River community in Arizona, one of the six men who raised the second flag on Mount Suribachi.

When and where: Iwo Jima, February 23, 1945. He died in Arizona on January 24, 1955.

Movie: *The Outsider* (1961). Adam Beach also plays him in *Flags of Our Fathers* (2006).

He raised the flag on Iwo Jima and died of exposure at 32.

Ira Hayes, from the Gila River Indian Community in Arizona, was a Marine paratrooper, a soldier trained to jump from planes by parachute. He was one of the six men who raised the second American flag on Mount Suribachi, on Iwo Jima, on February 23, 1945. Americans celebrated the photograph of that flag-raising.

Hayes came home to a fame he had not asked for. He and two other men from the photograph raised a flag at a ceremony in Washington on May 9, 1945. The ceremony started a tour to sell war bonds, loans people made to the government to pay for the war. Later that month the Marines ordered Hayes back to his unit.

Americans celebrated the photograph, but Hayes got little help after the war. Police arrested him 52 times for being drunk in public. Years later President Dwight Eisenhower met him and called him a hero.

Hayes was found dead on the morning of January 24, 1955, near an empty mud-brick hut close to his home at Sacaton, in the Gila River community. He had been drinking the night before. The coroner, the official who decides how a person died, gave the cause as alcohol poisoning and exposure, dying from cold or other harsh weather without shelter. He was 32.

Chester Nez

Who: Navajo Marine, one of the twenty-nine who built the code. As a boarding-school student, he was punished for speaking the language the code was made from.

When and where: the Fort Defiance boarding school, Arizona, then the Pacific, 1942 to 1945. He died June 4, 2014.

He outlived the other twenty-eight who built the Navajo code.

When Chester Nez spoke Navajo at the Fort Defiance boarding school, staff washed his mouth out with soap.

Marine Corps recruiters signed Nez up in 1942. He was one of the twenty-nine who went to San Diego and built the code out of the language.

He wrote about what happened to him in *Code Talker*, a memoir, or book about the writer's own life, published in 2011 with Judith Schiess Avila. It is the only memoir by one of the original twenty-nine. Nez died on June 4, 2014, the last of the twenty-nine still alive.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 15 MINUTES

Native nations spent these fifty years fighting a federal plan to end them as nations, and winning back the running of their own affairs. Members of Congress declared in 1953 that the United States should end its recognition of Native nations, which means its dealings with each nation as a government. Twenty-two years later, in 1975, President Ford signed a law under which Native nations could take control of their own schools, clinics and police.

The Menominee, whose nation members of Congress had terminated, ending its recognition, organized until members of Congress restored it. Fishermen in the Northwest kept fishing until a federal judge ruled on their 1850s treaties. A group called Indians of All Tribes took Alcatraz Island and held it for nineteen months. In 1980, in the Sioux Nation's Black Hills case, the justices of the Supreme Court ruled that United States officials had broken the 1868 treaty when they took the hills.

Termination and relocation

Members of Congress passed House Concurrent Resolution 108, a formal statement of policy that they voted on, on August 1, 1953. In it they declared that the United States should end its recognition of Native nations, along with the federal services that came with it. The policy's name was termination. Under it, members of Congress and federal officials stopped treating a tribe as a nation with its own government, and the tribe lost its federal services.

Members of Congress ran about sixty termination proceedings, the formal legal steps that ended a nation's recognition, between 1953 and 1970. Those proceedings covered more than a hundred tribes and bands. More than 3 million acres of land stopped being held in trust, which meant the United States no longer held that land on the nations' behalf.

The Menominee. The Menominee of Wisconsin ran a profitable timber business. Members of Congress passed the Menominee termination act in 1954. It took effect in 1961, and the Menominee, who had done well before, became poor. Menominee people organized a movement called DRUMS, with Ada Deer among its leaders. They kept pushing until members of Congress reversed the termination. The Menominee Restoration Act became law on December 22, 1973.

Officials of the Bureau of Indian Affairs, the federal agency in charge of Indian affairs, also moved Native people off reservations and into cities in these years. They began this relocation program between about 1948 and 1952, and members of Congress backed it with the Indian Relocation Act of 1956. People who signed up got a one-way ticket and short-term help. About 30,000 people moved in the 1950s, and more than 100,000 had moved by the time the program ended in the 1970s.

Many of them lived in poverty in the cities. They also built lasting Native communities in Minneapolis, Chicago, Oakland and San Francisco, Los Angeles, and Denver. The next Native movement started in those cities.

Alcatraz and Wounded Knee, 1969 to 1973

George Mitchell, Dennis Banks, Clyde Bellecourt and about 200 other people founded the American Indian Movement, known as AIM, in Minneapolis in July 1968. Its members began with street patrols against police abuse. Many Native people had moved to Minneapolis under relocation.

Alcatraz. A group calling itself Indians of All Tribes landed on Alcatraz Island in San Francisco Bay on November 20, 1969. They occupied the island's federal prison, closed since 1963, moving in and holding it. Richard Oakes, who was Mohawk, was among the leaders. In their proclamation, a public statement, they offered to buy the island for "$24 in glass beads and red cloth." They held it for nineteen months, until June 11, 1971. After the occupation began, President Nixon ended termination as federal policy.

Blue Lake. Nixon also signed H.R. 471, a law that members of Congress had passed, on December 15, 1970. Under it, Blue Lake and 48,000 acres of sacred land went back to Taos Pueblo.

Alaska. A year after Blue Lake, members of Congress settled the land claims of Alaska Natives, ending them by agreement. The Alaska Native Claims Settlement Act became law on December 18, 1971. Under it, the claims were settled for 44 million acres and $962.5 million.

That is nearly as much land as the 48 million acres all Native nations together held in 1934. The land and money went to twelve regional corporations, later thirteen, and to more than 200 village corporations. These were businesses, and Alaska Natives became their owners, called shareholders.

Wounded Knee, 1973. About 200 Oglala Lakota and AIM members occupied the village of Wounded Knee, on the Pine Ridge Reservation in South Dakota, in 1973. They chose it because soldiers of the 7th Cavalry had killed between 250 and 300 Lakota people there in 1890. Of the 146 dead whom a burial party put in one grave there, 62 were women and children.

The occupiers held the village for seventy-one days, from February 27 to May 8, against federal marshals, officers who carry out the orders of the national courts, and agents of the FBI, the national police force that looks into federal crimes. The federal forces surrounded the village with armored vehicles.

Why they came. The occupiers were protesting against the treaties that United States officials had broken, and against Richard Wilson, the tribal chairman at Pine Ridge since 1972, who was Oglala himself.

His opponents accused him of corruption, of giving the few jobs and benefits to his family and friends, and of using an armed group of his own, the Guardians of the Oglala Nation, known as the GOONs, to attack people who opposed him. Three weeks before the occupation, members of the tribal council had brought charges against him at a hearing to remove him from office, and Wilson avoided a trial.

Both sides fired shots during the siege, the seventy-one days in which federal forces surrounded the village. Early in the siege, someone shot US Marshal Lloyd Grimm, and afterward he could not move his legs. Accounts of the siege do not say who shot him.

Frank Clearwater, an Eastern Cherokee man, was shot in the head on April 17 while he rested in a church during a gunfight with federal forces. He died on April 25. FBI officials released a report on deaths on the Pine Ridge Reservation in 2000. It found that Clearwater was killed by gunfire from federal officers, who were firing back after people shot at them.

A federal agent firing as a sniper, a hidden marksman, shot and killed Lawrence "Buddy" Lamont, an Oglala man, with a bullet through the heart on April 26.

The charges. Judge Fred Nichol threw out the charges against the AIM leaders Dennis Banks and Russell Means in 1974. He wrote that "the misconduct by the government in this case is so aggravated that a dismissal must be entered in the interests of justice." He meant that government officials had broken the rules so badly that the case had to end.

The fish-ins and the Boldt decision

Leaders of the Northwest nations signed treaties with Isaac Stevens, the governor of Washington Territory, in the 1850s. In them they gave up land and kept the right to fish.

The Treaty of Medicine Creek, signed by the Nisqually, the Puyallup and other nations on December 26, 1854, says that "the right of taking fish, at all usual and accustomed grounds and stations, is further secured to said Indians." Those words promised that they could keep fishing at all the places where they had always fished. A century later, Washington State officers were arresting their people for fishing.

Through the 1960s and into the 1970s, the Nisqually, the Puyallup and other nations held fish-ins. At a fish-in, people fished in the open, in front of the state's officers, and let themselves be arrested. They did it to force the treaties into a courtroom. Frank's Landing on the Nisqually River was the center of the fish-ins.

Judge George Boldt heard the treaty case, *United States v. Washington*, in federal court. He ruled on February 12, 1974, that the treaty rights still stood. Under them, the tribes had a right to half the harvestable salmon, the salmon that could be caught each year.

Boldt also ruled that the tribes were co-managers of the fishery, the salmon catch and the waters it comes from, so that tribal governments and the state run it together. The justices of the Supreme Court upheld the ruling in 1979, which means they let it stand.

Why do the Lakota refuse more than a billion dollars?

The Lakota have refused the money that Supreme Court justices awarded them for the Black Hills in 1980, which with the interest it has earned is now more than a billion dollars. Lakota leaders say that the Black Hills were never for sale.

United States officials guaranteed the Black Hills of South Dakota to the Lakota in the Fort Laramie treaty of 1868. Members of an Army expedition led by George Custer announced in 1874 that they had found gold there. United States officials ignored the treaty and took the hills.

The Lakota call one mountain in the Black Hills Tunkasila Sakpe, the Six Grandfathers. It is the mountain known in English as Mount Rushmore.

The justices of the Supreme Court held in *United States v. Sioux Nation*, in 1980, that United States officials had broken the treaty when they took the hills. They awarded the Lakota compensation, money paid to make up for a loss.

Self-rule, children taken and women sterilized

President Ford signed the Indian Self-Determination and Education Assistance Act in January 1975, self-determination meaning a nation deciding its own affairs. Under the act, a nation could sign a contract with the federal government and run federal programs itself, such as its own schools, clinics and police. The word Education is in the act's name because schools were at the center of it.

Children taken. While nations were taking over their own programs, workers at agencies were still taking Native children from their families, as they had for decades before 1978. Writers at the National Indian Child Welfare Association state that 25 to 35 percent of Native children were taken, between one in four and one in three. They also state that 85 percent of them were placed outside their families, even when relatives or members of their tribe could care for them.

Members of Congress passed the Indian Child Welfare Act in 1978. In it they set federal standards for those cases, meant to keep Native children with Native families. They also gave tribal courts the power to decide the cases.

Sterilized. Doctors at hospitals of the Indian Health Service, the federal agency that runs hospitals and clinics for Native people, sterilized thousands of Native women in the same years. Sterilization is an operation after which a woman can never become pregnant. The doctors at these hospitals did two kinds of operation. In a tubal ligation, a surgeon cuts or ties the two tubes that carry eggs to the womb. In a hysterectomy, the surgeon cuts out the womb.

Investigators from the General Accounting Office, a federal office, studied 4 of the agency's 12 areas. In 1976 they reported 3,406 sterilizations of Native women there from 1973 to 1976. Writers at the National Library of Medicine state that the women had not given their permission. The investigators' report does not name the doctors. No surviving record says how many of the women had each kind of operation.

Thirty-six of the women were under 21, although a court had ordered a stop to sterilizing women that young. Two years before the report, Dr. Connie Pinkerton-Uri, a Choctaw and Cherokee doctor, had found that one in four Native women had been sterilized without agreeing to it.

Gaming. Ten years after the child welfare law, members of Congress set rules for gaming run by Native nations, meaning gambling businesses such as casinos. Their Indian Gaming Regulatory Act became law on October 17, 1988. For some nations gaming became a large source of income, and the amount varies a great deal from nation to nation.

Under the act, tribal gaming falls into three classes of games, and a nation and a state can make a compact, a formal agreement about the games. In the act, members of Congress also set up the National Indian Gaming Commission to watch over tribal gaming.

President George H. W. Bush signed the Native American Graves Protection and Repatriation Act, known as NAGPRA, on November 16, 1990. Under it, Native human remains and sacred objects held in museums and federal collections belong to the nations and families they came from, and the people holding them must send them home, which the law's name calls repatriation.

Nations take the schools back

Navajo leaders founded a college of their own at Tsaile, Arizona, in 1968. It was called Navajo Community College, and today it is Diné College. It was the first college in the country controlled by a Native nation. Native nations have founded dozens of tribal colleges since.

Senators on a Senate subcommittee on Indian education, a small group of senators assigned to that one subject, published their report in November 1969. The report's title is *Indian Education: A National Tragedy, A National Challenge*. It is known as the Kennedy Report, because Senator Robert F. Kennedy led the work at first and Senator Edward Kennedy finished it.

The report states that federal policy had been "coercive assimilation," forcing a group of people to give up their own language and ways of life, with "disastrous effects." Its authors called for Native people to run Native schools.

Boarding-school enrollment peaked at about 60,000 children in 1973. After that it fell, as the leaders of Native nations took over schools under the 1975 law and other schools closed. A few boarding schools are still open, run by tribes or by the Bureau of Indian Education, the federal office in charge of Indian schools. People who had been children at the schools began publishing accounts of what had happened to them there.

Wilma Mankiller

Who: the first woman elected Principal Chief of the Cherokee Nation.

When and where: Cherokee Nation, Oklahoma. She was chief from December 14, 1985 to August 14, 1995.

Movie: *Mankiller* (2017)

Cherokee voters re-elected her in 1991 with 83 percent of the vote.

Wilma Mankiller was a child when her family moved to San Francisco under the relocation program. She joined the movement during the occupation of Alcatraz by Indians of All Tribes in 1969.

She went back to Oklahoma. There she worked on projects in which Cherokee communities built their own water lines and health clinics, with the people who lived there doing the work.

She became Principal Chief of the Cherokee Nation, the head of the nation's government, on December 14, 1985, when Ross Swimmer left the office. Cherokee voters elected her in her own right in 1987 and re-elected her in 1991. Until August 14, 1995, she led a nation of about 140,000 citizens.

She received the Presidential Medal of Freedom, an award given by the president of the United States, in 1998. Mankiller died on April 6, 2010.

Billy Frank Jr.

Who: Nisqually fisherman, a leader of the fish-ins, who later chaired the Northwest Indian Fisheries Commission.

When and where: Frank's Landing on the Nisqually River, Washington. He was first arrested at fourteen.

Officers arrested him more than fifty times for fishing the Nisqually.

Billy Frank Jr. was fourteen, in 1945, the first time officers arrested him for fishing the Nisqually River. He kept fishing through the fish-ins of the 1960s and 1970s, and he went to jail more than fifty times.

After the Boldt decision of 1974, Frank chaired the Northwest Indian Fisheries Commission.

He died in May 2014 and received the Presidential Medal of Freedom after his death, in 2015. As of 2026, Washington State officials planned to place his statue in the National Statuary Hall in the United States Capitol.

Adam Fortunate Eagle

Who: Ojibwe writer. He was a Pipestone boarding-school student who became a lead organizer of the Alcatraz occupation.

When and where: Pipestone Indian Boarding School, Minnesota, 1935 to 1945. San Francisco Bay, 1969 to 1971.

He called his boarding-school days "a little bit of heaven."

Adam Fortunate Eagle spent ten years at the Pipestone Indian Boarding School in Minnesota, from 1935 to 1945. In those years John Collier was Commissioner of Indian Affairs, and federal officials were changing some of the schools. Three decades later, Fortunate Eagle was one of the lead organizers of the occupation of Alcatraz.

He published his account of the school, *Pipestone: My Life in an Indian Boarding School*, in 2010. The line about heaven is from that book. In the same book he writes about the harm the boarding-school system did.

Other people who were children at the schools told it differently. Chester Nez was punished with soap for speaking Navajo at Fort Defiance, and Zitkala-Ša's essays of 1900 criticized her school.

BY 2000

If you remember one thing: Members of Congress set out to end the nations as governments in 1953, and by 2000 the nations were running many of their own schools, clinics and courts.

- 1973: Members of Congress restore the Menominee Nation, twelve years after its termination took effect.
- 1974: Judge George Boldt rules that the treaty tribes have a right to half the salmon that can be caught.
- 1978: Members of Congress pass the Indian Child Welfare Act and give tribal courts the power to decide Native children's cases.

Next: After 2000 the first Native cabinet secretary had her officials count the boarding-school dead, and five Supreme Court justices ruled that a reservation in Oklahoma had never ended.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 10 MINUTES

Native nations govern themselves today. There are 574 federally recognized Native nations in the United States, which means that United States officials deal with each one as a government. There are also nations recognized by their states, and nations still working to win federal recognition. More than 200 Alaska Native villages have their own corporations. Native Hawaiians have no federally recognized government of their own.

Census takers counted 9.7 million people who identified as American Indian or Alaska Native, alone or together with another group, in 2020. That was 2.9 percent of the people in the country, and almost forty times the 250,000 counted in 1900.

The Navajo Nation's land covers more than 27,000 square miles across Arizona, New Mexico and Utah. It is the largest reservation in the country. The number of Cherokee Nation citizens passed 450,000 in 2023, counting

enrolled citizens, people officially listed as members. Some counts in 2024 and 2025 put it above 475,000.

The National Museum of the American Indian opened on the National Mall in Washington on September 21, 2004. About 25,000 Native people from across North and South America walked in the opening procession.

Sovereignty in court and in office

Justices of the Supreme Court ruled on a question of Native sovereignty, a nation's right to govern itself, in 2020. When United States officials forced the Muscogee (Creek) Nation to move to Oklahoma, they promised it a reservation there. The justices decided *McGirt v. Oklahoma*, a case about whether that reservation still existed, on July 9, 2020. Five of the nine justices held that members of Congress had never ended it. Four justices disagreed.

Under the ruling, about 3.25 million acres of eastern Oklahoma, including much of Tulsa, are still reservation land. Because of that, Oklahoma's state officials can no longer put Native people on trial for major crimes there. Those cases go to federal and tribal courts instead. Justice Neil Gorsuch wrote the opinion, the written decision of the court. Its first sentence is: "On the far end of the Trail of Tears was a promise."

The Trail of Tears was the forced removal of the Cherokee and the other Southeastern nations to Indian Territory, in what is now Oklahoma, in the 1830s. In later rulings, judges applied the same reasoning to the reservations of the other nations that United States officials had forced out of the Southeast.

Seven of the nine justices upheld the Indian Child Welfare Act, which means they kept it in force, in *Haaland v. Brackeen* on June 15, 2023. The people challenging the act had claimed that it broke the Constitution. Two justices disagreed with the ruling.

Deb Haaland of Laguna Pueblo and Sharice Davids, who is Ho-Chunk, became the first Native American women elected to Congress in 2018. In 2021 Haaland became the first Native American cabinet secretary, as Secretary of

the Interior, the head of the federal department in charge of the government's dealings with Native nations.

Standing Rock, and land returned

Leaders of the Standing Rock Sioux Tribe opposed the Dakota Access Pipeline, a long pipe built to carry oil, in 2016. Its route ran under Lake Oahe, upstream of the reservation. The lake is the reservation's water supply.

People set up camps beginning in April 2016, among them one called Oceti Sakowin. Young people carried the tribe's message on foot. They ran a 500-mile relay to the office of the Army Corps of Engineers, the part of the army whose permission the pipeline needed, in Omaha, and then a 2,000-mile run to Washington, D.C. Thousands of people came to the camps. News reports at the time called the camps the largest gathering of Native nations in more than a century.

North Dakota's governor, Jack Dalrymple, declared an emergency in August 2016 and put the Morton County Sheriff's Office and other police forces under one command. On November 20, 2016, at the Backwater Bridge, officers fired tear gas, rubber bullets and bags filled with lead into a crowd of protesters. They also sprayed the protesters with a fire hose.

Sophia Wilansky. A protester named Sophia Wilansky was hit that night. In 2026 federal appeals judges wrote out her account of what happened, in a ruling on her lawsuit. In that account, three officers fired rounds at her as she ducked behind a metal sheet, and one hit her arm. She ran about 30 yards, and as she bent to pick up a piece of plywood, a round fired by Officer Jonathan Moll hit her.

The judges described the round, called an aerial warning munition, as an exploding flash-bang inside a bullet made to hurt rather than kill. "It tore the flesh off her arm, and she fell to the ground," the judges wrote. "Her left hand and forearm are permanently and severely injured." Federal judges threw out her lawsuits and those of the other injured protesters, and no officer was held responsible.

An Army official, the Assistant Secretary for Civil Works, turned down the easement, the legal permission the pipeline needed to cross under the lake, on December 4, 2016. That same week, more than 2,000 United States military veterans arrived to stand with the camps.

The oil flows. President Donald Trump ordered the Army to approve the pipeline quickly in January 2017. Army officials granted the easement two weeks later, and oil has moved through the pipeline since that June. A federal judge cancelled the easement in 2020, but the oil kept flowing for about five years without one. Army officials granted the easement again in 2026, and the tribe's leaders then asked the court to end their own appeal.

Land returned. Some land has gone back to Native nations. Federal officials took 18,800 acres out of the Flathead Reservation in Montana in 1908 for the National Bison Range, a federal wildlife refuge, land set aside to protect wild animals. Members of Congress passed a law in December 2020 that gave the range back to the Confederated Salish and Kootenai Tribes, and the tribes took over running it in 2022.

The boarding-school investigation

Secretary Haaland started an investigation of the boarding schools in June 2021. Earlier officials of her own department had run them.

The first volume of the investigators' report came out in May 2022. It identifies 408 federal schools, and marked and unmarked burial sites at 53 of them. The final volume came out on July 30, 2024. It lists 417 federal Indian boarding schools in 37 states or places that were then territories, open from 1819 to 1969. It also lists 1,025 more places with similar aims that fell outside the four rules the investigators used to count federal schools.

The report records what school staff did to the children. Staff cut the children's hair, replaced their clothes with uniforms, gave them English names and forbade them to speak the languages they had grown up speaking. The punishments the report records for speaking those languages include beatings, solitary confinement, which means being locked up alone, holding back food, and washing children's mouths out with soap.

At least 973 children died at the schools. The investigators found at least 74 burial sites at 65 schools. The report states that the real number of deaths is higher than the number the investigators could count.

President Biden apologized on behalf of the United States for the boarding-school system on October 25, 2024. He spoke at the Gila River Indian Community in Arizona, which was Ira Hayes's home community. It was the first formal presidential apology for the system. He called the system "a sin on our soul."

Coming home. Children who died at the Carlisle Indian Industrial School are buried in a cemetery at the Carlisle Barracks, an Army post. Army officials have been digging up the children's remains and returning them to their nations.

Army officials returned two children, Little Chief and Horse, to the Northern Arapaho in 2017. When they opened the grave of a third child, Little Plume, they found two other children in it. They found Little Plume and returned him

the next year. Nine Rosebud Sioux children went home to South Dakota in July 2021, and Rosebud young people escorted them.

Schools in Native languages

Boarding-school staff punished children for speaking Native languages. In the two world wars, soldiers used two of those languages, Choctaw and Navajo, to send messages the enemy could not read. Today Native nations run schools that teach children in their own languages.

Hawaii's lawmakers banned teaching in Hawaiian in a law dating from 1896. The first Pūnana Leo immersion preschool, a school where teachers give every lesson in the language itself, opened at Kekaha on Kaua'i in 1984. Children there learn arithmetic and reading in Hawaiian instead of learning Hawaiian as one subject. The Pūnana Leo schools were the first immersion preschools in the United States in an Indigenous language, a language of the people who lived in a place first.

The ban on teaching in Hawaiian was lifted in 1986, and the first public immersion classes opened in 1987. According to ʻAha Pūnana Leo, the group that started the Pūnana Leo schools, students can now be taught in Hawaiian from preschool through graduate school, the university study that comes after a first degree.

Wôpanâak, the Wampanoag language of Massachusetts, had no living speakers after the middle of the 1800s. Jessie Little Doe Baird helped found the Wôpanâak Language Reclamation Project, reclamation meaning taking something back, in 1993. She began rebuilding the language from documents written in it.

Wôpanâak is the first American language with no living speakers to come back into living use. The project opened Mukayuhsak Weekuw, the Children's House, in September 2016. It is a school in Mashpee where Wampanoag children are taught mostly in Wôpanâak.

Cherokee, Lakota, Diné and many other nations run immersion schools of their own.

Deb Haaland

Who: Laguna Pueblo. She was one of the first two Native American women elected to Congress, and the first Native American cabinet secretary.

When and where: New Mexico and Washington, D.C., from 2018.

Her grandparents were taken to boarding school as children.

Deb Haaland is a citizen of Laguna Pueblo. She describes herself as a 35th-generation New Mexican. Members of the Senate voted to approve her as Secretary of the Interior on March 15, 2021.

The line about her grandparents is from her own account, which does not name who took them. Three months after the Senate vote, she ordered officials of her department to count what earlier officials had done at the schools. They published the final count on July 30, 2024, while she was still the secretary.

Jessie Little Doe Baird

Who: Mashpee Wampanoag social worker who became a linguist and brought back a language that no one had spoken since the middle of the 1800s.

When and where: Mashpee, Massachusetts, from 1993.

Movie: *We Still Live Here: Âs Nutayuneân* (2011)

She rebuilt a language using a Bible printed in 1663.

By her own account, the work began with a dream about the language.

Among the written records of the language was the Eliot Bible, a Bible printed in Wôpanâak in 1663. Baird used that Bible and the other documents to rebuild the language.

After she helped found the project in 1993, Baird went to the Massachusetts Institute of Technology and earned a degree in linguistics, the study of how languages work. Her daughter grew up speaking Wôpanâak. In 2010 the MacArthur Foundation gave Baird a MacArthur Fellowship, a prize for people's work.

THE THREE QUESTIONS, ANSWERED

1. **How did Native nations govern themselves and deal with other nations before the United States existed?** They ran their own councils and laws, as the Haudenosaunee did under the Great Law of Peace. Their leaders made alliances and treaties and recorded them on wampum belts.
2. **What did United States officials and soldiers do to take the nations' land and break the nations up?** Soldiers forced whole nations west and onto reservations, and killed hundreds of people at a time at Sand Creek, Wounded Knee and other places. Officials cut

the nations' land from about 138 million acres to 48 million and took children to boarding schools, where at least 973 died.

3. **How did Native nations hold on to their governments, their languages and some of their land?** They went to court, from *Worcester v. Georgia* in 1832 to *McGirt v. Oklahoma* in 2020. They organized until members of Congress restored the Menominee, and they kept their languages, first in secret and now in schools of their own.

What changed: Nations that held nearly the whole continent in the 1600s had lost most of it by 1900, and after 1950 they won back the running of their own governments, schools and courts.

FIVE DATES TO KEEP

1680: Pueblo fighters drive the Spanish out of New Mexico.

1838: Soldiers force the Cherokee west on the Trail of Tears.

1887: Allotment begins under the Dawes Act.

1974: Judge George Boldt upholds the Northwest fishing treaties.

2020: Five justices rule that the Muscogee (Creek) reservation never ended.

NOT KNOWN: whether anyone carried out Oñate's 1599 sentence to cut off the Acoma men's feet, which the Acoma account says happened to 24 men.

Where to go: The National Museum of the American Indian, on the National Mall in Washington, D.C.

Next: Chapter 3, Land and Environment. It asks how Americans cleared, used up and protected the land, and who lost most at each step.

Chapter 3: Land and Environment

CHAPTER 3 OF 37 · LAND AND ENVIRONMENT · 10 ERAS · ABOUT 95 MINUTES

Americans cleared this land, used it up and then saved pieces of it, and at almost every step the people who lost most had the least say: first Native nations, later poor and Black neighborhoods.

Miantonomi, a leader of the Narragansett nation, told the Montaukett people on Long Island in 1642 what the English were doing to the land. The plains had once been full of game, he said, but the English were cutting down the grass and the trees. Their cows and horses ate the grass, their hogs spoiled the clam banks, and he warned that his listeners would all starve. An English soldier wrote his words down. The next year, English officials sentenced Miantonomi to death.

This chapter follows the land itself through ten eras, from Native nations burning forests on purpose to government fire crews learning that same kind of burning from Yurok people today. Keep an eye on two things. The first is the numbers. Beavers, salmon, forests, 30 million bison and billions of passenger pigeons fall era by era. Some, like the eastern forests and the bison, later climb back, and the passenger pigeon never does. The second is who had to move. The families driven out of the first national parks were Native. The neighborhoods beside the waste dumps of the 1900s were far more likely than others to be Black or poor.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did Native nations shape the land before Europeans came?
2. What happened to the 30 million bison and the billions of passenger pigeons?

3. Who was pushed out when parks were made, and who lived next to the waste?

Five minutes? Read "Yosemite and the Ahwahneechee" in 1850 to 1900.

Can skip: "Whaling from Nantucket", "The forest reserves", "Plastic in the rain". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 2 MINUTES

Native nations shaped the land of North America for thousands of years before any European arrived. In the eastern forests, people set fires on purpose to keep the woods open and to grow food for the animals they hunted. Farmers planted three crops together in a way that kept the soil good. In southwest Florida, the Calusa built pens in the water to hold live fish.

Animals shaped the land too. Beavers dammed streams across the continent, and bison grazed the Plains. Nobody knows how many bison lived there before 1500. The figure usually given, about 30 million, is for the early 1800s, before hunters killed off the herds.

Why Native people burned the woods

For thousands of years, Native people in what is now the eastern United States burned their forests on purpose to keep them open. They set low fires in the understory, the layer of brush and small plants under the tall trees. They burned the same ground again and again. The fires helped oaks and other trees that can live through fire. Food plants grew back after each burn, and so did food for game, the wild animals people hunted.

What the trees show. Researchers at Penn State, a university in Pennsylvania, published a study in the journal *Annals of Forest Science* in 2019. They found that which trees grew in the eastern forests depended more on Native burning than on the climate. Even small groups of people burned large areas, over and over. European colonists treated this burning as unimportant.

Three crops in one field

Native farmers grew corn, beans and squash together in the same field, three crops known as the Three Sisters. The beans put nitrogen, a natural substance that plants need to grow, into the soil. The wide squash leaves shaded the ground and held the soil in place. The tall corn stalks gave the bean vines something to climb.

Growing the three crops together kept the soil good for years. A field planted with only one crop, year after year, wears out.

Beavers, bison and fish pens

Beavers changed whole watersheds, all the land that drains into one stream or river. Their dams held back water in ponds. The ponds slowed floods, and the wet ground around them became meadows. Nobody counted the beavers, so the numbers are estimates. They run from 60 million to 400 million beavers in North America before the fur trade, the buying and selling of animal skins between European traders and Native trappers.

Bison lived on the Plains, the wide grasslands in the middle of the continent. About 30 million lived there in the early 1800s. Estimates for the years before Europeans came are less certain.

In what is now southwest Florida, the Calusa people built watercourts between 1300 and 1400. These were pens in the water that held live fish until people needed them for food.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

Two things changed the land of the Americas in the 1500s: new animals arrived from Europe, and most of the Native people who had farmed the land died. Ships brought pigs, horses, cattle and earthworms. Pigs that escaped from the Spanish explorer Hernando de Soto and his men went wild in the Southeast, and European earthworms moved into northern forests that had never had worms.

Most of the Native people died of diseases that came across the ocean with Europeans: with European settlers, and with the Africans whom Europeans had enslaved and carried over. European soldiers and settlers killed others in wars to take Native lands, and many starved. Forest grew back over the farmland of the people who died.

Pigs, horses and cattle

Pigs that escaped from Hernando de Soto's herd became the ancestors of the feral hogs of the Southeast, pigs from farm stock that live in the wild.

Thirteen pigs. De Soto landed near Tampa Bay, in what is now Florida, in May 1539, with about 600 men and a herd of pigs. The written histories of his expedition list the first herd as 13 pigs. By the time de Soto died in 1542, the herd had grown to about 700. That count leaves out the pigs the men ate or gave away and the pigs that escaped.

Horses and cattle came with the Spanish. Columbus brought horses on his second voyage, in 1493, and Spanish colonists brought horses and cattle to their colony in New Mexico in 1598.

Earthworms

Before Europeans came, the forests of northern North America had no earthworms. Glaciers, thick sheets of ice that once covered the north, had scraped the ground bare of them. For roughly the last 12,000 years, the forests that grew back after the ice stood on a thick, soft layer of fallen leaves called duff. Native wildflowers and young trees grew in it.

European earthworms crossed the ocean hidden in ballast soil, heavy dirt carried low in a ship to keep it steady. Worms also came in the soil around the roots of plants brought from Europe. Later they spread west with wagons, horses and farms. Where European worms move into a northern forest, they eat the duff that the wildflowers and young trees need.

Forest over lost farms

Most of the Native people of the Americas died after 1492. Epidemics, diseases that spread quickly to many people, killed most of them. European settlers brought the diseases, and so did enslaved Africans whom Europeans had carried across the ocean. The diseases included smallpox, measles and influenza, and Native people had never been exposed to any of them before.

European soldiers and settlers made war on Native nations to take their land, and they enslaved Native people. Famine, a lack of food so great that people starve, followed when too few people were well enough to farm.

What the deaths did to the land. A team of researchers at University College London, in England, published an estimate in 2019. They estimated that the Native population of the Americas fell from about 60 million to about 6 million within roughly a hundred years. Other estimates of the starting number differ. For North America north of Mexico alone, they run from 1 million to 18 million.

The team estimated that about 55.8 million hectares of farmland grew back into forest after its farmers died. A hectare is a square 100 meters on each side, so that is an area bigger than California.

The new trees took carbon dioxide, a gas that traps heat, out of the air. By the team's estimate, the regrowth lowered the carbon dioxide in the air by 7 to 10 parts in every million. It cooled the whole planet by about 0.15 degrees Celsius, about a quarter of a degree Fahrenheit. All of these figures are this one team's estimates.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 4 MINUTES

English colonists and the Native nations of New England had different ideas in the 1600s about what land was for. The colonists treated land as property that one owner held forever, marked off with fences and recorded in deeds, the papers that say who owns a piece of land. The Native nations used their land by season, with planting grounds, fishing places and hunting grounds, and no one person owned it forever.

The historian William Cronon describes these two ways of using land in his 1983 book *Changes in the Land*. The colonists let their cattle and hogs roam free. The animals got into Native planting fields, and colonists and Native people quarreled over it again and again, as the Narragansett leader Miantonomi told his listeners in 1642.

Trappers changed the land too. They caught so many beavers for the fur trade in these years that the beaver's numbers began a long fall.

The beaver trade

Hat makers in Europe wanted beaver fur to make felt, a thick cloth made by pressing fur together. Native trappers caught the beavers, and European traders paid for the furs with goods made in Europe. The number of beavers in the Northeast began to fall in the 1600s.

The fall went on until about 1900, when about 100,000 beavers were left in North America, most of them in Canada. Today there are roughly 15 million, against the 60 million to 400 million of the years before the fur trade. All of these numbers are estimates.

The first limits on cutting trees

A Plymouth Colony rule of 1626 forbade anyone to cut timber, wood for building, on the colony's land, or to sell it, without official permission. It was among the earliest conservation rules in the colonies, rules for protecting land, water, plants and animals so that people do not use them up.

William Penn wrote rules for settlers in Pennsylvania in 1681. For every five acres a settler cleared of trees, Penn's rules required the settler to leave one acre, a piece of land a little smaller than a football field, still covered in trees. The rules named oaks and mulberry trees, which were useful for ships and for silk. Settlers widely ignored this rule.

Miantonomi

Who: A sachem, or leader, of the Narragansett nation, who said out loud in 1642 what English settlers were doing to Native land.

When and where: A speech to the Montaukett people on Long Island in 1642, written down by the English soldier Lion Gardener. He was killed near present-day Norwich, Connecticut, in 1643.

English officials sentenced him to death and handed him to his enemy.

Miantonomi spoke to the Montaukett people on Long Island in 1642. English settlement in New England was then about one generation old, and he told them what the English were doing to the land.

Lion Gardener, an English soldier, wrote the speech down in his *Relation*, an account he set down in 1660, years later. By Gardener's record, Miantonomi said that "our fathers had plenty of deer and skins and our plains were full of game and turkeys."

Then he said that the English "with scythes cut down the grass, and with axes fell the trees" (a scythe is a long curved blade for cutting grass, and to fell a tree is to cut it down). He went on: "their cows and horses eat the grass, and their hogs spoil our clam banks, and we shall all be starved."

KNOWN:	The complaints match what colonists were doing at the time, cutting the forests and letting their cattle and hogs roam into Native fields.
NOT KNOWN:	Nobody can check Miantonomi's exact words, because an Englishman wrote them down years after the speech.

The sentence. Uncas, the sachem of the Mohegan nation, captured Miantonomi in 1643 and took him to Hartford. That September the commissioners of the United Colonies of New England met in Boston. They were English officials from the Massachusetts Bay, Plymouth,

Connecticut and New Haven colonies. They passed the case to a group of ministers, or church leaders. Then the commissioners sentenced Miantonomi to death and handed him back to Uncas to carry out the sentence.

Governor John Winthrop of Massachusetts Bay wrote in his journal that "they all agreed that he ought to be put to death." He gave their reason, spelling the name a different way: "Uncas could not be safe while Miantonomo lived."

Mohegan men took Miantonomi back to the place near present-day Norwich, Connecticut, where he had been captured. There one of Uncas's men, walking behind him, killed him with a hatchet blow to the head. Mohegan tradition and later histories name that man as Wawequa, the brother of Uncas. By the historian Neal Salisbury's account, several Englishmen went along to make sure the killing was carried out.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 3 MINUTES

Colonists of the early 1700s used land and sea as if there would always be more. Tobacco planters in Virginia, the owners of large farms called plantations, wore out the soil of a field in three or four years. Then they cleared new ground farther up the rivers and moved on.

In New England the king's officials saved one thing, the largest white pines, for the masts of the Royal Navy, Britain's navy. Whalers from the island of Nantucket were sailing far out into the ocean to hunt sperm whales by the middle of the century.

The king's pines

The king's officials kept the largest white pines in New England for the masts of the Royal Navy's ships, the tall poles that hold up the sails. The rule appeared in the Massachusetts Bay charter of 1691, the written grant from the king that set up the colony's government. It covered every white pine 24 inches across or more.

Under the White Pine Act of 1722, cutting any white pine more than 12 inches across without a license, or written permission, was against the law in New Hampshire and nearby colonies. The king's trees carried a mark called the Broad Arrow, three slashes cut with a hatchet. Royal officials enforced these laws loosely until the 1760s.

Worn-out tobacco fields

A tobacco field in colonial Virginia gave good crops for only three or four years. After that, planters cleared new ground and let the old field grow over with scrub, brush and small trees. The land around Jamestown wore out early. Planters moved up the rivers and reached the Rappahannock and the Potomac by about 1650, and they kept moving up the rivers all through the 1700s. Because new land was cheap, they kept wearing out one field after another.

Whose land it was. The new land along the Rappahannock River was the homeland of the Rappahannock Tribe. The tribe's own history states that English settlement there began illegally in the 1640s. By that history, Rappahannock leaders sold their first land to the English in 1651. They spent more than ten years in county courts trying to get paid for that sale and others, and they never received full payment.

The tribe's history goes on to say that by the late 1660s, settlers and bands of settlers who acted as their own law had forced the Rappahannock to move. The tribe moved first inland on the north side of the river, and later to its old hunting grounds on the south side. In 1683, the history states, officials of the Virginia colony forced the tribe out of their homes and moved them to a place called Portobago Indian Town.

Who did the work. Indentured servants and enslaved Africans worked the tobacco fields. An indentured servant worked for a master for a set number of years, often four to seven, to pay for the trip to America. Planters held enslaved Africans as property and forced them to work without pay for life. Under a Virginia law of 1662, a child born to an enslaved mother was enslaved for life too. Growing tobacco took a great deal of hand work, and planters wanted more and more workers to do it.

Whaling from Nantucket

Whalers from Nantucket, an island off Massachusetts, were hunting sperm whales far out in the ocean by the middle of the 1700s. Before that, New Englanders hunted right whales, another kind of whale, from the beaches. On Nantucket, people tell a story that deep-sea whaling began there in 1712, when wind blew Christopher Hussey's boat out to sea and the men aboard killed a sperm whale.

KNOWN:	Obed Macy first wrote the story down in his history of Nantucket in 1835, more than 120 years later, and historians at the Nantucket Historical Association call 1712 the traditional date.
NOT KNOWN:	No record from 1712 shows that Hussey's voyage happened the way the story tells it.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 5 MINUTES

After independence, American leaders turned the land beyond the mountains into squares that could be sold, and they took it from the nations who lived there with treaties signed under threat and then with armies. In 1785 members of Congress ordered the land north and west of the Ohio River measured into a grid. The Shawnee, the Miami, the Lenape (Delaware) and other nations lived on that land. That January, US officials had claimed most of Ohio in a treaty, a written agreement between nations, signed under threat.

Surveyors measured the land under army guard. US generals led armies against the nations, who had joined together to stop settlement, from 1790 to 1794. After General Anthony Wayne's army defeated them in 1794, leaders of eleven nations signed a treaty in 1795 in which they handed most of Ohio to the United States.

The king's claim to New England's biggest white pines ended with independence. Before that, in 1772, men in Weare, New Hampshire, beat a sheriff who came to arrest a mill owner fined for cutting them. Once the king's claim was gone, settlers crossed the Appalachian Mountains and cleared the forest for farms.

Ebenezer Mudgett

Who: A sawmill owner in Weare, New Hampshire, fined for cutting the king's white pines, who led the Pine Tree Riot.

When and where: South Weare, New Hampshire, April 13 and 14, 1772.

At dawn, 20 to 30 men with soot-blackened faces beat the sheriff.

Ebenezer Mudgett owned a sawmill in Weare, New Hampshire. He had been fined for cutting the king's white pines, the trees kept by law for the masts of the Royal Navy.

Sheriff Benjamin Whiting rode into South Weare on April 13, 1772, with a warrant to arrest Mudgett, a paper from a court that allowed the arrest. Mudgett told him he would pay in the morning.

At dawn on April 14, Mudgett came back with 20 to 30 men who had blackened their faces with soot, the black powder that smoke leaves behind. They beat the sheriff and his deputy with rods and drove them out of town. The fight became known as the Pine Tree Riot.

The trial. Eight men stood trial in the Superior Court at Amherst, New Hampshire, in September 1772, for rioting and for beating Whiting. They pleaded guilty. The four judges fined each man only 20 shillings, in British coins, and made them pay the cost of the hearing. After the riot, officials mostly stopped enforcing the law that kept the pines for the navy.

KNOWN:	Some accounts count the riot as a forerunner, an earlier event of the same kind, of the Boston Tea Party, a protest in December 1773.
NOT KNOWN:	No one has proved that the riot led to the Tea Party.

The grid, 1785

Members of the Confederation Congress, the national government of the United States before the Constitution, passed a law called the Land Ordinance on May 20, 1785. It specified how the public land would be sold. Public land was land that US officials claimed for the nation, and Native nations lived on much of it. Under the ordinance, surveyors had to survey that land, which means measure it and map it, before anyone could buy it.

The surveyors divided the land into townships, squares six miles long on each side. They cut each township into 36 sections. A section was one square mile, which is 640 acres. The sections were numbered, and members of Congress set aside section 16 in every township to support public schools.

After changes to the system in 1796, surveyors carried the grid across the continent to the Pacific Ocean. People in airplanes over the Midwest can still see its checkerboard pattern on the ground.

Whose land the grid covered

The land north and west of the Ohio River was the home of the Shawnee, Lenape, Wyandot, Miami, Ottawa, Chippewa, Potawatomi and other nations in 1785. As members of Congress saw it, the historian George W. Knepper writes, "Indian claims to that land had to be cleared." Here, cleared means ended, so that no Native nation still had a right to the land.

The treaty at Fort McIntosh. US commissioners, officials sent to do a certain job, met leaders of several nations at Fort McIntosh in January 1785, four months before the Land Ordinance passed. In the treaty they made there, the commissioners said that most of the Native people of Ohio had to stay inside a reserve, an area set aside for them, between the Cuyahoga and Maumee rivers. Under the treaty, Knepper writes, most of Ohio would be open for settlement.

The Shawnee refused to obey the treaty. Knepper writes that it was made under threat by minor chiefs who had no right to speak for their people. A year later, US commissioners forced the Shawnee into another treaty, at Fort Finney.

The first survey. Surveyors for the national government began measuring this land in eastern Ohio in September 1785, and they stopped after a few miles when they heard of an attack by Native people. They went back to work in 1786 under army guard, and they measured the land for sale while the nations who lived on it still rejected the treaty.

The war for Ohio and the Treaty of Greenville

Chapter 2 tells this war from the nations' side. The nations of the region had joined in a confederacy, a union of nations, to stop American settlement. Led by Little Turtle of the Miami and others, its warriors beat American armies in 1790 and 1791, and General Anthony Wayne's army defeated the confederacy at Fallen Timbers in 1794. Here is what the war meant for the land.

The land the nations lost. A year after Fallen Timbers, on August 3, 1795, leaders of eleven northwestern nations signed the Treaty of Greenville. In it they handed nearly 17 million acres to the United States, an area a little bigger than West Virginia. Under the treaty, the nations kept only the northwest quarter of Ohio and the lands beyond it, behind a boundary called the Greenville Treaty Line.

Clearing after independence

After independence, the British king no longer had any right to the white pines in the United States. Settlers crossed the Appalachian Mountains, some of them into the Northwest Territory, the US name for the land north and west of the Ohio River, and cut down the forest to make farms.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 5 MINUTES

New Englanders put their rivers to work and cut down most of their forests in the first half of the 1800s, and a few Americans began to write about saving wild places. Mill dams across the rivers stopped the salmon from swimming upstream to lay their eggs. By 1850 farmers had cleared most of New England's forest, partly to feed a boom in sheep.

The painter George Catlin wrote in 1832 about keeping a huge park for the bison and the Plains nations, which he called "a nation's park." He meant a park that would hold both the bison and the Native nations who lived there. In these same years John James Audubon painted the birds of North America, and Henry David Thoreau lived for two years in a cabin he built at Walden Pond, in Massachusetts.

Dams stop the fish

Atlantic salmon live in the ocean but swim up rivers to spawn, or lay their eggs. A dam across a river blocks them on the way. The first dam across the Connecticut River went up at Turners Falls, Massachusetts, in 1798, and it cut the salmon off from the water where they spawned. By the War of 1812, no salmon came into the Connecticut River at all.

The Great Stone Dam. Workers for the Essex Company, a company formed to use the river's water to power mills, built the Great Stone Dam across the Merrimack River at Lawrence, Massachusetts. They finished it in 1848. It stood 30 miles from the sea, and salmon could not get past it. By 1865 the salmon runs, the yearly trips of fish up a river, were gone from the rivers of southern New England. The runs of shad, another fish, collapsed as well.

The writers of an 1857 report in New Hampshire named three causes: the dams, fishing with no limits, and mill machinery that killed young fish.

The bare East

New Englanders had cut down most of their forest by 1850. Estimates of how much was cleared run from about 60 percent to 80 percent of the land, and some places were cleared even more. One estimate puts the forest left in 1850 as low as a quarter of New England.

A boom in Merino sheep, a kind of sheep raised for its wool, was one cause of the clearing. By 1840 New England farmers kept about 4 million sheep, more sheep than there were people, and they cleared still more forest to feed them.

Across the eastern United States, the forest reached its smallest size around 1872, roughly half the land it had covered in 1620. After that, many eastern farmers left their farms and moved west, and trees grew back on the fields they left behind.

A park for people and bison

The painter George Catlin traveled far up the Missouri River, into the West, in 1832. He feared that the bison and the Plains nations would be destroyed together. He wrote of "a magnificent park," which he called "a nation's park, containing man and beast, in all the wild and freshness of their nature's beauty." In Catlin's plan, the people who lived on the land would stay on it with the animals.

Forty years later, in 1872, Yellowstone became the first national park. By 1879 its superintendent, the official in charge, had the Tukudika people who lived there forced out and taken to a reservation, land set aside for a Native nation to live on. The next era tells how.

John James Audubon

Who: A painter and naturalist, a person who studies animals and plants in the wild. He painted *The Birds of America*, 435 life-size pictures of birds.

When and where: He lived from 1785 to 1851. His book came out from 1827 to 1838. In 1813, on the way to Louisville, Kentucky, he saw a flock of passenger pigeons that he figured at more than 1 billion birds.

Movie: *John James Audubon: Drawn from Nature* (PBS American Masters, 2007)

One flock of passenger pigeons darkened the sky for three days.

John James Audubon painted the birds of North America at their real size. His book *The Birds of America* contains 435 of these paintings. It came out from 1827 to 1838, and Audubon worked on it for about 18 years.

Audubon was riding to Louisville, Kentucky, in 1813 when a flock of passenger pigeons, wild pigeons that flew in huge flocks, passed over him. In his own account, that one flock darkened the sky for three days. He did the arithmetic himself and put it at more than 1 billion birds.

Why this story is here: About a hundred years after Audubon's count, the passenger pigeon was gone.

Henry David Thoreau

Who: A writer who also worked as a land surveyor, measuring woodlots for a living.

When and where: He lived from 1817 to 1862. He lived in a cabin at Walden Pond, near Concord, Massachusetts, from July 4, 1845, to September 6, 1847.

He lived at Walden Pond for two years, two months and two days.

Henry David Thoreau wrote about wild nature, and he earned his money measuring land. He worked as a land surveyor, measuring and mapping woodlots, pieces of land kept for growing trees.

Thoreau moved into a cabin he had built himself at Walden Pond, near Concord, Massachusetts, on July 4, 1845. He lived there until September 6, 1847. His book about those years, *Walden*, came out in 1854.

Thoreau gave a talk called "Walking" in Concord on April 23, 1851. It came out as an essay in June 1862, just after he died. In it he wrote that "in Wildness is the preservation of the world," using preservation to mean keeping something safe.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 22 MINUTES

US officials gave away the land they had taken from Native nations in these fifty years, and hunters killed nearly all the bison, the animals the Plains nations lived on. Members of Congress passed laws in 1862 for giving the land to railroad companies, to settlers called homesteaders and to the states for colleges. By one historian's count, US officials took more than 1.5 billion acres from the nations between 1776 and 1887.

On the Plains, hide hunters killed the bison for their skins, which are called hides. About 30 million bison lived there in the early 1800s, and fewer than 1,000 were left by 1900. Army generals wrote in favor of the killing, to take away the nations' food and force them onto reservations. Professional hunters killed passenger pigeons at their nesting grounds, a reported 50,000 birds a day for months at one Michigan nesting in 1878.

The first parks were made on Native land, and soldiers and officials forced out the people who lived there. Volunteer soldiers drove the Ahwahneechee people out of Yosemite Valley in 1851, and President Abraham Lincoln signed the Yosemite Grant in 1864. Yellowstone became the first national park in 1872, and its superintendent had the Tukudika people forced out in 1879. John Muir helped found the Sierra Club in 1892, in part to protect the forests and mountains of California's Sierra Nevada.

Land taken from Native nations, in acres

US officials took more than 1.5 billion acres from Native nations from 1776 to 1887, more than half the area of the United States today. They took it by treaty and by executive order, a command from the president. Historian Claudio Saunt, of the University of Georgia, made this count from maps that Charles C. Royce published in 1899, which show every piece of land US officials took from the nations by treaty or order.

Once officials had taken the land, it counted as public land, land that US officials claimed for the nation. Members of Congress then passed it on to railroads, settlers and colleges.

Railroads. President Abraham Lincoln signed the Pacific Railway Act on July 1, 1862. Under it, railroad companies received "every alternate section of public land, designated by odd numbers," meaning every other square mile. For each mile of track, a company got five of these sections on each side of the line.

The act also states: "The United States shall extinguish as rapidly as may be the Indian titles to all lands falling under the operation of this act." With those words, which use extinguish to mean end, the lawmakers told officials to end the nations' legal ownership of the land along the railroads as fast as they could. From 1850 to 1871, members of Congress granted railroad companies about 130 million acres, an area bigger than California.

Homesteads. Lincoln signed the Homestead Act on May 20, 1862. Under it, a person could claim up to 160 acres of public land and keep it after living on it or farming it for five years. Over the life of the law, US officials handed 270 million acres to private owners this way, 10 percent of the area of the United States. A National Park Service page states that much of this land "was seized from the Native Americans who previously inhabited it." Seized means taken by force.

Colleges. Lincoln signed the Morrill Act on July 2, 1862. Under it, each state received 30,000 acres of public land for each of its senators and representatives in Congress. State officials sold the land to pay for colleges

of "agriculture and the mechanic arts," which means farming and the use of machines.

A page about the act from the National Archives, the office that keeps the government's records, states that the act "resulted in the expropriation," or taking away, "of over 10 million acres from Native American tribal lands."

The reporters Robert Lee and Tristan Ahtone traced that land for the magazine *High Country News* in 2020. US officials got it through takings that the reporters call "violence-backed," meaning that violence or the threat of it forced the nations to give the land up. Officials paid the nations less than $400,000 in all. By the early 1900s, sales of the land had raised $17.7 million for 52 universities, more than 40 times what the nations were paid. In 2020 the universities still held more than 500,000 acres of it.

One example comes from Minnesota. Four bands of Dakota people signed treaties at Mendota and Traverse des Sioux in the summer of 1851. The reporters describe the conditions as "withholding of rations," or food supplies, "the threat of violence, enforced starvation." The Dakota received "less than 2.4¢ per acre."

Allotment. Chapter 2 tells how federal officials used the Dawes Act of 1887 against the nations. Here is what became of the land. Under the act, federal officials cut reservations into plots, 160 acres for the head of a family and less for others, and opened the land left over, which they called "surplus," to white settlers.

By the National Park Service's count, reservation land fell from 138 million acres in 1887 to 48 million acres in 1934. About 90 million acres, 65 percent of what the nations held, passed out of their hands.

Fire made a crime, 1850

California's state lawmakers passed a law called the *Act for the Government and Protection of Indians* on April 22, 1850. Under Section 10 of the law, it was a crime to set the prairie on fire, or to refuse to help put out a prairie fire. Section 10 states that such people "shall be subject to fine or punishment, as a Court may adjudge proper." That means a judge would choose the punishment.

Section 10 speaks of "any person or persons." The whole law was about Native people, though, and burning the land on purpose was a Native practice. Reporters at the news outlet ICT write that under California law, cultural fire, burning done by Native people to care for the land, was "explicitly banned" for more than 150 years.

The rest of the law. Under other sections of the same law, white people could take custody of Native children, meaning control over the children and where they lived, until the children were grown. Officials could also arrest Native people they called "vagrants," meaning people with no home or work. Within 24 hours, officials could hire those people out "to the best bidder" for up to four months. This was forced labor: the arrested person had to work for whoever won the bidding.

Yosemite and the Ahwahneechee

The Ahwahneechee people lived in Yosemite Valley, in California's Sierra Nevada mountains, and their headman, or leader, was Tenaya. In 1851 volunteer soldiers burned their villages and their food and drove them out of the valley.

How it started. James D. Savage was a trader who had moved onto Ahwahneechee land to mine gold and to trade. Ahwahneechee fighters attacked his trading post on the Fresno River in December 1850, took his supplies and killed two of his men. One account says Chowchilla fighters joined them.

California's governor, John McDougal, called for volunteers early in 1851 after attacks on miners and traders. About 200 men on horseback formed the Mariposa Battalion, a unit of soldiers, on January 24, 1851. Their commander was Major James D. Savage. State officials supplied their camp gear and supplies. Federal money paid for the battalion, through federal officials called US Indian commissioners.

What the battalion did. The battalion's men first entered Yosemite Valley on March 27, 1851, by the Park Service's date. A National Park Service page states that they "systematically burned villages and food supplies and forced men, women, and children away from their homes."

Lafayette H. Bunnell rode with the battalion and wrote an account of it in 1880. He writes that in Captain John Boling's company, men on foot had orders "to burn any caches they might find," the hidden stores of food. Acorns were the people's main food for the winter.

On the upper San Joaquin River, next to Yosemite, Bunnell says the huts and "adjacent supplies of acorns, were at once given to the flames." He estimated the acorns burned there at 800 to 1,000 bushels, and pine nuts too. A bushel fills a large basket, so that was 800 to 1,000 large baskets of winter food.

In Yosemite Valley, Bunnell found that "nearly all the acorns had been burnt." The battalion's men marched Tenaya and his people to a reservation on the Fresno River.

Tenaya's son. Battalion men held Tenaya's youngest son and another young man as hostages, prisoners held to force others to do something, tied to a tree. Bunnell writes that the guards let the two untie themselves "in order to fire upon them, expecting to kill them both." One guard shot Tenaya's son in the back and killed him. The other young man escaped.

Bunnell describes the shooter only as "a young man" urged on by "an old Texan," and he names neither of them. Captain Boling told the guards "that they had committed murder." Bunnell writes that "no punishment was ever inflicted upon the perpetrators," meaning the men who did it. Tenaya was killed in 1853 in a fight with Mono Lake Paiutes. Accounts of why the fight happened differ.

The park. President Lincoln signed the Yosemite Grant on June 30, 1864. With it, US lawmakers set aside Yosemite, the first land the nation's lawmakers set aside to protect and to keep for public use. California's state officials took charge of it under the grant. Yosemite became a national park on October 1, 1890.

The National Parks Conservation Association, a group that campaigns for the parks, states in an article that the 1890 park came "with authorization," or official permission, "to remove anyone making homes without permission." Ahwahneechee families came back and lived in the valley anyway, and they worked for the hotels and the park.

The count of the dead. A Park Service page states that by 1910, more than 90 percent of the Ahwahneechee who had lived in the valley were dead or missing. The page does not say how each of them died or went missing.

To Tu Ya, also called Maria Lebrado Ydrte, saw the 1851 raid as a child. She was Tenaya's granddaughter. She saw the battalion's men destroy her home in Yosemite Valley, and during the raid she saw her uncle murdered.

Because she was Tenaya's granddaughter, Tenaya's sons were her uncles, so the son the guard shot was one of them. The Park Service page does not say whether he was the uncle she saw killed, and it does not name who killed that uncle. The page describes To Tu Ya as the last survivor of the raid. She came back to Yosemite in the late 1920s and told her story.

BY 1887: Railroads, homesteaders and colleges held hundreds of millions of acres that had belonged to Native nations, and US officials had begun cutting up the reservations that were left.

Hide hunters and the railroads

Hide hunters, who sold the skins for money, killed most of the Plains bison. About 30 million bison lived on the Plains in the early 1800s. By 1900 fewer than 1,000 were left, about one for every 30,000, and one count in 1884 found only 325. The hunters called themselves "buffalo runners," because bison are also called buffalo.

The railroads. The first railroad across the country, finished in 1869, carried hunters out to the herds. Leather makers at a tannery in Pennsylvania, a place where animal skins are made into leather, found a way in 1871 to turn bison hides into leather for harnesses and machine belts. Each hide sold for $1 to $3. The Kansas Pacific and the Atchison, Topeka and Santa Fe railroads carried the hides east.

Lieutenant Colonel Richard Irving Dodge, an army officer, estimated that three railroads carried about 1.4 million hides from the southern Plains in 1872, 1873 and 1874. He had a count from one line, the Santa Fe, and guessed that the other two lines carried as many.

Dodge also figured that hunters wasted so many hides before 1874 that about three bison were killed for every hide shipped. By his estimate, that adds up to more than 3 million bison killed by white hunters in those three years, and about 1.2 million more killed by Native hunters, about 4.4 million in all. William T. Hornaday of the Smithsonian Institution reported these totals in 1889. They are Dodge's estimates, not counts.

Dodge described Kansas in the fall of 1873: "Where there were myriads of buffalo the year before, there were now myriads of carcasses. The air was foul with a sickening stench." (Myriads means huge numbers, and carcasses are the dead bodies of animals.)

Officers who wanted the bison gone

Army officers encouraged the hide hunters. Several officers also wrote that killing the bison would force the Plains nations onto reservations.

KNOWN:	No one has found a written order to kill off the bison.
DISPUTED:	Historians disagree about whether the army had a plan anyway. Robert Utley writes that the army had no official policy, but that officials cheered the killing because it would force the nations onto reservations. David Smits argues that the army followed a plan that was mostly never written down. William Dobak doubts that the army caused much of the killing at all.

What the officers wrote. General William T. Sherman wrote to General Philip H. Sheridan in May 1868 that the nations would go wherever the bison were. He suggested inviting hunters from England and America to a great buffalo hunt to "make one grand sweep of them all." In 1869 Sherman became the commanding general of the whole army.

Sheridan answered in a letter of October 15, 1868, that the best way was "to now make them poor by the destruction of their stock, and then settle them on the lands allotted to them." By "stock," Sheridan meant the nations' bison and horses. A month earlier, another officer had written in his journal that his orders were to kill all the buffalo his men found.

Not every officer agreed. Colonel William B. Hazen wrote in 1872 that killing the buffalo to take away the nations' food was a false idea, and he called the killing a waste.

Help from the forts. Officers at army posts, among them Forts Griffin, Dodge, Concho and Richardson, gave the hunters protection and supplies and helped them ship hides. In 1873 hide hunters asked Dodge, then in command at Fort Dodge, what he would do if they hunted south into Texas, on hunting grounds reserved for the Kiowa, Comanche, Southern Cheyenne and Arapaho under the 1867 Medicine Lodge Treaty. One of the hunters later recalled that Dodge told them to hunt buffalo where the buffalo were.

Colonel Nelson A. Miles wrote out his plan in December 1874, during the Red River War of 1874 and 1875: "I would leave as few Indians or Buffalo behind, and as little for them to subsist on as possible." (To subsist is to stay alive.) In a book about his own life, published in 1896, he wrote that the buffalo and the Indian had both stood in the way of what he called civilization.

Officials in Washington

Leaders of the Plains nations asked officials to stop the hunters, and the officials did not stop them. A Sioux delegation, a group sent to speak for its people, asked Columbus Delano in 1871 to keep white hunters out of Sioux country. Delano was the Secretary of the Interior, one of the president's top officials. He refused.

Colonel Edward Wynkoop had been the Cheyenne's Indian agent, the US official in charge of their reservation. In 1872 he reported words that Little Robe, a Cheyenne chief, had said to him: "What do you think my people ought to do when they see their cattle, the buffaloes, killed by your race when they are not hungry?" Only Wynkoop's report records these words.

Delano's yearly report for 1873 records that he "would not seriously regret the total disappearance of the buffalo from our western prairies, in its effect on the Indians." He saw the loss of the bison as "a means of hastening their sense of dependence upon the products of the soil and their own labors." He meant that without the bison, Native people would have to live by farming.

A law that never was. Members of both houses of Congress passed a bill to protect the bison in 1874. Under it, no one but a Native person could kill a female bison, or more males than needed for food, and the fine would be $100 for each animal. President Grant did not sign the bill. Members of Congress ended their meeting before he signed it, so the bill never became law. This is called a pocket veto.

Grant had promised a Southern Cheyenne and Arapaho delegation that hunters would be kept out of their country. Their agent, John D. Miles, wrote on September 30, 1874, that "they looked in vain." They watched for the hunters to be kept out, and the hunters kept coming.

Texas lawmakers brought in their own bill to protect the bison in 1875. The *Handbook of Texas*, published by the Texas State Historical Association, states that Sheridan protested it, "contending that peace with the Indians could be maintained only if their food supply was eliminated." The lawmakers did not pass the bill.

The speech in Texas. A speech that Sheridan is said to have given against the bill comes from one source only. The former hide hunter John R. Cook wrote about it in 1907, about 32 years later. In Cook's account, Sheridan told the lawmakers to give each hunter "a medal of bronze, with a dead buffalo on one side and a discouraged Indian on the other." Cook also has him say: "let them kill, skin, and sell until the buffaloes are exterminated," or killed off completely.

DISPUTED: No official record of Sheridan speaking to the lawmakers has turned up. Smits reports that, but he judges Cook believable. Writing in *Harper's* magazine in 2008, Christopher Ketcham called the speech "believed to be apocryphal," which means probably made up.

BY 1890: One count in 1884 had found only 325 bison left on the Plains, and no federal law protected the ones that remained.

Frank Mayer

Who: A buffalo runner, one of the hunters who killed bison for their hides, from 1872 to 1878, who later said the army helped the runners.

When and where: The Plains in the 1870s. He died in Fairplay, Colorado, in February 1954, at a reported age of 104.

He said the army gave hunters "free ammunition, all you could use."

Frank H. Mayer killed bison for their hides from 1872 to 1878. At about age 100 he told his story to a writer, Charles B. Roth. It came out in 1958 as a book, *The Buffalo Harvest*, four years after Mayer died.

The book describes the business: the rifle, the wagons, the skinners who cut the hides off the dead animals, and hides that sold for a dollar or two each.

Mayer said that "army officers in charge of plains operations encouraged the slaughter of buffalo in every possible way." They gave hunters free ammunition. "All you had to do to get it was apply at any frontier army post," he said. "I received thousands of rounds in this way." Mayer also quoted an officer he did not name: "if we kill the buffalo we conquer the Indian."

The last part of the book records Mayer's regret for what the runners did.

NOT KNOWN: Mayer told the story when he was very old, the numbers in it are his own, and some people have questioned even his age.

The pigeon nestings

Professional hunters killed passenger pigeons where the birds gathered to nest, and by the mid-1890s the wild flocks were almost gone. At their peak, an estimated 3 to 5 billion passenger pigeons lived in North America. By one estimate they made up four of every ten birds on the continent.

About 136 million pigeons nested across some 850 square miles of Wisconsin in 1871, by one estimate. Professional netters, who caught the birds in nets, and shooters worked one of the last great nesting grounds, near Petoskey, Michigan, in 1878. They killed a reported 50,000 birds a day for months. Railroads carried the dead birds to city markets. Hunters learned where each big nesting was from telegraph messages, which were sent over wires.

Yellowstone and the Tukudika

President Grant signed a law on March 1, 1872, and under it Yellowstone became the first national park. In the law, members of Congress set the park apart "for the benefit and enjoyment of the people." The Tukudika, a band of Mountain Shoshone also called the Sheep Eaters, already lived there. A Park Service page states that they had lived in that area "for thousands of years." The Shoshone, Bannock, Crow, Blackfeet and other nations also have ties to the park's land.

Chapter 1 tells this removal briefly, and here is how it happened. Philetus W. Norris, Yellowstone's superintendent from 1877 to 1882, found a Tukudika camp near Bunsen Peak in the fall of 1879 and asked the Indian agent at Fort Washakie for help. The agent, whom the writer John Clayton names as James Patten, sent a party of Shoshone, who brought the Tukudika to the Wind River Reservation. In the words of a Park Service page, the Tukudika "were forcibly removed to reservations."

NOT KNOWN: The records do not say how many Tukudika were taken or what force the Shoshone party used, and the letters between Norris and Patten have not survived.

Keeping people out. Norris met in Washington with a Crow delegation in the spring of 1880, while officials were asking the Crow to give up 1.6 million acres. That spring Norris also got a "solemn promise" from people at the Lemhi agency, the office of another Indian agent, and at the Wind River Reservation to stay out of the park.

A Park Service page states that early superintendents "actively discouraged tribes from visiting the newly established park to hunt or collect resources." In his reports, Norris called the Tukudika "feeble," or weak, "and harmless." He wrote that Native people stayed away from the geysers out of "superstitious awe," meaning fear that came from beliefs about spirits. Clayton reports that historians and Shoshone scholars treat that claim as false. With it, Norris helped support a false story that no one had lived on the park's land.

The court case. Justices of the US Supreme Court ruled on Native hunting in and around the park in 1896. Wyoming officials had arrested a Bannock man named Race Horse for hunting elk in Wyoming. He hunted under the 1868 Fort Bridger Treaty, in which US officials promised a right to hunt on "unoccupied lands."

Justice Edward Douglass White wrote the Court's decision, in *Ward v. Race Horse*. He called the treaty right "temporary and precarious," which means easily lost, and he ruled that the right had ended when Wyoming became a state. After the ruling, hunting under the treaty in and around Yellowstone was a crime under Wyoming law.

More than 120 years later, on May 20, 2019, the justices threw out the 1896 decision in a different case, *Herrera v. Wyoming*, about the Crow people's own treaty. They ruled that the Crow treaty right to hunt had not ended when Wyoming became a state.

The forest reserves

George Perkins Marsh, a scholar from Vermont who also represented the United States in other countries, published a book called *Man and Nature* in 1864. In it, Marsh argued that whole societies collapse when their people destroy the forests and wear out the soil. Writers at the Forest History Society and the National Park Service link his book to the Forest Reserve Act of 1891. Under that law, a president could set aside public forest land. Those forest reserves were the start of the national forests.

John Muir

Who: A writer born in Scotland whose magazine articles made Yosemite known across the country, and who helped found the Sierra Club.

When and where: He lived from 1838 to 1914. He came to California in 1868 and was president of the Sierra Club from 1892 to 1914.

Movie: *John Muir in the New World* (PBS American Masters, 2011)

The Sierra Club started with 182 members in San Francisco.

John Muir was born in Scotland in 1838 and came to California in 1868. He wrote magazine articles about Yosemite. Readers across the country learned about Yosemite from them, and protecting it became a national cause.

Muir and others founded the Sierra Club in San Francisco on May 28, 1892. The founders wrote down the club's aims. One was "to explore, enjoy, and render accessible the mountain regions of the Pacific Coast," which means to make them easy for people to reach. Another was to win the help of "the people and government in preserving the forests and other natural features of the Sierra Nevada."

Muir was the club's first president, and he led it until he died in 1914. In May 1903 he took President Theodore Roosevelt camping in Yosemite.

BY 1900

If you remember one thing: US officials gave away the land they had taken from Native nations, hunters killed nearly all the bison the Plains nations lived on, and soldiers and officials forced Native people out of the first parks.

- 1851: Volunteer soldiers drive the Ahwahneechee out of Yosemite Valley.
- 1862: Lincoln signs the Pacific Railway Act, the Homestead Act and the Morrill Act, the laws under which officials give away public land.
- 1872: Yellowstone becomes the first national park. In 1879 its superintendent has the Tukudika forced out.
- 1872 to 1874: Three railroads carry about 1.4 million bison hides east.

Next: After 1900, presidents put hundreds of millions of acres under federal protection, and some of that land had belonged to Native nations.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 17 MINUTES

President Theodore Roosevelt and the federal officials after him took charge of hundreds of millions of acres in the first half of the 1900s, and some of that land had belonged to Native nations. Roosevelt alone put about 230 million acres under federal protection from 1901 to 1909, in national forests, parks, bird refuges (land where wild birds are kept safe) and monuments.

Glacier National Park, created in 1910, lies mostly on land that federal officials count as sold by the Blackfeet in 1895. Before the sale, about 600 Blackfeet had starved to death in one winter. Many Blackfeet say they only rented the land out.

The last passenger pigeon died in the Cincinnati Zoo in 1914. In Yellowstone, park managers poisoned wolves until they killed the park's last pack in 1926.

On the southern Plains, farmers had plowed up the grass that held the soil, and in the 1930s that soil blew away. Forest Service leaders ordered crews in 1935 to bring every wildfire under control by 10 the next morning. Young men in the Civilian Conservation Corps planted billions of trees.

Roosevelt's acres

The 230 million acres Roosevelt protected, an area bigger than Texas, included 150 national forests, 5 national parks, the first 18 national monuments, 51 federal bird reservations and 4 national game preserves. Some counts combine the bird reservations and game preserves into one figure of 55.

A national forest is public land where federal foresters, people trained to study and manage forests, look after the trees. The U.S. Forest Service began in 1905, with Gifford Pinchot as its first chief, and its foresters ran the national forests.

The first refuge. Roosevelt named Pelican Island, in Florida, the first federal bird reservation on March 14, 1903. It became the first piece of what is now the National Wildlife Refuge System.

Roosevelt signed the Antiquities Act on June 8, 1906. Under it, a president could protect land by proclamation, an official announcement, and land protected this way is called a national monument. Devils Tower became the first one that September 24.

Whose land. Many national forests were made from the ancestral lands of Native nations, the lands their ancestors lived on. Arthur Blazer, the president of the Mescalero Apache Tribe, told a Senate committee in 2018 that the US Department of Agriculture, which runs the Forest Service, "has acknowledged that the vast majority of federal forest lands are carved out of the ancestral homelands of Indian tribes."

Forest Service staff say the same of the national forests in North Carolina, and the staff of Olympic National Forest say it of all the land in present-day Washington. A Park Service web page states that Devils Tower is sacred to dozens of Native nations, including the Arapaho, Cheyenne, Crow, Kiowa, Lakota and Shoshone. The Lakota name for it is Mato Tipila, which means Bear Lodge.

Theodore Roosevelt

Who: The president from 1901 to 1909. In those years he put about 230 million acres of land under federal protection.

When and where: The White House, 1901 to 1909. Yosemite, California, in May 1903.

Movie: *The Roosevelts: An Intimate History* (PBS, Ken Burns, 2014), a documentary about the whole Roosevelt family

Roosevelt slept under a pile of about 40 wool blankets.

President Theodore Roosevelt went camping in Yosemite with John Muir, the first president of the Sierra Club, in May 1903. Muir wanted the best of the wild land left wild. The two men spent three nights sleeping in the open.

They camped first under the Grizzly Giant, a giant sequoia tree, on May 15, and that was the night of the blankets. The next night, near Sentinel Dome, a snowstorm dropped five inches of new snow on top of about five feet of old snow. They spent the last night in a meadow near Bridalveil Fall.

Glacier and the Blackfeet

Most of Glacier National Park lies on land that federal officials say the Blackfeet sold to the United States in 1895. The deal came after a winter in which about 600 Blackfeet starved to death. Many Blackfeet say the tribe only rented the land out and never sold it.

Before the sale. US Army troops attacked Heavy Runner's camp of Piikani people, one of the Blackfeet peoples, on the Marias River in 1870, as Chapter 2 tells. By the best estimate they killed about 177 men, women and children. The army's own count was 173, and the National Parks Conservation Association's figure is more than 200.

By 1880 hide hunters had killed nearly all the bison. Members of Congress then cut the money for annuities, the food and goods that US officials had promised a tribe every year in a treaty as payment for land.

The Starvation Winter. Early storms held up supplies in the winter of 1883 and 1884. In December a wagonload of bacon reached the Blackfeet agency near Browning, the office of the US official who ran the reservation. The Montana Historical Society's textbook describes the bacon as "so old it was contaminated with maggots," the young of flies, which feed on rotting meat.

The textbook states that 600 Blackfeet died of starvation, about one in four of the tribe. Other accounts give counts from 500 to 800. The Assiniboine, another nation, lost about 300 people. That winter is known as the Starvation Winter.

No record names the person who sent the spoiled bacon. John Young had been the Blackfeet's Indian agent, the US official in charge of their reservation, since December 1876. He went to Washington in 1881 and got $15,000 put back into the reservation's budget. He protested against shrinking supplies and more cuts to the agency's budget.

No one acted on his protests, and in September 1883 he resigned. The records do not name the officials who ignored him. The new agent, R. A. Allen, did not arrive until the middle of March 1884.

The sale. The same textbook states: "After Starvation Winter, the tribes sold the only resource they had left: land." The Blackfeet sold a strip of about 800,000 acres in 1895 for $1.5 million. Prospectors, people who search for gold and other metals, hoped the strip held gold.

Many Blackfeet say the tribe offered the land as a 99-year lease, which is a rental, and never sold it. They also say that because of a surveying mistake, US officials took another 45,000 acres. Under the agreement, the Blackfeet kept the right to hunt, fish, cut wood and gather plants on the land.

Little Dog told the US commissioners, the officials sent to buy the land, that the Blackfeet "did not ask the government to come and buy their land." White Calf, a Piikani chief, said of Chief Mountain: "Chief Mountain is my head. Now my head is cut off."

The park. Prospectors found no gold. The strip became a forest reserve in 1897, under the 1891 law that let a president set aside public forest land. Members of Congress made most of the strip Glacier National Park on May 11, 1910. After that, an article by the National Parks Conservation Association states, the Blackfeet's rights on the land "essentially vanished."

After the park was created, judges ruled that the Blackfeet's right to go into the mountains in the park no longer counted. A 2019 *High Country News* report states that hunting and fishing rights ended in 1910 and that only the right to gather plants remained. By 1912 a park ranger had arrested a Blackfeet tribal member for hunting in the park. The accounts of that arrest name neither the ranger nor the hunter.

A judge of a US District Court ruled in 1932 that the Blackfeet had no right to hunt in the park. In 1973 a judge ruled that Blackfeet people could enter the park without paying the entrance fee.

Hetch Hetchy

People who wanted to protect land split into two sides over Hetch Hetchy Valley. Gifford Pinchot's side said conservation meant using the land carefully, forever. The side of John Muir, the first president of the Sierra Club, said the best of it should be left wild.

Hetch Hetchy Valley lies inside Yosemite National Park. After the earthquake and fire of 1906, San Francisco's city leaders wanted the valley for a reservoir, a lake made by a dam to store water. Pinchot backed the city. Muir and the Sierra Club fought the dam for years.

Members of Congress sided with the city and passed the Raker Act, which allowed the city to dam the valley. President Wilson signed it on December 19, 1913. Muir died a year later, on December 24, 1914. The O'Shaughnessy Dam was finished in 1923, and the valley is under water today.

Members of Congress passed the National Park Service Organic Act on August 25, 1916, partly in reaction to the Hetch Hetchy fight. With it they created a new federal office, the National Park Service, whose officials took charge of protecting the parks.

Gifford Pinchot

Who: The first American trained as a professional forester, and the first chief of the U.S. Forest Service, until President Taft fired him. Later he was twice governor of Pennsylvania.

When and where: He lived from 1865 to 1946. He ran the Forest Service from 1905 to 1910.

Movie: *Seeking the Greatest Good* (WVIA and PBS, 2013)

President Taft fired him on January 7, 1910.

Gifford Pinchot was the first American trained as a professional forester. He defined conservation as "the greatest good to the greatest number for the longest time." To Pinchot, that meant using the public lands carefully and keeping them useful forever.

Pinchot became the first chief of the Forest Service in 1905. In 1909 and 1910 he fought in public with the Secretary of the Interior over claims to federal coal lands in Alaska, and President Taft fired him for refusing to obey his bosses.

Pinchot and John Muir had been friends until they took opposite sides over Hetch Hetchy. Pinchot later served two terms as governor of Pennsylvania.

The last passenger pigeons

In about a century, the passenger pigeon went from an estimated 3 to 5 billion birds to none. After the last confirmed wild bird was shot, a few people reported seeing wild passenger pigeons until about 1902, and no one confirmed those sightings.

Press Clay Southworth

Who: A 14-year-old boy who shot the last confirmed wild passenger pigeon.
When and where: Pike County, Ohio, on March 24, 1900.

His family stuffed the bird and gave it buttons for eyes.

Press Clay Southworth, age 14, shot a passenger pigeon in Pike County, Ohio, on March 24, 1900. He asked his mother first, then used his family's 12-gauge shotgun. His bird is the last wild passenger pigeon that anyone has confirmed. Southworth told the story himself decades later.

His family had the bird mounted, which means stuffed and set up for display. It got buttons for eyes, so people called it "Buttons." The Ohio History Connection, in Columbus, keeps it today.

Martha. The last passenger pigeon of all was a bird named Martha. She died at the Cincinnati Zoo on September 1, 1914, at about 29 years old. Her body was frozen in a 300-pound block of ice and shipped to the Smithsonian Institution, which still has it. Sol Stephan, the zoo's general manager, had cared for Martha, and he saved her feathers in a cigar box.

NOT KNOWN: Nobody can say for sure where Martha came from, because Stephan's accounts changed over the years and the zoo's own records do not agree with each other.

Yellowstone's wolves

Park managers in Yellowstone killed at least 136 wolves between 1914 and 1926, and in 1926 they killed the park's last wolf pack. The National Park Service gives these numbers. The *Idaho Capital Sun* and other later accounts report that park rangers shot the last two wolf pups near Soda Butte that year.

The managers used poison, especially one called strychnine, which they put inside the bodies of dead animals for wolves to eat. Dan Stahler, a biologist, told *Smithsonian* magazine in 2026: "We're talking crates and crates of this poisoning." In 1915 the park's superintendent called wolves "a decided menace," or danger, to the animals they hunted.

The killing in Yellowstone was part of a program to wipe out predators, animals that hunt other animals for food, on public lands across the whole country. The program's targets were wolves, bears, cougars and coyotes. Rewards for dead wolves went back almost 300 years. The first recorded wolf bounty in the colonies, a reward paid for each dead animal, dates from Massachusetts in 1630.

Why did the Plains soil blow away?

Wind carried away the soil of the southern Plains in the 1930s, because farmers had plowed up the grass that held it. Wheat sold at high prices during World War I. Farmers with tractors plowed up tens of millions of acres of shortgrass, the short native grass of the southern Plains. Its roots formed sod, a thick mat of roots and earth that held the soil in place.

A drought, a long time with too little rain, began in 1931. With the sod gone, the dry soil blew away.

What blew away. By the count of the US Department of Agriculture, about 35 million acres of farmland, an area about the size of Iowa, had been ruined for growing crops by December 1934. The same count listed 100 million acres that had lost all or most of their topsoil, the top layer of soil where crops grow. Another 125 million acres were losing it fast. In 1935 alone, an estimated 850 million tons of topsoil blew off the southern Plains.

The worst single dust storm struck on April 14, 1935, a day called Black Sunday. It crossed the Plains as a black wall of dust moving at 60 miles an hour.

That spring, a soil scientist named Hugh Hammond Bennett was testifying, or giving evidence, at a hearing in Washington while dust from the Plains darkened the sky outside. Bennett said: "This, gentlemen, is what I've been talking about." Accounts of the hearing differ about the day. Some put it in late March 1935, and others in early April.

Members of Congress declared soil erosion, the wearing away of soil by wind or water, "a national menace." The Soil Conservation Service began on April 27, 1935, with Bennett as its director. The methods that followed included contour plowing, which means plowing along the curves of a slope instead of up and down it. They also included shelterbelts, rows of trees planted to slow the wind, and planting grass on the land again.

Caroline Henderson

Who: A farmer and writer who homesteaded in the Oklahoma Panhandle and stayed on her land through the dust years.

When and where: Near Eva, Oklahoma, from 1907. She lived from 1877 to 1966.

When the dust came, she kept farming and did not leave.

Caroline Henderson graduated from Mount Holyoke College. In 1907 she began homesteading near Eva, in the Oklahoma Panhandle, claiming public land and farming it for years in order to own it. When the dust storms came in the 1930s, she stayed on her land.

Henderson wrote letters about the dust years. In one, dated June 30, 1935, she described trying to rescue her home from wind-blown dust "which penetrates wherever air can go." Soon everything was covered again, she wrote, with dust that ran "from a film to actual ripples on the kitchen floor." She swept her floors with sawdust that had oil mixed in.

The *Atlantic Monthly* magazine printed her letters as "Letters from the Dust Bowl." One appeared in May 1936. That same month, Henry A. Wallace, the Secretary of Agriculture, wrote to praise her.

Across her whole life, her letters run from 1908 to 1966. The University of Oklahoma Press later collected them in a book, *Letters from the Dust Bowl*.

Every fire put out

Forest Service rules from 1935 to 1978 required crews to control every wildfire by the morning after someone spotted it. A fire called the Big Burn covered 3 million acres of the Northern Rockies in 1910 and killed at least 78 people. After it, Forest Service leaders tried to put out every fire. In 1935 they made the "10 a.m. policy," under which crews had to bring each fire under control by 10 o'clock the morning after it was spotted.

What the stopping did. For thousands of years Native people had burned the eastern forests on purpose. Researchers at Penn State call the total stopping of fires after about 1940 "an ecologically transformative event in all forests." They mean it changed how the plants and animals of every forest lived together.

The men who made it work. About 3 million young men worked in the Civilian Conservation Corps, a federal work program, from 1933 to 1942. Because the corps had so many men, Forest Service leaders could carry out the 10 a.m. policy. Estimates of the trees the corps members planted run from more than 2 billion to 3.5 billion, and the figure most often given is about 3 billion. The corps members also fought fires, worked to stop erosion and did building work in more than 800 parks.

Forest Service officials worked with the Ad Council, an advertising group, to start the Smokey Bear campaign in 1944. Its slogan, "Only YOU can prevent forest fires," dates from 1947. In 1950 a bear cub was rescued from the Capitan Gap fire in New Mexico, and the cub became the living Smokey Bear.

Aldo Leopold

Who: A forester for the U.S. Forest Service who got the first wilderness area set aside, and later wrote *A Sand County Almanac*.

When and where: He lived from 1887 to 1948. He worked in New Mexico in the 1920s and later in Wisconsin.

Movie: *Green Fire: Aldo Leopold and a Land Ethic for Our Time* (2011)

In 1924 he got the world's first official wilderness area set aside.

Aldo Leopold began as a forester for the U.S. Forest Service. In 1924 he got the Gila Wilderness, in New Mexico, set aside. It was the first area in the world officially named a wilderness area, which is land kept free of roads and buildings. Frank C. W. Pooler, the Forest Service official in charge of the region, approved Leopold's plan on June 3, 1924.

The Gila Wilderness covered about 755,000 acres. Under the plan the area had no roads, cabins or other buildings. People could still hunt and fish there, and ranchers could let their animals feed on its grass.

Whose homeland it was. The Gila had been a homeland of the Chiricahua and Warm Springs Apache, and Mogollon and Mimbres people had also lived in the region. Before Leopold came to New Mexico, US Army soldiers, federal officials and white settlers had forced many Apache people onto reservations. Army soldiers imprisoned Chiricahua and Warm Springs Apache people for defending their land.

Of the thousands of Chiricahua and Warm Springs Apache who had lived in the Gila, only a few hundred were still alive after the Army imprisoned them. US officials later sent the survivors to Fort Sill, Oklahoma, more than 500 miles away.

Later years. Leopold taught at the University of Wisconsin. He bought a worn-out farm in Wisconsin and rebuilt its soil and its woods. On April 21, 1948, he had a heart attack and died while helping to fight a grass fire on a neighbor's land.

His book *A Sand County Almanac* came out in 1949, the year after he died. In it he called for a "land ethic," an ethic being a set of ideas about right and wrong. In Leopold's land ethic, people count themselves as members of the land community and stop acting as its conquerors. The book includes his "green fire" essay, about watching a wolf die after it was shot.

BY 1950

If you remember one thing: Federal officials took charge of protecting hundreds of millions of acres, much of it Native land, while the passenger pigeon, Yellowstone's wolves and the soil of the southern Plains were lost.

In 1900: The Forest Service, the National Park Service and the first national monument did not exist yet, and a boy in Ohio shot the last confirmed wild passenger pigeon.

In 1950: Crews had orders to put out every wildfire by 10 the next morning, and a bear cub rescued from a fire in New Mexico had become the living Smokey Bear.

Next: After 1950 a chemical called DDT thinned the eggshells of bald eagles, a river in Cleveland caught fire, and families found buried chemicals seeping into their basements.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 17 MINUTES

Pollution that people could see pushed members of Congress to pass the big laws that protect the land, air and water, and then people began to count who lived next to the waste. DDT, a chemical for killing insects, left bald eagles with eggs so thin they broke. In 1969 an oil well blew out off Santa Barbara, California, and oil and trash on the Cuyahoga River in Cleveland caught fire.

Between 1970 and 1973, members of Congress passed the Clean Air Act, the Clean Water Act and the Endangered Species Act, and the Environmental Protection Agency opened.

Park Service officials forced the last Native families in Yosemite Valley out of their homes in 1969. Later in the 1970s, families at Love Canal, in Niagara Falls, New York, found chemicals seeping into their basements. They lived on and beside more than 20,000 tons of buried chemical waste.

Residents of Warren County, North Carolina, lay in the road in 1982 in front of trucks carrying poisoned soil to a landfill, a place where trash and waste are buried, in a mostly Black community. In a 1983 federal study, investigators looked at four landfills for dangerous waste in eight southeastern states. All four were in areas where Black residents were 38 to 90 percent of the people.

In a 1987 national study, Charles Lee found that race was the strongest clue to where such waste sites stood. That year Rev. Benjamin F. Chavis Jr. named the pattern "environmental racism."

DDT and the eagles

DDT is a pesticide, a chemical made to kill insects, and it was in wide use from the mid-1940s. DDT thinned the eggshells of raptors, birds that hunt other animals, until the eggs broke in the nest. By 1963 only 417 nesting pairs of bald eagles were left in the lower 48 states, meaning every state except Alaska and Hawaii.

Rachel Carson

Who: A marine biologist, a scientist who studies life in the sea, and a writer. She had worked as a writer and editor for the U.S. Fish and Wildlife Service. She wrote *Silent Spring*.

When and where: She lived from 1907 to 1964. *Silent Spring* came out in September 1962. She died in Silver Spring, Maryland.

Movie: *Rachel Carson* (PBS American Experience, 2017)

She went on television to defend her book while sick with cancer.

Rachel Carson first became famous for a book called *The Sea Around Us*. In September 1962 she published *Silent Spring*. In it she laid out what persistent pesticides, the kind that stay in soil, water and living things for a long time, were doing to birds, soil, water and people.

People in the chemical industry attacked her, and Carson answered them with evidence. She spoke on the television program *CBS Reports* on April 3, 1963. By then she was already sick with breast cancer, and she died of it on April 14, 1964. Officials of the Environmental Protection Agency banned DDT in 1972, eight years later.

Yosemite's last village

Park Service officials evicted, or forced out of their homes, the last Native families who lived in Yosemite Valley in 1969. Then they destroyed their cabins.

How the village began. Ahwahneechee and Paiute families lived in a village in the valley in the 1920s and worked in the park. The Ahwahneechee are also called the Southern Sierra Miwok. Native workers helped build the Ahwahnee Hotel, which was finished in 1927. Park Service workers built cabins at a new site, called Wahhoga, in 1933, for families that park officials had moved out of the old village.

Charles Goff Thomson was Yosemite's superintendent from 1929 to 1937. A history published by Brigham Young University states that Thomson wanted to use the new village to control the Native people in the park. The families paid rent, and they paid for their power and water.

Park Service officials made a housing rule in 1953 under which only permanent government workers could live in the village. As each home fell empty, the officials destroyed it. In 1969 they evicted the families who were still there.

How it ended. Deborah Tucker's parents lived in the village. She told the National Parks Conservation Association: "The Park Service came and burned the cabins out." Some later magazine accounts say the empty cabins were burned in a firefighting training exercise. A Park Service web page states that a Native home near Camp 4 "was razed," or torn down completely, "in the 1960s when the last Indian village was removed from Yosemite Valley."

Jay Johnson, the last Native park worker who lived in the valley, retired and left in 1996.

NOT KNOWN: No record names the official who ordered the village torn down in 1969. Erin Davenport, a Yosemite park historian, told the National Parks Conservation Association that park historians have found no record of why it was done either.

The river that burned

Oil and trash floating on the Cuyahoga River in Cleveland, Ohio, caught fire on June 22, 1969. The fire burned for about 20 to 30 minutes before it was brought under control. The river had burned at least 13 times since 1868. The 1912 fire killed five men, and the 1952 fire did $1.3 million in damage.

Whose waste it was. The river ran past steel mills and other factories. A 2019 *Smithsonian* magazine article names American Ship Building, the Sherwin-Williams Paint Company, Republic Steel and Standard Oil as Cleveland companies whose success left the river full of poisonous waste. A Cleveland State University history states that the river was "polluted from decades of industrial waste."

The 1969 fire started in oil and trash caught under two railroad bridges near the Republic Steel mill. A flare thrown from a passing train most likely lit it. Investigators from Cleveland's Bureau of Industrial Wastes looked into the fire. No record names the company whose oil burned.

Editors at *Time* magazine published a story on the burning river on August 1, 1969, and readers across the country saw it. Carl Stokes was Cleveland's mayor and the first Black mayor of a major US city. The day after the fire, he held a news conference at the river and called on the state and federal governments to act.

Santa Barbara. Earlier the same year, oil had spilled on the coast of California. Five months before the Cuyahoga fire, on January 28, 1969, an oil well blew out under Platform A. It was a Union Oil Company drilling platform about 5.5 miles southeast of Santa Barbara, California. A blowout is an uncontrolled burst of oil and gas up a well. Officials of the U.S. Geological Survey, the federal agency that approved offshore drilling, had excused Union Oil from federal safety rules when they approved its drilling permit.

Federal and state investigators found that extra steel pipe lining the well would have prevented the blowout. About 100,000 barrels of oil, more than 4 million gallons, leaked out by December 1969, and the oil blackened the beaches at Santa Barbara. By one estimate, about 9,000 birds died.

Earth Day and the new laws

An estimated 20 million Americans took part in Earth Day events on April 22, 1970, a day set aside for events about protecting the land, air and water. The 1970 census, the national government's count of everyone in the country, counted 203,392,031 people in the United States, so about one in ten Americans took part. Senator Gaylord Nelson organized Earth Day with Denis Hayes.

The new laws. The National Environmental Policy Act became law on January 1, 1970. Under it, federal officials had to study how a big federal project would affect the land, air and water before they went ahead. The Environmental Protection Agency, called the EPA, opened on December 2, 1970. Its officials enforce the federal laws against pollution.

Members of Congress passed the Clean Air Act in 1970. In 1972 EPA officials banned DDT, and members of Congress passed the Clean Water Act. The Endangered Species Act, for kinds of plants and animals in danger of dying out, became law on December 28, 1973.

After the DDT ban, bald eagles came back. They grew from 417 nesting pairs in 1963 to about 10,000 pairs by 2007. That year, federal officials took the bald eagle off the endangered list.

Love Canal

Workers for Hooker Chemical buried more than 20,000 tons of chemical waste in an old canal in Niagara Falls, New York, from the 1940s into the 1950s. Families later lived on and beside it, and the chemicals seeped into their homes.

What was buried. The canal, called Love Canal, covered 15 acres. Hooker Chemical and Plastics Corporation began using it in 1942. The sources put the waste at about 21,000 tons, and they differ slightly on the exact amount and on whether the dumping ended in 1952 or 1953. In a 1981 report, officials of New York State's health department wrote that Hooker "admits" burying 21,800 tons.

Investigators later found more than 200 chemical compounds there. The timeline lists 200 tons of dioxin, a group of chemicals that cause cancer and harm babies before they are born.

Who knew. A federal judge wrote in a 1994 decision that Hiram Young, Hooker's works manager, was responsible for the company's waste disposal. The court record does not say who first decided to use the canal as a dump.

Hooker's lawyer visited the dump in 1946 and saw children with swimsuits. He warned the company's president that Hooker was "running a real hazard," and he suggested guards or a fence. Hooker's executives talked about his ideas, but they never built the fence. City officials of Niagara Falls also used the canal as a dump for the city's own waste until 1953.

The sale for $1. Hooker sold the covered canal to the Niagara Falls Board of Education for $1 in 1953. Hooker's officials wrote into the deed "a disclaimer of responsibility for future damages due to the presence of buried chemicals," a statement that refused blame for any harm the chemicals did later. That same year, Hooker officials told Board members "that homes could not be built at the Canal site."

The school. The members of the Board of Education had a public elementary school, the 99th Street School, built on the middle third of the canal in 1954. That January their architect wrote that the builders had dug into two pits of

chemical waste, some of it in 55-gallon drums. He wrote that it was "poor policy to attempt to build over this soil."

Building of homes on 97th and 99th Streets, beside the canal, began in 1954. The Board of Education later sold part of the canal land to others. Board members talked in 1957 about a plan to sell a piece of it to developers for building homes. A Hooker lawyer told the Board on November 7, 1957, that the land was "unsuitable," or not fit, "for construction" where "basements, water lines, sewers and such underground facilities would be necessary."

Ninety-nine homes had backyards that touched the canal by the spring of 1978. No record names the companies that built the homes.

The chemicals come up. By the 1970s, chemicals were coming up into yards and basements. On October 3, 1976, chemicals from the buried waste were reported "seeping into basements of homes." In November 1976, testers found 15 chemicals, including three toxic chlorinated hydrocarbons, a kind of chemical that contains chlorine.

Families in the neighborhood counted miscarriages, the deaths of unborn babies before they can live outside the mother's body. They also counted birth defects, problems in a baby's body that are there when the baby is born, and illness. Dr. Beverly Paigen, a scientist, found a "high rate of birth defects and miscarriages among Love Canal families."

The emergency. Dr. Robert Whalen, New York State's health commissioner, the state's top health official, declared a state of emergency on August 2, 1978. That is an official order saying that people are in danger and need help fast. He closed the 99th Street School and ordered pregnant women and children under 2 moved out.

President Jimmy Carter approved emergency federal money on August 7 so that state officials could buy homes. State officials moved the first 236 families out, at a cost of $10 million. Other counts say 239 families.

The lawsuit. New York State's lawyers sued Occidental Petroleum, which owned Hooker by then, and two Hooker companies for $635 million in April 1980.

Scientists in a study paid for by the EPA reported on May 17, 1980, that they had found chromosome damage in 11 of the 36 residents tested. Chromosomes are the strands in each cell that carry a person's genes. Damage to them can raise the risk of cancer, and of birth defects in the person's children.

The second emergency. That month, residents held two EPA officials for about six hours to demand that the rest of the families be moved. Carter then declared a second emergency, which opened the way to move 710 more families. In all, about 950 families left.

Members of Congress passed a law called Superfund in December 1980. Under it, federal officials could make companies that polluted a site pay for cleaning it up. Occidental agreed in 1994 and 1995 to pay New York State and the federal government more than $225 million for the cleanup and the moves.

Lois Gibbs

Who: A 27-year-old housewife at Love Canal whose son went to the 99th Street School. She started the Love Canal Homeowners Association.

When and where: Love Canal, in Niagara Falls, New York, from 1978 to 1980.

Movie: *Lois Gibbs and the Love Canal* (CBS television movie, 1982), with Marsha Mason playing Gibbs

She was 27, and her son's school stood on buried chemicals.

Lois Gibbs was a housewife when she learned about the buried chemicals at Love Canal. Her son went to the 99th Street School, which stood on and beside the old canal. Officials brushed off her worries. In August 1978 she organized her neighbors into the Love Canal Homeowners Association.

Gibbs later founded the Center for Health, Environment & Justice. Through it, she has helped other neighborhoods fight the pollution near their homes. In 1990 she won the Goldman Environmental Prize, an award given to people who protect the environment. A CBS television movie about her aired on February 17, 1982.

Warren County

Residents of Warren County, North Carolina, lay down in the road in front of trucks in September 1982. The trucks carried soil poisoned with PCBs to a new landfill near Afton, a mostly Black community. An exhibit by the University of North Carolina Library and other histories describe the protest as the start of the environmental justice movement. People in that movement fight a pattern in which companies and government officials put polluting sites next to poor, Black, brown and Native communities.

PCBs are a group of chemicals made by people. They were used in electrical, heating and hydraulic equipment, machines worked by liquid under pressure. An EPA web page states that PCBs cause "a variety of adverse health effects," or harmful effects, "in animal and humans."

Where the soil came from. The poisoned soil came from roadsides. Robert Ward, of the Ward Transformer Company of Raleigh, hired Robert Burns and his sons to get rid of oil that contained PCBs. The Burns family ran a business called Transformer Sales, in Allegany, New York. In the summer of 1978, the Burns men sprayed about 31,000 gallons of the oil from their trucks at night, on the shoulders, or edges, of about 240 miles of roads in 14 North Carolina counties.

The site. Governor James B. Hunt Jr. announced a plan in December 1978 to bury about 60,000 tons of the soil scraped from those roadsides. He chose a landfill at Afton, in Warren County. State officials bought farmland there from a farmer who was in money trouble. Warren County had the highest share of African American residents in North Carolina, and it was one of the poorest counties in the state. The Afton community was 84 percent African American.

Most people near Afton drank water from wells. The water table there, the level underground where the soil is full of water, was only about 5 to 10 feet down. The U.S. Commission on Civil Rights later wrote that the site "was not scientifically the most suitable site, because the water table was a mere 5-10 feet below the surface."

The protest. Residents formed a group called Warren County Citizens Concerned About PCBs and sued. They lost in 1982. The trucks began to deliver the soil that September, and protesters lay in the road. Officers arrested about 500 people, and one later count says more than 500.

State officials went ahead and built the landfill. Governor Hunt promised that the soil would be cleaned of poison once a way to do it existed. The cleanup was finished by 2003 and cost $17.1 million.

Counting who lives near the waste

The authors of two studies in the 1980s counted who lived near hazardous waste sites, the places that hold waste that can harm people's health. Both found the answer tied to race.

The 1983 study. Members of Congress asked the US General Accounting Office, a federal office that investigates for Congress, to study landfills for hazardous waste in eight southeastern states. Its report came out on June 1, 1983.

The report lists four landfills in those states that took other people's waste for pay. One was the Warren County landfill. The others were in Sumter County, Alabama, Chester County, South Carolina, and Sumter County, South Carolina. All four were in areas where Black residents made up 38 to 90 percent of the population.

The 1987 study. The Commission for Racial Justice of the United Church of Christ published a national study in 1987, *Toxic Wastes and Race in the United States*. Charles Lee wrote it. He found that race was "the most potent variable in predicting where these facilities were located," more powerful than household income or the value of homes. The race of the people nearby predicted where a waste site stood better than how much money they had.

When the report came out, the commission's leader, Rev. Benjamin F. Chavis Jr., called the pattern "environmental racism." He meant "intentionally selecting communities of color for wastes disposal sites and polluting industrial facilities." Communities of color are places where most people

are not white. The authors of a follow-up study in 1994 found that people of color were "47 percent more likely to live near a hazardous waste facility than white Americans."

President Bill Clinton signed Executive Order 12898 on February 11, 1994. In it he directed the officials of federal agencies to find and deal with pollution that fell hardest on communities of color and poor communities. A 2007 report by the United Church of Christ states that the EPA "has failed to implement" the order, meaning its officials had not carried it out.

Wolves back in Yellowstone

Gray wolves brought from Canada were released in Yellowstone National Park starting in January 1995, and by the end of 1996, 31 wolves had been moved there. Park managers had killed the park's last wolf pack in 1926. For most of the 1900s, elk had eaten the park's willows and other woody plants so heavily that the plants could not grow tall. After the wolves came back, the willows began to grow.

KNOWN:	Park Service scientists wrote in 2019 that most studies agree on that growth.
DISPUTED:	Scientists still debate how much of that growth the wolves caused, by hunting the elk and changing where the elk fed.

BY 2000

If you remember one thing: Members of Congress passed the big federal laws against pollution in the 1970s, and then residents and researchers showed that waste sites stood far more often beside Black and poor neighborhoods.

One number: In 1963 there were 417 nesting pairs of bald eagles in the lower 48 states. By 2007, after the DDT ban, there were about 10,000, roughly 24 times as many.

Next: After 2000 came the warmest year ever measured, fires that burned millions of acres, and a fight in Louisiana over a chemical plant beside a school.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 15 MINUTES

The land grew hotter and drier after 2000, and fires grew bigger. The year 2024 was the warmest ever measured, both for the whole world and for the lower 48 states. Heat and drought dried forests that had filled up with fuel during about a century of stopping fires.

Fires burned about 4.2 million acres of California in 2020. Lake Mead and Lake Powell, two reservoirs on the Colorado River, fell to record lows in 2021 and 2022. Fire managers now set fires on purpose again, and Yurok people teach cultural fire to government fire crews.

Fights over pollution and protected land went on. Shell's managers agreed in 2002 to pay to move the families of Old Diamond, a Louisiana neighborhood beside a Shell chemical plant. Federal lawyers sued the owner of a plant near an elementary school in LaPlace in 2023, and they dropped the suit in 2025.

President Donald Trump cut Bears Ears National Monument, in Utah, by about 91 percent on July 13, 2026. As of September 26, 2026, the land he removed was open to mining claims, and lawsuits against the cut were waiting

in federal court.

Some animals came back. Bald eagles grew from 417 nesting pairs in 1963 to about 71,400 in the 2020s, by the newest count. The bison, fewer than 1,000 in 1900, now number more than 400,000, most of them in herds raised for sale. Wolves, wiped out of Yellowstone by 1926, numbered 2,797 in seven western states at the end of 2022.

The warmest year

Scientists at NOAA, the federal agency that tracks weather and climate, reported in January 2025 that 2024 was the warmest year on record for the planet. The world averaged 1.29 degrees Celsius, about 2.3 degrees Fahrenheit, above the average for the 20th century, the years 1901 to 2000. Scientists at NASA and other groups agreed. The lower 48 states averaged 55.5 degrees Fahrenheit in 2024, which was 3.5 degrees above their 20th-century average. Seventeen states set records.

Why are the fires bigger?

After about a century of stopping fires, the woods held heavy loads of fuel, the dead wood and brush that burns. Heat and drought dried that fuel out.

The Camp Fire. The Camp Fire of November 8, 2018, killed 85 people in California and destroyed nearly all of the town of Paradise. About 19,000 buildings burned. Those figures are the ones given by the encyclopedia *Britannica* and by a timeline from the National Institute of Standards and Technology, a federal science agency. It was the deadliest wildfire in the United States in a century.

The 2020 fires. Fires burned about 4.2 million to 4.3 million acres of California in 2020, an area bigger than Connecticut and about 4 percent of the state. By the count of CAL FIRE, California's fire agency, that was the most in modern records. One fire, called the August Complex, passed 1 million acres. It became known as the first "gigafire" in the state's modern history, meaning a fire that burned more than a million acres.

Fire managers at government agencies now set fires on purpose to burn off fuel. These planned fires are called prescribed burns, and prescribed burning is official policy again.

Margo Robbins

Who: A member of the Yurok Tribe who helped found the Cultural Fire Management Council, to bring traditional burning back to Yurok land.

When and where: The Klamath River country of northern California. The first community burn was in 2012, and the council formed in 2013.

She wanted straight hazel shoots to weave baskets for her grandchildren.

Margo Robbins, a member of the Yurok Tribe, wanted hazel for weaving baskets. When hazel is burned, it sends up new shoots that grow straight, and weavers need straight shoots. Her first goal was to weave baskets to carry her grandchildren.

Robbins and others held their first community burn on Yurok land along the Klamath River in 2012. In 2013 they formed the Cultural Fire Management Council. Cultural fire, burning done by Native people to care for the land, was the practice California's lawmakers had made a crime in 1850, in the same law that let officials hire out Native adults to the highest bidder.

After the council's burns, deer came back to the burned ground at Weitchpec. Council members now run training exchanges, called TREX, that teach cultural burning to fire crews.

The shrinking river

The Southwest had its driest 22 years in at least 1,200 years from 2000 to 2021. Scientists from UCLA and Columbia University found this by studying tree rings, which show how much a tree grew each year. They published their study in the journal *Nature Climate Change* in February 2022. They found that about 42 percent of how bad the drought was came from climate change caused by people.

About 40 million people depend on the Colorado River for water, and so does much of the country's winter vegetable crop. Lake Mead and Lake Powell, two reservoirs on the river, fell to record lows in 2021 and 2022. By the middle of 2022, Lake Mead was about a quarter full.

The cut. Officials of Arizona, California and Nevada agreed in May 2023 to cut their use of the river by at least 3 million acre-feet through the end of 2026. News reports gave that figure from the federal Bureau of Reclamation. An acre-foot is enough water to cover one acre of land one foot deep. The cut is about a tenth of the water those three states are allowed to take, and federal officials agreed to pay the states for the water they gave up.

Cancer Alley

The stretch of Louisiana between Baton Rouge and New Orleans holds a long line of chemical plants. A 2007 report by the United Church of Christ describes this strip as "so-called 'cancer alley,' the chemical manufacturing corridor between Baton Rouge and New Orleans," a corridor being a long, narrow strip of land. The towns of Norco and LaPlace are both in it.

The same report records who lived near commercial hazardous waste sites across the country in 2000, using census figures. In neighborhoods with such sites, 56 percent of the people were people of color, against 30 percent elsewhere. The poverty rate was 18 percent near the sites and 12 percent elsewhere. Forty of the 44 states with such sites showed the same gap.

Margie Richard

Who: A schoolteacher from the Old Diamond neighborhood of Norco, Louisiana, who led her neighbors' campaign to make Shell pay to move them away from its plant.

When and where: Norco, Louisiana. The campaign ended in 2002. She won the Goldman Environmental Prize in April 2004.

Her family's home stood 25 feet from a Shell plant's fence.

Four generations of Margie Richard's family lived in the Old Diamond neighborhood of Norco, Louisiana. Their home stood 25 feet from the fence of a Shell Chemical plant. Shell had bought land in Diamond and built the plant there in the early 1950s. The neighborhood sat between the chemical plant and a Shell refinery, a plant that turns crude oil into fuels.

Residents of Old Diamond kept a record of the cancers and birth defects among their neighbors.

The fires. Gas leaked from a Shell pipeline in 1973, and a spark from a lawnmower set it on fire. The fire burned Leroy Jones, age 16, to death while he was cutting grass. It also burned to death Helen Washington,

who was resting on her porch. An explosion at the Shell refinery in 1988 killed seven workers and damaged homes in Diamond.

In a 2004 interview with *Grist* magazine, Richard remembered: "The elder people were always coughing ... black soot falling on the grass, on our houses." She also said: "My sister died at a very early age from a rare bacterial disease."

The campaign. Richard led the neighborhood's campaign for about 13 years. Residents tested their own air with buckets built to catch air samples. They took their case to Shell's shareholder meetings, where the company's owners gather, and to Shell in the Netherlands.

Shell's managers agreed in 2002 to pay to move every Old Diamond family that wanted to leave. They also agreed to cut the plant's emissions, the pollution it sends into the air, by 30 percent, and to put $5 million into a community fund. Shell paid at least $80,000 for each house and $50,000 for each trailer, about $30 million in all.

Richard became the first African American to win the Goldman Environmental Prize, in April 2004.

The plant by the school

Federal lawyers sued the owner of a plant in LaPlace, Louisiana, in 2023, and they dropped the suit in 2025. The plant released a chemical likely to cause cancer into the air near an elementary school.

The plant is in St. John the Baptist Parish (a parish in Louisiana is like a county in other states). The company DuPont built the plant to make neoprene, a kind of man-made rubber. The Japanese company Denka bought it about 2015, according to AP news reporting in 2025. To make neoprene, the plant used a chemical called chloroprene, and it released chloroprene into the air.

EPA scientists found in 2010 that chloroprene is "likely to be carcinogenic to humans," meaning likely to cause cancer. They also found that children breathing it build up a lifetime risk of cancer faster than adults do.

The school. More than 300 children went to the 5th Ward Elementary School in 2023, about 450 feet from the plant, or about a football field and a half.

The EPA's recommended long-term level for chloroprene is 0.2 micrograms in each cubic meter of air, a microgram being one millionth of a gram. In their 2023 lawsuit, federal lawyers reported the averages at the five air monitors closest to the plant. The lowest was "more than four times" the recommended level, and the highest was "more than 14 times" that level.

AP reporters wrote in March 2025 that the community around the plant is about 59 percent Black. They also reported that the plant's air pollution posed the highest cancer risk from any single source to a mostly Black population in the country.

The lawsuit. Lawyers for the US Justice Department, acting for the EPA under President Biden, sued Denka under the Clean Air Act on February 28, 2023. They asked the court to force deep cuts in the plant's chloroprene pollution. A trial was set for April 2025.

Under President Trump, Justice Department lawyers dropped the suit on March 7, 2025. Their press release stated that dropping it carried out the president's order called "Ending Radical and Wasteful Government DEI

Programs and Preferencing." DEI stands for diversity, equity and inclusion.

Denka's managers announced on May 13, 2025, that the LaPlace plant would not start making chloroprene again "for an indefinite period," meaning with no end date. They named losses of more than $100 million, rising costs, falling production and problems keeping enough staff. Articles in trade magazines also listed the pollution rules as a reason. The plant was not making chloroprene as of May 2025.

Plastic in the rain

More than 1,000 tons of tiny plastic pieces fall each year on protected land in the western United States. Janice Brahney, a scientist at Utah State University, and her team found this in a study published in the journal *Science* on June 12, 2020. The pieces are called microplastic, bits of plastic too small to see easily, and they fall with rain and with dust. The team sampled 11 parks and other protected areas.

Each year's total is about as much plastic as more than 120 million plastic bottles. Most of the pieces were tiny fibers from clothing.

Comebacks

People nearly wiped out the bald eagles and the bison, and wiped out the wolves of Yellowstone and of public lands across the country. All three live in far larger numbers now. Hide hunters killed the bison, park managers and others poisoned and shot the wolves, and DDT that people sprayed thinned the eagles' eggshells.

Eagles. The U.S. Fish and Wildlife Service counted about 71,400 nesting pairs of bald eagles in the 2020s, against 417 in 1963. The figure of about 10,000 pairs for 2007 and the figure for the 2020s come from different counts. For the newer one, the service's crews surveyed nests from the air in 2018 and 2019, used bird watchers' reports for places they could not fly over, and built a computer model to estimate the total. The service's officials said the eagles had kept increasing fast since their survey of 2009.

Bison. About 30 million bison lived on the Plains in the early 1800s, and fewer than 1,000 were left by 1900. A count in 2008 found about 20,500 Plains bison in 61 herds kept for conservation. It also found about 400,000 bison in commercial herds, which are raised for sale. A U.S. Fish and Wildlife Service web page now lists about 420,000 bison in commercial herds.

Wolves. State wildlife officials estimated 2,797 wolves in seven western states at the end of 2022. Park Service biologists counted 108 wolves in nine packs in Yellowstone National Park at the end of 2024. At the end of 2025, the park's lead wolf biologist, Dan Stahler, gave a count of 84 wolves in eight packs. People are still fighting in court over whether wolves should stay on the endangered list.

Land given back

Chapter 2 tells how members of Congress gave the National Bison Range, a bison refuge on the Flathead Reservation in Montana, back to the Confederated Salish and Kootenai Tribes in 2020.

How the tribes lost it. President Theodore Roosevelt signed a law on May 23, 1908, under which federal officials could spend money to buy land on the reservation for a bison range. The tribes objected strongly. Federal officials took the land anyway and paid about $1.56 an acre.

The Fifth Amendment to the Constitution requires fair payment when the government takes private property for public use. Judges of the U.S. Court of Claims, a federal court that heard claims for money against the national government, ruled in 1971 that the price had been below the land's fair value. That made the taking a break of the Fifth Amendment. The judges awarded the tribes about $231,548.

Wahhoga. Park Service officials in Yosemite agreed in 2018 to share the care of Wahhoga, the site of the valley's last Native village, for 30 years. They share it with the American Indian Council of Mariposa County. A roundhouse, a round building for gatherings, was finished there in the winter of 2025.

Bears Ears

Three presidents have created, cut, restored and cut again Bears Ears National Monument in Utah since 2016. As of September 26, 2026, most of the land was out of the monument and open to mining claims, and no court had ruled on the latest cut.

Created and cut. President Obama created the monument on December 28, 2016, with 1.35 million acres. Five tribes had proposed it: the Hopi Tribe, the Navajo Nation, the Ute Mountain Ute Tribe, the Ute Indian Tribe and the Pueblo of Zuni.

President Donald Trump cut it by about 85 percent in December 2017, to about 201,876 acres. President Biden restored it on October 8, 2021. In June 2022, the five tribes signed an agreement with the Bureau of Land Management and the Forest Service to manage the monument together.

The 2026 cut. Trump signed a proclamation on July 13, 2026, that cut Bears Ears to 121,096 acres, a cut of about 91 percent. Reporters for the *Moab Sun News* published these figures on July 18, 2026. About 1.24 million acres left the monument. What is left is two pieces, Shash Jáa, about 106,816 acres, and Indian Creek, about 14,279 acres.

The proclamation lists minerals in the removed land: silver, copper, uranium, vanadium and zinc. The same day, Trump cut Grand Staircase-Escalante National Monument from about 1.87 million acres to about 181,500 acres.

The tribes' commission. In the July proclamation, Trump also ended the Bears Ears Commission. Elected representatives of the five tribes sat on it, and they had managed the monument with federal officials under the 2022 agreement. Reporters for the *Moab Sun News* wrote that a committee that only gives advice took its place, with tribes holding 5 of about 15 seats.

The tribes say Interior Department officials promised in writing in June 2025 to ask the commission's views before any change to the boundaries, and that no one asked it before July 13. Their statement said: "Our Tribes were not informed of or asked about this decision, and that's unacceptable."

The mining claims. Under the proclamation, the removed land opened on September 11, 2026, to new mining claims, mineral leasing, grazing and timber cutting. A mining claim is a legal claim to the right to mine minerals on public land, and mineral leasing means renting out the right to take minerals from the ground.

By noon on September 11, 16 claims had been recorded in San Juan County. By September 23 staff of a conservation group had counted 23 claims in the land taken out of Bears Ears, 20 of them filed by one mining company.

In court. On September 2, 2026, three sets of groups that had sued over Trump's 2017 cut went back to the federal court in Washington and asked it to hear the new cut as well. They argue that the Antiquities Act of 1906 lets a president create a monument and does not let a president undo one. Utah's members of Congress called the cuts "a return to an appropriate application of the Antiquities Act."

The tribes' own 2017 case, *Hopi Tribe v. Trump*, is still pending, which means undecided, in the same court. As of September 26, 2026, no court had ruled on the 2026 cuts, and no judge had ordered them stopped.

BY 2026

If you remember one thing: After 2000 the land grew hotter and drier and the fires grew bigger, bald eagles, bison and wolves came back by the thousands, and the fights went on over chemical plants beside Black neighborhoods and over Native land such as Bears Ears.

Still open: No court has yet decided whether a president can undo a national monument another president made. The tribes' 2017 case and the suits filed in September 2026 were still waiting in federal court on September 26, 2026.

THE THREE QUESTIONS, ANSWERED

1. **How did Native nations shape the land before Europeans came?** They burned the eastern forests on purpose, again and again, to keep them open and grow food for game, and they planted corn, beans and squash together to keep the soil good.
2. **What happened to the 30 million bison and the billions of passenger pigeons?** Hide hunters, carried by the railroads and helped by army officers who wanted the Plains nations' food gone, left fewer than 1,000 bison by 1900. Netters and shooters killed the pigeons at their nestings, and the last one died in a zoo in 1914.
3. **Who was pushed out when parks were made, and who lived next to the waste?** Native people were pushed out: the Ahwahneechee in Yosemite, the Tukudika in Yellowstone, the Blackfeet at Glacier. Studies from 1983 on found waste sites far more often beside Black and poor neighborhoods.

What changed: Americans cleared, sold and wore out the land that Native nations had kept with fire, then began to protect parts of it by law, and fire crews now learn the old burning from the Yurok.

FIVE DATES TO KEEP

1642: Miantonomi describes what English settlers are doing to the land.

May 20, 1785: Members of Congress pass the Land Ordinance, the start of the grid.

March 1, 1872: Yellowstone becomes the first national park.

September 1, 1914: Martha, the last passenger pigeon, dies.

April 22, 1970: About 20 million Americans take part in Earth Day.

NOT KNOWN: Nobody counted the bison on the Plains before 1500, and the usual figure of about 30 million comes from the early 1800s.

Where to go: Devils Tower National Monument, the first national monument, which the Lakota call Mato Tipila, or Bear Lodge.

Next: Chapter 4, Immigration to America. It asks why people left home to come here, and whom Americans tried to keep out.

PART 2

Coming, Moving, Settling

Chapter 4: Immigration to America

CHAPTER 4 OF 37 · IMMIGRATION TO AMERICA · 10 ERAS · ABOUT 100 MINUTES

People came here to stay from almost every country on earth, and from the 1600s on, the people who had come earlier kept deciding who could join them, by law and sometimes by mob violence.

The poet Emma Lazarus wrote a poem in 1883 to help raise money for the stone base of the Statue of Liberty. It includes the lines "Give me your tired, your poor, / Your huddled masses yearning to breathe free." Nobody read it aloud when the statue opened in 1886. In 1903 her friend Georgina Schuyler had the poem mounted on a bronze plaque inside the base. One year before Lazarus wrote those lines, President Chester A. Arthur had signed a law that shut Chinese workers out of the country.

This chapter follows the people who came to stay, from a Spanish fort in Florida in 1565 to the record number of people held in immigration detention in 2026. Watch why they came: for land and work, to worship in their own way, and to escape famine, riots against Jews, revolution and war. Watch, too, who decided whether they could stay. Lawmakers wrote the rules, from citizenship for white people only in 1790 to the Chinese Exclusion Act of 1882 and the quotas of 1924. Mobs in Philadelphia, Louisville and Rock Springs used fire and guns. The forced arrival of Africans appears here only where it meets those laws. Chapter 24, Slavery and Freedom, tells it in full.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Why did people leave home to come here?
2. Who did Americans try to keep out, and how?

3. Who could become a citizen, and how did that change?

Five minutes? Read "Angel Island" in 1900 to 1950, the Lee Puey You story after it, and the next section, "How the quota laws of 1921 and 1924 worked."

Can skip: "The Dutch and the Swedes" in the 1600s, "Jewish communities" in 1700 to 1750, "The Revolution and the Loyalists" in 1750 to 1800. The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 1 MINUTE

No one from across the ocean came to settle here for good before 1500. Hundreds of Native nations lived in the land that is now the United States, and their people spoke hundreds of different languages. Every group of newcomers who came later arrived on land where people were already living.

Nobody knows how many people lived north of Mexico in 1492. Estimates run from about 1 million to as many as 18 to 20 million. Chapter 2, Native Nations, tells who they were.

The land bridge and the Norse

The first people to reach this land came on foot from Asia, long ago. They walked across the ice-age land bridge, a stretch of dry ground that joined Asia to North America.

Chapter 1 tells the Norse voyages in full. What matters here is that the Norse did not stay. Around the year 1000, Norse sailors from Greenland, the people often called Vikings, built a camp at L'Anse aux Meadows, in Newfoundland, in what is now Canada. Wood they cut there with metal blades dates to 1021. Before Columbus, it is the only camp that anyone from across the ocean is known to have built in North America.

Native people had lived at that spot long before the Norse came. Five Native groups had lived there, the oldest about 6,000 years earlier. The Norse stayed only a short time, from a few years to about twenty by different estimates, and built no settlement that lasted.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

Europeans came to these coasts in the 1500s to conquer and explore, and almost none of them stayed. Most were soldiers, explorers, sailors and Christian missionaries, people sent to bring others into their religion. Native nations held almost all of the land for the whole century. Of three European attempts to settle, only the Spanish town of St. Augustine lasted.

Which settlement lasted?

St. Augustine, Florida, lasted. It is the oldest town that Europeans founded on the US mainland, and people have lived in it without a break since it began. The Spanish navy commander Pedro Menéndez de Avilés founded it on September 8, 1565. He named it for Saint Augustine because he had first sighted land on that saint's feast day, a day the church sets aside to honor a saint. St. Augustine is 42 years older than Jamestown and 55 years older than Plymouth.

Seloy. Menéndez landed at Seloy, a town of the Timucua people. Counts of the people who came with him differ. The National Park Service gives about 600 soldiers and settlers. The Florida Museum of Natural History gives about 800, including 26 women and an unknown number of enslaved Africans.

The newcomers used the council house of the Timucua chief, also named Seloy, as their first fort. It was the building where the town's leaders met. Timucua fighters attacked again and again to drive the Spanish away. In May 1566 Menéndez moved the settlement across the bay to Anastasia Island, and by about 1572 the Spanish had moved back to the place where the town stands today.

Fort Caroline. Two other attempts to stay failed. René de Laudonnière founded Fort Caroline, a French settlement near where Jacksonville, Florida, stands today, in 1564. The French there met Timucua people, and one of their leaders was Athore. The French settlers were Huguenots, French Protestants,

members of the Christian churches that split away from the Catholic Church led by the pope in Rome. In 1565 Menéndez destroyed Fort Caroline and killed most of the French defenders. The Spanish were Catholics, and the fight was partly over religion.

Roanoke. Nobody knows what happened to the 117 English settlers who landed on Roanoke Island in 1587. The island lies off the coast of what is now North Carolina, and it was the land of the Roanoke, Secotan and Croatoan peoples. Sir Walter Raleigh organized the colony, a settlement ruled from a faraway country, and John White led it. On August 18, 1587, a settler named Eleanor Dare gave birth there to a daughter, Virginia Dare, the first English child recorded as born in the Americas.

The settlers sent White back to England for supplies. Before he left, they agreed on a signal. If they moved, they would carve the name of their new place on a tree or a post. If they were in trouble, they would carve a cross above the name. White could not get back for three years. In 1588 Queen Elizabeth I took every English ship for her navy, to fight the Spanish Armada, a fleet of Spanish warships.

What White found. White went ashore on August 18, 1590, Virginia Dare's third birthday. He found a wall of upright logs, the houses gone, and no people. Someone had carved CRO on a tree and CROATOAN on a post, with no cross. Croatoan was a nearby island, where a man named Manteo was born, and White wrote that its people were friends of the English. A storm blew his ship out to sea before he could search there. No one found the settlers.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 9 MINUTES

Most English people who went to Virginia and Maryland in the 1600s paid for the voyage with years of their own work. People from Europe began coming to stay in these years. Some came so that they could worship in their own way. Others came to make money by farming, trading or growing tobacco.

The colonists settled along the Atlantic coast, on land where Native nations already lived. English colonists built Jamestown on Powhatan land and Plymouth on the site of a Wampanoag town. Dutch colonists built New Amsterdam on Lenape land, and Quakers under William Penn settled Pennsylvania on Lenape land too.

Jamestown and indentured servitude

Jamestown. English colonists founded Jamestown, Virginia, in 1607, and it was the first English settlement that lasted. The Virginia Company of London paid for it. Many people owned shares in the company, hoping to split a profit. The colonists built their fort inside Tsenacomoco, the land of the Powhatan, a union of Native towns and peoples under one head chief. Jamestown Island was a hunting ground of the Paspahegh, one of those peoples, and Paspahegh fighters attacked the new settlement on May 26, 1607.

Many colonists died of disease and hunger in the first years. In the fall of 1609 the Powhatan leader, also called Powhatan, cut off the food trade with the colonists and surrounded their fort. About 500 colonists were alive at the start of that winter. About 61 were alive by spring.

Tobacco. John Rolfe began growing tobacco for sale overseas in the 1610s. Once tobacco sold well, more settlers came to Virginia to grow it, and they took more Powhatan land without paying for it. On March 22, 1622, fighters from an alliance of Virginia Indian nations, led by Opechancanough, attacked the English settlements and killed as many as 347 colonists.

Most early English arrivals in the Chesapeake, the country around the Chesapeake Bay in Virginia and Maryland, came as indentured servants. An indentured servant signed a contract, called an indenture, and gave up four to seven years of work in exchange for the trip across the ocean. The contract often promised food, a place to live, and a payment at the end called freedom dues.

Servants made up about 80 to 90 percent of the European immigrants to the Chesapeake in the 1600s, eight or nine of every ten. Across all the British colonies over the whole colonial period, the share was lower: about one-half to two-thirds of white immigrants came this way.

Africans brought by force, 1619

An English privateer, a privately owned armed ship whose crew attacked the ships of enemy countries, brought more than twenty Africans to Virginia in late August 1619. The ship was the *White Lion*, and it landed them at Point Comfort, near the mouth of the James River.

Where they came from. These Africans had been seized in wars around the kingdoms of Kongo and Ndongo, in West Central Africa, in what is now Angola. In 1618 and 1619 Luis Mendes de Vasconçelos, the Portuguese governor of Angola, led two attacks on the people of Ndongo.

He fought alongside the Imbangala, African fighters paid to fight for others, and together they captured thousands of people. Their captors marched them to the Portuguese port of Luanda and loaded them onto the Portuguese ship *San Juan Bautista*, with about 350 captives bound for Mexico.

Two English privateers, the *White Lion* and the *Treasurer*, attacked that ship in the Gulf of Mexico. Their crews took 50 to 60 of the Africans between them. The *White Lion* carried its share, more than twenty people, to Virginia. They are the first Africans recorded in English Virginia, and their landing began the forced arrival of Africans in the English mainland colonies.

Richard Frethorne

Who: An English boy who came to Virginia as an indentured servant and wrote home begging for help.

When and where: Arrived in December 1622 on the *Abigail*. Martin's Hundred, Virginia. Listed among the dead there by February 1624.

"I never ate anything but peas and loblollie," he wrote home.

Richard Frethorne is one of very few ordinary people in the early colonies whose own words survive. He came to Virginia as an indentured servant, landing in December 1622 from a ship called the *Abigail*, and he worked at a place called Martin's Hundred.

In March and April 1623 he wrote letters to his parents in England. He begged them to buy out his indenture, which meant paying to free him from the rest of his years of work. If they could not do that, he asked them to send food. "I never ate anything but peas and loblollie (a thick porridge)," he wrote. In another line he wrote, "there is nothing to comfort us."

His name was on a list of the dead at Martin's Hundred by February 1624. The list does not give the cause of his death.

Plymouth and the Puritans

Farther north, the *Mayflower* carried about 102 passengers across the Atlantic in 1620. They founded Plymouth, in what is now Massachusetts, on the site of Patuxet, a Wampanoag town. A disease had killed many of Patuxet's people between 1616 and 1619. The Pilgrims among the passengers were English Separatists. They wanted to worship apart from the Church of England, the official church of their country, and before crossing the ocean they had first moved to Leiden, in Holland.

A larger group followed ten years later. In 1630 John Winthrop led a fleet of 11 ships to Massachusetts Bay with about 700 passengers. His flagship, the ship that carried the fleet's leader, was the *Arbella*. These colonists were Puritans, English Protestants who disagreed with how the Church of England was run.

Laud's courts. King Charles I made William Laud Archbishop of Canterbury, the head of the Church of England, in 1633. Laud wanted every church to follow the same rules and ceremonies. Judges in a royal court called the Star Chamber and in a church court called the High Commission took church jobs away from many Puritan ministers, the men who led church services, or banned them from preaching.

Three Puritan writers, William Prynne, Henry Burton and John Bastwick, wrote against Laud. In 1637 judges sentenced them to have their ears cut off and their cheeks branded. Branding means burning the skin with a hot iron to leave a mark that never goes away.

About 20,000 Puritans came to New England over the 1630s, in what is called the Great Migration. They were one part of a larger movement. About 80,000 people left England in that decade, and roughly 20,000 went to each of four places: Ireland, the West Indies, the Netherlands and New England. The West Indies are the islands of the Caribbean Sea.

Anne Hutchinson

Who: An English woman who followed her minister to Boston, was put on trial and banished (ordered to leave and never come back) three years later, and was killed by Siwanoy fighters in 1643.

When and where: Crossed on the *Griffin* in the fall of 1634. Boston, then Rhode Island, then land the Dutch claimed.

She asked the court why she was banished, and got no answer.

Anne Hutchinson sailed from England on the *Griffin* in the fall of 1634 with her husband, William, and their children. About 200 passengers were on board. She was following her minister, John Cotton, the preacher who led her church, to Boston.

What she taught. She held a meeting in her Boston house every week, starting in 1636, to go over the Sunday sermons. Women came at first, and then men came too. She taught that God's grace, his gift of being saved and going to heaven, did not depend on good behavior. She also said she could tell which of the colony's ministers had received that grace and which had not.

The trial. Governor John Winthrop and other colony leaders accused her of heresy, which means teaching against the church's beliefs. They counted the meetings against her too. In November 1637 the colony's lawmakers and judges, sitting as the General Court of Massachusetts, tried her at Newtown, now Cambridge, and Winthrop led the questioning.

At the end Winthrop told her, "you are banished from out of our jurisdiction (the land the court ruled) as being a woman not fit for our society." She answered, "I desire to know wherefore (why) I am banished?" Winthrop replied, "Say no more, the court knows wherefore and is satisfied."

She moved to Portsmouth, Rhode Island, in 1638. In 1642 she moved again, to land on Long Island Sound that the Dutch claimed, near what is now New York City. The Siwanoy, a Native people, lived there. The Dutch governor was Willem Kieft. On the night of February 25, 1643, Kieft's

men killed at least 80 and perhaps as many as 120 Munsee people. With those killings they started a war with the Native nations nearby. It is now called Kieft's War, and it lasted until 1645.

Her death. During that war, in August or September 1643, Siwanoy fighters attacked Anne Hutchinson's household near Pelham Bay. They killed her, her servants, and all but one of the children who were with her.

The Dutch and the Swedes

Dutch settlement began earlier than the Puritan fleet, in the 1620s, between Virginia and New England. Dutch colonists founded a colony called New Netherland. Its main town was New Amsterdam, on the island of Manhattan, in Lenapehoking, the homeland of the Lenape people. From 1638 to 1655, Swedish and Finnish settlers ran a small colony called New Sweden along the Delaware River, until the Dutch took it over in 1655.

Four English warships arrived at New Amsterdam in 1664. The Dutch governor, Peter Stuyvesant, surrendered without a fight, and the papers of surrender were signed in late August. The English renamed the colony New York, after James, the Duke of York, the younger brother of King Charles II of England.

The first Jewish refugees, 1654

Twenty-three Jewish refugees, people fleeing danger at home, landed at New Amsterdam in 1654 on a ship called the *Ste. Catherine*. They came from Recife, in Brazil. The Dutch had held that part of Brazil, and the refugees left after Portuguese forces took it back. Another Jewish man, Jacob Barsimson, had arrived earlier that year.

Governor Peter Stuyvesant tried to force the refugees out of the colony. Leaders of the Dutch West India Company, the trading company that ran New Netherland and gave the governor his orders, overruled him.

Catholics, Quakers and Huguenots

Other groups crossed the ocean for their religion too. Catholics settled in Maryland from 1634. Quakers, members of a Protestant group also called the Society of Friends, settled in Pennsylvania under William Penn from 1681. The Lenape people lived on both sides of the Delaware River there.

The Huguenots. King Louis XIV of France canceled the Edict of Nantes in 1685. King Henry IV had made that law in 1598, and under it French Protestants could worship in the towns they held. Huguenots fled France, and most went to other countries in Europe. Only about 1,500 to 2,000 had reached the American colonies by 1700. They settled in places such as New York, Massachusetts, and Charleston, South Carolina.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 6 MINUTES

Scots-Irish and German newcomers came by the thousands in these fifty years, and many other arrivals came bound to work for years or for life. The Scots-Irish came from the north of Ireland, and the Germans from the lands along the Rhine River. Small Jewish communities grew in the port towns. The colonists still lived in a thin strip along the Atlantic coast, and the land farther inland was still Native land.

Bound workers could not leave their work until their time was up, and some never could. Indentured servants had signed contracts for years of work. Merchants sold British convicts as laborers. Slave traders brought enslaved Africans by force.

Why Germans and Scots-Irish left home

German newcomers left to escape war, taxes and failed crops, and they came for cheap land. They came from southwest Germany and from the lands along the Rhine River, including the Palatinate, a region along the Rhine whose people were called Palatines. About 2,100 Palatines reached New York in 1709 and 1710.

A larger number of Germans went to Pennsylvania, mostly between about 1725 and 1775. About 12,000 German speakers had come to Pennsylvania by 1749. By the time of the Revolution, Germans made up about one-third of the people in that colony. The name Pennsylvania Dutch comes from *Deutsch*, the German word for German.

The Scots-Irish were Presbyterians, members of a Protestant church, from Ulster in the north of Ireland. Their ancestors were Scots who had settled in Ulster. Between 1710 and 1775 about 200,000 of them came to the land that later became the United States.

The Test Act. They left to escape high rents and a law called the Test Act, which Ireland's lawmakers passed in 1704. Under it, only people who took communion, a church ceremony of bread and wine, in the Church of Ireland could hold a public job. That rule shut Presbyterians out of public jobs. Marriages performed by Presbyterian ministers did not count under the law, so the law said the children of those marriages were born outside a lawful marriage.

Pennsylvania was the main place where the Scots-Irish landed. Many then moved south along the Appalachian backcountry, the land in and near the Appalachian Mountains, far from the coast. That backcountry was Native land.

John Peter Zenger

Who: A boy from the German Palatinate who grew up to be a New York printer, jailed and tried over what his newspaper printed.
When and where: Arrived in New York in June 1710. Died July 28, 1746.

His paper missed one issue in his almost nine months in jail.

John Peter Zenger reached New York in June 1710, at the age of 13. His father, Nicolaus, had died on the voyage. The family came from Rumbach, in the Palatinate, and had joined the Palatine migration in late 1709, traveling first to England. John Peter landed with his widowed mother, Johanna, and his two siblings. In 1711 he began work as an apprentice, a young worker who learns a trade from a master, to the New York printer William Bradford.

The newspaper. In 1733 Zenger became the printer of the *New-York Weekly Journal*, a newspaper started by men who opposed the governor, William Cosby. Cosby had copies of the paper burned. Two judges on Cosby's side, James De Lancey and Frederick Philipse, ordered Zenger's arrest, and on November 17, 1734, the sheriff took him to jail.

The charge. He was charged with seditious libel, the crime of printing words that blame a public official or the government. His bail, money paid to a court so that a person can leave jail until the trial, was set at 400

> pounds. Zenger did not have that much money, so he stayed in jail until his trial, almost nine months later. His wife, Anna, and his apprentices kept printing the paper, and only one issue was missed. On August 4, 1735, a jury found Zenger not guilty.

Jewish communities

Most of the Jews in the colonies were Sephardic Jews, whose families had come from Spain and Portugal. After the first group landed at New Amsterdam in 1654, Jewish communities formed at Newport, Rhode Island, and at Charleston, New York and Savannah, Georgia. On July 11, 1733, 42 Jews landed at Savannah.

Convicts sent as bound labor

The Transportation Act. British lawmakers passed the Transportation Act in 1718. Under it, merchants shipped about 50,000 convicts, people found guilty of crimes, from Britain to the American colonies. Some counts put the number as high as 60,000, and more than 20,000 went to Virginia. Officials of the British treasury, the office that handled the government's money, paid the merchants for each convict. The first merchant to get this contract was Jonathan Forward.

In the colonies the merchants sold the convicts as bound laborers, workers who had to work for a buyer for a set number of years. Most had to work seven years, and some had to work fourteen. Buyers included merchants, tradesmen, shipbuilders and ironworks owners, because a convict cost less than an indentured servant or an enslaved African. The shipping went on until 1775.

Convicts made up roughly a quarter of the people who emigrated from Britain in the 1700s, leaving their own country to live in another. Indentured servants kept coming alongside them.

Forced arrival through Charleston

The number of enslaved Africans that slave traders brought to the mainland colonies rose sharply in these years. Rice planters in the South Carolina Lowcountry, the low coastal land, bought large numbers of West and Central Africans. Some planters chose Africans who already knew how to grow rice. Charleston, South Carolina, was the main mainland port where enslaved Africans arrived.

Sullivan's Island. Many were held first at a quarantine station on Sullivan's Island, at the mouth of Charleston's harbor, where new arrivals were kept apart so that any disease they carried would not spread. They were kept in buildings called pest houses and checked for disease there. The histories of the island do not name the people who kept them. Then slave traders took them to Charleston and sold them at public auction.

The historian Peter Wood wrote in 1974 that Sullivan's Island "might well be described as the Ellis Island of black Americans." Ellis Island was the New York station where millions of European immigrants later arrived. Published estimates put at least 200,000 Africans through Charleston harbor and say that about 40 percent of African Americans today have an ancestor who came that way. Nic Butler, a historian at the Charleston County Public Library, argues that the share credited to Sullivan's Island is too high.

Across the whole slave trade, slave traders forced about 12.5 million Africans onto ships. About 10.7 million lived through the crossing, and about 1.8 million died on the slave traders' ships on the way. Fewer than 4 of every 100 people who lived through the crossing were brought to mainland North America. About 305,000 came straight from Africa, and close to 388,000 came in all, counting those brought by way of the Caribbean.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 5 MINUTES

After the Revolution, members of Congress decided who could become a citizen, a full legal member of the new country, and they limited it to free white people. Fewer people crossed the Atlantic to settle during the American Revolution, from 1775 to 1783, than before it. In the 1790s thousands of refugees arrived from a revolution in the Caribbean.

Alexander Hamilton

Who: An orphaned clerk from the Caribbean who came to New York as a teenager to go to school, and stayed.

When and where: Born on Nevis. Sailed from St. Croix in late 1772 or early 1773. King's College, New York.

Movie: *Hamilton* (2020), the filmed Broadway stage musical with its original cast, released on Disney+ on July 3, 2020. It is a dramatization, not a documentary.

A letter about a hurricane paid his way to school.

Alexander Hamilton was born on the Caribbean island of Nevis on January 11. The year is disputed: accounts of his life give either 1755 or 1757. By 1772 he was working on the nearby island of St. Croix as a clerk, a worker who keeps written records for a business.

A hurricane struck St. Croix on August 31, 1772. Hamilton wrote a letter describing the storm, dated September 6, and a newspaper called the *Royal Danish American Gazette* printed it on October 3. After reading it, men on the island raised money to send him to school in North America.

He sailed in late 1772 or early 1773. Accounts differ on the date. He studied at King's College in New York, and he stayed. Later he worked for the new national government at the Treasury, the department that handles the government's money.

The Revolution and the Loyalists

Fewer immigrants crossed the Atlantic during the Revolutionary War, from 1775 to 1783, than in the years before it. The shipping of British convicts to the colonies ended in 1775. During and after the war, tens of thousands of Loyalists, colonists who sided with the British king against the Revolution, left the country, many of them for Canada.

Under the peace of 1783, the western border of the United States was the Mississippi River. Spanish and French officials claimed the land beyond the river. Most of the land away from the Atlantic coast was still Native land.

Who could become a citizen in 1790?

Only "a free white person" of "good character" could. Members of Congress wrote those words into the Naturalization Act of 1790, the national government's first law on naturalization, the legal process by which a person born in another country becomes a citizen. To qualify, a person had to live in the United States for two years, including at least one year in the state where they applied, and swear loyalty to the Constitution. Children born abroad to citizens were included as citizens.

Under this law, an immigrant who was enslaved or was not white could not become a citizen. Members of Congress did not fully remove the limit to white people until 1952, 162 years later.

The men who wrote the Constitution in 1787 also set a date for arrivals by force. In Article I, Section 9, they barred Congress from stopping the bringing in of enslaved people before 1808. So for about twenty more years, slave traders could legally bring captives into the country.

Pierre Toussaint

Who: A man born enslaved in Saint-Domingue and brought to New York by the family that enslaved him. He became a leading hairdresser and was freed in 1807.

When and where: Brought to New York in 1787. Freed July 2, 1807. Died in New York, June 30, 1853.

He was one of New York's leading hairdressers, and still enslaved.

Pierre was born enslaved in Saint-Domingue, a French colony in the Caribbean, in about 1766, though some recent accounts give 1781. Until he was freed, he was known simply as Pierre. In 1787 Marie Elisabeth Bérard and her husband, the family that enslaved him, took him to New York. The Bérards were fleeing fighting and disorder in the colony, four years before the revolution there began.

In New York Pierre trained under a hairdresser and became one of the city's leading hairdressers. When Marie Elisabeth Bérard's husband died, Pierre supported her. He was still enslaved by her family at the time. During an outbreak of yellow fever, a deadly disease spread by mosquitoes, in New York in 1798, he nursed sick people who were kept apart from others.

Freedom. Marie Elisabeth Bérard married again, to a Mr. Nicolas, and she died in 1807. On her deathbed she made her second husband promise to free Pierre. Mr. Nicolas kept the promise, and Pierre was free on July 2, 1807. If he was born in about 1766, he was about 41, though one account says 45. As a free man he took the surname Toussaint, to honor Toussaint Louverture, a leader of the revolution in Saint-Domingue.

Toussaint used his money to care for orphans and to fund early Catholic charities in New York, groups that helped the poor. In 1811 he married Juliette Noel, an enslaved woman, after he paid for her freedom.

> **After his death.** Cardinal John O'Connor, the head of the Catholic Church in New York, had Toussaint's remains moved in 1990 to the crypt of St. Patrick's Cathedral, a burial room beneath the church. Pope John Paul II declared him Venerable in 1996, a title the pope gives to a person whom church leaders are studying as a possible saint.

Refugees from Saint-Domingue

Enslaved Africans in Saint-Domingue, a French sugar colony, rose up on August 21, 1791, against the French planters who enslaved them and against French rule. The fighting went on until January 1, 1804, when Saint-Domingue became the independent country of Haiti.

Refugees fled to cities in the United States. They included white planters and free people of color, meaning people of African or mixed descent who were not enslaved. They also included enslaved people, whom their owners brought with them. That first year a ship called the *Charming Sally* carried 15 refugees to Philadelphia. By 1794 more than 3,000 refugees had come to that city, and nearly 20,000 refugees from Saint-Domingue came to the United States across the 1790s and the 1800s.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 11 MINUTES

The first large wave of people who chose to come here arrived in these years, mostly from Germany and Ireland, and some Protestant Americans met the Irish Catholics with mobs. Germans were the largest group of newcomers from about 1840.

One kind of arrival ended early in these years. Under a national ban that began on January 1, 1808, no one could legally bring an enslaved person into the country from abroad.

Protestants, Christians whose churches had split away from the Catholic Church led by the pope, formed mobs that attacked Catholics near Boston in 1834 and burned Irish Catholic homes in Philadelphia in 1844. Then more than 1.5 million Irish people reached American ports between 1845 and 1855, during and after a famine in Ireland, a time when food ran so short that many people died of hunger. New York was the main port where they landed, and large numbers also came ashore at Boston and at New Orleans.

The end of legal arrival from Africa

President Thomas Jefferson signed a law on March 2, 1807, that banned bringing enslaved people into the United States from other countries. It is called the Act Prohibiting Importation of Slaves, importation meaning bringing people or goods in from abroad. The ban began on January 1, 1808, the earliest date the Constitution allowed.

No one could legally bring an enslaved African across the ocean after that. Smugglers kept bringing in captives against the law. From then on, the number of enslaved people in the country grew mainly through children born to enslaved mothers. Enslavers held those children as property from birth.

Germans and the Forty-Eighters

More immigrants came from Germany than from any other country from about 1840 to 1890. Many Germans left home because their crops had failed, and they came for farmland, most of all in the Midwest. Roughly three out of every five German immigrants settled there to farm. About 6 million Germans came to the United States between 1820 and World War I.

The Forty-Eighters. Revolutions broke out in Germany in 1848 and 1849. The people who fought in them wanted democratic government, in which the people choose their leaders. Soldiers from Prussia, a kingdom in what is now Germany, crushed the revolutions, and some of the revolutionaries fled abroad.

The ones who came to the United States are called the Forty-Eighters, after the year 1848. There were only about 4,000 to 10,000 of them. Many were journalists or professionals, people trained for skilled work such as law or medicine. Some of them later became leaders in their new country.

Jette Bruns

Who: A German woman who settled in Missouri with her doctor husband and wrote letters home to her brother for more than fifty years.

When and where: Born 1813 in Oelde, Westphalia. Arrived at the Westphalia Settlement, central Missouri, in 1836. Died 1899.

She wrote home to her brother for more than fifty years.

Henriette Geisberg Bruns, known as Jette, came from Oelde, a town in Westphalia, a region of Germany. In 1836 she arrived at the Westphalia Settlement in central Missouri with her husband, the doctor Bernhard Bruns. Their baby son came too, along with two of her brothers and a maid.

Bernhard became mayor of Jefferson City, the capital of Missouri, and he died in office during the Civil War. After he died, Jette had almost no money. She ran a boardinghouse, a house where people paid to sleep and eat, across from the Missouri state capitol, the building where the state's lawmakers meet.

The letters. Her letters home to her brother Heinrich survive. The University of Missouri Press printed them in 1988, along with a short account of her life that she wrote after the Civil War. Adolf E. Schroeder edited them and translated them into English. The book is called *Hold Dear, As Always: Jette, a German Immigrant Life in Letters*.

Mobs against Catholics, 1834 and 1844

Some Protestant Americans turned against the Irish newcomers and against Catholics. Before the Irish famine, Protestant mobs attacked Catholics in two cities and burned their buildings.

Charlestown, 1834. A mob of mostly Protestant workmen burned a Catholic convent school, a school that nuns ran in their own home, in Charlestown, near Boston, on the night of August 11, 1834. The nuns and 47 girl students were inside, and only six of the girls were Catholic. One Boston newspaper put the mob at 50 to 60 men, and another put it at 150 to 200. About 2,000 people gathered to watch.

The mob broke down the doors and windows, set fire to the buildings and burned them to the ground. The men also broke open the tomb where several dead nuns were buried. The records of the attack list no deaths.

Police arrested 13 men. At trial, juries found 12 of them not guilty, including their leader, John R. Buzzell. He later wrote that the evidence against him was enough "to have convicted (found guilty) twenty men, but somehow I proved an alibi (proof that he was somewhere else)." The one man found guilty was 16 years old, and Governor John Davis pardoned him, forgiving the crime and ending the punishment.

Massachusetts lawmakers at first voted down a request from Catholic church leaders to be paid for the loss. In 1846 they voted the church $10,000. Church leaders put the loss at about $100,000, ten times as much, and refused the money.

Philadelphia, 1844. In Philadelphia the fighting began over schools. Teachers in the public schools made Catholic children read the Protestant version of the Bible. Francis Patrick Kenrick, the Catholic bishop of Philadelphia, the leader of the city's Catholic churches, objected. Nativists, people who wanted power kept for native-born Protestants, then claimed that Catholics were trying to throw the Bible out of the schools.

Nativists held a rally on May 6, 1844, in Kensington, a mostly Irish Catholic neighborhood. Shooting and fighting broke out between the nativists and the Irish Catholics. An 18-year-old nativist named George Shiffler was shot dead. The records do not say who fired the shot.

Nativist crowds burned Irish Catholic homes, a fire station and a market on May 7 and 8. They also burned two Catholic churches, St. Michael's and St. Augustine's, and the school of St. Augustine's. They burned a seminary, a school that trains people for church work, run by the Sisters of Charity, a group of Catholic nuns. One count gives about 30 homes burned and about 200 people driven from their homes.

St. Philip de Neri. Nativist crowds learned in July that the brother of the priest at a third church, St. Philip de Neri, had stored guns in it to defend it. They gathered there and brought a cannon. Soldiers of the state militia, a force of citizens called up to serve as soldiers, fired on the crowd under General George Cadwalader. The crowd attacked the soldiers with bricks, stones, bottles and guns.

Accounts give different counts of the dead. For the May riots, the counts run from at least 14 dead to 20 dead. One of the Catholics killed was Joseph Rice. The Encyclopedia of Greater Philadelphia lists four soldiers and "probably a dozen rioters" dead in July. EBSCO's reference articles give figures that add up to about 34 dead and at least 126 wounded in both riots together. There is no agreed total.

Who was blamed. A grand jury, a group of citizens who decide whether there is enough evidence to put a person on trial, charged 19 of the rioters. Juries found only a handful of the 19 guilty. In June 1844 a grand jury blamed the Catholics who had been attacked. It said the May riots came from efforts "to exclude the Bible from the public schools." Catholics answered that the jury had called no Catholic to testify.

That October, Philadelphia voters elected Lewis Levin to Congress. Levin was a newspaper editor who had founded the nativist group that held the Kensington rally.

The Irish famine

A plant disease called potato blight rotted Ireland's potatoes from 1845 to 1852. The blight is a water mold, a tiny living thing that grows on the plant and makes it rot. At least two out of every three people in Ireland lived mainly on potatoes. People starved, and at least 1 million people in Ireland died. This is called the Great Famine.

Food kept leaving. Ireland had been part of the United Kingdom since 1801, ruled by the government and the lawmakers in London. Ships kept carrying food from Ireland to Britain while people starved. The historian Christine Kinealy counted almost 4,000 ships that carried butter, grain and farm animals from Ireland to British ports in 1847. Soldiers guarded some of those shipments. About 400,000 people in Ireland died that year. Accounts still differ about how much of the need that food could have met.

In an earlier food shortage, in the 1780s, British officials had banned grain from leaving Ireland, and the ban had worked. In 1846 and 1847, Prime Minister Lord John Russell, the head of the British government, and his ministers, the officials who ran its departments, refused to ban grain from leaving Ireland again. They also made Irish taxpayers pay for famine relief, the food and work given to people who were starving.

Charles Trevelyan was the senior official at the Treasury, the government's money department, who ran famine relief. In December 1846, writing to Lord Monteagle about Ireland, he said that the real problem was not the famine. He said it was "the selfish, perverse (stubbornly wrong) and turbulent (unruly) character of the people," meaning the Irish.

The quarter-acre rule. In 1847 members of the British Parliament, the lawmakers in London, added a rule to the law on help for the poor. The rule was named for one of them, William H. Gregory. Under it, a family holding more than a quarter of an acre of land could get no relief. To get food, a family had to give up its land.

Evictions. Landlords forced tenant families, families who rented the land they farmed, off their land and often pulled their houses down. This is called eviction. Police records list almost 250,000 people evicted from 1849 to 1854.

The historian James S. Donnelly Jr. judged that count too low. He also counted families forced to give up their land in other ways from 1846 to 1854, and he wrote that the total "would almost certainly exceed half a million persons." Lord Palmerston, a minister in the British government, cleared about 2,000 tenants from his land in County Sligo and paid their fares overseas. Major Denis Mahon evicted thousands of tenants in County Roscommon.

Most of the people who died in the famine died of disease, which people then called fever. Officials in Ireland did not record deaths then, so the numbers are estimates. They run from about 1 million to 1.5 million dead.

The crossing. At least 2.1 million people left Ireland from 1845 to 1855, and most of them went to the United States. People called the crowded ships of those years "coffin ships." The *Virginius* sailed to Canada in 1847 with 496 passengers, and a report in the Toronto *Globe* said that 158 of them had died, "nearly one third."

More than 1.5 million Irish people arrived at American ports between 1845 and 1855. Most of them were poor when they landed. They settled in cities of the Northeast, such as New York and Boston, and in other cities in Pennsylvania, Massachusetts and beyond.

Patrick Kennedy and Bridget Murphy

Who: Two people from County Wexford, Ireland, who married in Boston during the famine years. Patrick was the great-grandfather of President John F. Kennedy.

When and where: Patrick left Ireland in 1848 or 1849. They married in September 1849. East Boston, Massachusetts.

He made barrels in East Boston and died of cholera at 35.

Patrick Kennedy was born in 1823 at Dunganstown, in County Wexford, Ireland. He left during the Great Famine and made a new home in East Boston, Massachusetts. Accounts differ on whether he left in 1848 or in 1849. In East Boston he worked as a cooper, a person who makes barrels.

He married Bridget Murphy in September 1849. She also came from County Wexford, from a place called Owenduff. The couple had five children.

Patrick died of cholera, a disease people catch from dirty water or food, on November 22, 1858, at the age of 35. Cholera causes heavy diarrhea, and a sick person can lose so much water from the body that they die within days.

Patrick's son Patrick Joseph Kennedy, known as P.J., had a son named Joseph P. Kennedy. Joseph's son was John F. Kennedy, who later became president of the United States.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 21 MINUTES

Chinese immigrants became the first people that lawmakers barred from the country because of where they came from. Newcomers from Europe kept arriving, about 11 million through the port of New York alone between 1855 and 1890. Germans still came in the largest numbers in the 1850s. Chinese immigrants began arriving on the West Coast in 1849. Toward the end of the century, Italians, Poles, Hungarians, Greeks and Jews from the Russian Empire came in growing numbers.

Mobs in the West killed Chinese immigrants and drove whole Chinese communities out of their towns from 1871 to 1887. The Chinese Exclusion Act of 1882 was the first law in the United States to bar a group of people because of their nationality, meaning the country they came from.

Germans and the Know-Nothings

More than 950,000 Germans came to the United States in the 1850s. About 220,000 of them arrived in 1854 alone.

Members of secret societies that opposed immigrants and Catholics formed a political party in the 1850s. Its official name was the American Party. Members who were asked about the group answered, "I know nothing," and the party came to be called the Know-Nothings. The Know-Nothings feared that Catholics were a danger to the Protestant faith and to democracy. In the 1854 elections in Massachusetts, Know-Nothing candidates won all but 3 of the 400 seats in the state's lawmaking body.

Bloody Monday. Know-Nothing mobs attacked immigrants in Louisville, Kentucky, on Monday, August 6, 1855. It was election day, and people call it Bloody Monday. Irish and German immigrants made up about a third of the city. In the weeks before the vote, George D. Prentice, editor of the *Louisville Journal*, wrote newspaper articles against immigrants.

Know-Nothing gangs stopped immigrants from voting. Mobs led by party members attacked the German neighborhoods east of downtown and the Irish neighborhoods to the west. They set fires and robbed homes and businesses, and they damaged more than 100 homes and businesses.

Accounts written later say the mob burned Quinn's Row, a row of houses owned by an Irishman named Quinn, and shot people as they ran from the flames. A study published in the 2020s in the Kentucky Historical Society's journal uses court statements from the 1850s to challenge many of the stories told about the riot.

The Kentucky Historical Society lists at least 22 dead. Other counts give 19 to 22, and Catholic leaders at the time put the number at well over 100. Most of the dead were Irish and German. A grand jury charged five people, and none was found guilty. No one paid the victims for their losses. The Catholic bishop, Martin John Spalding, asked Catholics to stay calm and not to take revenge.

The party's members then split over slavery. By 1860 the party had broken apart, and many of its members had joined the new Republican Party.

Carl Schurz

Who: A German revolutionary who fled after the revolutions of 1848 and 1849 failed. In the United States he became a Union general, a senator and Secretary of the Interior.

When and where: Born March 2, 1829, in the Rhine Province of Prussia, near Cologne. Settled in Watertown, Wisconsin, in 1852. Died May 14, 1906.

He fought a revolution in Prussia and became a United States senator.

Carl Schurz was one of the Forty-Eighters. He grew up near the city of Cologne, in the Rhine Province of Prussia, a kingdom in what is now Germany. Schurz joined the revolutions of 1848 and 1849. When Prussian forces crushed them, he fled to France and then to London. In 1852 he crossed the Atlantic as a refugee and settled in Watertown, Wisconsin.

In the Civil War he served as a general in the Union army, the army of the United States government, which fought the Southern states that had broken away. From 1869 to 1875 he represented Missouri in the United States Senate, as the first senator born in Germany. President Hayes then chose him as Secretary of the Interior, one of the heads of government departments who advise the president. He held that job from 1877 to 1881.

The last known slave ship

A sailing ship called the *Clotilda* carried about 110 African captives to Mobile, Alabama, around July 8, 1860. Bringing captives into the country had been against the law for 52 years. The businessman Timothy Meaher paid for the voyage, reportedly to win a bet that he could smuggle captives in. The ship's captain, William Foster, set the *Clotilda* on fire near Twelve-Mile Island. It is the last documented slave ship to reach the United States.

Kossola. One of the captives was Oluale Kossola, born in about 1841 in what is now Benin, in West Africa. Accounts say soldiers of the kingdom of Dahomey captured him in a raid and took him to the coast. In Alabama, Meaher, his brothers and some friends enslaved the captives for the next five years, until slavery ended in 1865.

Africatown. After the end of slavery the survivors could not pay for the trip home. They built their own town near Mobile and called it Africatown. The writer Zora Neale Hurston interviewed Kossola in 1927, and her book about him, *Barracoon*, came out in 2018. The wreck of the *Clotilda* was found in the Mobile River and confirmed in 2019.

Chinese immigrants in the West

Chinese immigration to the United States began with the California Gold Rush, when crowds of people went to California to look for gold. About 325 Chinese people came in 1849. Three years later, in 1852, some 20,000 came. About 40,400 arrived in all between 1851 and 1860. Most came from Guangdong province, also called Canton, in southern China. By 1880 about 105,465 Chinese people lived in the United States.

The railroad. Chinese workers built the western part of the first railroad to cross the country. Managers of the Central Pacific Railroad had about 10,000 to 12,000 Chinese workers on the job at any one time between 1865 and 1869, about nine out of every ten of the railroad's workers. Chinese workers earned about $35 a month and paid for their own food and housing. White workers got about $42 a month plus housing.

The strike. Thousands of Chinese workers went on strike in June 1867, which means they stopped work together to press for better terms. They asked for $40 a month, a 10-hour workday instead of 11 hours, and shorter shifts in the tunnels. Charles Crocker was the railroad director in charge of building. He cut off all food and supplies to their camps and brought in the sheriff and his deputies. After about eight days the workers went back to work.

Snow, explosions and disease killed Chinese railroad workers. In the winter of 1866 and 1867, 44 storms hit the Sierra Nevada mountains. At Strong's Canyon an avalanche, a mass of snow sliding down a mountainside, carried away the camp of two work crews of Chinese workers who were building tunnels there. One worker's body was not found until spring.

Workers blasted through solid granite rock with black powder, an early kind of gunpowder. From 1867 they also used nitroglycerin, a liquid explosive that can go off from a jolt. Smallpox, a disease that passes from person to person and covers the body in sores, broke out in 1868 and 1869.

The count of the dead. The railroad's managers kept no record of how many workers died. A figure of about 1,200 dead comes from one newspaper report in 1870. A reporter for the *Sacramento Reporter* wrote that a train had

brought in "the accumulated bones of perhaps 1,200" Chinese men from along the line. Chinese aid societies paid to send such bones home to China. On the same day, the *Sacramento Union* reported about 50 dead.

KNOWN:	Chinese workers died of snow, explosions and disease, and the railroad's managers did not count them.
NOT KNOWN:	The real number. Researchers at a railroad history museum think about 100 to 150 Chinese workers died building the railroad, and other estimates run from hundreds to thousands.

The Page Act and the Chinese Exclusion Act

Members of Congress passed the Page Act in 1875, the national government's first law to limit immigration. Under it, contract laborers from China, Japan and other Asian countries could not come in. These were workers brought over without their free consent, already bound to work for someone for a set time. The law called them by an insulting name used then for Asian laborers. A Chinese worker who came freely, with no such contract, could still come in.

Chinese women. Under the Page Act, no one could bring in women for prostitution, which means selling sex for money. Immigration officers at the ports decided which women those were. In practice they treated Asian women in general as suspects and kept out most Chinese women. The stated reason, stopping prostitution, was a pretext, meaning a false excuse.

What changed in 1882. President Chester A. Arthur signed the Chinese Exclusion Act, a law to shut Chinese workers out, on May 6, 1882. Under it, no Chinese laborer could come in for 10 years, whether he had a contract or not. It was the first law in the United States to bar a group of people because of their nationality or their ethnicity, the group a person is born into, with its own language and customs. Members of Congress later renewed the law and made it wider. They did not cancel it until 1943, 61 years after Arthur signed it.

BY 1882: Chinese workers had built the western part of the first railroad across the country, and lawmakers had now shut new Chinese workers out for ten years.

Attacks on Chinese immigrants, 1871 to 1887

Before and after the Exclusion Act, mobs in the West attacked Chinese immigrants. Juries and judges punished almost none of the attackers.

Los Angeles, 1871. A gunfight broke out between two groups of Chinese residents of Los Angeles on October 24, 1871. A local rancher, Robert Thompson, fired into a Chinese store. He was hit by return fire and died about an hour later. A mob of about 500 non-Chinese men then spent about two hours pulling Chinese people out of the Chinese part of town. They shot, beat and hanged them, and they robbed Chinese homes and stores.

They killed 18 Chinese men and boys, about one in ten of the city's Chinese people. Only one of the dead is thought to have taken part in the first gunfight. The mob hanged seven men from the wooden crossbar of a porch and three more from the side of a wagon.

The dead included Chee Long Tong, a doctor who healed people with herbs, and a teenager, Ah Loo. Dr. Tong offered the mob money and the diamond ring on his finger if they would spare his life. The geographer Reece Jones writes that a man in the crowd shot him in the mouth and cut off his finger to take the ring. The mob also hanged him.

A grand jury charged 25 men. By one account eight were found guilty of manslaughter, the crime of killing someone without planning to, and by another account nine. A judge sentenced them to two to six years in San Quentin prison. About a year later the judges of the California Supreme Court threw out the guilty verdicts because of a mistake in how the charges were written. None of the men was tried again.

Rock Springs, 1885. Between 100 and 150 armed white miners and railroad workers attacked the Chinese miners they worked beside in Rock Springs, in Wyoming Territory, on September 2, 1885. A territory was land the national

government ran before it became a state. Managers of the Union Pacific Railroad had hired the Chinese miners at lower pay. Most of the attackers were immigrants themselves, from Britain, Ireland, Wales and Scandinavia.

The attackers shot Chinese miners, struck them with picks, hatchets and clubs, and burned all 79 houses in the Chinese part of town. Some Chinese people burned to death in their cellars. About 600 Chinese people fled. The Wyoming State Historical Society lists 28 Chinese killed and 15 wounded. Other counts put the dead at 40 to 50, because some who fled were never found.

President Grover Cleveland sent army troops, and the railroad's managers brought the Chinese miners back to work under army guard. Officials arrested 16 men, or 22 by some accounts. A grand jury charged none of them. It said that no one had been able to testify to "a single criminal act committed by any known white person that day."

Eureka, 1885. Other mobs drove Chinese people out of their towns. In Eureka, California, in February 1885, a stray bullet from a gunfight between two Chinese groups killed a city councilman, David Kendall. That night more than 600 white residents gathered and put up a gallows, a frame for hanging people. City leaders ordered every Chinese resident to leave within 24 hours. A committee of white residents put about 480 Chinese people, nearly all of the town's Chinese residents, on two steamships to San Francisco. No one was killed.

The Chinese families left behind their furniture, goods, shrimp boats and vegetable farms. Chinatown was torn down, and the accounts do not name who did it. A Chinese aid group, the Six Companies, sued the city in 1886, and the case was dropped. Rules keeping Chinese people out stayed in Eureka's city charter, its basic set of laws, until 1959.

Tacoma and Seattle. Mayor Jacob Weisbach of Tacoma, in Washington Territory, led a year-long campaign to drive the Chinese out. He called them "a curse." Tacoma's leaders ordered all Chinese residents to leave by November 3, 1885, and about 150 left before that date. On November 3, a mob forced about

200 more Chinese residents out of their homes in the rain and onto trains out of town. The mob then burned their houses. Officials charged 27 Tacoma men, Weisbach among them, and later dropped every charge.

Mobs in Seattle forced more than 300 Chinese residents to the docks in February 1886, and ships carried about 300 of them away. Of 13 men tried for the Seattle riot, none was found guilty.

Hells Canyon, 1887. A gang of white horse thieves shot and killed as many as 34 Chinese gold miners in May 1887. The miners were camped in Hells Canyon, on the Snake River in Oregon, and the gang took their gold dust. One of the gang, Frank Vaughan, confessed that they had agreed nearly a year earlier to murder the miners. Vaughan testified for the state and was not tried. Three of the accused men fled before trial. A jury found the three who stood trial not guilty.

A stone marker placed at the site in 2012 states, "No one was held accountable." Its words are in English, in Chinese and in Nez Perce, a Native American language.

Jews from the Russian Empire, and others from southern and eastern Europe

Italians, Poles, Hungarians and Greeks came in growing numbers late in the century. Many of them were peasants, poor farm workers, who had lost their land as farming in Europe became a business. They came to earn enough money to go home and buy a piece of land. One Slavic steelworker put the plan this way: "A good job, save money, work all time, go home, sleep, no spend." Many did go home.

Jews from the Russian Empire came too, running from riots and from laws aimed at them. They came as families and planned to stay.

Revolutionaries murdered the ruler of the Russian Empire, Tsar Alexander II, in March 1881. In the towns, many people in the crowds believed a rumor that Jews had killed him. They also believed that a special order from the government allowed them to beat Jews.

Six weeks after the murder, on April 15, 1881, a fight in a tavern in the town of Elisavetgrad, in what is now Ukraine, turned into an attack on the town's Jews. It was the first of about 250 pogroms, violent riots in which a crowd attacks Jewish people and their homes, shops and synagogues, the buildings where Jews worship. The pogroms went on until 1884, in Kiev, Warsaw and many other places. Another count gives 259 pogroms from 1881 to 1883.

Who attacked. The historian John Klier describes many of the attackers as laborers who drifted from place to place looking for work. Railroad workers, factory workers and local business rivals of Jews also took part. Peasants joined in mostly to steal. The attackers robbed and wrecked Jewish homes and shops. They beat, raped and killed Jews. Rape means forcing a person into sex.

Counts of the dead differ. One count says at least 40 Jews were killed from April to December 1881. Klier counts about 50 deaths in the whole wave. About half of those dead were Jews, and about half were rioters killed while the tsar's officials put down the riots.

For many years, accounts said that officials of the tsar's government had planned the attacks. Later, the historians Hans Rogger, I. Michael Aronson and John Klier looked for evidence of that and found none. Some local officials helped stir the attacks up. Klier writes that more than a thousand rioters were punished in some way. Another account says the tsar pardoned most of the rioters who were brought to trial. The two accounts do not agree.

The May Laws. Nikolai Ignatiev, the tsar's minister in charge of the police and of other matters inside the country, proposed rules called the May Laws in May 1882. Tsar Alexander III approved them. Ignatiev blamed the pogroms on the Jews themselves. The rules were for Jews in the Pale of Settlement, the region of the Russian Empire where Jews were allowed to live.

Under the May Laws, Jews could not move to new homes outside towns. They could not buy or rent land in the countryside, and they could not trade on Sunday mornings or on Christian holidays.

More than 2 million Jews from the Russian Empire came to the United States between 1881 and 1914. Many of them were escaping the pogroms and the May Laws. Over 1.5 million of them had arrived by 1910, most of them from Russia.

The Statue of Liberty and Emma Lazarus

The Statue of Liberty, a gift from France, was opened with a ceremony in New York Harbor on October 28, 1886. Emma Lazarus wrote the poem quoted at the start of this chapter, "The New Colossus," in 1883, to help raise money for the statue's pedestal, the stone base it stands on. She wrote it one year after lawmakers shut Chinese workers out of the country.

Lazarus was born in New York in 1849, into a Sephardic Jewish family, whose ancestors were Jews of Spain and Portugal. She had worked with Jewish refugees from Russia who arrived in the 1880s. She died in 1887. People mostly forgot her poem until 1903, when her friend Georgina Schuyler had it mounted on a bronze plaque inside the pedestal. After that, people began to link the statue with the idea of America as a refuge, a safe place, for immigrants.

Castle Garden and Ellis Island

Most immigrants who landed at New York from August 1855 to April 1890 passed through Castle Garden. It stood at Castle Clinton, in Battery Park, at the southern tip of Manhattan. It was the country's first official depot for immigrants, a building where officials received newcomers, checked them and recorded them. New York State and New York City officials ran it together. About 11 million immigrants arrived through New York in those years, and about 8 million of them passed through Castle Garden.

People had complained that officials at Castle Garden were dishonest. When it closed in 1890, officials of the national government took charge of immigration. On January 1, 1892, they opened Ellis Island, the national government's immigration station on an island in New York Harbor, in its place.

Annie Moore

Who: A 17-year-old from County Cork, Ireland, the first immigrant processed at Ellis Island. For about a century, another woman's life was told as hers.

When and where: Arrived January 1, 1892, on the steamship *Nevada*. Lived on the Lower East Side of New York. Died in 1924.

First through Ellis Island, she received a $10 gold coin.

Annie Moore sailed from Ireland on the steamship *Nevada* with her two younger brothers, Anthony, who was about 15, and Philip, who was about 12. They reached New York on January 1, 1892, the day Ellis Island opened, and officials processed her before anyone else.

The wrong Annie. For about a century, writers described the wrong woman as Annie Moore. That woman went west and died in Texas, and she had been born in Illinois. In 2006 the genealogist Megan Smolenyak, a person who traces family histories through old records, offered $1,000 to anyone who could find the real Annie. Researchers who took up the challenge found her.

The real Annie Moore never left New York. She lived in a tenement, a crowded apartment building, on Monroe Street on the Lower East Side, and she married a clerk at a fish market. She died in 1924, at the age of 50. A headstone was placed on her grave in 2008. Statues of her stand at Ellis Island and at Cobh, in Ireland.

Irving Berlin

Who: A Jewish boy from the Russian Empire who arrived at Ellis Island at five and grew up to write "White Christmas" and "God Bless America."

When and where: Born in 1888 in the Russian Empire (the place is uncertain). Arrived at Ellis Island September 14, 1893. Died September 22, 1989, at 101.

He remembered his family's house in Russia burning.

Irving Berlin was born Israel Beilin in 1888 in the Russian Empire. The place of his birth is uncertain. Recent research points to Tyumen, in Siberia, and older accounts give the region around Mogilev. His family used May 11 as his birthday, but one account gives May 23.

His memory of Russia was of his family's house burning during violence against Jews. No record says who set the fire. The family arrived at Ellis Island on September 14, 1893, and in America their surname became Baline.

He wrote his songs, among them "Easter Parade," under the name Irving Berlin. He wrote a first version of "God Bless America" in 1918, and the singer Kate Smith first performed it for the public in 1938. Berlin died on September 22, 1989, at the age of 101.

Wong Kim Ark

Who: A cook born in San Francisco to Chinese immigrant parents. Officials refused to let him back into the country, and his case went to the Supreme Court.

When and where: Born 1873, San Francisco. Refused landing August 1895. Supreme Court decision March 28, 1898.

Born in San Francisco, he was refused entry to his own country.

Wong Kim Ark was born in San Francisco in 1873. His parents were Chinese immigrants, and he worked as a cook. In August 1895 he was coming home from a visit to China on the steamship *Coptic*.

John H. Wise, the official in charge of collecting taxes on goods coming into the port of San Francisco, refused to let him land. Wise acted under the Chinese exclusion laws. He said Wong was not a citizen, because his parents had not become citizens, and he held Wong on the ship.

The court order. On October 2, 1895, the national government's court in San Francisco issued a writ of habeas corpus for him, an order that the people holding him bring him before a judge and give a lawful reason for holding him. Judge William Morrow ruled that Wong was a citizen and ordered him freed.

Henry Foote, the national government's lawyer in San Francisco, had brought the case against Wong. Lawyers for the national government took it higher. The case, *United States v. Wong Kim Ark*, went on to the Supreme Court. On March 28, 1898, the justices, the judges of the Supreme Court, decided it 6 to 2 in Wong's favor. They ruled that under the Fourteenth Amendment, an addition to the Constitution, everyone born in the United States is a citizen.

BY 1900

If you remember one thing: Lawmakers shut Chinese workers out in 1882, the first time a law barred people for the country they came from, and in 1898 the Supreme Court ruled that anyone born here is a citizen.

One number: 61 years. Members of Congress kept the Chinese Exclusion Act, renewed and widened, from 1882 until they canceled it in 1943.

Next: After 1900 more newcomers came through Ellis Island than ever before, and lawmakers answered with limits on how many could come from each country.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 17 MINUTES

The great wave of newcomers peaked in the early 1900s, and then members of Congress cut it down with quota laws, laws that fixed how many people could come from each country. Officials at Ellis Island admitted 1,004,756 people in 1907 alone. Under the 1924 law, no more than about 165,000 immigrants could come each year, and almost no one from Asia could come at all. On the West Coast, officials at Angel Island held Chinese arrivals anywhere from a few days to many months.

Officials pushed somewhere between 500,000 and 2 million people of Mexican descent out of the country from 1929 to 1936. By the two larger counts, about 6 in 10 of them were US citizens. Officials in Cuba, the United States and Canada refused to let a ship full of Jewish refugees land in 1939.

Ellis Island's busiest years and the melting pot

Ellis Island's busiest year was 1907. Officials there admitted 1,004,756 immigrants that year. On the busiest single day, April 17, 1907, 11,747 people came through. About 12 million immigrants passed through Ellis Island from 1892 to 1954. Older claims of about 17 million are too high.

The melting pot. A play by Israel Zangwill called *The Melting Pot* opened in Washington, D.C., on October 5, 1908. Theodore Roosevelt watched the first night from his box and praised it. After that the phrase "melting pot," a pot in which different metals melt together into one, spread. People used the phrase to mean that newcomers from many lands would blend together into one nation.

Frank Capra

Who: A boy from Sicily who crossed to America in the cheapest part of a ship in 1903. He grew up to win three Academy Awards for directing films.

When and where: Born May 18, 1897, in Bisacquino, Sicily. Came through Ellis Island in 1903, then went on to Los Angeles.

Movie: *Frank Capra's American Dream* (1997), a documentary made for television. Kenneth Bowser directed it, and Ron Howard hosted it.

He crossed in steerage and rode a train across the whole country.

Frank Capra was born Francesco Rosario Capra in the town of Bisacquino, in Sicily, an island that belongs to Italy. His family crossed the Atlantic on the ship *Germania*. They traveled in steerage, the cheapest space on a ship, below the decks. They passed through Ellis Island and then rode a train across the whole country to Los Angeles.

As a grown man he directed films. He won his three Academy Awards as best director in the 1930s, and he made the film *It's a Wonderful Life* in 1946.

Doukenie Bacos

Who: A Greek girl who reached Ellis Island at 16. She was traveling underage and was afraid officials would send her back.

When and where: Born December 18, 1904, to a Greek family in Thrace. Sailed from Piraeus, Greece. Reached Ellis Island January 5, 1921.

She thought of jumping into the water rather than be sent home.

Doukenie Bacos was born to a Greek family in Thrace, a region of southeastern Europe now divided among Greece, Turkey and Bulgaria. She was 16 when she sailed from Piraeus, the port city of Athens, on the ship *King Alexander* on December 22, 1920. She was traveling underage, younger than an adult, to join her uncle in America.

Three days. She reached Ellis Island on January 5, 1921, and officials held her there for three days. Her uncle was a bachelor, a man who had never married. The officials would not hand a girl her age to a bachelor alone, so he had to find a family for her to live with. She was afraid they would send her back, and she later said she had thought of jumping into the water rather than be sent home.

On the third day the officials let her go. That night her uncle came with a woman from the family he had found. "This is your aunt," he told her, and Doukenie went to live with that family.

Her full name was Doukenie Babayanie Bacos. She told her story to the Ellis Island Oral History Project, which records interviews with people who came through the island, in 1991. Her interview is number 49 in its EI series. Some records give 1919 as the year she left Greece, and National Park Service staff marked that year as a mistake.

Angel Island

Angel Island Immigration Station opened in 1910 on an island in San Francisco Bay. The officials who worked there mainly enforced the Chinese Exclusion Act, an 1882 law that barred Chinese workers from coming in, and other laws against Asian immigrants. They held many Asian arrivals for days or months. The National Park Service states that some stays lasted several years, while the longest stay in other records is 22 months.

Officials refused entry to about 18 out of every 100 people who arrived at Angel Island. At Ellis Island the figure was 1 to 3 out of every 100.

Station officials kept the detainees, the people being held, locked in crowded dormitories, large rooms full of beds. No detainee could leave without a guard. Officers read every letter the detainees sent or received. No one could visit a detainee until the officials had decided the case.

The doctors. Doctors from the Public Health Service examined the arrivals. They turned people's eyelids inside out to look for trachoma, an eye infection that can cause blindness. They took samples of blood, spit, urine or stool, which means bowel movements, and they tested Asian arrivals for worms that live inside the body, such as hookworm. When officials doubted a person's age, doctors made the person strip naked. The doctors then examined the person's hair, skin, teeth, voice and genitals, the private parts of the body.

Paper sons. Chinese Americans born in the United States were citizens, as the Supreme Court had ruled in 1898. Under the exclusion laws, most other Chinese people could get in only by showing a family tie to a citizen. Some claimed a tie that was false. They were called "paper sons" and "paper daughters," because the family tie existed only on paper.

To catch them, a group of officials called a Board of Special Inquiry questioned each Chinese applicant about home villages and relatives. The board was made up of two inspectors, a translator and a stenographer, a clerk who wrote down every word. One inspector said in 1934 that "well over ninety percent" of his time went to questioning arriving Chinese people.

A few detainees killed themselves, most of them by hanging themselves in the bathrooms. The historian Judy Yung, who gave this account in 2026, said they were "driven to suicide." She gave no names and no count.

The poems. Detainees carved poems into the wooden walls of the barracks where they were held. The poems were almost lost before a park ranger, Alexander Weiss, found them in 1970, and then they were saved.

Counts of the Chinese people who passed through the station differ. One count is about 175,000 between 1910 and 1940, and the National Park Service states 250,000. A fire burned the station's main office building on August 12, 1940, and the station closed soon after.

Lee Puey You

Who: A Chinese woman who came as a "paper daughter" in 1939. Officials held her on Angel Island for about 20 months and then sent her back to China.

When and where: Arrived at Angel Island in 1939. Deported to China in November 1940. Came back in 1947 and settled in San Francisco.

Inspectors asked her about 170 questions, then sent her back.

Lee Puey You arrived at Angel Island in 1939 as a "paper daughter," and inspectors asked her about 170 questions. Officials held her there for about 20 months, one of the longest stays known for a Chinese detainee.

In November 1940 they refused to let her in and deported her, which means they forced her to leave the country. She later said she "cried a bowlful of tears."

Members of Congress canceled the Chinese Exclusion Act in 1943. Lee Puey You came back to the United States in 1947 as a war bride, a woman engaged or married to a man who served in the war. She married and settled in San Francisco. Judy Yung later wrote about her in an article called "A Bowlful of Tears Revisited."

How the quota laws of 1921 and 1924 worked

The Emergency Quota Act of 1921 was the first law to put number limits on immigration. Under it, the yearly quota for each nationality was 3 percent of the people born in that country who lived in the United States in 1910. That count came from the census, the official count of everyone living in the country.

The 1924 law. Members of Congress set much lower limits in the Immigration Act of 1924. It is also called the Johnson-Reed Act, after the two lawmakers behind it. Representative Albert Johnson of Washington State was chairman of the House committee on immigration, and David Reed was a senator from Pennsylvania. President Calvin Coolidge signed the law on May 26, 1924.

Under the 1924 law, each country's quota was 2 percent of the people born there who lived in the United States in 1890. Lawmakers picked 1890 because it came before the large wave from southern and eastern Europe. Italy's yearly quota fell from more than 42,000 to fewer than 6,000.

Asia shut out. Lawmakers also shut out anyone "ineligible for citizenship," meaning anyone who could not become a citizen under US law. At that time the law let only white people and people of African birth or descent become citizens. Members of Congress had added people of African birth or descent in 1870, five years after the Civil War, and left Asian immigrants out. In 1922 and 1923 the justices, the judges of the Supreme Court, ruled that immigrants from Japan and from India could not count as white. Under that rule, almost no one from Asia could come in.

Lawmakers capped the total at about 165,000 people a year, down from about 355,000 under the 1921 law. About 86 of every 100 quota places went to northern and western Europe, and about 9 went to southern and eastern Europe. Under those limits, the great rush of newcomers from Europe came to an end.

Coolidge had told Congress in his first message to it, in December 1923, "America must be kept American. For this purpose, it is necessary to continue a policy of restricted immigration." The State Department's Office of the

Historian states: "The most basic purpose of the 1924 Immigration Act was to preserve the ideal of U.S. homogeneity (sameness)."

Eugenics and the men behind the 1924 law

The men who shaped the 1924 law argued for it with eugenics. Eugenics was a false belief that a nation could improve its people by controlling who had children and who came into the country. Its believers ranked groups of people as "better" or "worse" by birth.

Harry Laughlin. Harry H. Laughlin ran the Eugenics Record Office at Cold Spring Harbor, New York. He testified, meaning he spoke under oath at a hearing, to Johnson's committee three times between 1920 and 1924, and Johnson named him the committee's "expert eugenics agent."

Laughlin claimed that immigrants from southern and eastern Europe, mainly Italians and Jews, had higher rates of "feeblemindedness, insanity, criminality, and dependency." Those were old words for low intelligence, mental illness, crime and needing public charity. He said that too many of the people in mental hospitals came from southern and eastern Europe. His own figures showed high rates for German and Irish immigrants as well.

Madison Grant. Madison Grant was a New York lawyer. In 1916 he wrote a book called *The Passing of the Great Race*. In it he claimed that a "Nordic race" from northwestern Europe was better than all other people. Grant helped Johnson write the 1924 law. Adolf Hitler, who later ruled Germany, wrote to Grant and called the book his "Bible."

At home. Laughlin also turned eugenics against Americans already living here. In 1922 he wrote a model law, a sample law for lawmakers to copy, for forced sterilization.

Sterilization is an operation after which a person can never have a baby. For a woman, a doctor cut or tied the two tubes that carry eggs from the ovaries to the womb, or cut out a piece of each tube, so that no egg could reach the womb again. For a man, a doctor cut the tubes that carry sperm. The operation could not be undone.

In part because of Laughlin's work, lawmakers in dozens of states passed laws that let officials force people to be sterilized against their will. By the 1960s doctors in the United States had sterilized more than 62,000 people this way, about 60 out of every 100 of them women.

Carrie Buck. Carrie Buck grew up with foster parents in Charlottesville, Virginia. In 1923 she became pregnant, by her own account because the foster parents' nephew raped her. The foster parents took the pregnancy as proof that she was "feebleminded" and had her sent to a Virginia state colony for people called feebleminded. The colony's head, Dr. Albert Priddy, picked her for a court case that would test whether Virginia's new sterilization law was allowed.

On May 2, 1927, in the case Buck v. Bell, the justices of the Supreme Court ruled 8 to 1 that Virginia officials could sterilize her against her will. On October 19, 1927, Dr. John H. Bell cut out a piece of each of her tubes.

In Germany. In 1933 the Nazis, Hitler's party, which then ruled Germany, passed a forced sterilization law based in part on the American practice. Under it, special courts of a judge and two doctors decided each case, and an approved doctor did the operation. About 400,000 people in Nazi Germany were sterilized this way. In 1936 leaders of the University of Heidelberg, in Germany, gave Laughlin an honorary degree, a degree given as an honor instead of for study.

Mexican arrivals and the Mexican Repatriation

The Mexican Revolution was a war in Mexico that lasted from 1910 to 1920. During those years about 350,000 people fled north across the border into the United States. More kept coming in the 1920s.

The Repatriation. Officials pushed people of Mexican descent out of the United States from 1929 to 1936, in what is called the Mexican Repatriation, from a word for sending people back to their own country. By the larger counts, most of the people sent to Mexico had been born in the United States, so they were being sent out of their own country. It happened during the Great Depression, the years when many people in the United States had no work.

Secretary of Labor William N. Doak, who served under President Herbert Hoover, led a national campaign to remove Mexicans. He claimed they were taking jobs from other workers. In Los Angeles, Charles P. Visel, head of the city's unemployment relief committee, which handled public money for people without work, planned a publicity campaign.

Officials raided Mexican American neighborhoods and public places. County welfare officers, the officials who handed out relief money, told families that their relief money would stop unless they took free train tickets to Mexico. Officials of the Los Angeles County welfare office ran the trains, and the first one left on March 23, 1931.

Hospital staff carried patients on stretchers to trucks bound for the border. Families lost their property. In a 2005 California law, state lawmakers wrote that this property "often was sold by local authorities" as "payment" for the cost of removing the families.

La Placita. Immigration agents blocked the exits of La Placita, a park in Los Angeles, on February 26, 1931, while about 400 people were inside. Accounts of what happened next differ. According to the California Migration Museum, the agents arrested about a dozen people and deported a few. According to a History.com article, they rounded up more than 400 people and deported them.

Counts of the people removed run from about 500,000 to about 2 million. The California Migration Museum states about 1 million, following the historians Francisco Balderrama and Raymond Rodríguez. By that count, about 60 of every 100 were citizens born in the United States. The 2005 California law states about 2 million, and about 1.2 million of them had been born in the United States.

Officials pushed about 35,000 people out of Los Angeles, about a third of the Mexican people living there. California lawmakers apologized for the removals in that 2005 law. In February 2012 the members of the Los Angeles County Board of Supervisors, who run the county, apologized and put up a plaque, a metal sign with words on it, at LA Plaza. No apology from the federal government, the national government in Washington, is on record.

The braceros. US and Mexican officials started the Bracero Program in August 1942. Under it, Mexican farmworkers came to the United States on contracts to work for a set time and then go home. Bracero is a Spanish word for a man who works with his arms, from *brazo*, the word for arm.

The St. Louis and the first refugee law

The German ship *St. Louis* left Hamburg for Havana, Cuba, on May 13, 1939, with 937 passengers. Almost all of them were Jewish refugees. Cuba's president, Federico Laredo Brú, canceled their papers to land, and Cuban officials let only 28 passengers off at Havana. The passengers asked President Franklin D. Roosevelt for help, and he never answered them. State Department officials told them they must "await their turns on the waiting list." Canadian officials refused them too.

Why they fled. The passengers were fleeing attacks on Jews that had grown worse in 1938. The Nazi government of Germany had taken over Austria in March 1938. On the night of November 9 and 10, 1938, Nazi leaders set off attacks on Jews across Germany. That night is called Kristallnacht, the Night of Broken Glass.

Nazis burned more than 1,400 synagogues, the buildings where Jews worship, wrecked thousands of Jewish-owned shops and broke into Jewish homes. German police locked about 26,000 Jewish men in concentration camps, prison camps for people the Nazis targeted, just because they were Jewish. Afterward Nazi officials seized property that Jews owned.

The ship turned back to Europe on June 6. The passengers went to four countries: 288 to Britain, 224 to France, 214 to Belgium and 181 to the Netherlands.

The German army invaded France, Belgium and the Netherlands in May 1940. Before the invasion, 87 of the passengers in those countries had moved on to other countries. Nazis killed 254 of those who were still there in the Holocaust, their murder of Jews and other people during World War II. The other 278 survived.

The first refugee law. Members of Congress passed the Displaced Persons Act in 1948, the first refugee law in the United States. Displaced persons were Europeans who had lost their homes in the war. Under the law, 200,000

people could come at first, counted against the yearly quotas, and in 1950 lawmakers raised the total. About 350,000 to 400,000 European refugees settled in the United States between 1948 and 1952. One count gives 393,542.

BY 1950

If you remember one thing: Lawmakers cut the great wave from Europe with quota laws and shut out almost everyone from Asia, and only after World War II did they pass a law for refugees.

In 1907: officials at Ellis Island admitted 1,004,756 immigrants in a single year.

After 1924: no more than about 165,000 could come in a year, and about 86 of every 100 places went to northern and western Europe.

Next: After 1950 federal officers rounded up Mexicans in the hundreds of thousands, and lawmakers ended the quotas.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 13 MINUTES

Members of Congress threw out the country-by-country quotas in 1965, and after that most newcomers came from Asia, Latin America, Africa and the Caribbean instead of Europe. Federal officers rounded up Mexicans and Mexican Americans in 1954 and sent them to Mexico, and many of the people they sent were US citizens.

Refugees came from Cuba after 1959 and from Vietnam, Laos and Cambodia after 1975. Counts credited to the United Nations refugee agency give at least 200,000 Vietnamese who died at sea while escaping by boat, from storms, hunger, disease and attacks by pirates. About 2.7 million people who had lived in the country for years without legal permission got legal status under a 1986 law.

The braceros and the 1954 deportations

The Bracero Program lasted until 1964. Over those years, Mexican farmworkers signed about 4.5 million short-term contracts to work in the United States. The workers came for the length of a contract and were expected to go home afterward.

Federal officers carried out a mass deportation of Mexicans in 1954, in a federal operation whose official name used an insult for Mexican people. The insult was aimed at Mexicans who crossed the border without papers, and it suggested that they had swum across the Rio Grande, the river along the border between Texas and Mexico.

Who ran it. Attorney General Herbert Brownell Jr., the head of the US Justice Department under President Dwight D. Eisenhower, pushed for the operation. General Joseph M. Swing ran it. He was the commissioner, or head, of the Immigration and Naturalization Service (INS), the federal office in

charge of immigration. Swing announced the operation on June 9, 1954. INS officials planned it with officials of the Mexican government. Officers started in California and Arizona and moved into Texas in the middle of July.

The roundups. Border Patrol officers, the federal agents who guard the border, ran the roundups in a military style. Newspapers covered them heavily, and officials meant the coverage to scare people into leaving on their own. On the first day in Texas, July 15, 1954, officers caught 4,800 people. That July officers held 42,000 people in Texas, and more than 63,000 left on their own.

Officers sent people south by truck, bus, train and plane. From Port Isabel, Texas, they also put people on two ships, the *Emancipation* and the *Mercurio*, bound for Veracruz, Mexico. About a quarter of the people removed from Texas went by ship. A History.com article states that the ships were later compared to slave ships.

Seven deportees jumped from the *Mercurio*. The *Handbook of Texas* says a mutiny followed, meaning the people on board rose up against the crew. Other accounts say the seven drowned. After protests in Mexico, officials stopped sending people by ship.

The heat. The historian Mae M. Ngai reports that in July 1955 officers rounded up workers in 112-degree heat, and as a result 88 braceros, Mexican farm workers hired under contract, died of sunstroke, an illness in which the body gets so hot that it can no longer cool itself. A labor official told Ngai that more would have died without help from the Red Cross.

Ngai also quotes a Mexican labor leader. He reported that deportees were carried into Mexico on trucks "like cows" and unloaded in the desert, fifteen miles down the highway from the border. US immigration officials also left deportees in Mexicali, a Mexican border city where the summer heat averages 108 degrees. Other deportees died of disease and other causes while officers held them.

NOT KNOWN: No record gives a full count of the dead, says whether the 88 were left in the desert, names the officers who ran that roundup, or shows that any official was charged for the deaths.

The count. INS officials claimed that as many as 1,300,000 people had left, counting people who, officials said, had fled out of fear. The historian Kelly Lytle Hernández puts the true number deported at "likely closer to 300,000."

The official numbers rested on an INS report of nearly 1.1 million people caught. Katrina Burgess, a professor at Tufts University, wrote in 2024 that this figure covered a whole government year, which ended in June 1954. The operation was announced on June 9, 1954, so most of those people had been caught before it began. Many of the arrests were also the same people caught again, sometimes on the same day, Burgess wrote.

Many of the people deported were US citizens of Mexican descent. No one knows how many.

Antonio García

Who: A Mexican farmworker who joined the Bracero Program at seventeen, after having his military ID card changed to say he was eighteen.

When and where: Born June 13, 1937, in Tepehuanes, Durango, Mexico. Worked on contracts in Texas, California, Colorado and New Mexico into the early 1960s. Told his story in Chicago in 2003.

At seventeen he had his ID changed to say eighteen.

Antonio García was born in Tepehuanes, in the Mexican state of Durango. He grew up in Nuevo Ideal and left school after fourth grade. With his changed ID card, he signed up at the contracting centers in Chihuahua and in Empalme, Sonora, where Mexican workers signed contracts to work in the United States.

His first contract was for work in the cotton fields of Texas, and within a week he was seriously ill. He kept working on contracts, on and off, into the early 1960s, in California, Colorado, New Mexico and Texas.

Claudia Morales Haro recorded his life story in Chicago on March 12, 2003. The recording is item 162 in the Bracero History Archive, which contains more than 700 such interviews. His record does not say whether he settled in the United States for good.

What the 1965 law changed

With the Immigration and Nationality Act of 1965, also called the Hart-Celler Act, members of Congress ended the national-origins quotas, the rules that had limited immigration country by country since the 1920s. Under the new law, people got in mainly through family ties to people already here or through their job skills. Lawmakers also ended the bars against Asians and against southern and eastern Europeans.

For the first time, lawmakers also set a limit on the number of immigrants from the Western Hemisphere, the half of the world that includes North and South America. That limit included Mexico. Over the following decades, the main sources of immigration shifted away from Europe, toward Asia, Latin America, Africa and the Caribbean.

Cubans and the Mariel boatlift

Fidel Castro led a revolution in Cuba in 1959. Through the 1960s, many Cubans came to the United States, especially to Florida.

Mariel. Castro briefly let people leave in 1980. From April to October that year, about 125,000 Cubans crossed by boat from the port of Mariel to Florida. This was the Mariel boatlift.

About a month before the boatlift began, members of Congress passed the Refugee Act of 1980. With it, lawmakers created a permanent system for admitting refugees. They defined a refugee the same way the United Nations does: a person outside their own country who cannot go back because of a real fear of being harmed for their race, religion, nationality, group or political beliefs.

Reinaldo Arenas

Who: A Cuban novelist whom Castro's officials jailed for his writing and for being gay, and who left Cuba in the Mariel boatlift.

When and where: Born July 16, 1943, near Holguín, Cuba. Left through the port of Mariel in May 1980. Lived in New York. Died December 7, 1990.

Movie: *Before Night Falls* (2000), a drama based on his life story. Julian Schnabel directed it. Javier Bardem played Arenas, a role that earned an Oscar nomination.

He tried to escape Cuba floating on a tire inner tube.

Cuban officials persecuted Reinaldo Arenas, which means they punished him again and again, for what he wrote and for being gay, which means loving people of the same sex. In 1973, according to records at Princeton University Library, they charged him with "ideological deviation," holding ideas that Cuba's rulers banned, and with publishing his books in other countries without permission. A court convicted him on both. Another account says the court also called him "extravagant," which here means living too freely, and "immoral."

A charge he denied. The Mexican writer Rafael Lemus writes that in 1973 officials also accused Arenas and a friend of abusing two young people who were not yet adults. Arenas denied it, and none of these accounts says it was ever proved. Lemus says Arenas hid for four months to avoid arrest and was held from January 1974.

Arenas escaped from prison and tried to leave Cuba by floating away on a tire inner tube. Cuban officers caught him and locked him in El Morro, an old fort in Havana used as a prison. Officers of State Security, the political police of Fidel Castro's government, moved him to their headquarters, called Villa Marista.

Villa Marista. Lemus writes that at Villa Marista officers sent steam into the prisoners' closed cell until it became a steam room. There officers forced Arenas to sign a paper saying he was sorry for being gay and for his

books. He was released in 1976, after he signed a promise not to write again. No record names any of the officers who held him.

In May 1980 he left Cuba through the port of Mariel, one of about 125,000 Cubans in the boatlift. In the United States he lived in New York, and there he wrote the story of his own life, called *Before Night Falls*.

He became sick with AIDS, a disease caused by a virus that destroys the body's defenses against other illnesses. On December 7, 1990, at the age of 47, he killed himself. His life story came out in 1992, two years after his death, and in English in 1993.

Refugees from Southeast Asia and the boat people

North Vietnamese soldiers took Saigon, the capital of South Vietnam, in 1975, at the end of the Vietnam War. After that, refugees fled Vietnam, Laos and Cambodia. They included the Hmong, an ethnic group from the mountains of Laos. Many Vietnamese escaped in small boats, and they became known as the boat people.

Storms, hunger, disease and pirates killed many of them at sea. Counts credited to the United Nations refugee agency run from 200,000 to 400,000 dead. The journalist Barry Wain estimated 30,000 dead by 1981. No one knows the exact number.

The pirates. According to a UN refugee official in 1986 and a later study, the pirates were Thai fishermen in the Gulf of Thailand. Robert C. McCabe, a researcher at Maynooth University in Ireland, writes that some fishermen turned to piracy after big commercial fishing boats had cut the catch in their villages. No record names a single pirate.

Pirates robbed and raped refugees, murdered some and set others adrift. Rape means forcing a person into sex. In 1981 alone, the UN refugee agency counted 452 boats that reached Thailand with 15,479 refugees. Pirates had attacked 349 of those boats, on average three times each. They kidnapped 228 women, and 881 people were dead or missing.

Officials of the UN refugee agency and of the Thai government started a program against the pirates in June 1982. The governments of twelve countries paid for it, and the US government gave $1.2 million of the $3.67 million. By October 1987, 96 suspects had been arrested. No record names the officers who arrested them. Judges gave sentences of two to fifty years in prison, and one pirate was sentenced to death in December 1986.

US officials accepted 402,382 Vietnamese refugees from camps in Southeast Asia and Hong Kong from 1975 to 1997, more than any other country. A different count gives nearly 281,000 Vietnamese refugees settled in the United States from 1981 to 1990 alone. About 500,000 more Vietnamese came to the United States by 1994 through the Orderly Departure Program, a legal way to leave Vietnam without the boat trip.

Tung Trinh

Who: One of 52 survivors of a refugee boat from Vietnam that drifted at sea for 37 days in 1988.

When and where: Left Vietnam by boat in 1988. Brought ashore at Bolinao, in the Philippines. Later settled in Orange County, California.

Movie: *Bolinao 52* (2008), a documentary directed by Duc Nguyen. It won two regional Emmy awards in 2009.

More than 20 ships passed the boat, and one stopped, then left.

Tung Trinh was one of 110 people on a small boat that left Vietnam in 1988. The boat's engine stopped working, and the boat drifted at sea for 37 days.

More than 20 ships passed the boat during those days. One of them, the USS Dubuque, a ship of the United States Navy, stopped on June 10, 1988. The ship's commanding officer ordered food, water and sea charts given to the people on the boat. The sailors guessed 50 to 70 people were on the boat, not 110. Then the Dubuque left, and the boat stayed adrift.

As many as 58 of the 110 people on board died. An estimated 20 had died before the Dubuque came, and the others died after it left. During the drift, some of the people on the boat ate human flesh to stay alive, which

is called cannibalism.

The captain. Navy leaders removed the Dubuque's commanding officer from his command on August 11, 1988. At his own request, he was tried by a military court. Its officers found him guilty of breaking orders to help people in danger at sea, and he received a letter of reprimand, a written scolding.

Filipino fishermen found the boat and brought the 52 survivors to Bolinao, in the Philippines. Tung Trinh later came to the United States and settled in Orange County, California.

Sergey Brin

Who: A Jewish boy from Moscow whose family left the Soviet Union in 1979. In 1998 he started Google with Larry Page.
When and where: Born 1973 in Moscow. Arrived in the United States October 25, 1979, at six.

He left Moscow at six and later started Google with Larry Page.

Sergey Brin was born in 1973 in Moscow, the capital of the Soviet Union, a communist country where the government owned the businesses and only one party was allowed. His family was Jewish. In the Soviet Union his parents were held back in their careers and harassed because they were Jews. The accounts of his life do not name the people who did it.

The family got permission to leave in 1979. About 51,000 Soviet Jews left that year, the most in any single year. In the United States his father, Michael, taught mathematics at the University of Maryland. His mother, Eugenia, became a researcher at NASA, the US space agency. In 1998 Sergey and Larry Page started the company Google.

The 1986 law

President Ronald Reagan signed the Immigration Reform and Control Act, called IRCA, on November 6, 1986. About 2.7 million people who had lived in the country for years without legal permission got legal status under it. To qualify, they had to show they had lived in the country without a break since before 1982. Certain farmworkers could also qualify.

Under the same law, officials could for the first time punish employers who knowingly hired workers without legal permission. These punishments are called employer sanctions. After 1986 the number of people living in the country without legal permission grew again.

BY 2000

If you remember one thing: After lawmakers ended the quotas in 1965, the main sources of newcomers shifted from Europe to Asia, Latin America, Africa and the Caribbean.

The question this era leaves open: Which countries would send the most people once the quotas were gone? The 2023 count in the next era gives the answer.

Next: After 2000 the share of people born abroad climbed to its highest since 1910, and new federal agencies took over immigration.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 18 MINUTES

The share of people here who were born in another country rose almost to its highest ever, and federal officers held more people in immigration detention than ever before. About 47.8 million people living in the United States in 2023 had been born in another country, by the Census Bureau's count. That was 14.3 percent of the population, the highest share since 1910. More of them came from Mexico than from any other country.

Attorney General Jeff Sessions announced a "zero tolerance" policy in April 2018, during President Donald Trump's first term: every adult who crossed the border illegally was to be charged with a crime. Border Patrol agents then took thousands of children from their parents. The US Border Patrol counted 895 migrant deaths along the border with Mexico in the year ending September 2022, the most on record. In January 2026 immigration officers held more than 71,000 people in detention, the most ever, according to a report by two human rights groups.

Who comes now

About 11 million of the immigrants living here in 2023 were born in Mexico, 22 of every 100, Pew Research Center researchers found. Immigration from Mexico has slowed since about 2007.

India came next with 3.2 million, then China with 3 million, the Philippines with 2.1 million and Cuba with 1.7 million. Counted by region, about 52 of every 100 immigrants were born in Latin America and 27 of every 100 in Asia.

The number of immigrants from Africa south of the Sahara Desert roughly tripled from 2000 to about 2.5 million in 2024, the Migration Policy Institute found. Communities of people born in Jamaica, Haiti, the Dominican Republic and other Caribbean countries also grew.

The share of people born abroad, 14.3 percent in 2023 by the Census Bureau's count, came close to the record of 14.8 percent, set in 1890. The lowest share was 4.7 percent, in 1970.

Pew and the Department of Homeland Security both publish estimates of how many people live in the country without legal permission. Their estimates reached about 12 million in 2007, then fell to about 11 million, and rose again in the 2020s. The estimates are uncertain.

Homeland Security and DACA

Hijackers from the group al-Qaeda flew planes into the World Trade Center in New York and the Pentagon near Washington on September 11, 2001, and a fourth plane crashed in Pennsylvania. They killed 2,977 people.

A new department. After those attacks, members of Congress passed the Homeland Security Act of 2002. With it, lawmakers created the Department of Homeland Security, called DHS, which began work in 2003. They ended the old Immigration and Naturalization Service and split its work among three new agencies inside DHS.

Officers of Immigration and Customs Enforcement, called ICE, arrest and hold immigrants inside the country. Officers of Customs and Border Protection, called CBP, work at the borders, and the Border Patrol is part of CBP. Staff of the third agency, US Citizenship and Immigration Services, took over the government's other immigration work, such as handling requests to become a citizen.

DACA. Janet Napolitano, the Secretary of Homeland Security, created DACA, short for Deferred Action for Childhood Arrivals, on June 15, 2012. President Barack Obama spoke about it at the White House that day. Under DACA, some people who were brought to the country as children can apply to have their removal from the country deferred, or put off, and to work legally.

Lawyers and judges have fought over DACA in court again and again. In September 2017, in President Donald Trump's first term, Sessions advised ending it, and Elaine Duke, the acting Secretary of Homeland Security, ended it. On June 18, 2020, the justices of the Supreme Court ruled that the way officials had ended DACA broke federal law, so DACA stayed.

A federal appeals court ruled on January 17, 2025, that its work permits were unlawful and limited that ruling to Texas. About 455,000 people held DACA status on March 31, 2026, according to the National Immigration Forum, an immigrant rights group, using figures from US Citizenship and Immigration Services.

Deaths at the border

Every year hundreds of migrants die trying to cross from Mexico into the United States. People die of heat and thirst in the desert, drown in the Rio Grande, or die during or after chases by Border Patrol agents. Some die in custody, meaning while officers are holding them. Investigators inside CBP counted 171 deaths in the 2022 budget year in which CBP officers were involved "in some way," and 52 of those people died in CBP custody.

Two counts. Border Patrol officials and the staff of the International Organization for Migration (IOM), a United Nations agency, count these deaths in different ways. For 2022, Border Patrol officials counted 895 deaths along the border in the federal budget year, which runs from October to September. IOM staff counted 686 deaths and disappearances there in 2022. They call their figures minimums, because Texas county coroners, the officials who look into deaths, and Mexican search teams do not report every death to them.

Auditors at the Government Accountability Office, which checks federal agencies for Congress, found in 2022 that Border Patrol officials had left out deaths found by sheriffs, by medical examiners, the doctors who find out why a person died, and by other agencies. The auditors later reported that Border Patrol officials had made the changes they asked for. In a report of April 2025, the same auditors gave 704 deaths and more than 5,800 rescues for 2023.

Border Patrol officials' yearly counts were 281 in 2018, 300 in 2019, 254 in 2020, 568 in 2021 and 895 in 2022. The 2022 count is the highest on record, more than three times the count for 2018.

IOM staff called the US-Mexico border "the world's deadliest migration land route." Of the 686 people they counted there in 2022, 307 died crossing the Sonoran and Chihuahuan deserts, most of them from heat.

For 2025, IOM staff counted 409 migrant deaths in all of North and South America, the lowest count since 2014. They linked the drop to fewer people trying to cross the US-Mexico border and the Darién, a jungle between Colombia and Panama. In February 2026 they said the 2025 figures would not be final until the middle of 2026.

Children taken from their parents, 2018

Zero tolerance. Attorney General Jeff Sessions, the head of the Justice Department, announced a "zero tolerance" policy on April 6, 2018. He told federal prosecutors along the southwest border to charge with a crime every adult whom DHS officers sent to them for crossing the border illegally. That included parents who came with their children. Officers sent the parents to jail to face criminal charges, and Border Patrol agents took their children away from them.

The memo. Kirstjen Nielsen, the Secretary of Homeland Security, approved a plan on May 4, 2018, to send every adult caught crossing illegally to be charged with a crime, parents included. Sessions had urged her to approve it. The plan came from a memo of April 23, 2018, signed by the heads of three agencies inside DHS: Kevin K. McAleenan of CBP, Thomas Homan, the acting head of ICE, and L. Francis Cissna of US Citizenship and Immigration Services. It covered adults "initially arriving or apprehended (caught) with minors (children)."

Border Patrol leaders told their commanders along the Mexican border to begin on May 5. McAleenan left out parents with children under five who were crossing illegally for the first time. Agents asked a federal refugee office to take each child, and ICE officers held the parents. In a later court case, government lawyers wrote that there was "no prescribed specific course of action for reunification." That means no one had set a plan for putting the families back together.

Sessions said in a speech on May 7, 2018, "If you are smuggling a child, then we will prosecute you and that child will be separated from you as required by law." Officials had already separated about 280 families in 2017, under a trial program in El Paso, Texas.

What the inspector general found. Michael Horowitz, the Justice Department's inspector general, an official who checks the work of a government department, later investigated. In January 2021 Horowitz reported that Sessions and a small number of other Justice Department

officials knew, when the policy was issued in April 2018, that DHS "would change its long-standing practice" and separate families. He found that the Attorney General's office "was a driving force" in that change.

He also wrote that the department's "single-minded focus on increasing immigration prosecutions came at the expense of careful and appropriate consideration of the impact of child separations."

The count of the children. Officials deported hundreds of parents without their children before a federal judge ordered the government to put the families back together in June 2018. The counts of the children differ because each one includes a different group of children.

Taken. President Joe Biden set up the Family Reunification Task Force in February 2021. Its staff counted 3,924 children taken from their parents between January 20, 2017, and January 20, 2021.

Back together, and still apart. By February 1, 2023, 2,926 of those children had been reunited with their families. Most were reunited before the task force began, and more than 600 through its work. The other 998 were still apart, and task force staff said the true number still apart was "likely greater than 1,000."

Covered by the lawsuit. A federal judge approved a settlement, an agreement that ends a lawsuit, on December 11, 2023, in a lawsuit brought by the American Civil Liberties Union called *Ms. L. v. ICE*. It covers an estimated 4,500 to 5,000 children and their parents. By March 20, 2024, task force staff had confirmed 1,120 separated children as part of that group. No final count of children returned to their parents is on record. As of September 2026, no record shows that any official had been charged for the separations.

Arrests, detention and deportation, 2025 and 2026

Chief Justice John G. Roberts Jr. swore in Donald Trump as president for a second term on January 20, 2025, in the Rotunda, the round central hall of the US Capitol. A year later, in January 2026, ICE officers held more than 71,000 people in detention, in custody while officials decided whether to deport them. It was a record.

Human Rights Watch and Physicians for Human Rights gave that figure in a report of June 25, 2026. ABC News reported on July 21, 2026, that ICE officers held 65,765 people, citing figures ICE had posted.

Deaths in custody. The same report counted 52 people who died in ICE custody from January 20, 2025, to June 4, 2026. Thirty-nine of them died in the first year. Of those 39, seven were apparent suicides, meaning they appeared to have killed themselves, and five died of injuries. The others died of strokes, heart failure, long-term illness and failure to breathe. The yearly death rate reached about 8.4 for every 10,000 people held, which the report describes as "nearly four times" the rate under the previous president, Joe Biden.

The report lists how each of the five died of injuries. One was Silverio Villegas González, whom an ICE officer shot during an arrest near Chicago. His death is told below, with the other shootings. On September 24, 2025, a gunman fired on a van of detainees at the ICE office in Dallas, Texas. Two of the men in the van died of their wounds. Norlan Guzmán-Fuentes of El Salvador died that day, and Miguel Ángel García-Hernández of Mexico died on September 30. The gunman, Joshua Jahn, 29, shot and killed himself, NBC News reported.

José Castro-Rivera of Honduras, 24, ran into traffic in Virginia on October 23 while ICE officers chased him to arrest him. A vehicle hit and killed him, and the report does not name the driver.

Camp East Montana. Geraldo Lunas Campos, 55, from Cuba, died on January 3, 2026, inside Camp East Montana, an ICE camp at Fort Bliss in El Paso, Texas. The El Paso County medical examiner ruled his death a homicide,

the El Paso TV station KFOX14 reported. On a death record, homicide means that another person caused the death. The ruling is not a finding that anyone broke the law.

The medical examiner found that pressure on his neck and torso, the middle of his body, kept him from breathing. The human rights groups' report states that the pressure came from force that ICE staff used on him. In a later death report of their own, ICE officials said he had tried to harm himself and that staff used force to stop him. The report names none of the staff involved.

Removals. Removal is the government's word for deportation. ABC News reported that ICE had posted 356,389 removals in the 2026 budget year through about July 21, 2026. For the 2025 budget year, the immigration researcher Austin Kocher counted about 329,018 ICE removals.

DHS officials claimed on January 20, 2026, "more than 675,000 deportations" and "an estimated 2.2 million self-deportations" in the year since January 20, 2025. Self-deportation means leaving the country on one's own, without being deported by officers. Kocher notes that DHS officials have not published how they count these numbers. He found that ICE's own removals made up only about 54 percent of an earlier DHS claim of 605,000. In the year after January 20, 2025, DHS officials counted 90,084 people caught along the southwest border.

Shootings. Federal immigration officers shot and killed at least four people from January 2025 to late January 2026, PBS NewsHour reported. Three of them were Silverio Villegas González, Renée Nicole Good and Alex Pretti.

Villegas González was a citizen of Mexico. ICE officers stopped his car in Franklin Park, a suburb of Chicago, on September 12, 2025, just after he had dropped his children at school. One officer shot him in the neck, and he died.

DHS officials said that Villegas González drove his car at officers and dragged one of them, and that the officer fired "fearing for his own life." In body-camera video, an agent described his own injuries as "nothing major." Federal officials have not released the name of the officer who shot him, and federal prosecutors declined to charge that officer.

Investigators of the Illinois State Police opened their own case in spring 2026, at the request of the Franklin Park police. It was still open in September 2026, the Chicago Sun-Times and WBEZ reported.

ICE officer Jonathan Ross shot Renée Nicole Good, a US citizen, in Minneapolis on January 7, 2026. CBP officers shot Alex Pretti in Minneapolis on January 24, 2026. As of the PBS NewsHour report, no officer had been charged in either death.

Giannis Antetokounmpo

Who: A basketball player born in Greece to Nigerian parents. He grew up a citizen of no country and came to the United States when a National Basketball Association (NBA) team picked him in 2013.

When and where: Born December 6, 1994, in Athens, Greece. Came to the United States in 2013, at 18, to play for the Milwaukee Bucks.

Movie: *Rise* (2022), a Disney+ drama about the Antetokounmpo family, made with the family. It is a dramatization, not a documentary.

As boys in Greece, he and his brothers sold goods on the street.

Giannis Antetokounmpo's parents, Charles and Veronica, were immigrants from Nigeria with no legal status in Greece. Giannis was born in Athens and grew up stateless, which means no country counted him as its citizen. Under Greek law, a child does not become a citizen just by being born in Greece. In the United States, the 1898 ruling in Wong Kim Ark's case makes any child born in the country a citizen. As boys, Giannis and his brothers sold goods on the street.

Greek officials made him a citizen in 2013. A few weeks later, in June 2013, the managers of the Milwaukee Bucks picked him 15th in the NBA draft, the yearly event in which teams choose new players, and he came to the United States at 18 to play for them. He was named the league's Most Valuable Player in 2019 and in 2020. In 2021 he won the NBA championship with the Bucks and was named the most valuable player of the finals. His parents and brothers joined him in the United States.

Peter Dut and Santino Chuor, Lost Boys of Sudan

Who: Two Dinka teenagers whose parents were killed when government forces attacked their villages in Sudan's civil war. They lived for years in a refugee camp in Kenya. They were among the "Lost Boys" resettled in the United States.

When and where: From Sudan. Kakuma refugee camp, Kenya. Houston, Texas, in their first year in the United States, during the resettlement that began in 2001.

Movie: *Lost Boys of Sudan* (2003), a documentary that records the lives of these two young men. Megan Mylan and Jon Shenk made it. It was nominated for an Emmy and won the Truer Than Fiction Award at the Independent Spirit Awards.

They walked out of Sudan and spent years in a camp in Kenya.

Peter Nyarol Dut and Santino Majok Chuor were Dinka, an ethnic group of southern Sudan. Sudan's civil war was a war inside one country, between the government in the north and rebels in the south. Military forces of the central government attacked the boys' villages, destroyed them and killed their families, according to the notes for the PBS film about them. Those notes do not state which soldiers or fighters killed each boy's parents.

The militias. Researchers at Human Rights Watch report that in these years Sudan's rulers gave modern weapons to militias, armed groups outside the regular army, called the muraheleen. The militia fighters burned Dinka villages, stole cattle and food, and carried off women and children as slaves. Human Rights Watch does not say that these militias attacked the two boys' own villages.

The rebel army of the south, the Sudan People's Liberation Army, also took many of the older Lost Boys as soldiers. The two boys survived a long walk out of Sudan and then spent years in Kakuma, a refugee camp in Kenya.

Starting in 2001, about 4,000 of these young refugees from Sudan were resettled in the United States. People called them the "Lost Boys of Sudan," and Peter and Santino were among them. The documentary records their first year in the United States, which began in Houston. After a time, Peter left Houston for Kansas to go to high school.

THE THREE QUESTIONS, ANSWERED

1. **Why did people leave home to come here?** Many came for land and work, like the Germans who farmed the Midwest and the Chinese who built the western railroad, or to worship in their own way, like the Puritans. Others ran from danger: the Irish famine, the pogroms against Jews in the Russian Empire, the Nazis, and wars in Vietnam and Sudan.
2. **Who did Americans try to keep out, and how?** Lawmakers shut out Chinese workers in 1882 and almost everyone from Asia in 1924, and they cut the number of southern and eastern Europeans with quotas. Mobs burned Catholic churches in Philadelphia and drove Chinese people out of Eureka and Tacoma. Officials pushed hundreds of thousands of people of Mexican descent, many of them citizens, across the border in the 1930s and again in 1954. In 2018 agents took thousands of children from their parents at the border, and in January 2026 officers held more than 71,000 people in detention, the most ever.
3. **Who could become a citizen, and how did that change?** In 1790 only "a free white person" could become a citizen. In 1870 members of Congress added people of African birth or descent. In 1898 the Supreme Court ruled in Wong Kim Ark's case that anyone born here is a citizen, and in 1952 members of Congress removed the limit to white people.

What changed: In 1500 no one from across the ocean had come to stay, and by 2023 about 47.8 million people living in the United States had been born in another country.

FIVE DATES TO KEEP

September 8, 1565: Menéndez founds St. Augustine, the oldest European town on the US mainland.

1790: Members of Congress limit citizenship to free white people.

May 6, 1882: President Arthur signs the Chinese Exclusion Act.

May 26, 1924: President Coolidge signs the quota law.

1965: lawmakers end the national-origins quotas.

> **NOT KNOWN:** No one knows how many Chinese workers died building the railroad, and the estimates run from about 100 to the thousands.

Where to go: Ellis Island, in New York Harbor, where about 12 million immigrants came through from 1892 to 1954 and a statue of Annie Moore stands.

Next: Chapter 5, Migration Across America. It asks how people moved, and were moved, across the land once they were here.

Chapter 5: Migration Across America

CHAPTER 5 OF 37 · MIGRATION ACROSS AMERICA · 10 ERAS · ABOUT 75 MINUTES

Many of the biggest moves across this land were forced or driven. Soldiers marched whole nations west, and slave traders and enslavers forced more than a million enslaved people south. Later, about 6 million Black Southerners went north to get away from mob killings and from Jim Crow laws, the laws that kept Black and white people apart.

In about 1805, in Maryland, a slave trader from Georgia locked an iron collar around the neck of a man named Charles Ball. A padlock fastened the collar to a chain about 100 feet long. Fifty-one other people were locked to the same chain, and the trader handcuffed the men in pairs. He had just bought Ball away from his wife and children. The line of people walked south for more than a month, to Columbia, South Carolina.

This chapter follows people moving across the land that became the United States, from the first walkers out of Asia to the families who left New Orleans after Hurricane Katrina in 2005. Some went because they chose to: a church walking to the Connecticut River, wagon families on the Oregon Trail, homesteaders on the Great Plains. Others were driven out: the Acadians, the Tuscarora, the Cherokee, the Navajo, Japanese Americans in 1942. In each move, watch who decided that people would go, and whose land they went to. Before 1900 that land almost always belonged to a Native nation.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did horses reach the Native nations of the Plains?

2. How many Cherokee died when soldiers forced them west?
3. Why did about 6 million Black Americans leave the South between 1910 and 1970?

Five minutes? Read "Indian removal and the Trail of Tears" in 1800 to 1850, the Rebecca Neugin story after it, and the next section, "The overland trails."

Can skip: "Seasonal rounds and trade paths", "The cattle drives", "The frontier line disappears from the census, 1890". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 2 MINUTES

People were moving across this land for thousands of years before any European saw it. The first people came on foot from Asia during the ice age, and their descendants kept moving. Some built towns and later left them. Some nations traveled south over a long time, and many families moved with the seasons to hunt, fish and gather food.

Hundreds of Native nations lived here. There were no horses and no wagons. Trails and trade paths crossed the continent, and later newcomers followed many of them.

Cahokia and Chaco Canyon: towns people built and left

Cahokia was the largest town north of Mexico. It stood on the Mississippi River, on the Illinois side, near where the city of St. Louis is today. People lived there from about the year 700 to about 1400. Around 1100, between 10,000 and 20,000 people lived in the city, about as many as lived in London at the time. Some estimates put as many as 50,000 people in the area around it.

Most of Cahokia's people had moved away by about 1350, and by the 1400s the town was nearly empty. Nobody knows for sure why they left. The main explanations are floods, a shortage of wood and food, and drought, a long stretch with little or no rain. No single cause has been settled.

Chaco Canyon, in what is now New Mexico, was a center of the Ancestral Puebloan people, the ancestors of today's Pueblo peoples. People started to leave the canyon around 1140, after a run of bad droughts, and most had gone by the end of the 1100s. They moved out and joined the Pueblo communities of the Southwest.

The Navajo and Apache move south

The ancestors of the Navajo and the Apache came from the far north, from what is now western Canada and eastern Alaska. The Navajo call themselves the Diné. Over a long time, groups of them moved south along the edge of the Rocky Mountains and the Great Plains toward the Southwest. Their long move is called the Athabascan migration.

When they arrived in the Southwest is disputed. Many accounts place their arrival between the 1400s and about 1525. Others argue that they came earlier, in the 1200s.

Seasonal rounds and trade paths

Many peoples moved in a pattern called a seasonal round, a yearly circuit from one camp to the next. Over a year, a family moved between its fishing places, its hunting grounds and the spots where wild plants ripened.

Trade goods moved across the land as well. Traders passed turquoise, seashells, copper and obsidian, a black glass made by volcanoes, from nation to nation along trade paths. Some of these goods ended up hundreds of miles from where they were found.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 5 MINUTES

Spanish colonists brought two things north in the 1500s that later changed how people moved across this land: horses, and families who came with wagons and herds to stay. The whole land from coast to coast was still Native land. Europeans reached its edges, but no crowds of settlers moved across the interior. The first colony that came over land to stay arrived at the very end of the century, when Juan de Oñate led Spanish colonists north into what is now New Mexico in 1598.

Why there were no horses here, and how they came back

Horses lived in North America during the ice age and died out here thousands of years ago. Spanish sailors and colonists brought them back.

Christopher Columbus carried horses on his second voyage across the Atlantic, in 1493. Spanish expeditions, groups of men sent out to explore, then brought horses onto the mainland. Francisco Vázquez de Coronado's expedition had them from 1540 to 1542, and Juan de Oñate's colonists brought them to New Mexico in 1598. In the next century, horses changed how people lived on the Great Plains.

Oñate's colony on the Camino Real, 1598

Juan de Oñate and his colonists left Santa Bárbara in January 1598. It was a town in northern New Spain, the Spanish colony that included Mexico. Earlier Spanish expeditions had followed the Conchos River north. Oñate's column, the long line of people, wagons and animals, cut straight across the Chihuahuan Desert instead.

The column reached the Rio Grande in late April, at El Paso del Norte, near where El Paso, Texas, and Ciudad Juárez, Mexico, stand today. On April 30, 1598, Oñate claimed New Mexico for Spain in a ceremony called La Toma, which means "the taking." In July he set up the colony's headquarters at San Juan Pueblo, which its people call Ohkay Owingeh.

Whose land. The colonists moved onto the homeland of the Pueblo peoples. Families from Chaco Canyon had joined the Pueblo communities after the droughts of the 1100s, about 400 years earlier.

The road the colonists traveled was later called El Camino Real de Tierra Adentro, the royal road of the interior. It ran from Mexico City to northern New Mexico, and Oñate's march made it more than 600 miles longer. Its stretch inside the United States is a National Historic Trail today.

Two colonies by sea. Before Oñate, two groups of Spanish colonists had come to what is now the United States by ship. Tristán de Luna y Arellano brought about 1,500 people in 11 ships to Pensacola Bay, in what is now Florida, in 1559. They were soldiers, colonists, enslaved people and Aztec allies.

A hurricane sank many of the ships a month later, and Spanish ships took the survivors back to Mexico in 1561. Pedro Menéndez de Avilés founded St. Augustine, also in Florida, with about 600 settlers in 1565.

Juan de Oñate

Who: The Spanish leader of the first known colonists to travel over land, with families, wagons and herds, into what is now the United States, and the man who ordered the attack on Acoma Pueblo.

When and where: From Santa Bárbara in northern New Spain to San Juan Pueblo (Ohkay Owingeh), New Mexico, January to July 1598. Acoma Pueblo, December 1598 to February 1599.

He sentenced each Acoma man over 25 to lose a foot.

Oñate's column had about 400 men, about 130 of them with their families, and 83 wagons and carts. The colonists drove more than 7,000 head of livestock, or farm animals, with horses among them. The colony included soldiers, farmers, workers, servants and Franciscan friars, men who belong to a Catholic religious order. Enslaved people walked in the column too. The surviving records do not say how many.

Acoma. Oñate's nephew, Juan de Zaldívar, went to Acoma Pueblo in December 1598 with about thirty soldiers to demand food. In the Acoma people's own account, the soldiers also raped an Acoma woman, forcing her into sex. The Acoma killed Zaldívar and between eleven and fourteen of his men.

Oñate sent Zaldívar's brother, Vicente de Zaldívar, with about seventy soldiers in January 1599. Acoma stands on top of a mesa, a steep hill with a flat top. The soldiers climbed it, killed Acoma men, women and children, and burned much of the town.

Nobody counted the Acoma dead at the time. Estimates run from about 300 to about 1,500. The number given most often is about 800, which Pueblo leaders gave in a 2023 statement from the All Pueblo Council of Governors, the governors who lead the 20 Pueblo nations of New Mexico and Texas.

The sentences. The soldiers captured about 500 people. In February 1599 Oñate sentenced them in four groups. Each man over 25 was to have a foot cut off and do twenty years of forced work as a slave. Boys and men

from 12 to 25 got twenty years as slaves. Girls and women over 12 got the same twenty years. Children under 12 were to be taken from their families and given to the friars.

The Acoma's own account, passed down since 1599, gives the number of men whose feet were cut off as 24, and so do news reports. Reporters for AP and NPR, and Pueblo leaders, say it was the right foot. Two historians, Marc Simmons and John Kessell, doubt that the feet were ever cut off. Simmons had once written that they were.

A National Park Service page on the Camino Real states that about 70 Acoma girls were sent down the road to convents, homes for nuns, in Mexico. The same page states that probably none of the girls ever came home. Pueblo leaders count 60 children taken to Mexico, and they say none came home.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

Native nations of the Plains and the Rocky Mountains got horses in this century, and that changed how they moved more than anything else did. People on horseback could travel farther and faster than on foot, and they could follow the buffalo herds.

Along the Atlantic coast, English, Dutch and other colonists settled at places like Jamestown, founded in 1607, and Plymouth, founded in 1620. Almost none of them went far inland. The Appalachian Mountains were hard to cross, and many Native nations lived on the far side of them. The few colonists who did move inland went short distances. Thomas Hooker's group walked from Massachusetts to the Connecticut River in about two weeks.

How did horses spread to the Plains nations?

Two accounts explain how horses spread, and the timing is still not settled. In the older account, horses passed north through trade after the Pueblo Revolt of 1680. In the newer one, many nations already had horses by the early 1600s.

The older account. In this account, Pueblo peoples drove the Spanish out of New Mexico in 1680, and the Spanish left their horses behind. The trouble began with the Spanish governor of New Mexico, Juan Francisco Treviño. In 1675 he ordered the arrest of 47 Pueblo medicine men, who were religious leaders, on a charge of sorcery, or witchcraft. Spanish officials sentenced four of them to be hanged. They hanged three, and the fourth killed himself. Treviño's men whipped the others in public and put them in prison.

Pueblo people went to Santa Fe and demanded that the prisoners be let go, and the Spanish freed them. One of the freed men was Popé, a religious leader of the Tewa, one of the Pueblo peoples. In 1680 Popé led the Pueblo peoples of what is now New Mexico in a rising against Spanish rule. They killed about 400 Spaniards and drove the rest out of New Mexico for more than a decade.

The horses the Spanish left behind, perhaps more than 1,500, were the largest number of horses to pass into Native hands at one time. In the older account, these horses then moved north and east through trade. The Ute, Navajo and Apache got them first. Over the next few decades horses reached many other nations, as far as the northern Plains.

The newer account. It comes from a study published in the journal *Science* in 2023. The archaeologist William Taylor, a scientist who studies the past through the things people left behind, led it, working with Lakota, Comanche, Pawnee and other Native partners. The team tested horse bones from Kansas, New Mexico and Wyoming to find their age. Some dated from the 1500s and 1600s.

Marks on the teeth and bones showed that people had put bridles on these horses and fed them corn, so people were keeping and caring for them. The team found that many nations across the Plains and the Rocky Mountains had

horses by the early 1600s, decades before the Pueblo Revolt. The finding matches what Native people have long said in their nations' own histories, passed down by word of mouth.

Over the next century, horses changed how the Comanche, Lakota, Cheyenne and the other Plains nations hunted and traveled.

The first colonial moves inland

Two English ministers moved out of the colony of Massachusetts Bay in 1636 and started new towns in what are now Connecticut and Rhode Island. Thomas Hooker chose to go, and his story follows this section.

Roger Williams. The other minister did not choose. The leaders of Massachusetts ordered Roger Williams out of the colony for what he preached: he taught that the government should not force religious beliefs on people. He fled in the winter rather than be sent back to England, and Wampanoag people helped him survive.

With help from Wampanoag and Narragansett people, Williams then traveled by canoe to a freshwater spring at a place called Moshassuck. He settled there with the permission of the Narragansett and named the place Providence. In 1638 two Narragansett sachems, or leaders, named Miantonomi and Canonicus signed a deed, a paper that says who owns a piece of land, for the settlement.

Thomas Hooker

Who: A minister who led about 100 members of his church from Massachusetts to the Connecticut River, where they settled Hartford.

When and where: From Newtown (now Cambridge), Massachusetts, to Hartford, Connecticut, May and June 1636.

His church walked for two weeks, living partly on milk from 160 cows.

Thomas Hooker was the pastor of the church at Newtown, the town that is now Cambridge, Massachusetts. His church set out on foot for the Connecticut River in May 1636.

They drove 160 cattle with them and lived partly on the cows' milk. They followed Native trails, a route later called the Old Connecticut Path. John Winthrop, a leader of Massachusetts Bay, wrote about the departure in his journal on May 31, 1636: "Mr. Hooker, pastor of the church of Newtown, and most of his congregation (the people of his church), went to Connecticut." Winthrop also noted that Hooker's wife rode on a horse litter, a stretcher carried by horses.

Whose land. The place where they settled was Suckiaug, which means "black earth." It was the main village of the River Indians, and their sachem was Sequassen. In 1636 Sequassen and his people signed the land over by deed to Samuel Stone and William Goodwin, two men in Hooker's group. The land ran along the river between the towns of Wethersfield and Windsor, and six miles west of the river.

Nobody wrote the deed into the official land records at the time, and the settlers and the Native owners argued over its terms for generations. The histories of the deed do not say what Sequassen's people received for the land.

Dutch traders had built a fort there, the House of Hope, before Hooker's group came. The town the settlers built is Hartford. In 1639 the people of Hartford and the towns near it adopted a plan of government called the

> Fundamental Orders of Connecticut.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 4 MINUTES

Settler families began moving inland from the Atlantic coast in the first half of the 1700s, because land near the coast had filled up and grown expensive. They moved into the valleys and hills behind the older settlements, an area colonists called the backcountry. The main road inland was the Great Wagon Road.

Native nations were moving too. After a war with colonists in North Carolina, the Tuscarora walked north to New York. On the southern Plains, the Comanche moved in on horseback and took control, and many Apache there fled south. The country beyond the Appalachian Mountains was still Native land.

Who traveled the Great Wagon Road?

Many of the families on the Great Wagon Road were German or Scots-Irish. The road ran about 730 miles into the backcountry. It started in Philadelphia and went southwest through the Shenandoah Valley of Virginia. Then it ran down through the hill country of the Carolinas, called the Piedmont, toward Augusta, Georgia. Heavy traffic began in the 1720s.

Both groups had come to Pennsylvania. By the time of the Wagon Road, land there had grown costly, so many families moved on. The Scots-Irish were Protestants, Christians whose churches had split from the Catholic Church. Their families had moved from Scotland to the north of Ireland in the 1600s and then on to America. The Germans were called the "Pennsylvania Dutch," from *Deutsch*, the German word for German. Moravians, members of a Protestant church from central Europe, came along the road as well.

An older path. The road followed a Native path that colonists called the "Indian Road." When settlers began arriving in the Shenandoah Valley in about 1729, most of the people living near the present-day town of Winchester, Virginia, were Shawnee. Other nations used the valley too, among them the Iroquois, a league of six nations also called the Six Nations or the Haudenosaunee. The valley's north-south trail was a war path between nations to the north and the Catawba nation to the south.

The Treaty of Lancaster. Officials sent by Virginia's governor, William Gooch, met Iroquois leaders at Lancaster, Pennsylvania, in 1744. In the treaty they signed there, a written agreement between nations, Gooch's officials bought the Iroquois claim to the valley, meaning their right to the land. Colonists also got the right to use the Indian Road. Accounts of how much the officials paid do not agree.

The Native delegates at Lancaster came from five nations of the Iroquois league, the West Virginia Encyclopedia states. None came from the Shawnee, who lived in the valley. Even more settlers traveled the road after 1744.

Why did the Tuscarora walk north?

The Tuscarora nation moved about 500 miles north, from North Carolina toward Pennsylvania and New York, after colonists defeated them in war. The move took from 1713 to 1722, and they traveled in stages.

Neoheroka. The war ended at Neoheroka, a Tuscarora fort on Contentnea Creek in what is now Greene County, North Carolina. Colonel James Moore of South Carolina led the attack. He commanded militia, colonists called up to fight as soldiers, from both Carolinas, and Native warriors who fought on the colonists' side.

Moore's men laid siege to the fort, which means they surrounded it and kept attacking it, from March 1, 1713. They dug under an outer wall and set the fort on fire. It fell on March 23.

History pages from North Carolina's state government list 950 Native people killed or captured at Neoheroka. They list about 1,000 Tuscarora sold into slavery during the whole war. The colonists and allies who won the war sold these captives, and those state pages do not name who bought them. The colonists' side also forced more than 3,000 other Native people from their homes. About 200 colonists and about 1,000 Native people died in the war.

About 1,500 Tuscarora survivors made the walk north. The Oneida nation sponsored them in the Haudenosaunee league, which means the Oneida backed their joining. In 1722 the Tuscarora became its sixth nation.

How the Comanche took the southern Plains

The Comanche had moved onto the southern Plains by the early 1700s, and they became the strongest power there. The land they held became known as Comanchería, Comanche country.

Apache groups were already living on the southern Plains. The Handbook of Texas, a history reference, states that by 1700 the Comanche, Wichita and Tejas Indians were "better armed through trade with the French." Those nations took control of the southern Plains, and the Apache began moving southwest. Many Apache, most of all the Lipan and the Mescalero, "fled southward into Central Texas as well as into northern Mexico."

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 7 MINUTES

Crowds of American settlers crossed the Appalachian Mountains for the first time in these fifty years, onto land that belonged to Native nations. As many as 300,000 went through the Cumberland Gap into Kentucky and beyond between 1775 and about 1810. After the Revolutionary War ended in 1783, more settlers moved into the Ohio Valley. Members of Congress passed two laws, in 1785 and 1787, that set out how western land would be measured, sold and governed.

The Acadians. Farther north, British officers began forcing the French-speaking Acadians out of Nova Scotia, north of the British colonies, in 1755. They forced out about 10,000 to 11,500 people, and about 2,600 to 3,000 of them later made their way to Louisiana.

The Acadians forced from Nova Scotia, 1755

The Acadians were French-speaking Catholic farm families in Nova Scotia and the land around it, in what is now eastern Canada. Between 14,000 and 18,000 Acadians lived there in 1755. Nova Scotia was a British colony, and Charles Lawrence, its lieutenant governor, was one of the top British officials there.

The decision. Lawrence and his council of advisers in Halifax decided on July 28, 1755, to remove the Acadians from the colony. A navy admiral and the colony's top judge sat on the council that day. Some council members had recently come from New England and wanted the Acadians' farmland.

Lawrence had first asked Acadian delegates, men chosen to speak for their villages, to swear loyalty to Britain with no conditions. When they refused, Lawrence and his council had them jailed.

Grand-Pré. Lieutenant Colonel John Winslow commanded New England troops. On September 5, 1755, he ordered every Acadian male aged 10 and older at Grand-Pré to gather in the church there at 3 p.m., and he held them there. The order read to them said that their land, houses, cattle and other livestock now belonged to the Crown, meaning the British king. They could keep their money and household goods, and they would be removed from the colony.

Winslow wrote that the order was "very disagreeable to my nature," but that his job was "to obey such orders as I receive." Two other officers led arrests and removals in other districts.

The plan. Charles Morris, a New Englander, drew up the plan. Soldiers would surround the churches on a Sunday morning and capture as many men as they could. Then they would break the earth walls that kept the sea off the Acadians' fields, and burn their houses and crops.

New England and British soldiers did burn many Acadian houses, barns and churches that year. Around the Minas Basin, where Grand-Pré stands, Winslow's own list records 698 buildings that the soldiers under him burned by November 1755, most of them houses and barns, and one Catholic church.

The ships. When the men refused to go, the soldiers threatened their families with bayonets, blades fixed to the ends of their guns. By the fall of 1755, soldiers had put about 1,100 Acadians on ships bound for three colonies, South Carolina, Georgia and Pennsylvania, the historian James H. Marsh writes. That count includes only the people on ships for those three colonies. Winslow's own table records everyone shipped from the Minas district alone, to all places: 2,242 people, 1,510 of them by his men and 732 by a second company.

British officers and soldiers kept removing Acadians until 1764. One count gives about 10,000 Acadians forced out between 1755 and 1763, and another gives about 11,500 between 1755 and 1764. British ships carried them to the thirteen colonies, to England and to France. Many Acadians escaped into the forests, and British soldiers hunted them for the next five years. In French the forced removal is called *Le Grand Dérangement*, the great upheaval.

KNOWN:	In one group of about 3,100 Acadians removed in 1758, about 1,649 died by drowning or disease.
DISPUTED:	One count puts all the Acadian dead at close to 5,000, from disease, shipwreck or violence, and other counts put the dead at as many as half of those forced out.

How did the Acadians become Cajuns?

About 2,600 to 3,000 Acadians made their way to Louisiana between 1764 and 1785, and their descendants are the Cajuns. The word Cajun comes from the word Acadian.

Louisiana was then a Spanish colony. The largest group came in 1785, when Spanish officials paid for seven ships that carried 1,596 Acadians from Nantes, in France, to Louisiana. The first of them reached New Orleans on July 29, 1785. The Acadians settled along the bayous, slow-moving streams through low, wet land, and on the prairies west of New Orleans.

Joseph Broussard (Beausoleil)

Who: An Acadian who fought the British removal of his people, then led one of the first Acadian groups to Louisiana.

When and where: Acadia (Nova Scotia and New Brunswick), 1755 to 1762. New Orleans and the Attakapas district of Louisiana, 1765. Born about 1702, died 1765.

Freed from a British prison, he led about 200 Acadians to Louisiana.

Joseph Broussard, whom people called Beausoleil, organized armed resistance when British officers began forcing the Acadians out in 1755. He and his men raided British troops. British soldiers captured him and held him at Halifax until 1763. That year Britain and France signed the Treaty of Paris, a peace agreement that ended their war.

South. Broussard and about 600 Acadians hired a ship in late 1764 to carry them to Saint-Domingue, the island colony that is now Haiti. He and about 193 to 200 of them sailed on to Louisiana in February 1765 and reached New Orleans late that month. He was one of the first Acadians to settle there.

> Colonial officials named him a militia captain on April 8, 1765. They also made him the commander of the "Acadians of the Attakapas," the district around the present-day town of St. Martinville.
>
> A sickness spread through the new settlement that year. Most accounts say it was yellow fever, and Broussard died of it in October 1765. Officials at Parks Canada, the Canadian government office that runs historic sites, have named him a National Historic Person, a title they give to people who were important in Canada's history.

The Wilderness Road and the Cumberland Gap

The Cumberland Gap is a low notch through the mountains near the place where Kentucky, Virginia and Tennessee meet. In 1775 Daniel Boone and about 30 axmen cut a road through it called the Wilderness Road. As many as 300,000 settlers traveled that road into Kentucky and beyond between 1775 and about 1810. Kentucky filled with settlers and became a state in 1792.

The deed. Boone cut the road for Richard Henderson's Transylvania Company, a business its partners formed to buy up what they called "wild lands" and open them to settlers. At Sycamore Shoals on the Watauga River, from March 14 to 17, 1775, Henderson got a deed from Cherokee leaders, among them Attakullakulla, Oconostota and Old Tassel.

The deed covered about 20 million acres between the Cumberland and Ohio rivers, most of Kentucky and part of Tennessee. In return the Cherokee received trade goods, which one estimate values at about 10,000 British pounds.

Who objected. Dragging Canoe, Attakullakulla's son, spoke against selling land that the Cherokee nation held in common, and he rejected the sale. Other nations had claims to the land too, among them the Shawnee, who had once lived on part of it. The Tennessee Encyclopedia describes the Cherokee claim as the strongest of these.

By buying the land, Henderson broke a British rule of 1763, the Royal Proclamation, which banned private buyers from buying Native land. Officials in Virginia and North Carolina and members of the Continental Congress, the meeting of leaders from the colonies, all refused to accept Henderson's colony as lawful.

Into the Ohio Valley, and a grid laid over the land

Settlers moved in large numbers into the Ohio Valley and the Northwest Territory after the Revolutionary War ended in 1783. The Northwest Territory was the land north of the Ohio River that later became the states of Ohio, Indiana, Illinois, Michigan and Wisconsin. It was the land of the Shawnee, Miami, Delaware and other nations, and in the 1790s those nations and the settlers fought each other.

The grid. Members of Congress adopted the Land Ordinance, a law, on May 20, 1785. Under it, surveyors, workers who measure land, marked the western land into squares called townships, each six miles on a side, and divided each township into 36 sections of 640 acres. In the law, the members of Congress set aside one section in every township to pay for public schools. Because of that grid, much of the American countryside is laid out in squares today.

Two years later, on July 13, 1787, members of Congress passed the Northwest Ordinance. In it they wrote the rules for governing the territory, set out how parts of it could become new states equal to the original thirteen, and banned slavery north of the Ohio River. Five states later came from the territory.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 14 MINUTES

Two kinds of journey crossed the country in these fifty years: families who chose to go west in wagons, and whole nations and enslaved people whom soldiers and slave traders forced to move. The United States about doubled in size in 1803, and by 1850 its land reached the Pacific Ocean. Families drove wagons over the Oregon, California and Mormon trails, and about 300,000 people rushed to California for gold between 1848 and 1855.

Forced journeys. United States soldiers drove the Cherokee, Choctaw, Muscogee, Chickasaw and Seminole nations from their homelands in the Southeast. Slave traders and enslavers forced more than a million enslaved Black people to move from the Upper South to the Deep South, in chains or in ships.

The Louisiana Purchase, 1803

American officials bought about 827,000 square miles of land west of the Mississippi River from France in 1803. The price was 15 million dollars, and afterward the country was about twice as big as before. All or part of 15 later states came from this land.

Thousands of Native people, in dozens of nations, already lived on this land. None of them had a part in the sale. After the purchase, American settlers began moving onto it, into the interior of the West.

The domestic slave trade: a forced march south

Slave traders and enslavers forced more than one million enslaved people to move from the Upper South to the Deep South between about 1790 and 1860. The Upper South meant Virginia, Maryland, the Carolinas, and later Kentucky and Tennessee. The Deep South meant the cotton lands from Georgia west to Texas.

Traders and enslavers moved about 200,000 people this way every ten years from 1820 to 1860. This trade inside the country was later called the "Second Middle Passage," after the first Middle Passage, the voyage of captured Africans across the Atlantic Ocean.

Traders moved people south in two ways. They marched some on foot in coffles, lines of enslaved people chained together and marched over land. They shipped others down the coast to New Orleans, which had the largest slave market in the country.

Franklin and Armfield. The largest slave-trading company in the country was Franklin and Armfield, founded in Alexandria, Virginia, in February 1828. John Armfield bought people in Alexandria. Isaac Franklin sold them in Natchez, Mississippi, and after 1829 in New Orleans. Rice Ballard joined them in the early 1830s and ran their office in Richmond. The partners bought, moved and sold more than 8,500 people, 1,000 to 1,500 a year in their busiest years, the mid-1830s.

Near the end of each summer, the partners sent coffles "in chains over the mountains." Each coffle held from several dozen to several hundred people, and the partners timed it to reach the Deep South for the fall selling season. They also owned three ships fitted to carry enslaved people, the *Tribune*, the *Uncas* and the *Isaac Franklin*. The voyage from Virginia to Louisiana took about three weeks, and at the busiest time one of these ships left every two weeks. The last shipload left in November 1836.

Sold, or taken along. Some of these people were sold to traders. Others were forced to move when the enslavers who held them moved to new land and took them along. Historians' estimates of the traders' share run from

about 16 percent to about two-thirds. Walter Johnson puts it near the top, at about two-thirds sold and one-third taken along, and Michael Tadman gives 60 to 70 percent for the years after 1808.

Charles Ball

Who: An enslaved man who was chained into a coffle and marched from Maryland to South Carolina. He later escaped and told his life story.

When and where: Sold in Maryland about 1805. Marched to Columbia, South Carolina. His story was printed in Philadelphia in 1837.

He escaped slavery twice, hiding by day and walking at night.

The chapter opening describes how a Georgia slave trader chained Charles Ball into a coffle of 52 people in Maryland in about 1805 and marched them for more than a month to Columbia, South Carolina. At Columbia the trader sold Ball again, into Georgia.

Escape. Years later Ball escaped and walked north back to Maryland, hiding by day and moving at night. He was captured again and held as a slave. After his second escape he settled near Philadelphia.

Ball told his story to Isaac Fisher, a white abolitionist, someone who worked to end slavery. Fisher wrote it down, and it came out in 1837 as *Slavery in the United States: A Narrative of the Life and Adventures of Charles Ball*. Because Fisher did the writing, the book records Ball's story in Fisher's words. Many of the dates in Ball's life are known only roughly, even his birth, in about 1780 in Calvert County, Maryland.

Indian removal and the Trail of Tears

President Andrew Jackson signed the Indian Removal Act in 1830. He then directed the removal of the Cherokee, Muscogee (Creek), Choctaw, Chickasaw and Seminole nations from their homelands in the Southeast. Federal troops forced them to Indian Territory, which is now Oklahoma.

The Choctaw. Federal troops removed the Choctaw from 1831 to 1833, forcing the first groups out in snow and river ice. Andrew K. Frank, writing for the Oklahoma Historical Society, counts more than 14,000 Choctaw removed and says hundreds died. Other counts give about 15,000 removed and about 2,500 dead.

The Creek. After a war with the Creek, United States troops marched the remaining Creek people west in five large groups in August and September of 1836. Soldiers put chains on Creek men taken prisoner in the war and marched them to Montgomery, Alabama, and their families followed in wagons. More than 14,500 Creek were removed. Several hundred died on the way. About 3,200 more died after they arrived, from disease, hunger and exposure, the harm cold and bad weather do to the body.

The steamboat *Monmouth*, carrying about 600 Creek people, was in a collision in October 1837. About half of the Creek on board died.

The Chickasaw. Under the Treaty of Pontotoc, signed in 1832, the Chickasaw had to leave their lands in Mississippi. They moved west from 1837, and more than 500 Chickasaw died of smallpox during the removal.

The Seminole. Many Seminole in Florida fought removal in a war that lasted from 1835 to 1842. For every four Seminole sent west, US Army soldiers killed one, the National Park Service states. A few hundred Seminole stayed in the Everglades, the swamps of southern Florida, and never surrendered.

The Cherokee. The Cherokee removal of 1838 and 1839 is called the Trail of Tears. United States Army troops under General Winfield Scott began rounding up the Cherokee who had not moved west in May 1838. President

Martin Van Buren had sent Scott with about 7,000 soldiers, and state militia, part-time soldiers called up by a state, joined them, Georgia's among them. Soldiers took families from their homes and farms, often with no time to pack.

The soldiers held about 16,000 Cherokee in stockades, pens with walls of tall logs, in Tennessee and Alabama. They sent three groups west by river in June 1838. After that, Scott agreed to let John Ross, the Cherokee's Principal Chief, organize the rest. Ross organized fourteen groups, which left between August and December 1838. The walk over land was about 800 miles, and people died on the way from cold, hunger and disease.

How many died. The number of Cherokee dead is not settled. The count most often given is about 4,000. The National Park Service's history of the trail states that more than 1,000 people died on the journey itself, and "perhaps several thousand" more died later because they had been forced from their homes.

Higher estimates run from above 5,000, in an article on the History.com website, to about 8,000 or more, twice the usual figure. Russell Thornton, a scholar who studies population, gave that highest estimate in 1984. Andrew K. Frank, writing for the Oklahoma Historical Society, says as many as one in four Cherokee died.

Rebecca Neugin

Who: A Cherokee woman who, at about three years old, was forced west on the Trail of Tears. She told what she remembered when she was 97 or 98.

When and where: Soldiers took her from Georgia in 1838. Interviewed in 1932 in what is now Oklahoma.

She rode west in a wagon at three and remembered it at 97.

Soldiers rounded up Rebecca Neugin's family in Georgia in 1838. Her father was Tickaneesky, and her mother was Sallie Ketcher. The soldiers held the family in a camp in Tennessee.

The family started west in September 1838 with the group led by Mose Daniel and George Still. Rebecca and the smaller children rode in a wagon. Her mother, her father and her older brother Dick walked the whole way.

The historian Grant Foreman interviewed her in 1932, when she was 97 or 98 years old and one of the last living people who had made the journey. Her memory of it is one of the few first-hand accounts by a survivor. She died on July 15, 1932.

The overland trails

Most of the western trails started from towns on the Missouri River, mainly Independence and St. Joseph, in Missouri.

The Santa Fe Trail opened in 1821, when William Becknell led the first trading trip from Missouri to Santa Fe, which then belonged to Mexico. It was mainly a road for traders hauling freight.

The Oregon Trail ran about 2,000 to 2,170 miles, from Independence, Missouri, to the Willamette Valley in Oregon, and the trip took four to six months. About 1,000 people set out on it on May 22, 1843, with about 120 wagons and thousands of oxen and cattle, and they reached Oregon that fall. This trip was called the "Great Migration" of 1843. It is a different event from the Great Migration of Black Southerners in the 1900s, which this chapter describes later.

After it, other families knew that wagon trains could make the whole journey, and hundreds of thousands followed over the next twenty years. From the 1840s on, tens of thousands of them came to the Willamette Valley, where at least twenty Native nations lived, among them the Kalapuya, Molala and Chinook peoples.

The California Trail split off from the Oregon Trail and turned southwest toward California. Traffic on it grew fast after gold was found in 1848.

How did people die on the wagon trails?

About one in ten people who set out on the wagon trails died on the way, between 20,000 and 30,000 people. Most of the dead had cholera, a disease that causes severe diarrhea and vomiting, or typhoid, a disease that causes a high fever. Both spread through dirty water at crowded camps.

Other emigrants, people leaving one home to settle in another, died in accidents or drowned while crossing rivers. Later stories often showed Native people attacking wagon trains, but most of the emigrants who died on the trails died of disease. Families traveled in groups for safety, in covered wagons pulled by oxen.

Why the Latter-day Saints moved west

Members of the Church of Jesus Christ of Latter-day Saints, also called Mormons, moved west after armed men attacked them in Missouri and in Illinois.

Missouri. Missouri's governor, Lilburn Boggs, ordered on October 27, 1838, that the Latter-day Saints be driven out of the state. If necessary, in the order's own word, they were to be "exterminated," killed off entirely. Three days later about 200 armed Missourians led by Colonel Thomas Jennings attacked the Mormon settlement at Haun's Mill. They killed seventeen or eighteen men and boys. One of the boys, Sardius Smith, was ten years old. No record shows that anyone was ever tried for the killings.

Both sides in Missouri used force that year. The Missouri State Archives records that mobs of older Missouri settlers and armed Mormon groups roamed the countryside. Armed Mormon groups raided the towns of Gallatin and Millport in mid-October 1838 and burned property there. Over the next year, about 8,000 church members left Missouri for Illinois, many of them ragged and stripped of their property, and settled at Nauvoo.

Illinois. About 100 men from Illinois militia units broke into the jail at Carthage, Illinois, on June 27, 1844. They killed the church's founder, Joseph Smith, and his brother Hyrum. Five men were tried for the killings, and all five

were found not guilty. Vigilantes, people who use force to punish others without any legal right to, then attacked Mormon farms around Nauvoo.

Brigham Young, a leader of the church, planned to move about 15,000 people west. The first wagons crossed the Mississippi River into Iowa on February 4, 1846, and by March 1 about 500 wagons were on the move. More than 70,000 Latter-day Saints had traveled the Mormon Trail by 1869. Some of the poorer groups pulled handcarts, small two-wheeled carts pulled by hand, instead of driving wagons.

Whose land. The Salt Lake Valley lay between the lands of the Ute, to the south, and the Shoshone, to the north. A few Native people crossed the valley itself, but none had camps there. The Ute, Goshute, Shoshone, Paiute and Navajo peoples lived in what is now Utah, and their homelands had been there for thousands of years.

Brigham Young

Who: The Latter-day Saint leader who led the first company of Mormon emigrants to the Salt Lake Valley.

When and where: From Winter Quarters, in what is now Nebraska, to the Salt Lake Valley, in what is now Utah. Arrived July 1847.

Three of the men in his first company were enslaved.

The Saints called Young's first company the vanguard company, the group that goes ahead of the rest. About 148 people traveled in it in 1847, about 1,300 miles from Winter Quarters, a camp in what is now Nebraska, to the Salt Lake Valley.

Counts of who was in the company differ. One count lists 143 men, 3 women and 2 children. Three of the men were enslaved Black men: Hark Lay, Green Flake and Oscar Crosby.

The three men. William Lay and his wife, Sytha, held Hark Lay in slavery and took him along. James Madison Flake held Green Flake in slavery, and William Crosby held Oscar Crosby, according to the Century

of Black Mormons project at the University of Utah. The two enslavers sent Green Flake and Oscar Crosby ahead to build shelters and plant crops for their white families, who came later.

The three enslaved men hunted for the travelers, guarded the animals, and went into the Salt Lake Valley on July 22, 1847, ahead of most of the company. The rest reached the valley that July, and Young himself arrived on July 24.

New land from Mexico, and the Gold Rush

A journalist named John O'Sullivan wrote the phrase "Manifest Destiny" in the *Democratic Review* in 1845. It named an idea that many Americans held: that the United States was meant to spread across the continent to the Pacific Ocean. People used the idea to argue for moving west and for going to war with Mexico.

The Mexican Cession. The Mexican-American War lasted from 1846 to 1848 and ended with the Treaty of Guadalupe Hidalgo. In it, Mexican officials, after losing the war, gave up California, Nevada and Utah, most of Arizona and New Mexico, and parts of Colorado and Wyoming. The land they gave up is called the Mexican Cession. Texas had already been annexed, made part of the United States, in 1845. In 1846 officials of the United States and Britain agreed on the border of Oregon.

Gold. Gold was found at Sutter's Mill in California in early 1848, and the rush came in 1849. About 80,000 people, called forty-niners, arrived that year. From 1848 to 1855 about 300,000 people came to California, about half by sea and about half over land on the California Trail.

California's population, not counting Native people, grew from about 14,000 in 1848 to about 250,000 in 1852. San Francisco grew from about 200 people in 1846 to about 36,000 in 1852.

Whose land. The forty-niners arrived on the land of California's Native nations. About 150,000 Native people lived in California in 1848, and by 1870 only about 30,000 were left, about 120,000 fewer. The historian Benjamin

Madley documents the causes: killings, kidnapping, forced labor, disease, hunger, and newcomers driving Native people off their land.

Vigilantes and United States Army soldiers killed 1,000 or more Native people between December 1849 and May 1850. On the last day of 1854, 116 volunteer militiamen attacked the Tolowa people and killed hundreds of them. One militiaman died. Madley documents that state and federal officials took part in the killings, and that taxpayers paid for militia campaigns.

BY 1850

If you remember one thing: The country grew to the Pacific in these fifty years, and soldiers and slave traders forced hundreds of thousands of people to move across it.

In 1800: the United States ended at the Mississippi River, and the Cherokee, Choctaw, Muscogee, Chickasaw and Seminole lived in their homelands in the Southeast.

In 1850: the country reached the Pacific, soldiers had forced those five nations to Indian Territory, and wagon trains had carried families to Oregon, Utah and California.

Next: After 1850, settlers claimed free farmland on the Great Plains, and soldiers forced the nations who lived there onto reservations.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 16 MINUTES

Settlers filled the Great Plains and the far West after 1850, and United States soldiers forced the Native nations who lived there onto reservations, areas of land that federal officials set aside for them, often far from their homelands. In 1864 soldiers marched about 8,500 Navajo people more than 300 miles to one of them.

Free land and fast travel. Under a law of 1862, settlers could claim free farmland, and they filed about 4 million claims under it. After 1869 a railroad could carry them across the country in about a week. Tens of thousands of Black Southerners also moved west, to Kansas, to get away from violence and cheating in the South. By 1890 the officials who counted the country's population no longer found a clear line between settled land and thinly settled land in the West.

Still on the trail. Wagon trains kept rolling west on the Oregon Trail after 1850. One family that set out in 1853 was Amelia Stewart Knight's.

Amelia Stewart Knight

Who: A wife and mother who kept a diary, day by day, of her family's wagon journey on the Oregon Trail.

When and where: From Monroe County, Iowa, to the Willamette Valley near Milwaukie, Oregon Territory, April to September 1853.

Her diary says nothing of her pregnancy until the baby came.

Amelia Stewart Knight, her husband and their seven children left Monroe County, Iowa, for Oregon in April 1853. She was pregnant, and she kept a diary of the trip.

Her diary records rain and mud, dust, sick children and hard river crossings. It also records the daily work of handling the wagons and the cattle.

The family reached Oregon on September 17, 1853. The next day she gave birth to her eighth child, a son named Adam.

Why were the handcart companies trapped in the snow?

More than 1,000 Latter-day Saint emigrants set out late in the season in 1856 to walk to Salt Lake City pulling handcarts, small carts they pulled by hand. Church leaders urged them to go forward that late in the year, even after one of their own leaders, Levi Savage, warned that snow would catch them. Snow trapped many of them in what is now Wyoming. Counts of the dead run from about 170 to about 250.

The emigrants traveled in two companies. The Willie company, about 500 people, left Florence on August 17, and the Martin company left on August 27. Florence was in Nebraska Territory, land the United States governed that was not yet a state.

An early blizzard struck on October 19, 1856, just after the Martin company had waded across the North Platte River, near where Casper, Wyoming, is today. More than 300 rescuers came from Salt Lake with wagons, and they brought the survivors in through November.

Counts of the dead differ. Modern counts give about 67 to 77 dead in the Willie company and about 103 to 150 in the Martin company. Older accounts say about 200 to 250 people died in the stranded companies and the wagon trains traveling with them.

Levi Savage

Who: A leader in the Willie handcart company who warned the emigrants not to leave so late, then stayed with them through the blizzards. His journal records what happened.

When and where: From Florence, Nebraska Territory, to Salt Lake City, August to November 1856. Born 1820 in Ohio.

Movie: *17 Miracles* (2011), a film directed by T. C. Christensen about the Willie handcart company. It draws on Savage's journal.

He warned that leaving so late would bring snow and deaths.

Levi Savage was 36 and one of the Willie company's sub-captains, the leaders under the captain. At a camp meeting at Florence on August 13, 1856, he spoke to the roughly 500 emigrants. They still had more than 1,000 miles to go, and he urged them to wait until spring.

In his journal, Savage wrote that most of the emigrants still meant to go on if the church's leaders said go. At later meetings, church leaders urged them to go forward whatever happened. Out on the trail on September 12, the church leader Franklin D. Richards scolded Savage "very severely in open meeting for his lack of faith in God."

Savage went with the company anyway, and when the blizzards came he worked through them to keep people alive. His journal survives, and most modern accounts of the Willie company rely on it.

The Weeping Time, 1859

The domestic slave trade went on through the 1850s. Its largest single sale took place at the Ten Broeck Race Course near Savannah, Georgia, on March 2 and 3, 1859. Pierce Mease Butler sold between 429 and 436 enslaved men, women and children there to pay his gambling debts. The sale brought him $303,850. It rained hard on both days.

Joseph Bryan, a broker who arranged sales for others and the largest slave dealer in Savannah, ran the sale. For weeks he advertised it in newspapers across the South, from Richmond to New Orleans. Mortimer Thomson, a reporter for the *New York Tribune*, came to the sale dressed as a buyer and wrote a long account of it. The surviving accounts do not say where the buyers took the people they bought.

Sold in families. Butler required that people be sold in "families" as far as possible, and Bryan's advertisement promised that they would be "sold in families." Thomson told the story of a 23-year-old man named Jeffrey, who planned to marry a woman named Dorcas. Because they were not married, they could not be sold as a family. Jeffrey begged his buyer, "Please buy Dorcas," but she was being sold with her family of four and could not be bought alone, and another buyer took her. Parents were also separated from children at the sale. Black Georgians remembered the sale as "the weeping time."

Free land and the railroad

President Abraham Lincoln signed the Homestead Act on May 20, 1862. Under it, an adult who headed a household could claim up to 160 acres of public land for free, and after living on the land and farming it for five years, the settler owned it. Federal officials had taken much of that land from the Native nations who lived on it. Women could claim land. After the Civil War, freed people could claim land too, and so could immigrants who planned to become citizens.

Settlers filed about 4 million claims over the years the law was in force. Settlers and other private owners got about 270 million acres this way, about 10 percent of all the land in the United States. Many settlers moved onto the Great Plains to claim land under the law.

The railroad. The first railroad across the country was finished at Promontory Summit, Utah, on May 10, 1869. By wagon, a trip from coast to coast took four months or more, and by train it took about a week. Under the Pacific Railroad Act, which Lincoln signed in 1862, each railroad company got 6,400 acres of federal land for every mile of track it built. The railroads' owners sold that land to settlers, and their trains carried settlers and immigrants west by the trainload.

The Long Walk of the Navajo, 1864

United States soldiers forced more than 10,000 Navajo people from their homeland in what is now Arizona and New Mexico from 1863 to 1866. General James Henry Carleton ordered Colonel Christopher "Kit" Carson to make the Navajo surrender.

Burning the food. Carson's troops, guided by Ute scouts and warriors, began burning Navajo fields in August 1863. They took more than 5,000 sheep, goats and mules, and they destroyed more than 75,000 pounds of wheat and the Navajo peach orchards.

The march. Starving, 6,000 Navajo had gathered at Fort Canby and Fort Wingate by March 1864. Soldiers then marched about 8,500 people more than 300 miles to the Bosque Redondo reservation at Fort Sumner, New Mexico. The walk took from 18 to 40 days, and the soldiers gave them food planned to last 8 days. This march is known as the Long Walk.

About 200 people died on the march, in winter. Navajo accounts passed down in families say soldiers shot people who could not keep up, among them old people, sick people and pregnant women.

Soldiers held more than 8,000 Navajo and Mescalero Apache people at Bosque Redondo, and thousands more died there. On June 1, 1868, Navajo leaders signed a treaty with the United States, and under it the Navajo could go home.

On the Plains. Through the 1870s and 1880s, soldiers forced many other nations onto reservations. In the Treaty of Fort Laramie of 1868, United States officials had set aside the Great Sioux Reservation, all of present-day South Dakota west of the Missouri River, the Black Hills included, "for the absolute and undisturbed use" of the Lakota. After soldiers on an Army expedition reported gold in the Black Hills in 1874, federal officials ignored the treaty. In December 1875 they ordered the Lakota bands in their winter camps to move onto the reservation by January 31, 1876, and then they sent the Army against the bands that stayed out.

Laura Ingalls Wilder

Who: The author of the Little House books. As a child she moved with her family by covered wagon again and again.

When and where: Born February 7, 1867, near Pepin, Wisconsin. Family moves from 1869 to 1879. Her own last move, to Mansfield, Missouri, in 1894.

Movie: *Little House on the Prairie* (NBC series, 1974 to 1983). It ran for nine seasons and 205 episodes, with Michael Landon as Charles Ingalls. It is loosely based on the books.

Her family's Kansas cabin stood on land that belonged to the Osage.

Laura Ingalls Wilder's family moved six times between 1869 and 1879. In 1869 they went to Montgomery County, Kansas, near the town of Independence. Their cabin stood on the Osage Diminished Reserve, land that still belonged to the Osage Nation, and the family had no right to be there. They left in 1871 and went back to Pepin, Wisconsin.

The family moved to Walnut Grove, Minnesota, in 1874, and swarms of grasshoppers ate their wheat crops there in 1875 and 1876. Then they moved to Burr Oak, Iowa, where they helped run a hotel from 1876, and back to Walnut Grove in 1877. In 1879 they settled at De Smet, in Dakota Territory. There Laura's father, Charles Ingalls, took a job at a railroad camp and then claimed a homestead.

Her own move. Laura married Almanzo Wilder in 1885. In 1894, a year of drought, Laura, Almanzo and their daughter Rose drove a covered hack, a light wagon with a cover, about 650 miles from De Smet to Mansfield, Missouri. She kept a diary of the trip, published in 1962 as *On the Way Home*. In Mansfield she later wrote the Little House books.

What the books changed. The books came out from 1932 to 1943, and in them Wilder changed the real story. In *Little House on the Prairie*, Laura is several years older than she really was in Kansas, where she was 2 to 4 years old. The books leave out the Burr Oak years completely, and they do not say that the family was living on Osage land.

The cattle drives

Cowboys drove herds of longhorn cattle north from Texas to Kansas after the Civil War. They took the cattle to railheads, the towns at the end of a railroad line, where the cattle were loaded onto trains. Abilene was one of these towns. The railroad reached Abilene in 1867, and after that cowboys used the Chisholm Trail from Texas heavily.

About 5 million cattle or more were driven north from Texas between 1866 and 1884. Some estimates put the total for the whole era at about 6 million. About 700,000 cattle reached the railheads in Kansas in 1871 alone.

The long drives ended in the mid-1880s for several reasons. Barbed wire fences went up across the open range. Railroads reached deeper into Texas, so the cattle no longer had to walk to Kansas. Kansas lawmakers passed a quarantine law in 1885 and 1886, keeping Texas cattle out of the state to stop the spread of disease. Then the cold of the winter of 1886 and 1887 killed much of the cattle herd.

Why did the Exodusters go to Kansas?

Thousands of Black Southerners left their homes in 1879 and moved to Kansas, to get away from violence and cheating in the South. People called them Exodusters, after the Exodus, the story in the Bible of the Israelites' escape from slavery in Egypt. Many came from Mississippi, Louisiana, Texas and Tennessee. As many as 40,000 moved to Kansas, Oklahoma and Colorado between about 1879 and 1881, and about 6,000 reached Kansas in the spring of 1879 alone.

What they left. Former Confederates took away their votes, white landowners cheated them, and armed white men attacked them. Many were sharecroppers, who farmed someone else's land and paid the owner with a share of the crop.

The Confederates had been the Southerners who fought against the United States in the Civil War to keep slavery. After the presidential election of 1876, former Confederates took back control of the Southern states and took away

Black Southerners' right to vote. The historian Damani Davis calls what Black Southerners faced "relentless terror."

Henry Adams's list. In Louisiana, the Black organizer Henry Adams collected the names of nearly 700 Black people who had been attacked. For each one he listed where it happened and what was done. Most of them had been whipped, beaten, shot or killed by white men, often by armed groups. Some entries name the man. One entry says that a white man, Dr. Moore, killed a Black man named Calvin in 1871, after Calvin was accused of cursing a white woman.

Many Exodusters traveled up the Mississippi River by steamboat, and crowds of them waited on the docks at St. Louis. In 1880 a United States Senate committee of three Democrats and two Republicans looked into why they had left. The three Democrats, the majority, held that the move had been planned to settle Black voters in Northern states for political gain. A 1912 history of Kansas states that the evidence hardly supported that idea.

The two Republicans wrote their own report. It said the migrants had fled because they could no longer bear the hardship, unfair treatment and suffering that "a class of Democrats in the South" had brought on them.

The migrants saw Kansas as a safe place. John Brown, who fought to end slavery, had lived there, and before the Civil War many Kansans had wanted it to be a free state, a state without slavery.

Benjamin "Pap" Singleton

Who: A man born into slavery who organized thousands of Black Southerners to move to Kansas.

When and where: Born enslaved in Nashville, Tennessee, about 1809. Led the move to Kansas in the late 1870s. Died 1900.

He called himself the "Father of the Exodus."

Benjamin Singleton ran away from slavery several times, and in the end he escaped to the North and to Canada. He came back to Tennessee in about 1871, after the Civil War. He worked there as a carpenter, a cabinetmaker and an undertaker, a person who prepares the dead for burial.

Singleton was angry that white landowners cheated the Black sharecroppers who worked their land, and he believed Black Southerners would never get a fair chance at land in the South. He printed handbills, short printed notices, to draw Black settlers to Kansas. He formed a group called the Edgefield Real Estate and Homestead Association to move people there.

Singleton said under oath, at a hearing, that his work helped more than 7,400 people move. Between 1877 and 1879, his group steered more than 20,000 people toward Kansas. He died in 1900.

The Oklahoma Land Run, 1889

About 50,000 people raced into central Oklahoma at noon on April 22, 1889, to claim land. The land they entered was called the Unassigned Lands. It covered about 1.9 million acres in the middle of Indian Territory, and nearly 2 million acres were claimed in a single day.

Indian Territory was the land in present-day Oklahoma where federal officials had moved many Native nations. The Unassigned Lands were the last part of it that federal officials had not given to any of those nations. Federal officials had taken land in Indian Territory from the nations there.

How the land was taken. After the Civil War, federal officials pressed the Creek and Seminole nations to give up land. Dennis N. Cooley, the Commissioner of Indian Affairs, was the federal official in charge of dealings with Native nations. In 1865 he told the nations' leaders that they had lost their rights under the old treaties by joining the Confederacy.

The Creek had to sign over the western half of their land for $975,168 in treaties of 1866, and the Seminole had to sign over all of theirs for fifteen cents an acre. With these treaties the Five Tribes, the Cherokee, Choctaw, Muscogee (Creek), Chickasaw and Seminole nations, lost the western half of present-day Oklahoma.

The boomers. Groups of settlers called boomers, led by David L. Payne and William Couch, entered the Unassigned Lands against the law from 1879 to 1888. Cavalry soldiers, who fought on horseback, arrested them and took them out again and again. Representative William Springer of Illinois changed a bill in Congress in 1889 so that President Benjamin Harrison could open the land, and Harrison announced the opening on March 23, 1889.

Each settler could claim 160 acres under the Homestead Act. People who sneaked in before the start to grab land were called "Sooners." By the end of that day, Guthrie and Oklahoma City were towns of about 10,000 to 15,000 people each.

The frontier line disappears from the census, 1890

The officials who ran the United States census, the official count of the population taken every ten years, reported in 1890 that the country no longer had a clear "frontier line." The frontier line had been the edge of thinly settled land in the West, where two to six people lived on each square mile.

The historian Frederick Jackson Turner wrote an essay about that census finding in 1893, called "The Significance of the Frontier in American History." Many people later treated 1890 as the end of the years when settlers could still find open land in the West, land that had belonged to Native nations.

BY 1900

If you remember one thing: In these fifty years settlers claimed farms across the Great Plains and the far West, and soldiers forced the Native nations who lived there onto reservations.

One number: about 270 million acres. That is how much land settlers and other private owners got under the Homestead Act, about a tenth of all the land in the United States.

Next: After 1900, millions of Black Americans left the South, and Plains farm families fled the Dust Bowl.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 11 MINUTES

About 6 million Black Americans left the South between about 1910 and 1970 to get away from lynch mobs, crowds that kill a person without any trial, and from Jim Crow laws, and most of the early travelers went north by train. Plains farm families moved too. In the late 1930s more than 250,000 people left the dried-out farms of the southern Plains for California.

Forced out. United States Army officers ordered Japanese Americans out of their homes on the West Coast in 1942. Soldiers and officials forced them into camps.

The Great Migration, the first wave

The movement of Black Americans out of the rural South from about 1910 to 1970 is called the Great Migration. The first wave, from about 1910 to 1940, went mostly to cities in the North and the Midwest. Most people rode the trains north, and later travelers also went by car and by bus.

The cities. Between 1910 and 1920, Chicago's Black population grew to about two and a half times its size, and Detroit's grew to about seven times. Many newcomers also went to New York, Philadelphia and Pittsburgh.

About 90 percent of Black Americans lived in the South in 1900. By 1970 fewer than 55 percent did.

Why they left. Georgia is one example. Black Georgians had several reasons to leave. The boll weevil, a beetle that eats cotton plants, and floods ruined the cotton crop in 1915 and 1916. Lynch mobs killed more than 450 people in Georgia between 1880 and 1930, most of them Black.

Under Jim Crow laws, the Southern laws that kept Black people and white people apart, nearly all Black Georgians could not vote. About 74,000 Black Georgians left between 1910 and 1920, and about 260,000 more left in the 1920s.

The Chicago Defender. Black Southerners from across the South went north for jobs, and some people in the North urged them to come. Robert S. Abbott started a Black newspaper, the *Chicago Defender*, in 1905. In its pages, job listings and train schedules ran beside editorials, articles that give a newspaper's opinion, and the editorials urged Black Southerners to come north. The *Defender* listed May 15, 1917, as the date for a "Great Northern Drive." Some Northern employers paid migrants' train fares and then took the money back out of their wages.

White officials in the South worked to keep Black workers from leaving. Officials in Macon, Georgia, charged Northern labor recruiters, people hired to find workers, a license fee of $25,000 for permission to work there.

Chicago, 1919. Black people in the North also met violence. Eugene Williams, who was 17, and four friends drifted on a homemade raft in Lake Michigan in Chicago on July 27, 1919. They crossed an unmarked line into the water off a beach at 29th Street where only white people were allowed. George Stauber, a 24-year-old white man, threw rocks at them until Williams drowned. A white police officer, Daniel Callahan, refused to arrest Stauber and stopped a Black officer from arresting him.

Five days of attacks followed, through August 3. The white attackers included youth gangs and groups that called themselves athletic clubs. Thirty-eight people were killed, 23 Black and 15 white, and the histories of the riot do not say who killed each of them. About 537 people were injured, two-thirds of them Black. Hundreds of homes were burned or damaged. Of the 138 people charged with crimes afterward, two-thirds were Black.

Ida Mae Brandon Gladney

Who: A sharecropper's wife who left Mississippi with her family after white men nearly beat a cousin to death.

When and where: From Chickasaw County, Mississippi, by train, late October 1937. Settled in Chicago.

The turkeys turned up the next day, and no one apologized.

Ida Mae Brandon Gladney and her husband, George Gladney, were sharecroppers in Chickasaw County, Mississippi, farming another man's land for part of the crop. They grew cotton on the plantation of Edd Pearson, whom they called Mr. Edd.

In 1937 a group of white men beat a cousin of theirs, Joe Lee, nearly to death with heavy chains. The men had falsely accused him of stealing turkeys. The accounts of the beating do not name them. After the beating, George came home and told Ida Mae, "This is the last crop that we're making."

The train north. The cotton was picked by late October 1937, and George settled with Mr. Edd over what the year's work was worth. None of the family had ever been on a train or out of Mississippi. A brother-in-law drove Ida Mae and the two children, James and Velma, in his truck to the train station at Okolona. There they met George and rode north through the night.

The family settled in Chicago. One account says they stopped first in Milwaukee, where Ida Mae's sister Irene lived. In Chicago, George hauled ice up four and five flights of stairs, and Ida Mae did housework for other people and then found work as a hospital aide. In time the family bought a house. Ida Mae died in 2002. The writer Isabel Wilkerson told Ida Mae's life, from interviews with her, in the 2010 book *The Warmth of Other Suns*.

The Dust Bowl move

Drought, years with too little rain, and windstorms tore the topsoil off farms across the southern Great Plains in the 1930s. The Dust Bowl was the name for those parts of Oklahoma, Texas, Kansas, Colorado and New Mexico.

More than 250,000 people left the Dust Bowl states for California from about 1935 to 1940. Another count covers only Oklahoma but every destination: everyone who left Oklahoma for any place, minus the people who moved in. By that count Oklahoma may have lost as many as 440,000 people. Many of the travelers went west on U.S. Route 66, and in California the newcomers were called "Okies."

The "bum blockade." The Los Angeles police chief, James E. Davis, sent his officers to the state line in February 1936 to turn back poor migrants. People called it the "bum blockade."

Davis's officers, 136 of them, stood at 16 crossing points from February 3 on California's roughly 700-mile border with Arizona, Nevada and Oregon, far outside the city. Davis pointed to a 1933 state law against bringing poor people into California. His officers stopped trains, cars and people hitchhiking. They took people's fingerprints and turned back anyone they judged unable to support themselves.

The officers arrested 122 people for vagrancy, the crime of having no home or means of support, on February 8 alone. A week into the blockade, Davis announced that he would force the people arrested to work without pay in quarries, digging rock, sand and gravel out of the ground for public projects. Many of the people arrested were locked up in prisons far from the state line.

For and against. Railroad executives and some county sheriffs backed the blockade. So did the people who ran the *Los Angeles Times* and the Los Angeles Chamber of Commerce, a group of the city's business owners. California's attorney general, the state's top lawyer, Ulysses S. Webb, said Davis had "no jurisdiction beyond the city's territorial limits," meaning no power outside Los Angeles. Arizona's governor, Benjamin Moeur, called the blockade illegal and against the Constitution.

Davis called his officers home in early April 1936. He claimed they had turned back about 11,000 people. Writing in *Smithsonian* magazine in 2025, Olatunji Osho-Williams reports that the real number was probably much lower.

Florence Owens Thompson

Who: A farmworker born in what is now Oklahoma, whose parents said their families were Cherokee, who moved from crop to crop in California. She is the woman in Dorothea Lange's 1936 photograph "Migrant Mother."

When and where: Born in Indian Territory in 1903. Moved to California in the 1920s. Photographed at a pea-pickers' camp in Nipomo, California, in March 1936.

Lange took seven pictures of her in about ten minutes.

Florence Owens Thompson was born Florence Leona Christie in Indian Territory, which is now Oklahoma, in 1903. Both of her parents said their families were Cherokee.

She married Cleo Owens in 1921, and during the 1920s, years before the Dust Bowl, they moved west with several of his relatives to Oroville, California. Cleo died in 1931. In about 1933 she and her parents moved to Shafter, California, and she worked in the fields as a farm laborer, following the crops from one harvest to the next.

Nipomo. The timing chain in the family's car, an engine part the car could not run without, snapped on March 6, 1936. The family stopped at a camp of pea pickers near Nipomo, where freezing rain had destroyed the pea crop. The photographer Dorothea Lange took seven pictures of Thompson in about ten minutes. One of them became known as "Migrant Mother," and it became one of the most reproduced pictures of the 1930s.

Thompson's name was not made public until 1978, when Emmett Corrigan, a reporter for the *Modesto Bee*, found her. She died on September 16, 1983.

The forced removal of Japanese Americans, 1942

United States Army officers forced more than 110,000 Japanese Americans out of their homes on the West Coast in 1942. The United States had been at war with Japan since Japanese forces attacked Pearl Harbor, in Hawaii, on December 7, 1941. President Franklin D. Roosevelt signed Executive Order 9066, a rule issued by a president, on February 19, 1942. Under it, military commanders could keep "any or all persons" out of areas they named.

General John L. DeWitt commanded the Army on the West Coast. In March and April 1942 he issued orders aimed at "all persons of Japanese ancestry," meaning everyone whose family came from Japan. United States citizens and people who were not citizens were ordered out alike.

108 orders. DeWitt set up an Army office on March 11 to carry out the removal. Karl Bendetsen, an Army officer, commanded it, and the next day, at 34, he was made a colonel. Bendetsen's staff divided the coast into 108 areas of about 1,000 Japanese Americans each and issued a separate order for each area.

Under each order, the people in that area had to report on a set day, about a week later, and they could bring only what they could carry. Under the first order, issued on March 24, the 55 Japanese American families on Bainbridge Island, near Seattle, had six days to leave their homes. Army officers carried out the 108 orders and forced out 110,442 people.

The camps. Army engineers built 15 temporary camps, many of them at fairgrounds and racetracks. When people arrived, soldiers searched their bags. At the Tanforan camp in California, half of the people lived in horse stables, three to six people in a stall built for one horse.

After about three months, on average, officials moved them again, to 10 larger camps run by officials of a federal office called the War Relocation Authority. Staff at the National Archives count about 120,000 people removed in all, a larger total than the count for the 108 orders alone.

The end. None of the people removed was charged with a crime or tried. Officials lifted the order that kept Japanese Americans off the West Coast on January 2, 1945, and they closed Tule Lake, the last camp, on March 20, 1946.

In 1983 the members of a federal commission that studied the removal found that its causes were "race prejudice, war hysteria and a failure of political leadership." Under the Civil Liberties Act, which President Ronald Reagan signed in 1988, each surviving person who had been held received a written apology and $20,000.

George Swanson Starling

Who: A Florida fruit picker who organized the other pickers to ask for better pay, then fled north when he learned that the grove owners were plotting to hang him.

When and where: From Wildwood, Florida, to Harlem in New York City, by train, April 14, 1945.

For asking ten cents more a box, grove owners plotted to hang him.

George Swanson Starling grew up in Eustis, in Lake County, Florida. He finished first in his high school class and went to Florida Agricultural and Mechanical State College in Tallahassee. In the middle of his second year, his father told him he had had enough schooling and must go to work.

The groves. Starling went to work picking citrus fruit. The pickers climbed trees as tall as 40 feet, and some fell and broke arms or legs. Starling organized the pickers to ask for better pay. In one dispute, the packing house, where the fruit was packed for sale, would pay the pickers ten cents for each box of tangerines. The pickers asked for twenty cents. At auction in 1944, tangerines sold for an average of $4.40 a box.

The plot. The grove owners were angry. Someone overheard them planning to take Starling and two other pickers out to the cypress swamps at Blackwater Creek and hang them. Starling left within days, on April 14, 1945. A man named Roscoe Colton drove him in his truck to the train station in Wildwood.

There Starling boarded the Silver Meteor, a train to New York. He rode in the Jim Crow car, the car set aside for Black passengers, where luggage was also stored. The ride took 23 hours. His wife, Inez, stayed behind until he could send for her.

Starling settled in Harlem, where an aunt and many of his friends lived. He later got a steady job working on the same train that had carried him north. Isabel Wilkerson's book *The Warmth of Other Suns* also describes his life. The accounts of Starling's life do not name the grove owners who planned to kill him.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 5 MINUTES

Americans moved south and west after 1950, toward jobs, warmer weather and cheaper land. The population of the South grew by about 36 percent between 1970 and 1990, and the population of the West by about 51 percent. In the second wave of the Great Migration, many Black Southerners moved to cities on the West Coast. Federal officials paid for Native people to move from reservations to cities.

By the late 1990s more Black Americans were moving to the South than were leaving it.

Where the second wave of the Great Migration went

The second wave of the Great Migration lasted from about 1940 to 1970, and it was larger than the first. More of its travelers went west, to Los Angeles, Oakland, Seattle and Portland, for factory jobs, first during World War II and then after it. These travelers are counted in the same total of about 6 million people who left the South between 1910 and 1970.

Robert Joseph Pershing Foster

Who: A Black surgeon who could not work in the hospital of his own home town in Louisiana. He drove alone to California and opened his own medical practice in Los Angeles.

When and where: From Monroe, Louisiana, to Los Angeles, California, by car, April 1953.

Motel clerks in Arizona turned him away under "vacancy" signs.

Robert Joseph Pershing Foster had served as a surgeon in the Army. Back home in Monroe, Louisiana, he found that the people who ran St. Francis Hospital there would not let Black doctors do even a simple operation to take out a patient's tonsils. Isabel Wilkerson traced his trip in *The Warmth of Other Suns*.

The drive. Foster set out alone on Easter Monday, April 6, 1953, in his 1949 Buick Roadmaster, a dark red car with white-walled tires. He planned to send for his family once he was settled. Once he was long past Texas, he thought he was a safe distance from the South.

In Arizona, motel clerks turned him away, a Black man traveling alone, even under "vacancy" signs, which tell drivers that rooms are free. One clerk told him they had forgotten to turn off the sign. Others said the rooms had just been rented. He could not find a place to stay the night, so he drove on until he reached California.

> Alone in the dark desert, he asked himself what he was doing. If he turned back, Wilkerson writes, "the I-knew-its would ring in his ear," meaning the people who would say they had known he would fail.
>
> In Los Angeles, Foster opened his own medical practice. Many of his patients were migrants from the South, as he was. One of them was the musician Ray Charles.

Why did Americans move to the Sun Belt?

Many Americans moved from the older factory states of the North to the South and the West after World War II, for jobs, for warmer weather and for cheaper land. People later nicknamed the Northern factory states the "Rust Belt" and the South and the West the "Sun Belt." Air conditioning made hot places comfortable all year, which helped the Sun Belt grow.

The South grew by about 36 percent between 1970 and 1990, and the West by about 51 percent. By counts from the Census Bureau, the federal office that counts the population, the whole country grew by about 22 percent in those years, from about 203 million people to about 249 million. California passed New York as the state with the most people in 1962. It had about 17 million people then, roughly three times as many as before World War II.

The interstates. Members of Congress passed the Federal-Aid Highway Act in 1956. Under it, work began on the Interstate Highway System, a network of big highways across the country. The interstates made long moves by car easier, and they made it easier to live in a suburb, a town at the edge of a city.

Federal officials move Native families to cities

Officials of the Bureau of Indian Affairs, the federal office in charge of the government's dealings with Native nations, paid for Native people to move from reservations to cities from about 1950 into the 1970s. They started the program, called Relocation, between about 1948 and 1952, and members of Congress backed it with the Indian Relocation Act in 1956. It ran in the same years as termination, a policy that members of Congress declared on August 1, 1953, to end the government's recognition of Native nations and the services that came with it.

The officials promised people one-way tickets to a city and help for a short time after they arrived. About 30,000 Native people moved to cities in the 1950s, and more than 100,000 had moved by the time the program ended in the 1970s. They went to Minneapolis, Chicago, Oakland and San Francisco, Los Angeles, Denver and other cities. Many of them lived in poverty there. They also built new Native communities in those cities.

When did the Great Migration turn around?

A small number of Black Americans began moving back to the South in the 1970s, and the number grew through the 1990s. By the late 1990s the South gained more Black migrants than it lost to each of the other three regions of the country, the Northeast, the Midwest and the West. For 35 years before that, more Black Americans had left the South than moved to it. William H. Frey, a researcher at the Brookings Institution, a research group, calls this return the New Great Migration.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 9 MINUTES

Hurricane Katrina and the broken levees around New Orleans forced more than 1 million people from their homes on the Gulf Coast in 2005, the largest sudden move of these years. After Hurricane María hit Puerto Rico in 2017, about 130,000 people left the island for the mainland within a year.

A steadier flow. By Census Bureau estimates, the South gained about 2.7 million more people from other states than it lost to them from 2020 to 2024.

How many people moved south after 2020

Census Bureau staff count moves between states as net domestic migration: the number of people who move into a state from other states, minus the number who move out to other states. By this measure the South gained about 2.7 million people from 2020 to 2024.

Many of the people who moved between states left coastal states where homes cost a lot. California lost about 343,000 people to other states from April 2020 to July 2022, and New York lost about 300,000, by Census Bureau counts. The metro areas, cities together with their suburbs, that lost the most people included New York, Los Angeles, San Francisco and Chicago.

Working from home. Some people could work from home after 2020. Researchers at the Pew Research Center, a group that studies how Americans live and what they think, reported that working from home let some people choose where to live by the cost of a home and the space it offered, not by where their job was.

Florida slows down. Florida's gains from other states shrank after 2022. By Census Bureau counts, Florida had a net gain of about 311,000 people from other states in 2022, about 184,000 in 2023, and about 23,000 in the year from July 2024 to June 2025. Census Bureau staff released the 2025 figures in January 2026. In that same year North Carolina gained the most people from other states, about 84,000, and Texas and South Carolina each gained about 67,000.

Researchers at the National Association of Realtors, a group for people who sell houses, ranked the states from the same Census figures. In that ranking, nine of the fifteen states with the biggest gains in 2024 to 2025 were in the South. The Midwest also gained about 16,000 people from other states that year, its first such gain of the 2020s.

The New Great Migration. The movement of Black Americans to the South went on. William Frey of the Brookings Institution found that the Black population of metro Atlanta grew about five times over from 1970 to 2020, and by 2010 it had passed Chicago's to rank second in the country. Atlanta was the

most common destination of young Black adults aged 16 to 26 who moved between 2000 and 2018, and seven of their ten most common destinations were in the South.

Leaving New Orleans after Hurricane Katrina, 2005

Hurricane Katrina struck the Gulf Coast in late August 2005, and the levees around New Orleans, walls of earth or concrete built to hold back water, broke. The storm and the broken levees forced more than 1 million people from their homes in the New Orleans area and along the Gulf Coast. A month later, the people of up to 600,000 homes were still away. These counts come from The Data Center, a research group in New Orleans, and from the federal housing department.

Many never came back. New Orleans had 484,674 people at the 2000 census. By July 2006 an estimated 230,172 people lived there, fewer than half as many, The Data Center reported. In 2024 the city had about 363,000 people, about 120,000 fewer than in 2000, by an estimate reported by the news site The Center Square in 2025.

The New Orleans metro area's seven parishes, the Louisiana name for counties, had 970,849 people in July 2025, 3.6 percent fewer than in April 2020, The Data Center found.

The bridge. Police stopped some of the people who tried to walk out of the flooded city. On September 1, 2005, officers from three police forces blocked the Crescent City Connection bridge over the Mississippi River: the Gretna police, the bridge police and the Jefferson Parish sheriff's office. They turned back people on foot at gunpoint. Two paramedics from San Francisco, medical workers who ride ambulances, were in the crowd, and they reported that police "fired their weapons above their heads."

Gretna Police Chief Arthur Lawson made the decision together with officials of the sheriff's office and the bridge police. Gretna's mayor, Ronnie Harris, defended it. He said the town was not a shelter or an evacuation route and had no running water, no electricity and no food. Members of the Gretna City

Council voted to support the blockade, which lasted until Labor Day, September 5, 2005. No count survives of how many people the officers turned back.

Houston. About 250,000 evacuees, people who leave a place to escape danger, came to Houston at the peak, and about 150,000 were still there a year later. Those are Houston officials' own estimates, reported by the *Texas Tribune* in 2010. By 2010 Houston's mayor, Annise Parker, said city officials no longer counted them apart from other residents: "They are Houstonians."

Kimberly Rivers Roberts

Who: A woman of 24 from the Lower Ninth Ward of New Orleans who wanted to be a rap singer. With her husband, Scott Roberts, she filmed the Katrina flood from inside it.

When and where: New Orleans, August 2005. Then Alexandria and northern Louisiana, then Memphis, Tennessee, then home to New Orleans.

Movie: *Trouble the Water* (2008), a documentary about Kimberly and Scott Roberts, directed by Tia Lessin and Carl Deal and built largely on her own video. It won the Grand Jury Prize for documentary at the 2008 Sundance Film Festival and was nominated for an Academy Award.

She filmed the Katrina flood on a $20 camcorder.

Kimberly Rivers Roberts and her husband, Scott Roberts, were still in their New Orleans neighborhood when Katrina's flood came, because someone had recently stolen their car. "If I had wheels I'd be gone too," she told a neighbor. She began filming on August 28, 2005, two days before the storm reached the city, with a camcorder she had bought for $20.

As the water rose, the couple and their neighbors climbed into an attic. They called 911 and heard that police would not come until conditions got better. A neighbor floated people to safety on a punching bag.

The Navy base. Afterward the group tried to take shelter at a Navy base that stood nearly empty. The couple's film shows men at the gate turning them away at gunpoint, and a voice says, "Get off our property, or we're

going to start shooting." Navy officials deny that this happened. The accounts of the film do not name the men at the gate.

Kimberly's grandmother died in a hospital that was not emptied of its patients, and one of her uncles, called Uncle Ned in the film, was later found dead in his home. The accounts do not say who decided to leave the hospital's patients there, and they do not state the cause of either death.

The couple went to a Red Cross shelter in Alexandria, Louisiana, then to the trailer of another uncle, in northern Louisiana. Next they moved to Memphis, Tennessee, to stay with one of Kimberly's cousins and try to start over. They waited for a promised check from FEMA, the federal office for disaster help, but it did not arrive, and they had a hard time settling in a new city.

Home. Kimberly and Scott went back to their home in the Ninth Ward and set out to rebuild it. Scott got a job with a builder repairing houses that the flood had ruined. Kimberly started her own record label, Born Hustler Records.

Leaving Puerto Rico after Hurricane María, 2017

About 130,000 people left Puerto Rico for the mainland within a year after Hurricane María hit the island in September 2017. That was almost 4 percent of the people of Puerto Rico. The count is the Census Bureau's estimate for July 2017 to July 2018.

Other counts run higher. Researchers writing in the science journal PNAS in 2020 described estimates made from air travel records, phone records and social media data. Those estimates run from about 160,000 to 470,000, depending on which data the researchers used.

Puerto Rico is a territory of the United States, land that belongs to the country but is not a state, and Puerto Ricans are United States citizens. A move from the island to the mainland is a move within the country. About a third of the people who moved from Puerto Rico to the mainland in 2018 went to Florida, by Census Bureau figures.

THE THREE QUESTIONS, ANSWERED

1. **How did horses reach the Native nations of the Plains?** In the older account, horses spread north through trade after the Pueblo Revolt of 1680, when the Spanish left perhaps more than 1,500 of them behind. A 2023 study of horse bones found that many nations had horses by the early 1600s, decades earlier, as the nations' own histories say.
2. **How many Cherokee died when soldiers forced them west?** Nobody knows exactly. The count most often given is about 4,000, and estimates run from more than 1,000 on the journey itself to about 8,000 or more.
3. **Why did about 6 million Black Americans leave the South between 1910 and 1970?** They left lynch mobs, Jim Crow laws and cotton crops ruined by the boll weevil and floods, and they went toward jobs in Northern and Western cities. In Georgia, one

example, lynch mobs killed more than 450 people between 1880 and 1930, and nearly all Black Georgians could not vote.

What changed: Before 1900 most of the moves in this chapter went west onto Native land, many of them forced, and after 1900 millions of Black Southerners went north, until the flow began turning back toward the South in the 1970s.

FIVE DATES TO KEEP

April 30, 1598: Oñate claims New Mexico for Spain in La Toma, "the taking."

May 1838: US soldiers begin rounding up the Cherokee for the Trail of Tears.

May 20, 1862: Lincoln signs the Homestead Act.

February 19, 1942: Roosevelt signs Executive Order 9066.

August 2005: Hurricane Katrina forces more than 1 million people from their homes.

NOT KNOWN: Nobody knows for sure why most of the people of Cahokia had left their city by about 1350.

Where to go: The Trail of Tears National Historic Trail, run by the National Park Service, marks more than 2,200 miles of the removal routes across nine states.

Next: Chapter 6, City Building. It asks how Americans built the towns and cities where so many of these travelers ended up.

Chapter 6: City Building

CHAPTER 6 OF 37 · CITY BUILDING · 10 ERAS · ABOUT 90 MINUTES

American cities were built by people who decided where the streets, pipes and buildings would go, and who could live where.

About 600 men lifted a row of brick and stone buildings on Lake Street in Chicago in 1860. The row was 320 feet long, and with its sidewalks it weighed about 35,000 tons. The men turned about 6,000 lifting screws, and in five days the whole row rose 4 feet 8 inches, up to a new street that crews had built on top of the city's sewers. The shops inside stayed open the whole time, and people kept shopping while the buildings rose.

This chapter follows American cities in order, from the earth mounds of Cahokia to the empty office towers of today. As you read, watch the problems people were trying to fix: fire in wooden towns, sickness from dirty water, streets of mud, families packed into dark rooms. And watch who got to live where. Every colonial town and boomtown here went up on a Native nation's land. In the 1900s, white owners and judges kept Black families out of most neighborhoods, and federal officials refused to back home loans where Black families lived. Later, officials cleared whole neighborhoods for developers and ran freeways through others.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Why do so many American cities have straight streets that cross in a grid?
2. How did people get clean water into crowded cities?
3. Who decided which families could live in which neighborhoods?

Five minutes? Read "Central Park and Seneca Village" in 1850 to 1900.

Can skip: "Which tower would be tallest?", "Growth in the Sun Belt", "The tallest buildings now stand in other countries". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

Hundreds of years before any European came, people on this land built planned cities, deciding ahead of time where each open square, wall and mound would go. They built them between about 900 and about 1350. The largest stood beside the Mississippi River. In the Southwest, people cut and stacked stone to build towns, and their descendants still live in towns along the Rio Grande.

The people who built these places kept no written records, and no builder's, planner's or ruler's name survives. Archaeologists, the scientists who dig up and study what people left behind long ago, know them only from the mounds, walls, rooms and roads they left.

Cahokia, a city laid out on purpose

People built up the city of Cahokia quickly from about 1050, in what is now Illinois, across the Mississippi River from St. Louis, Missouri. It was the largest town north of Mexico before Europeans came. At its peak, around 1100, roughly 10,000 to 20,000 people lived in the center, about as many as lived in London at the same date. Some estimates put as many as 50,000 people in the wider settlement around the center, but those larger estimates do not agree with one another.

The people of Cahokia planned where the big pieces of their city would go. At its center they raised Monks Mound. It is the largest prehistoric structure made of earth in the Americas, built before anyone here kept written records. The mound holds about 814,000 cubic yards of earth. Workers carried every basketload of it by hand, and they raised the mound in stages.

The mound. It has four terraces, or wide steps, and its top stands about 100 feet high. Its base covers roughly 14 acres. The World Heritage listing for Cahokia, kept by UNESCO, the United Nations body for historic sites, records fourteen separate building stages in the mound.

The Grand Plaza, about 50 acres of open ground, lay at the foot of the mound. Its builders leveled it by hand and filled in the low spots, to make a flat field for ceremonies and for the game of chunkey. In chunkey, one player rolled a stone disk across the ground, and the players threw spears to see whose spear landed closest to the spot where the stone stopped.

West of Monks Mound the builders set up a circle of red cedar posts. They built five of these circles, one after another, and each new circle took the place of the last.

A calendar of posts. The posts line up with the points on the horizon where the sun rises on four days of the year. Two are the solstices, the longest day and the shortest day. The other two are the equinoxes, the days between them when day and night are the same length. So the posts worked as a calendar, and the builders set them into the plan of the city.

A palisade, a wall of upright logs about two miles long, ran around the central part of the city. People began it around 1100 and rebuilt it three times over about two hundred years. Each rebuilding took between 15,000 and 20,000 logs of oak and hickory, each roughly a foot thick and twenty feet tall.

The people of Cahokia had scattered and left the city by about 1350.

Stone towns of the Southwest

Chaco Canyon, in what is now northwestern New Mexico, was the center of the Ancestral Puebloan world. The Ancestral Puebloans were the ancestors of the people who live in the pueblos of the Southwest today. Spanish colonists later used pueblo, their word for a town, for the towns of stone and adobe, or sun-dried mud brick, that they found there.

At Chaco the people built great houses, large buildings of shaped stone. They went on building and using the great houses for roughly 280 years, from about 900 to about 1180. One of them, Pueblo Bonito, had more than 650 rooms.

The people of Chaco planned their roads too. The roads run straight for miles across the Four Corners country, where Colorado, Utah, Arizona and New Mexico meet. They average about 30 feet wide, and they connected farther-off villages to the canyon.

At Mesa Verde, in southwestern Colorado, people built rooms of sandstone blocks and mud into the hollows under overhanging cliffs. They built Cliff Palace, the largest of these cliff dwellings, between 1190 and 1280. It has 150 rooms and 23 kivas, round rooms used for ceremonies and meetings and usually sunk into the ground. More than 100 people lived there.

People began leaving Chaco in the 1140s, and by about 1180 to 1200 they had stopped building and living in the canyon. People had left Mesa Verde by the 1280s. The people who left both places gathered again in the pueblo towns along the Rio Grande, and their descendants still live in those pueblos.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

The oldest lasting European town on the US mainland began inside a Timucua town. Eight years after Spanish colonists founded it, the king of Spain set written rules for how every new Spanish town must be laid out.

St. Augustine and the Laws of the Indies

Pedro Menéndez de Avilés landed on the coast of Florida on September 8, 1565, with about 800 colonists, among them 26 women and an unknown number of enslaved Africans. He placed his town, St. Augustine, inside Seloy's town, a town of the Timucua people whose chief was named Seloy. Chief Seloy offered Menéndez his council house, and the colonists used it as their first fort. Timucua council houses were round and roofed with thatch, dried straw or reeds, and they were big enough to hold up to a thousand people.

Within months the Timucua had tired of the Spaniards living in their town, and they attacked them again and again to drive them away. In 1566, according to the Florida Museum of Natural History, the Timucua shot flaming arrows at the fort. The fort was the Timucua's own council house, and the museum's account states that this is why the attack did so much harm. On April 1, 1566, half of the fort burned, and the Spaniards lost all their supplies.

Three places in seven years. Menéndez moved the settlement across the bay to Anastasia Island in May 1566, about nine months after landing. There the Spaniards felt safer from attack, and they lived on the island for about six years. By about 1572 they had moved back to the mainland, to the site of today's St. Augustine.

Through both moves, people went on living in the town. Of all the cities Europeans founded on the mainland of the United States, St. Augustine is the oldest one that people have lived in the whole time.

King Philip II of Spain issued the Laws of the Indies in 1573. They were written orders for Spain's lands in the Americas, which the Spanish called the Indies, and they stated exactly how the men who founded Spanish towns had to lay them out.

Each town began with a central plaza, a public square of open ground with the town built around it. The plaza's sides had to face north, south, east and west, and it had to be one and a half times as long as it was wide. The streets ran out from it in a grid, straight streets crossing at right angles. The founders had to set aside certain lots, or pieces of land, for the church and for the government buildings.

St. Augustine's Plaza de la Constitucion was laid out under those orders, after the town already existed. It is the oldest public square in the country. Government buildings and the church faced onto it, and traders began holding a market there in 1598.

The 1573 orders were among the first written rules anywhere in the world that specified the same town plan for every new town, wherever Spanish officials founded one. Across what is now the Southwest, Spanish town-builders went on laying out towns in the same plaza-and-grid pattern.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 8 MINUTES

Each colonial town of the 1600s went up in the homeland of a Native nation, and some were planned while others simply grew. English colonists began Jamestown in 1607 as a fort. Spanish officials laid out Santa Fe around a plaza. Boston, founded in 1630, had no plan at all, and its streets formed around the houses and the hills.

William Penn planned the most. In 1682 he had his surveyor, the man who measured the land and marked out the streets, draw the whole of Philadelphia on paper before a single street existed on the ground. The founders of many early American towns later followed Penn's example.

Fort towns, walls, and watchmen

Three English ships sailed into the Chesapeake Bay on April 26, 1607, with 144 English men and boys. They settled on Jamestown Island, on the James River in Virginia. The island lay inside the land of the Paspahegh people, who hunted there and had a town about four miles away. The Paspahegh were one of 28 to 32 nations, each with its own chief, that paid tribute, a payment of goods, to one ruler, Powhatan.

The Paspahegh attacked the newcomers on May 26. By June 15 the colonists had finished James Fort, a three-sided fort. Its wall was a stockade, a fence of upright oak and poplar logs about 14 feet high. In the 1620s the surveyor William Claiborne laid out a settlement east of the fort called New Towne, and archaeologists have dug up the foundations of rows of houses there.

Governor Pedro de Peralta founded Santa Fe about 1610 and planned it around a central plaza, in the Spanish pattern. He and his men laid it out at the foot of the Sangre de Cristo Mountains, on the ruins of an older Pueblo town. The Tewa people call that place O'Ga P'Ogeh, which means "white shell water place." The Palace of the Governors stands on Santa Fe's plaza. People have used it as a public building without a break for longer than any other building in the United States.

English colonists founded Boston in 1630 without any plan, on a peninsula that the Massachusett people called Shawmut, a piece of land with water on almost every side. The colonists put their houses up near the waterfront, and the streets formed around the hills, brooks and marshes that were already on the ground. The biggest hill was the Trimountain, a steep hill with three tops, which is now called Beacon Hill.

The cow-path story. According to a well-known story, Boston's crooked streets follow old cow paths. The story is a legend. A writer for Boston Magazine checked it in 2018 and traced it to a line that the American writer Ralph Waldo Emerson wrote in 1860.

Boston's first houses had chimneys made of wood and roofs made of thatch, and several of them burned in the colony's first months. Thomas Dudley, one of the colony's leaders, wrote a letter to the Countess of Lincoln in March 1631. In it he wrote that he and the other leaders had ordered "that noe man shall build his chimney with wood nor cover his house with thatch." The fires, he wrote, always began "in the wooden chimneys."

The people of Boston set up a night watch that same year. The watchmen walked the streets at night to guard the town against criminals, wild animals and fire. The Boston Police Department's own history lists that watch as the start of the city's police.

Wall Street in New York City runs along the line of a wall that is long gone. The wall ran across the northern edge of New Amsterdam, the Dutch town on the southern tip of Manhattan, in the homeland of the Lenape people. It stretched from the East River to the North River, which is now called the Hudson.

Who dug it. A gang of Black men dug a trench across the island for the wall in 1653. The Dutch West India Company, the trading company whose officials ran the colony, owned them. Some of the men had gained what the Dutch called half-freedom: a half-free man could hold land of his own, but he still owed the Company work and a yearly payment, and his children stayed the Company's property.

According to a Columbia University history project, the men dug as long as daylight allowed, all the way from the East River to the Hudson. The town's records show what went up along that line: a wall of planks 9 feet high, nailed to posts, from river to river. The officials had first planned a wall of sharpened logs 12 feet long, but nobody would build it for the price they offered, so they changed the plan to planks.

Who ordered it. Petrus Stuyvesant and the town's officials ordered the wall on March 13, 1653. Stuyvesant was the director general, the man who governed the Dutch colony of New Netherland for the Company. He and the officials had heard that the English in New England were preparing to attack.

In April, Stuyvesant's council gave out the rest of the work. The townsmen, "without exception," had to dig a ditch in front of the wall from river to river. The ditch was 4 to 5 feet deep and 11 to 12 feet wide, a much bigger hole than the trench, and it was there to slow down attackers. The soldiers, the other servants of the Company and the half-free Black men, "no one excepted," had to finish building up the town's fort.

So the order sent the half-free Black men to the fort, not to the ditch. The city's archivists write that enslaved and free workers built the wall itself together. The officials put the cost at 3,166 guilders, the Dutch money of the time. Townsmen paid that money in, and the minutes of the officials' meetings, their written record, name the men who paid. Officials reported the wall finished on July 28, 1653.

The Columbia project names three of the men who dug the trench: Paulo d'Angola, Simon Congo and Anthony Portuguese. All three were half-free. They were among eleven enslaved men who had worked for the Company for eighteen or nineteen years. The eleven asked the colony's council to free them, saying the Company had promised them their freedom.

The Company's director at the time, Willem Kieft, and his council granted half-freedom to the eleven men and their wives on February 25, 1644, nine years before the wall, on conditions. Kieft and his council gave the men plots of land north of the town. But their children, "at present born or yet to be born," stayed the property of the Dutch West India Company.

Each of the eleven owed the Company a yearly payment that Dutch colonists did not owe: 30 skepels (a Dutch measure for dry goods) of grain or beans, plus one hog. And whenever the Company's officials called, each had to come back and work for the Company.

A rattle watch began walking the streets of New Amsterdam on August 12, 1658. Its members were paid night patrolmen who carried wooden rattles, noisemakers that clack loudly when spun. The rattle watch was among the first paid public police forces in America.

Philadelphia, drawn before it was built

William Penn made Thomas Holme the surveyor-general, or chief surveyor, of his colony of Pennsylvania in 1682. The land along the Delaware River was the homeland of the Lenape people. When Penn's colonists arrived, about 2,500 Lenape and about 3,000 Europeans lived on the two sides of the river. The Europeans were Dutch, Swedish and Finnish settlers, and English settlers in West New Jersey.

Penn bought land in southeastern Pennsylvania from the Lenape from 1682 to 1684, paying goods worth at least 1,200 English pounds. He landed on October 28, 1682, and Holme laid out the grid of Philadelphia that December. Holme's map, "A Portraiture of the City of Philadelphia," was printed in 1683. Penn used the map to guide the work, and to advertise the town and draw settlers to it.

William Penn

Who: The founder of Pennsylvania, a Quaker (a member of the Religious Society of Friends, a Christian group that began in England in the 1600s), who had Philadelphia planned on paper before it existed on the ground.

When and where: The grid laid out by his surveyor-general Thomas Holme in December 1682, and Holme's map published in 1683.

Movie: *Penn of Pennsylvania* (1941), released in the United States as *The Courageous Mr. Penn* (1942). The film is about Penn's life in general, not the making of the city plan.

Holme drew the streets wide partly because London had burned in 1666.

In his instructions for laying out the town, Penn asked for "a greene Country Towne which will never be burnt, and always be wholesome," meaning healthy to live in.

Holme drew a straight grid on the land between the Delaware and the Schuylkill rivers. Two wide main streets crossed it, Broad Street and High Street, which is now called Market Street. Holme drew the streets wide,

partly because of the fire that burned London in 1666. Where the two main streets crossed, he placed a large central square, with one smaller public square in each of the four quarters of the town.

All five squares are still there. The four quarter squares are called Logan, Franklin, Washington and Rittenhouse squares, and Philadelphia's City Hall stands on the center square.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 3 MINUTES

As the four biggest colonial ports grew to between 8,000 and 13,000 people each, the people in them organized to fight fire. Around 1750 about 13,000 people lived in Philadelphia, about 12,000 in Boston, about 11,000 in New York, and about 8,000 in Charleston, though some of the Charleston counts come from 1760 rather than 1750. London at the same date had over 700,000 people.

Boston was the busiest port until about 1750, when New York and Philadelphia passed it.

Who fought fires in a wooden town?

Town officers and volunteers fought the fires. In Boston, a fire burned through the town on October 2 and 3, 1711. It destroyed some of the town's main buildings and left many families without homes.

A few months later, twelve men became Boston's first Board of Fire Wards, a group of town officers for fires. The Boston Public Library's guide to the city's great fires does not state who chose them or list their duties. Charleston had "firemasters," officers chosen by a vote. At a fire, everyone had to obey a firemaster's orders as if they were the law.

People in Boston also formed mutual fire societies, groups whose members helped one another. The members of each society agreed to protect one another's houses, and they had no duty to fight a fire at the house of anyone outside the society.

Men in Philadelphia went further in 1736. They formed a company of volunteers who agreed to fight a fire at any house in the town.

Benjamin Franklin

Who: A Philadelphia printer who helped start the first volunteer fire company in the colonies that protected a whole town, not only its own members.

When and where: Philadelphia, December 7, 1736.

Every member had to bring six leather buckets to every fire.

Franklin printed a newspaper, the *Pennsylvania Gazette*. On February 4, 1735, he printed an unsigned letter in it, "On Protection of Towns from Fire," which he had written himself. In the letter he warned people about carrying live coals from room to room. His advice began with the line "an Ounce of Prevention is worth a Pound of Cure." The next year he and other men in the city set up a fire company themselves.

About twenty-five men, Franklin among them, signed the Articles of the Union Fire Company, the written rules of the group, on December 7, 1736. Each member had to bring six leather buckets and two strong linen bags to every fire. Members carried water in the buckets, and they used the bags to pack up people's belongings and carry them out of a burning house.

Every member had to come out at every fire alarm, to any house in the town, whether its owner was a member or not. Other Philadelphians soon set up more fire companies, among them the Heart-in-Hand, the Britannia and the Fellowship, and Franklin encouraged them.

Volunteer companies fought the fires in American towns for more than a hundred years. Then, on April 1, 1853, firefighters in Cincinnati, Ohio, began work as the first fire department in the United States whose firefighters were all paid. Miles Greenwood was their first chief.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 9 MINUTES

The leaders of the new country had their capital city drawn on paper before anyone built it, on ground where three Native towns had once stood. The members of Congress put the capital on the Potomac River by a law of 1790, and in 1791 President George Washington chose the exact ground. By the spring of 1791 the chosen square held two towns that shipped tobacco, and enslaved people worked the farmland around them. Pierre L'Enfant drew the whole city on paper that year.

In Philadelphia, yellow fever killed about one person in every ten in 1793. After the fever came back in 1798, workers there built the first public waterworks in the country driven by steam.

The ground the capital was built on

President George Washington signed the Residence Act, a law the members of Congress had passed, on July 16, 1790. In it they placed the capital somewhere on the Potomac River, inside a square no bigger than ten miles on each side. They left it to Washington to say exactly where, and to appoint a surveyor and three commissioners, officials put in charge of building the capital.

Washington rode out and looked at the country himself. He chose the ground at and beside Georgetown, and he told Congress his choice on January 24, 1791.

Three Native towns had stood inside that square of land. The largest was Nacotchtank, on the southeast side of the Anacostia River, and the river's name comes from the town's name. A second town, Nameroughquena, stood on the west bank of the Potomac, across from today's Theodore Roosevelt Island. The third stood on a bluff, a high, steep bank, in the northwest part of today's city, and the record does not give its name.

Captain John Smith reached that stretch of the Potomac in 1608. Within forty years of that first contact, only about a quarter as many Native people lived in the region as before 1608, according to a National Park Service history of the Native peoples of Washington. Many had died of diseases that Europeans

brought, and others had been killed in wars, though the Park Service history does not say who fought them. Others joined nations to the north, south and west.

Two towns stood inside the square by the spring of 1791, and both are still there. Virginia's colonial lawmakers voted to create the town of Alexandria in 1749. The county surveyor, John West, laid out its first sixty acres around Hugh West's tobacco warehouse.

Maryland's colonial lawmakers approved the town of Georgetown in 1751. They bought sixty acres for it from George Gordon and George Beall for 280 English pounds. The site already had a tobacco inspection house, a building where tobacco was checked before it was shipped, and Georgetown grew into a tobacco port.

The members of Congress changed the law on March 3, 1791, so that the district, the land set aside for the capital, could reach south and take in Alexandria too. Jones Point, where the survey of the district's boundary began, is at Alexandria.

The rest of the land was farms, and the main crop was tobacco. Five men owned the ground where the National Mall is now. The Histories of the National Mall project at George Mason University reports that these men enslaved people, and the enslaved men and women raised tobacco, corn, wheat and cattle on the land.

The largest of the five farms was Notley Young's tobacco plantation, a big farm worked by enslaved people. It covered 800 acres, and the Smithsonian's National Museum of African American History and Culture stands on part of it. The museum gives the number of people enslaved there as 245, from the 1790 census, the government's count of the people. The Histories of the National Mall project gives 260. Federal officials bought Young's land in 1791.

In all, nineteen men owned the land for the new city, about 6,000 acres. Washington met them at a dinner in Georgetown, and they signed an agreement on March 30, 1791.

The deal. The owners got nothing for the land that became streets. For land taken for public buildings and squares, they were paid by the acre. The rest of the land was split into building lots, and half of the lots went back to the owners. These men were later called the Original Proprietors, which means the owners of the land when the city was laid out.

Before anyone could build the city, a crew had to survey the boundary of the district, measuring the ground and marking exactly where its corners and edges lay. Someone also had to draw the plan of the city that would go inside it.

Andrew Ellicott ran the boundary survey. Benjamin Banneker, a free Black farmer from Baltimore County, Maryland, worked under him and did the survey's astronomy, the science of the stars and planets. Pierre L'Enfant, an engineer born in France, drew the city plan in 1791, and Washington dismissed him the next year.

Pierre L'Enfant

Who: The French-born engineer who designed the plan of Washington, D.C., and was dismissed before it was built.
When and where: The federal district, 1791 to February 1792.

L'Enfant would not hand over his drawing, so Washington fired him.

Pierre Charles L'Enfant drew the plan of the capital in 1791. He laid down a street grid and then drew diagonal avenues across it that meet at circles and squares.

The three commissioners Washington had appointed under the Residence Act asked for L'Enfant's original drawing, so that an engraver could cut it into a printing plate and print copies. L'Enfant refused to hand it over, and he clashed with the commissioners. In February 1792 George Washington dismissed him for insubordination, refusing to obey the people in charge of him.

Andrew Ellicott, with help from his brother Benjamin Ellicott, rebuilt the plan and changed parts of it. He straightened Massachusetts Avenue and took out some of the squares. The engravers Thackara and Vallance made an engraving of Ellicott's version in March 1792. Copies of their engraving were the first plan of the city that many people saw, and the city was built from it: L'Enfant's plan as Ellicott had changed it.

L'Enfant died poor in 1825. He was buried on a farm in Prince George's County, Maryland, that belonged to his friend William Dudley Digges.

A second burial. In 1908 the members of Congress set aside $1,000 for a new grave. On April 28, 1909, his coffin lay at the US Capitol for three hours, so that people could pay their respects. He was the first person from another country to be given that honor. That afternoon he was buried again at Arlington National Cemetery, on a hillside above the city he had planned.

Benjamin Banneker

Who: A free Black tobacco farmer and self-taught astronomer who made the observations that fixed the starting corner of the federal district.
When and where: The survey's base camp at Jones Point, Virginia, February to April 1791.

At nearly sixty, Banneker worked nights, timing the stars.

George Ellicott, Andrew Ellicott's cousin and Banneker's neighbor and friend, recommended him, and Major Andrew Ellicott hired him as scientific assistant on the survey of the ten-mile square. Banneker was nearly sixty. He farmed tobacco, and he had taught himself astronomy.

Banneker worked at night. To find a position on the earth by astronomy, an observer watches particular stars cross a particular point in the sky and records the exact moment, then calculates the position from those times. Banneker made those observations and did those calculations, and he kept the survey's regulator clock, a very exact clock, running true.

He used his observations and calculations to fix the district's south corner at Jones Point. He was paid $2 a day, an ordinary day's pay for an assistant. Andrew Ellicott was paid $5.

Banneker left the survey in the spring of 1791, before the crew had run the full forty miles of the boundary. He was in poor health. His first almanac, a book printed once a year with a calendar and tables of the sun, moon and stars, was the one for the year 1792.

According to a popular story, Banneker redrew the whole plan of Washington from memory after L'Enfant was dismissed. The story is a legend. Banneker had left the project about ten months before L'Enfant was dismissed, and Andrew Ellicott rebuilt the plan. The historian Silvio Bedini and writers for the National Park Service and the Library of Congress have worked through the records. They credit Banneker with the astronomy for the boundary survey.

Water after the fevers

Yellow fever killed about 5,000 people in Philadelphia between August 1 and November 9, 1793. About 50,000 people lived in the city, so the fever killed roughly one of every ten of them. About 20,000 other people fled the city, among them the officials of the new federal government.

Yellow fever comes from a virus that mosquitoes carry from person to person. Most people who catch it get better within a week. In about one case in seven, the illness comes back worse and the virus destroys the liver, so the skin and the whites of the eyes turn yellow. The person bleeds from the mouth, nose and eyes and vomits blood turned black by stomach acid, which people then called the black vomit. Between 30 and 60 percent of these people die.

What people blamed. Nobody then knew that mosquitoes spread the fever. Many Philadelphians thought it came from dirty water or from rotting matter in the streets, so they wanted clean water for the city. In 1797 a group of them asked the city's councils to take charge of the water supply, and the council

members formed a Watering Committee. The fever came back in 1798. The city's leaders then hired Benjamin Henry Latrobe, an English-born architect and engineer, to design a waterworks.

The waterworks. The members of the Watering Committee accepted Latrobe's design in 1799, and workers began building the Centre Square Water Works that year. Nicholas J. Roosevelt built its engines and pumps under a contract worth $33,000. The steam engine went up from February 1800.

The steam pumps started supplying the city on January 21, 1801. The engines pumped water from the Schuylkill River through a tunnel along Chestnut Street to the pump house, a white marble building on Centre Square. From there the water ran through the streets in pipes made of hollowed-out logs. Philadelphia was the first American city with a public water supply driven by steam.

What the water could not do. Clean water could not stop a disease that mosquitoes spread. The fever came back seven times in the twelve years after 1793. Each time, only the winter frost, which killed the mosquitoes, brought it to an end.

The engines broke down often and cost a great deal to keep running. Centre Square ran for only fourteen years. In 1815 the Fairmount Water Works took its place.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 7 MINUTES

Towns beside water that boats could reach grew into cities in a few years, on land that had belonged to Native nations. In New York, three commissioners laid a grid of straight streets over Manhattan's hills. After a deadly disease and a great fire, the city's leaders had clean water brought in from a river to the north.

Boomtowns

Rochester, Chicago and San Francisco were all boomtowns between 1800 and 1850, towns whose number of people grew very fast, in a few years.

The City of Rochester's own history and the Monroe County Library's Rochester Voices project both describe Rochester as America's first boomtown. The land there was Seneca land. In 1788 Seneca leaders signed a treaty, a written agreement between nations or governments, that handed about 2,600,000 acres east of the Genesee River to two land dealers, Oliver Phelps and Nathaniel Gorham.

The Seneca leaders also granted land west of the river for a mill, on the condition that a mill be built for the Seneca to use. Ebenezer Allen built a sawmill and a mill for grinding grain on that tract in 1789.

The Erie Canal ran through Rochester from 1825, and workers finished the whole canal across New York that October. The falls of the Genesee River turned the mills' wheels. Grain from the Genesee Valley came to the mills, and canal boats carried the flour away. Before the canal, shipping a ton of flour from Rochester cost $100. By canal it cost $7. By 1838 the mills at Rochester ground more flour than the mills of any other American city, and Rochester got the nickname the Flour City.

About 1,500 people lived in Rochester in 1820. Census takers, who count the country's people every ten years, counted 9,269 there in 1830. By 1834, the year Rochester became a city, about 12,630 people lived there. That was more

than eight times as many people as in 1820.

Chicago grew where the Chicago River runs into Lake Michigan, beside Fort Dearborn, an army fort built at the river's mouth in 1803. It became a town in 1833, when about 350 people lived there.

That September, in the Treaty of Chicago, Potawatomi leaders signed over about 5,000,000 acres: their last lands in Illinois and Wisconsin, and their last reservations, or lands kept for them, in Michigan. The Potawatomi leaders agreed to move west of the Mississippi River. Chicago became a city on March 4, 1837, when 4,170 people lived there.

For most of the year Chicago's streets were mud, until crews began in 1855 to raise them over sewers, underground pipes that carry waste water away.

San Francisco grew on the homeland of the Yelamu, an Ohlone people. About 200 people lived in the town in 1846, and by 1852 about 36,000 lived there. They had come in the California Gold Rush, a race to California to dig for gold.

People put the town together in a hurry. They lived in tents and in hulks, the hulls of old ships that no longer sailed. Six great fires burned the town between December 1849 and June 1851, and the fire of May 3 and 4, 1851, destroyed as much as three-quarters of it. People rebuilt after each one.

A grid laid over Manhattan's hills

New York's state lawmakers appointed three commissioners on April 3, 1807, and gave them the job of laying out the streets of Manhattan. They were Gouverneur Morris, John Rutherfurd and Simeon De Witt, and they filed their plan in March 1811.

The commissioners laid the streets out as a grid. In the remarks they filed with the plan, they gave their reason: "straight-sided and right-angled houses are the most cheap to build and the most convenient to live in." Their plan covered Manhattan from Houston Street north to 155th Street. It had twelve avenues and 155 numbered cross streets, which cut the land into rectangles.

The commissioners drew the lines straight over the island's hills without bending them. Manhattan was Lenape land, and by 1811 much of this part of it was rocky hills, swamps and marshes, with farms, houses and barns scattered across it.

The chief surveyor, John Randel Jr., was hired for the job at twenty. In 1808 he mapped the island's hills, rocks, swamps, streams and ponds, and its houses, barns, fences and fields. Then his crews set 1,549 marble markers and 98 iron bolts into the ground to fix the grid in place.

Workers then had to make the island match the drawing. To build each street, they dug away hills or filled in hollows, leveled the strip of ground and paved it. The new streets ran through the spots where about 721 of the 1,825 buildings north of Houston Street stood in 1811, so those buildings had to be moved out of the way. The work took about sixty years to reach 155th Street.

The commissioners set aside very little land for parks, and Central Park came only later, on ground where the people of Seneca Village already lived.

How New York got clean water

Cholera causes watery diarrhea so heavy that the body loses its water very fast. A person with a bad case who does not get water back into the body fast enough can die of it within hours. In 1832 cholera killed about 3,500 out of about 250,000 New Yorkers, about one person in every seventy.

New York had no clean piped water then. People drew water from wells, ponds and springs inside the city. Workers for a private firm, the Manhattan Company, sank wells and laid wooden pipes to send the water out. Carters drove barrels of country spring water around town and sold it for a penny a gallon, and that water was often dirty too. Others caught rain in tanks called cisterns.

The water from the downtown wells was dirty by the 1830s. More and more privies, outdoor toilets built over pits in the ground, stood near the wells, and liquid from old graves soaked into the ground as well. When people sick with cholera used the privies, the waste overflowed into nearby wells and cellars.

A fire started in a five-story warehouse on Merchant Street, near Wall Street in lower Manhattan, on the evening of December 16, 1835. A strong wind blew it toward the East River. It burned about seventeen blocks and destroyed between 600 and 700 buildings, and the damage came to about $20 million. Two people died in it.

No water to fight it. The firefighters could not get enough water onto the fire. There was little water to be had, and what there was froze in the wells, in the hoses and in the hydrants, the street pipes that firefighters draw water from.

The Croton Aqueduct, a channel built to carry water a long way, became the first large city water supply in the United States that ran without a break. New York's city leaders had decided by the late 1820s that they needed a cleaner and bigger supply of water. After the cholera and the fire, they had the aqueduct built. Workers began building it in 1837, with John B. Jervis as chief engineer.

The workers dammed the Croton River in Westchester County, north of the city. Then they built a covered tunnel of brick on a stone base, forty-one miles long, to carry the water down to Manhattan. Inside, the tunnel was eight and a half feet high and seven and a half feet wide. It dropped about 13 inches in every mile, so gravity carried the water along it.

Water entered the city on June 22, 1842. On July 4 the distributing reservoir, a large basin that held the water and fed it out to the city's pipes, began filling at 42nd Street and Fifth Avenue.

New Yorkers held a celebration across the whole city on October 14, 1842. A parade seven miles long marched through the streets, and the new fountain in City Hall Park threw water fifty feet into the air. People called a glass of the new water a "Croton cocktail," though it had no alcohol in it.

George Templeton Strong

Who: A young New York lawyer whose diary, kept for forty years, records the coming of Croton water.
When and where: New York City, 1842.

In 1842 Strong doubted that even Croton water could clean New York.

George Templeton Strong was twenty-two when the Croton water arrived. He kept a diary from 1835 until his death in 1875, about 2,250 pages in all. It is a first-hand record of New York in the 1800s, and two editors, Nevins and Thomas, published it in 1952.

While the water was still on its way in 1842, Strong wrote that "Croton Water is slowly flowing towards the city, which at last will stand a chance of being cleaned." The sentence goes on: "if water can clean it." He thought the city was so dirty that even water might not get it clean.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 20 MINUTES

Builders made American cities taller in these fifty years, dug sewers under them, and spread them outward along streetcar lines. In Chicago, crews raised the streets over new sewers and lifted the buildings to match. Census takers counted 1,099,850 people in Chicago in 1890, which made it the second-largest city in the country.

In New York in the same years, poor families crowded into tenements, apartment buildings put up cheaply to hold as many families as a plot of land would take.

How crews lifted Chicago out of the mud

Rain and waste had nowhere to drain off Chicago's low, almost level clay ground, so pools of dirty water stood in the streets, and for most of the year the streets were mud. Diseases spread from that standing water, among them typhoid fever, a fever caught from food or water dirtied by human waste, and dysentery, a gut infection that causes bloody diarrhea. In 1854 cholera killed six of every hundred people in the city.

The members of the Board of Sewerage Commissioners, the officials in charge of Chicago's sewers, hired Ellis S. Chesbrough in December 1855. He had been the water engineer in Boston. His plan of 1856 was the first plan for a complete sewer system covering a whole American city.

Streets on top of the sewers. Workers laid the sewer pipes along the existing streets and then buried them under several feet of new fill, earth dumped on top. That raised the level of the street by an average of four to five feet, and by as much as eight feet in places. A building left at the old level now sat below its own street, and its ground floor became a basement.

Next the buildings had to come up to the new street level. The tool for lifting them was the jackscrew, a screw inside a case that a man turned by hand with a lever. Crews set many jackscrews under a building, and the men turned them together.

The first masonry building, one built of brick or stone, went up this way in January 1858. It was a four-story brick block at Randolph and Dearborn streets that weighed about 750 tons. It rose 6 feet 2 inches on 200 jackscrews. Reporters of the time wrote that it rose "without the slightest injury" to the building. More than fifty buildings like it were raised that same year. Every figure for these raisings comes from those newspaper reports.

A group of engineers that included George Pullman raised half a city block in 1860. It was the row of brick and stone buildings on Lake Street between Clark and LaSalle streets, 320 feet long. With its sidewalks, the row weighed about 35,000 tons. About 600 men worked about 6,000 jackscrews, and the block went up 4 feet 8 inches in five days. The shops in it stayed open the whole time, and people came and went, shopped and worked in them while the buildings rose.

Up: the elevator and the steel frame

Builders could not make tall buildings without two inventions: an elevator people trusted, and a frame that could hold the building up.

The danger in an elevator was that the rope could break and drop the platform. Elisha Graves Otis made a brake from a steel wagon spring that locked into a ratchet, a bar with teeth, and held the platform if the rope broke.

The test. Otis showed his brake in 1854 at the Crystal Palace exposition in New York, a large public show of new machines and goods. He rode a platform up an open-sided shaft, and halfway up he had the rope cut with an axe. The brake caught, and the platform held.

The first passenger elevator sold for everyday use in a building went into the E. V. Haughwout Building, at 488 Broadway in New York, on March 23, 1857. A steam engine drove it. It cost $300 and rose about two-thirds of a foot per second.

Rent on the top floor. Before elevators, the higher a room was, the lower its rent, because people had to climb the stairs to reach it. Once elevators ran, floors above the fourth or fifth could rent for as much as the floors below, or more.

In a wall-bearing building, the outside walls hold up everything. The taller the building, the thicker the walls at the bottom have to be. The Monadnock Building in Chicago, finished in 1891, is 16 stories tall, the tallest building ever held up by brick walls. Its walls are six feet thick at the bottom. In a framed building, a skeleton of iron or steel columns and beams carries the weight. The walls hang on that frame as a covering.

The Home Insurance Building in Chicago is the building most often called the first skyscraper, a very tall building held up by a metal frame. William Le Baron Jenney designed it, and it was finished in 1885. It stood ten stories and 138 feet tall, and builders added two more floors in 1890. Its frame of iron and steel carried loads that walls had carried in older buildings. Workers tore it down in 1931 to make room for the Field Building.

That title is in dispute. The Home Insurance Building was not built all of steel, and it was not the first building with a metal frame. Jason Barr, who writes about the history of skyscrapers, traces the label "first skyscraper" partly to a later publicity campaign. People close to Jenney ran it, along with Chicago boosters, people who promoted their city to bring in money and business.

Other buildings have a claim to be first. One is New York's Equitable Life Building of 1870, the first office building with an elevator. A fire destroyed it in 1912 and killed six people, and the Equitable Building of 1915, about 40 stories tall, went up on the same ground. Whichever building came first, builders used the frame and the elevator to roughly triple the height of buildings within one generation.

BY 1893: Chicago's downtown stood on streets raised over its sewers, and its office buildings rose ten stories and more on frames of iron and steel.

The White City. Steel frames also held up the buildings of a world's fair, the World's Columbian Exposition, which opened in Chicago in 1893. Daniel Burnham directed the building work, and Frederick Law Olmsted drew the site plan, the layout of the grounds. Workers put up a matched set of white buildings in the style of ancient Greek and Roman buildings, with rows of columns. Electric lights lit them, and the fair got the name the White City.

The buildings were temporary, built to stand only while the fair ran. Under their fronts they were sheds on those steel frames. The fronts were made of staff, a mix of plaster, cement and plant fiber that workers poured into molds, and then painted white. More than 27 million people visited the fair in its six months. Planners in the City Beautiful movement of the 1890s and 1900s took the White City as their model. They worked to bring grand public buildings, wide avenues and parks into American cities.

High steel. Mohawk ironworkers built steel frames like these. From 1886 on, men from two Mohawk communities, Kahnawake and Akwesasne, helped build bridges and tall buildings across the Northeast. That year, at a bridge job at Kahnawake, a Mohawk town near Montreal, Mohawk men started working high steel, joining the steel frames of bridges and buildings high above the ground.

From Kahnawake and Akwesasne, the men traveled to bridge and skyscraper jobs wherever the steel work was, and they called that "booming out." An exhibition at the Smithsonian's National Museum of the American Indian, *Booming Out: Mohawk Ironworkers Build New York*, documents their work. It includes their work in the next century on the Empire State Building, the Chrysler Building, the George Washington Bridge and the World Trade Center.

The tenement

New York's state lawmakers passed a tenement law on May 14, 1867, the first broad housing law in the country. Under it, cellar apartments were banned unless the ceiling stood at least a foot above the street, and every building needed fire escapes and one toilet for every twenty people. The law also set the first rules for letting fresh air into rooms.

Officials did little to make builders obey it. To meet its rules about fresh air, builders cut windows in the walls between inside rooms, so the windows let in no outside air. The lawmakers tried again with the Tenement House Act of 1879, later known as the Old Law. Under it, every room a person lived in had to have a window that opened to outside air. Builders met that rule with the dumbbell tenement.

Builders pinched each building in at its middle, which left room for a narrow air shaft, and rooms in the middle of the building got their required window onto that shaft. Seen from above, the building was wide at both ends and thin in the middle, the shape of a dumbbell, an exercise weight with a ball at each end of a short bar.

The shaft was too narrow and too deep to bring daylight or moving air down below the top floors, so most of the rooms it was built for stayed dark and stale. The shafts filled up with garbage. The shaft also worked as a flue, a channel that draws hot air and smoke upward, as a chimney does. A fire in the shaft could climb it to the floors above.

New York's state lawmakers passed a new Tenement House Act in 1901, later known as the New Law. In it they banned the dumbbell design and required windows facing outward in every room, along with courtyards, indoor toilets and protection against fire. The rules covered old buildings as well, so owners had to change those too.

The White Wings. The reporter Jacob Riis wrote that one man's broom "saved more lives in the crowded tenements than a squad of doctors." The man was George E. Waring Jr. New York's reform mayor, William L. Strong,

appointed him street-cleaning commissioner in 1895, and Waring held the job until 1898. He put about 2,000 street sweepers in white uniforms, and people called them the White Wings. Each day they cleaned about 450 miles of street.

Waring set up the first planned systems for getting rid of the city's waste and for recycling it. He organized Juvenile Street Cleaning Leagues too, clubs for children who helped keep their streets clean.

Jacob Riis

Who: A Danish immigrant and police reporter who took up flash photography early and used it to show how the poor of a city lived.
When and where: New York's tenement districts. *How the Other Half Lives* came out in 1890.

Riis took his photographs at night, by the flash of burning magnesium.

Jacob Riis used flash photographs as evidence in an argument about how poor families in New York lived. He came to the United States from Denmark in 1870 and worked as a police reporter for the *New York Tribune* and then the *Evening Sun*. As a reporter he covered the city's poorest streets, among them Mulberry Street. The police there also ran shelters for homeless people, called police lodging houses, and Riis saw inside them and wrote about them.

Riis began using magnesium flash around 1887. Magnesium powder burns for an instant with a light bright enough to record a picture on a photographic plate, a glass sheet coated with chemicals that change where light hits them. With the flash he photographed tenements, saloons and slums at night.

Riis published an eighteen-page article in *Scribner's* magazine in 1889. The next year he published the book *How the Other Half Lives*, with seventeen photographs and a number of engravings, pictures printed from lines cut into metal or wood.

The *Dictionary of American History* states that Riis's work, along with the work of other reformers, pushed New York's lawmakers toward the tenement law of 1901, which banned the dumbbell design. Theodore Roosevelt, as New York City's police commissioner, became Riis's ally.

Bridget and Joseph Moore

Who: An Irish immigrant waiter and his wife, one tenement family the records document, whose apartment the Tenement Museum has recreated.

When and where: 97 Orchard Street, on New York's Lower East Side, 1869.

The Moores' water came from a backyard pump, beside the privies.

Bridget Moore married at seventeen, in 1865. Joseph Moore worked as a waiter, and some of the Tenement Museum's accounts record him as a bartender. In 1869 the couple moved with their daughters into 97 Orchard Street, a tenement built in 1863. They were one of the few Irish families in a building where most people were German, and they lived there about a year.

Their daughter Agnes Mary died on April 21, 1869, at five months old. The cause given in the records was marasmus, severe malnutrition, a form of starvation. The body gets too little food of every kind, so it uses up its own fat and then its own muscle, and the child wastes away.

The Tenement Museum's account describes two things linked to the deaths of babies at that time. One was swill milk, which came from cows kept in stables beside distilleries, where liquor was made. The cows ate the leftover grain mush from making the liquor. Their milk was thin and dirty, and in the 1850s New Yorkers blamed it for the deaths of many babies. The museum says Agnes Mary's marasmus came from tainted milk.

> The other was the building itself. The water at 97 Orchard Street came from a pump in the back yard, beside the privies.
>
> Of the eight children Bridget and Joseph Moore had, four lived to be adults.
>
> The building still stands, and museum staff have recreated the Moores' apartment as it was in 1869. Between 1863 and 1935, when the floors where people lived were sealed shut, an estimated 7,000 people from more than twenty countries lived at 97 Orchard Street. The Moores are one of the families among them whose names appear in the records.

Central Park and Seneca Village

The commissioners who drew the 1811 plan had left almost no land for public parks. In 1853 New York's state lawmakers set aside more than 700 acres in the middle of Manhattan for a park. Frederick Law Olmsted and Calvert Vaux won the design contest in 1858 with a plan they called Greensward, and building began that year.

People already lived on part of that land, in Seneca Village. John and Elizabeth Whitehead had divided their farmland there into about 200 lots, or pieces of land for sale, in 1825. On September 27 of that year, Andrew Williams, a twenty-five-year-old Black shoeshiner, bought the first three lots for $125. Epiphany Davis bought twelve lots for $578, and the African Methodist Episcopal Zion Church bought lots as well.

About 225 people lived in Seneca Village by 1855. Roughly two-thirds of them were African American, and Irish and German families lived there too. They had built three churches and a school.

Land and the vote. Under New York law at the time, a Black man could vote only if he owned at least $250 worth of property. In 1845 about 100 Black men in the whole city met that rule, and 10 of them lived in Seneca Village.

New York City officials took the whole park site by eminent domain, the power of a government to take private property for public use, paying the owner whether the owner wants to sell or not. Officials set a price for each piece of

land, and the owners in Seneca Village were paid. The histories of the village by the Central Park Conservancy, the group that looks after the park, do not name the commissioners who set the prices.

Many of the owners said the price of their land was too low, and they objected in court. Researchers at the Conservancy have studied the records and found that, with few exceptions, the owners got about what their land would have sold for.

The New York State Supreme Court, the state's main trial court, approved the prices in February 1856, and the land became the city's property. The officials had taken the land from its owners, including Black men whose right to vote depended on owning it.

Many people left in 1856, and others stayed on as renters of the city. In the summer of 1856, Mayor Fernando Wood sent the people of Seneca Village a final notice to leave. In October 1857, once the money to build the park was in place, city officials evicted the last of them, forcing them out of their homes under the law. In all, city officials forced about 1,600 people off the whole park site by the end of 1857.

Accounts differ on how the last people were made to leave. The historians Roy Rosenzweig and Elizabeth Blackmar studied the records from the time for their 1992 history of the park, and they found that the people left "quietly and without violence." The Conservancy's researchers say their work since the early 1990s has found no sign of a fight over the taking.

A New York Public Library research guide describes it differently. It states that the people of Seneca Village fought the police sent to put them out, and that in August 1857 the last Black landowners were "forcibly and violently scattered throughout the city." Rosenzweig and Blackmar think the stories of police clubbing people out mix up the taking of the park land with police raids on pig farms near the park's western edge two years later.

Crews tore down the buildings, and workers began building the park in 1858.

Frederick Law Olmsted

Who: The designer, with Calvert Vaux, of Central Park, whom the Olmsted Network, a group that studies his work, calls the founder of landscape architecture as a job in the United States.

When and where: New York from 1858, and parks in Brooklyn, Boston, Washington and Chicago afterward.

Movie: *Frederick Law Olmsted: Designing America* (PBS, 2014), a documentary that premiered June 20, 2014.

Editors once sent Olmsted through the slave states as a reporter.

Olmsted had been a sailor on a trading voyage to China. From 1848 to 1855 he ran a farm on Staten Island, and in 1852 he published a book called *Walks and Talks of an American Farmer in England*. That year editors at the *New York Daily Times* sent him as a reporter through the Southern states, where slavery was legal.

His travels through the South and Texas lasted until 1857, and his reports were later collected in three books. In them he argued that slavery had held the South back. By his count, the same amount of work took four times as long in Virginia as in the North, and the profits of slavery went to no more than 8,000 owners of large plantations.

He and Calvert Vaux won the Central Park contest in 1858 with the Greensward plan. They designed the land itself, its paths, lawns, trees, water and roads, which is the work called landscape architecture. Olmsted meant the park for everyone in the city, rich and poor. He and Vaux gave it meadows and woods shaped to look like open country, so that city people could get some relief from the city.

Olmsted's best-known designs after Central Park include Prospect Park in Brooklyn, the Emerald Necklace in Boston, a chain of connected parks, and the grounds of the US Capitol in Washington. In 1893 he laid out the grounds of the World's Columbian Exposition in Chicago, in Jackson Park.

Out: streetcar lines and streetcar suburbs

American cities of the 1800s were walking cities. Most people lived close enough to walk to their work and their shops. Horses pulled streetcars along rails in many cities, at 5 or 6 miles an hour.

Electric cars. Frank J. Sprague's Richmond Union Passenger Railway, an electric streetcar line in Richmond, Virginia, began running cars on a regular schedule on February 2, 1888. It started with ten cars on about twelve miles of track, and by May twenty-three cars ran on it. It was the first large electric street railway that worked well.

Electric streetcars ran at 10 to 15 miles an hour, so a ten-minute ride covered ground that took thirty minutes to walk. Within two years, about 110 electric railways using Sprague's equipment were built or under contract.

Builders put up houses along the new lines, out past the old edge of town, and many white city families moved out to them. These new neighborhoods of homes at the edge of a city, where people lived and from which they traveled in to work, were called streetcar suburbs.

A city in one day

The land run into Oklahoma, a race in which settlers rushed in at a set signal to claim pieces of land, began at noon on April 22, 1889. That morning, Guthrie was a railroad station. By nightfall about 10,000 people were camped there.

The land was part of Indian Territory, where United States officials had forced many Native nations to move from their homelands. Dennis N. Cooley was the federal Commissioner of Indian Affairs in 1865, the official in charge of the government's dealings with Native nations. He told the leaders of five of those nations that they had lost their rights to their land. His reason was that they had sided with the Confederacy, the Southern states that fought the United States in the Civil War.

In treaties signed in 1866, the Creek signed over the western half of their land for $975,168, and the Seminole signed over all of theirs for fifteen cents an acre. The treaties stated that the land was for other Native nations and for people freed from slavery.

The Unassigned Lands. The land opened in 1889, about 1.9 million acres, lay in the middle of the land the Creek and Seminole had signed over. It was called the Unassigned Lands, because federal officials had not assigned it to any nation. In early 1889, members of Congress voted to pay the Creek about $2.28 million and the Seminole about $1.91 million to drop the rule about who the land was for. Then settlers could claim it.

Congressman William Springer wrote the change to a law that let President Benjamin Harrison open the land. Harrison announced the opening on March 23, 1889.

By the morning after the run, the settlers in Guthrie had set up a temporary government, a land office where settlers filed their claims, a newspaper and three banks, all of them working out of tents. Oklahoma City filled up on the same scale on the same day.

BY 1900

If you remember one thing: In these fifty years American cities grew taller and spread farther out, and in Chicago crews raised the streets over new sewers and lifted whole buildings to match.

In 1850: Chicago's streets were mud for most of the year, buildings were held up by their own walls, and most city people walked to work.

In 1900: Chicago's streets ran on top of its sewers, frames of iron and steel held up buildings ten stories and taller, and electric streetcars carried families out to new suburbs.

Who lived where: poor families in New York crowded into tenements, city officials forced the people of Seneca Village off their land to make Central Park, and in 1889 settlers raced onto Oklahoma land that the Creek and Seminole nations had signed over in 1866.

Next: In the 1900s, officials wrote rules about what could be built in each part of a city, and white owners and judges kept Black families out of most neighborhoods.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 18 MINUTES

New York's officials wrote the first rules for a whole American city on what could be built where, and builders in New York went on to put up the tallest buildings in the world. Millions of people moved into American cities in these decades. In 1907 alone, more than a million immigrants came through Ellis Island in New York, and millions of Black Americans moved from the South to cities such as Chicago and Detroit.

White property owners and judges kept Black families out of most neighborhoods, and federal officials refused to back home loans in the neighborhoods where Black families lived. To build a secret city for the atomic bomb, Army officials took farmland in Tennessee from the families who lived on it.

Drinking water for Chicago and San Francisco

People in Chicago drank water from Lake Michigan, drawn in through intake pipes about two miles offshore. The city's sewers emptied into the Chicago River, and the river flowed into the lake. In 1885 a great storm carried the river's filth far out into the lake, and people feared it would reach the intakes. The Sanitary District of Chicago, the public body in charge of the work, was set up to solve the problem.

The Sanitary District's engineers made the river flow the other way. Workers dug a canal 28 miles long, the Chicago Sanitary and Ship Canal. Through it, the river now flowed away from the lake, toward the Des Plaines River and on down to the Mississippi, carrying the city's sewage with it.

Missouri lay downstream on the Mississippi. Sanitary District officials feared that Missouri's officials would ask a court for an injunction, an order telling someone to stop. Partly to finish before a judge could issue that order, crews blasted out the last barrier at dawn on New Year's morning, and the reversal was complete on January 2, 1900.

Missouri's state officials sued the Sanitary District that year. A court later dismissed the case because Missouri could not prove that the river's pollution came from Chicago. The sewers of St. Louis also emptied that city's waste into the Mississippi.

Stephenson Strobel, a health researcher at McMaster University in Canada, estimated in a 2025 study that the reversal cut the number of deaths in Chicago by about 4 percent in 1900. That is about 985 people who would otherwise have died that year.

An earthquake broke the main pipes from San Francisco's reservoirs on April 18, 1906. It also broke the water mains, the large pipes that carry water under the streets, in more than 300 places. When firefighters hooked their hoses to the hydrants, no water came out. The fires burned for about three days and destroyed more than four square miles of the city.

Hetch Hetchy. After the fire, city officials planned to dam the Hetch Hetchy Valley in Yosemite National Park and pipe its water to the city. Damming the valley meant flooding it, and conservationists, people who work to protect wild land, fought to stop the dam.

President Woodrow Wilson signed the Raker Act on December 19, 1913. Under it, San Francisco's city officials could build the dam, and no other American city has been allowed to build in a national park for its own use. The members of Congress who passed the Act wrote into it that nobody could make a private profit from that water and power.

Workers finished the O'Shaughnessy Dam in 1923, and by 1934 the full system was carrying water to San Francisco. City officials later sold the dam's electricity to a private company, Pacific Gas and Electric, and people fought in court for decades over whether that broke the Act.

Federal work crews. In the 1930s, federal crews laid new water and sewer pipes in cities across the country. They worked for the Works Progress Administration (WPA), a federal program that hired people to build public projects such as roads, pipes and schools, from 1935 to 1943. WPA crews laid about 24,000 miles of storm and sewer lines, which carry away rainwater and waste, and about 19,700 miles of water mains.

WPA crews built about 500 water-treatment plants, more than 4,000 new schools, hundreds of hospitals, and airports, and they built or improved about 651,000 miles of road. Counts of the WPA's work differ from one record to another, so each of these figures is close but not exact.

Zoning: rules for what may be built where

Under zoning, officials divide a city into districts and set rules for what may be built in each one. The rules state how tall a building may be, how close it may stand to the street, and what it may be used for. No American city had zoning rules that covered the whole city before 1916. That year, on July 25, New York's officials voted to adopt the first citywide zoning resolution in the country.

Popular accounts state that the Equitable Building, finished in New York in 1915, caused the resolution. It rose about 40 stories straight up from the sidewalk, with no setback, no place where the upper floors step back from the street. It cast a shadow of about seven acres on the streets around it and cut off the sun from the buildings next to it.

Jason Barr, who writes about the history of skyscrapers, states that officials had been preparing the resolution for years. In his account they would have passed it without the Equitable Building, which became the best-known example of what the rules were meant to stop.

The resolution's height rule depended on the width of the street. A building's front wall could rise straight up to a height set by multiplying the street's width by a fixed number. Above that height, the building had to step back from the edge of its lot each time it went higher. A tower could go up with no height limit if it covered no more than a quarter of the lot.

The wedding cake. Architects who followed that formula designed New York's skyscrapers of the next decades as stacked boxes, each one smaller than the one below, and people called the shape a wedding cake. The officials who wrote the resolution meant the setbacks to keep air and sunlight reaching the sidewalks.

Officials also used city laws to decide who could live where. In Louisville, Kentucky, a city law barred Black buyers from buying homes on blocks where most people were white.

William Warley led the Louisville branch of the NAACP, a group that fought for Black Americans' rights. He agreed to buy a lot in a mostly white neighborhood so that the law could be tested in court. In 1917, in *Buchanan v. Warley*, the justices of the Supreme Court all agreed that the Louisville law could not stand. After that ruling, local officials turned to zoning rules that did not name race.

Officials in the village of Euclid, Ohio, had banned two-family houses and apartment buildings from parts of the village, so families who could not afford a whole house of their own could not live there. In 1926, in the case *Village of Euclid v. Ambler Realty Co.*, the justices of the Supreme Court ruled that a local government had the power to zone. After the ruling, officials in cities across the country wrote zoning rules.

Daniel Burnham

Who: The Chicago architect who directed the building of the 1893 world's fair and then wrote the first plan for the whole of a big American city.

When and where: Chicago, from the 1893 world's fair to the *Plan of Chicago* in 1909.

Burnham spent about thirty months on Chicago's plan and charged nothing.

Daniel Burnham ran the building of the White City at the 1893 world's fair in Chicago, where the buildings were designed together as one planned city. After the fair, Burnham applied the same idea to a real city that already existed.

Burnham and Edward Bennett published the *Plan of Chicago* in 1909. The members of the Commercial Club of Chicago, a club of the city's business leaders, asked for the plan and raised about $80,000 to pay for

it. Burnham worked on it for about thirty months and charged nothing. The club spent more than $40,000 more to print 1,650 copies of the finished book.

It was the first comprehensive plan for a large American city, setting out what the whole city should become, with its streets, parks and waterfront planned together. In it, Burnham and Bennett called for the lakefront to stay open to the public, for rings of parks around the city and for wider streets. Much of Chicago's lakefront is still open to the public because of that plan.

KNOWN:	Many people know Burnham for the line "make no little plans," but people began to credit it to him only after he died in 1912.
NOT KNOWN:	No record from his lifetime has him saying or writing it.

Which tower would be tallest?

The builders of the Chrysler Building beat the builders of 40 Wall Street in 1929, in a race for the tallest building in the world. Then, in 1931, the builders of the Empire State Building went higher than both.

The hidden spire. The Chrysler Building's architect, William Van Alen, was racing the builders of 40 Wall Street. His workers put together a spire, a tall pointed top, 125 feet long. They built it in secret inside the building's fire tower, a shaft that ran up through the building, where nobody outside could see it. In October 1929 they raised the spire up through the roof and fixed it in place.

The spire brought the Chrysler Building to 1,046 feet, the official figure from the Council on Tall Buildings and Urban Habitat, though some popular accounts print 1,048. The tower at 40 Wall Street stood 927 feet tall. The Chrysler Building opened on May 27, 1930, and it was the tallest building in the world for eleven months.

The Empire State Building opened on May 1, 1931. It had 102 stories and stood 1,250 feet to the roof, taller than both. Its builders put it up in 410 days, for about $41 million. President Hoover turned on its lights by pressing a button in Washington.

The building opened during the Depression, the years of the 1930s when businesses failed and people lost their jobs. Through the Depression the building stood about half empty.

Mohawk ironworkers from Kahnawake and Akwesasne worked on the steel of both the Empire State and Chrysler buildings. From the 1920s to the 1960s, their families lived in a Brooklyn neighborhood that people called Little Caughnawaga, after an older spelling of Kahnawake.

Where Great Migration families could live

The Great Migration was the move of about 6 million Black Americans out of the South between 1910 and 1970. In its first ten years, from 1910 to 1920, the Black population of Chicago rose 148 percent. Detroit's rose 611 percent, to about seven times its 1910 size. Philadelphia's rose about 500 percent, and New York's roughly doubled.

Black families who arrived could not live wherever they chose. White property owners kept them out of neighborhoods with restrictive covenants, sections written into the deed of a house, the legal paper that records who owns it. A covenant forbade the owner to sell or rent the house to a Black buyer, and sometimes to Jewish or Asian buyers as well. Each later owner of the house had to obey it too.

Through the 1920s, white owners in Chicago and across the country signed covenants into their deeds, and judges enforced the covenants by ordering owners to obey them. Because of the covenants and the judges, Black families could rent or buy homes in only a few districts. In Chicago that was a strip of the South Side called the Black Belt, which its own residents named Bronzeville. In New York it was Harlem.

Kitchenettes. The number of people who needed rooms in those districts kept rising. Landlords in the crowded districts split their flats, or apartments, into smaller units: one apartment became several one-room units, each rented separately. Each unit had a hotplate, a small electric burner for cooking, and the families shared one bathroom. Bronzeville had more than 80,000 of these kitchenettes. For each square foot of floor, families in them paid more rent than white families paid in white neighborhoods.

The 1948 ruling. In the case *Shelley v. Kraemer*, in 1948, the justices of the Supreme Court ruled that courts could no longer enforce the covenants. The ruling did not stop owners, builders and lenders from refusing Black buyers on their own, and many kept refusing for years.

The maps with red lines

Federal officials set up an agency called the Home Owners' Loan Corporation in 1933, during the Depression, the hard times of the 1930s. Its staff worked with mortgages, loans to buy a house. They bought more than a million home loans from lenders and replaced each one with a new 15-year loan at 5 percent interest, easier terms than banks then gave. By 1936 they had swapped in new loans for about one in ten home loans outside farms.

The same staff made maps of 239 cities between 1935 and 1940, called "Residential Security" maps. They went through each city neighborhood by neighborhood and gave each one a grade for how safe they judged it was to lend money on the houses there.

Four colors. A was the best grade, shaded green on the map, followed by B in blue and C in yellow. D was the worst grade. The maps described D neighborhoods as "hazardous," and the staff shaded them red. From those red areas comes the word redlining: drawing a line around a neighborhood on a map and then refusing to lend money for houses inside it.

The appraisers, the staff members who judged each neighborhood, wrote notes that describe Black families moving in as "infiltration," a word for an enemy sneaking in. If Black families lived in a neighborhood, that all but guaranteed it a D.

What the scholars dispute. Scholars disagree about how much these particular maps changed who got loans. In a 2017 study, researchers at the Federal Reserve Bank of Chicago, a branch of the country's central bank, found lasting harm in the neighborhoods graded red.

Price Fishback, a historian of money and business, and three other scholars found in a 2021 study that the maps changed little about where the government lent. They also found that officials at the Federal Housing Administration, another federal agency, had already built their own way of redlining before these maps were drawn.

What both sides agree on. Federal Housing Administration officials insured home loans, promising to repay the lender if a buyer could not. They refused to insure loans in the neighborhoods where Black homeowners lived,

and they backed loans mostly on new houses, which were sold almost only to white buyers.

Researchers at the National Community Reinvestment Coalition compared the old maps with present-day data in a study published in 2018. They found that about 74 percent of the neighborhoods graded red are low-to-moderate income today, meaning the families there earn well below the typical family in their area. About 64 percent are majority-minority, meaning most of the people living there are not white.

Researchers at the University of Richmond scanned the maps for their Mapping Inequality project and put them online, so anyone can look up what the appraisers wrote about a street.

BY 1940: White owners and judges had kept Black families in a few crowded districts for twenty years, and federal staff had shaded nearly every neighborhood where Black families lived red on their lending maps.

Oak Ridge: a secret city on taken farmland

Brigadier General Leslie Groves, an Army officer, had just taken charge of the Manhattan Project, the Army's secret program to build an atomic bomb. On September 19, 1942, he approved taking about 59,000 acres along the Clinch River in eastern Tennessee, a site Army officials called "Site X." Officers of the US Army Corps of Engineers took the land in October 1942.

Who lived there. About 1,000 families lived on that land. Some farmed it, and others lived in its small crossroads communities: Wheat, Elza, Scarboro (also spelled Scarborough) and Robertsville, with New Bethel and New Hope also named. Many of the families had farmed the same ground for generations. Accounts of how many people lived there differ: the Tennessee Encyclopedia states roughly 4,000 people, and other accounts state more than 3,000.

To take the land, the Corps officers filed a paper called a declaration of taking. Under it, the government could take the land right away, whether or not the owners wanted to sell, and settle the price later. Army officials paid an average of $46.86 an acre.

Army officials told the residents they had to leave, sometimes only by notices nailed to their front fence posts. The Tennessee Encyclopedia's account of the removals does not name the men who put up the notices. Families who had lived there for generations got a few weeks to go, and within a year all the families were gone.

Most families accepted the price the government set, and a few sued in court over what their land had been valued at. About an eighth of Roane County's land and about a seventh of Anderson County's land went into the site.

Workers built a city for the Army on that ground from 1942. The site's official name was the Clinton Engineer Works, and the city built there is Oak Ridge. The plans were for about 13,000 people, but by 1945 about 75,000 lived there, which for a short time made it the fifth-largest city in Tennessee.

Alphabet houses. Workers built about 3,000 houses from cemesto, ready-made panels of cement and asbestos, a mineral fiber. The houses came in a few standard types named by letters, such as the A house and the B house, so people called them alphabet houses. The flat-tops, flat-roofed houses, came in pieces made ahead of time by workers for the Tennessee Valley Authority, a federal agency, and crews put them together on the site.

The city had schools, buses, a 300-bed hospital and a symphony orchestra. Fences and gates surrounded it, and people had to show a badge to get in or out.

Oak Ridge did not appear on any published map. Los Alamos in New Mexico and Hanford and Richland in Washington were built for the same program. The plants at Oak Ridge separated the uranium, a heavy metal, for the atomic bomb that American forces dropped on Hiroshima. Most of the more than 70,000 people who lived and worked there did not know what they were making until the bombs fell. They had promised not to talk about their jobs.

Colleen Black

Who: A teenager from Nashville whose family moved to a city left off every published map, and who spent the rest of her life there.

When and where: Oak Ridge, Tennessee, from 1944 until her death in March 2015.

At nineteen, she hunted leaks in pipes without knowing what they carried.

Colleen Black was born Colleen Rowan, one of more than ten children in a Nashville family. In 1944 the family moved to Oak Ridge for war work. They lived in a trailer camp. The ground was mud, with boardwalks laid across it, and people needed a pass to get through the gates.

At nineteen, Colleen worked as a leak detector at the K-25 plant. Her employer was Ford, Bacon & Davis, a company hired to do work at the plant. Her job was to find holes in the welded joints of pipes, the places where two pieces of metal had been melted together. She climbed over the pipes with a probe that sensed helium, looking for pinhole leaks.

Helium atoms are small enough to escape through a flaw too fine to see, so where the probe found helium, the weld was leaking. The plant had hundreds of miles of pipe. Even the gas's name was kept quiet: the workers were not supposed to say the word "helium." Years later she said, "I didn't know where those pipes were going, I didn't know what was going through them ... I just knew that I had to find the leak and mark it."

She learned what the plant had been separating only after American forces dropped an atomic bomb on Hiroshima, in Japan, on August 6, 1945. The bomb killed between 90,000 and 166,000 people in the city within two to four months. That count comes from the Radiation Effects Research Foundation, a research group that the United States and Japan run together and that studies the bomb's survivors. An American survey in 1946 recorded a lower count, 70,000 to 80,000. The exact number is not known.

She married a man called Blackie Black and stayed in Oak Ridge for the rest of her life. In 2005 she gave an oral history, a recorded interview about her life, to the Atomic Heritage Foundation's Voices of the Manhattan Project. The K-25 Virtual Museum includes her account, and she is featured in Denise Kiernan's 2013 book *The Girls of Atomic City*.

BY 1950

If you remember one thing: In these fifty years officials began zoning American cities, white owners and judges kept Black families out of most neighborhoods, and federal officials refused to back home loans where Black families lived.

- January 2, 1900: Chicago's river runs backward, carrying the city's sewage away from Lake Michigan, its drinking water.
- 1935 to 1940: federal staff grade the neighborhoods of 239 cities and shade the D neighborhoods red.
- October 1942: Army officials take the land of about 1,000 families in Tennessee to build Oak Ridge.

Next: After 1950, families moved out of the old city centers to new suburbs, and officials cleared whole neighborhoods for developers and ran highways through others.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 12 MINUTES

St. Louis lost about 60 percent of its people between 1950 and 2000, and Detroit lost nearly half. Families moved out of the centers of older American cities to new suburbs at their edges. Cities in the hot South and West grew fast. Phoenix, Arizona, went from about 107,000 people in 1950 to more than 1.3 million in 2000.

At the edges of metropolitan areas, cities together with their suburbs, builders put up the same kind of neighborhood again and again: the subdivision, a tract of land divided into lots for single-family houses. White families bought those houses with mortgages that federal officials insured, promising to repay the lender if a buyer could not. Federal officials refused to insure the same kind of mortgage in the neighborhoods where Black families lived.

In the old centers, officials cleared whole neighborhoods and cut freeways through others. Under the Housing Act of 1949, city officials labeled neighborhoods blighted, run-down enough to tear down, and took the property by law. They had the buildings torn down, sold the cleared land to developers, and forced at least 300,000 families out of their homes.

Federal officials paid for new freeways with money from a highway law of 1956. Highway planners ran many of those freeways through poor neighborhoods, most of them home to Black families and other people of color.

Urban renewal: clearing neighborhoods for developers

Members of Congress voted for the Housing Act of 1949. Under Title I, one section of that law, federal officials offered money to city governments for a program the law identifies as "urban redevelopment." People later called it urban renewal.

Once city officials had given an area the legal label blighted, they took the property in it by eminent domain, the government's power to take private property at a price that officials set. They had crews tear the buildings down. Then they sold the cleared land to private developers for much less than it had cost to take and clear, and federal money covered the gap. In 1954, in *Berman v. Parker*, the justices of the Supreme Court ruled that this was allowed.

Officials ran the program from 1949 to 1974, in more than 400 cities and on more than 1,200 projects, and crews tore down about 2,000 neighborhoods. Officials forced at least 300,000 families out of their homes, the lowest count the records support. Counting people instead of families, researchers estimate about 1.2 million.

Who was forced out. Black Americans were about 13 percent of the country's population in 1960, and they were at least 55 percent of the people forced out. These figures come from Brent Cebul's 2020 article in the Boston Review and from the Digital Scholarship Lab's "Renewing Inequality" project.

The writer James Baldwin said in a filmed interview in San Francisco in 1963 that urban renewal "means Negro removal," using what was then the usual word for Black Americans.

Why freeways ran through Black neighborhoods

President Dwight D. Eisenhower signed the Federal-Aid Highway Act on June 29, 1956. It provided about $25 to $26 billion for a system of 41,000 miles of freeway.

Highway planners laid many of the routes where land was cheap and where the people who lived there were least able to organize against them. Those were mostly poor neighborhoods of Black families and other people of color. Builders defended taking land in Black neighborhoods by saying it was the cheapest. It was cheap partly because of redlining: for years, lenders and federal officials had refused to lend money for homes in those neighborhoods.

Rondo, a neighborhood in St. Paul, Minnesota, is one well-documented case. About 80 percent of St. Paul's Black residents lived there. Between 1956 and 1968, crews built Interstate 94 through the neighborhood.

Counts of what Rondo lost differ. Guides from the Minnesota Historical Society state about 600 families. ReConnect Rondo and reporting in Sahan Journal state about 700 homes and 300 businesses, and they record that Rondo lost 61 percent of its residents. One in eight of St. Paul's Black residents lost a home to the building of Interstate 94.

Marvin Roger Anderson

Who: A young man whose family lost its home and its apartment buildings to a freeway, and who has spent his later years working to build a land bridge over it.

When and where: Rondo, St. Paul, Minnesota. His family learned of the freeway in 1958.

Crews loaded his father's townhomes onto flatbed trucks and moved them away.

Marvin Roger Anderson grew up in Rondo. His father built Rangh Court there, twelve two-story townhomes, in 1947 or 1948 (accounts give both years). To build them, his father got "the largest Federal Housing Authority mortgage backed loan ever given to nonwhite applicants in the state."

The family learned in 1958, the year Anderson finished Central High School, that the new Interstate 94 would run through their land. State officials condemned the buildings for the freeway, taking them by law, and called the homes "inferiorly constructed." Crews loaded the buildings onto flatbed trucks and moved them away. Four of them still stand, on other ground, on the University of Minnesota's St. Paul campus.

Anderson became the State Law Librarian of Minnesota, the librarian in charge of the state's law library. In 1983 he and Floyd Smaller founded Rondo Days to keep alive "the history, culture and memories of the Rondo that existed before the highway."

He now leads ReConnect Rondo. Its members propose to build a lid over the freeway, a land bridge of about 21 acres, with homes, businesses and community space on top. Early design studies for the land bridge list between 350 and 1,400 homes.

The *Voices of Rondo* oral-history collection records his account, and so do press interviews.

Sprawl, and the people who left the old centers

Levittown, New York, opened in 1947, and by 1951 its builders had put up more than 17,000 houses there. The builders, Levitt and Sons, mass-produced the houses, building the same house over and over. They split the work into 27 steps and trained each crew to do one step. The houses stayed in place, and the crews moved from house to house. At the busiest time, about 30 houses went up in a day.

The first houses rented for $60 a month, and a renter could buy one for $7,500 after a year. From 1949, the builders sold ranch houses for $7,990. The lease for the first houses stated that they could not be "used or occupied by any person other than members of the Caucasian race," meaning white people. In 1960 every family in Levittown was still white.

Builders at the edges of other cities copied the pattern, and the spreading of cities outward in subdivisions like these came to be called sprawl.

The older cities lost people in the same fifty years. Detroit fell from about 1.85 million people in 1950 to about 950,000 in 2000, a loss of nearly half. St. Louis fell from about 857,000 to about 348,000, a loss of roughly 60 percent, and it kept shrinking after that, to about 300,000 by 2020.

Real estate agents and speculators, people who buy property to sell it again at a profit, pushed white families to sell and move out, a practice called blockbusting. They frightened white owners into selling cheaply by telling them Black families were moving in. Then they sold the same houses to Black families for much more, often "on contract."

On contract. Under a contract sale, if a buyer missed a single payment, the seller could put the family out, and the buyer lost everything already paid. In Chicago's North Lawndale neighborhood, about 3,000 buildings were sold on contract. North Lawndale went from 87 percent white in 1950 to 91 percent Black in 1960.

At the same time, federal officials insured mortgages on the new houses at the edge, under rules they set for which loans they would insure. Under those rules, they refused to insure mortgages in the neighborhoods where Black families lived.

Jane Jacobs and Robert Moses

Who: Robert Moses, who built roads, bridges and parks across New York for decades without ever winning an election, and Jane Jacobs, a writer who helped defeat three of the projects planned for the city.

When and where: New York City, 1950s to 1968.

Movie: *Citizen Jane: Battle for the City* (2016), a documentary directed by Matt Tyrnauer, 92 minutes.

Police arrested Jane Jacobs at a public hearing in April 1968.

Robert Moses held as many as twelve appointed posts at the same time, including parks commissioner and head of the Triborough Bridge and Tunnel Authority. Officials gave him every one of those posts, and he never won an election to any of them.

From those posts he directed the building of 13 bridges, 2 tunnels, 658 playgrounds, 17 state parks, and hundreds of miles of parkways and expressways, wide roads for fast traffic. To build the Cross-Bronx Expressway, Moses's crews cut a path through crowded blocks of the Bronx and forced thousands of families out of their homes.

Jane Jacobs lived in the West Village in New York and wrote about cities. She had never been trained in a school as a city planner. In 1961 she published *The Death and Life of Great American Cities*. In it she wrote that a busy street with both homes and shops stays safe because of "eyes on the street," the people who use it and watch it.

Three fights. Jacobs helped defeat three projects. In 1958 she and other opponents stopped a road planned through Washington Square Park. In 1961 and 1962 they beat city officials' attempt to label their own West Village a slum and clear it under urban renewal.

The third was the Lower Manhattan Expressway, a road ten lanes wide, raised above the street, planned across what is now SoHo and Little Italy. Jacobs led the Joint Committee to Stop the Lower Manhattan

Expressway. Police arrested her at a public hearing in April 1968. The charges included inciting to riot, urging a crowd to violence, and they were later reduced.

Jacobs moved to Toronto in 1968. In 1969 Mayor John Lindsay declared the expressway "dead for all time," and city officials took it off the city's map that year.

Robert Caro's book about Moses, *The Power Broker*, came out in 1974 and won a Pulitzer Prize in 1975. It is the standard account of Moses's career, and in it Caro criticizes much of what Moses did. In 2007 the historians Hilary Ballon and Kenneth T. Jackson edited a book, *Robert Moses and the Modern City*. In it they give parts of his record, especially his parks and swimming pools, more credit than Caro gives them. The argument is not settled.

Carl Stokes

Who: The first Black mayor of a major American city, elected in the years when officials were clearing neighborhoods and building freeways through cities.

When and where: Cleveland, Ohio. Elected on November 7, 1967, and mayor from January 1, 1968, to 1971.

In 1969 oil and trash on Cleveland's river caught fire.

Carl Stokes was the grandson of a man who had been enslaved. His mother was a widow, and she raised him in the Outhwaite public housing in Cleveland, apartments owned by a government and rented to families with low incomes.

Cleveland's voters elected Stokes mayor on November 7, 1967. He won about 50.5 percent of the vote and defeated Seth Taft. The 1960 census had counted 876,050 people in Cleveland, the eighth-largest city in the country.

Because Cleveland was one of the ten largest cities, Stokes counts as the first Black mayor of a major American city. On the same day, voters in Gary, Indiana, a much smaller city, elected Richard Hatcher their mayor. Stokes was re-elected in 1969 and served until 1971.

He had campaigned on housing, on bringing money into neighborhoods that had gone without it, and on the city's pollution. On June 22, 1969, an oil slick and piled-up trash on the Cuyahoga River caught fire under a railroad bridge, set off by sparks from a passing train. It burned for about twenty minutes and damaged two railroad bridges. It was at least the thirteenth fire on that river since 1868, and for a century people had used the working river as a sewer.

The next day Stokes held a press conference on the riverbank and demanded that state and federal officials act. In October 1972 the members of Congress passed the Clean Water Act over President Richard Nixon's veto, his refusal to sign it. Members of Congress can pass a law over a veto when two-thirds of each house vote for it. Stokes was one of the local leaders who had pushed for the Clean Water Act.

Black mayors followed Stokes in other big cities. By 1972 voters had elected Kenneth Gibson in Newark, James McGee in Dayton and Ted Berry in Cincinnati. In 1973 they elected Tom Bradley in Los Angeles, Maynard Jackson in Atlanta and Coleman Young in Detroit.

Growth in the Sun Belt

While Detroit and St. Louis lost people, cities in the Sun Belt, the warm states of the South and the West, gained them. Phoenix, Arizona, had about 106,818 people in 1950 and 1,321,045 in 2000, and its metropolitan area went from about 323,000 people to about 3,014,000 in the same fifty years.

Phoenix grew in area too. It covered about 17 square miles in 1950, more than 475 square miles by the 2000s, and about 518 square miles now. City officials added that land by annexation, moving the city's legal boundary out to take in neighboring land.

Houston, Texas, went from 596,163 people in 1950 to 1,953,631 in 2000, and by 1990 it was the fourth-largest city in the country. Air conditioners cooled the air inside homes and offices, so people in Phoenix and Houston could live and work indoors through the hot summers. Land at the edge of these cities was cheap, and city officials kept annexing it. In the 1950s alone, Phoenix more than quadrupled in population.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 7 MINUTES

Downtowns in most big American cities gained people in the 2000s, and in the 2020s many of their office towers began to empty. In the neighborhoods that buyers and lenders have returned to, rents and prices have risen, and some of the people who lived there can no longer afford to stay. Cities run hotter than the land around them, and in Miami Beach the sea now floods some streets at high tide.

Downtown living and empty offices

Researchers at the Brookings Institution studied census counts for big American cities. Between 2000 and 2010, the downtowns grew faster than the areas around them. Of 53 downtowns they studied, 42 gained people. Young adults had already begun moving in. By 2000, people aged 25 to 34 made up nearly a quarter of downtown residents, up from 13 percent in 1970.

After the coronavirus pandemic of 2020, many office workers kept working from home for some or all of the week. Companies shrank the office space they rented, and as their leases, the contracts for renting the space, ran out, they gave up floors.

A fifth of the space. By 2024 about 20 percent of American office space stood empty, with figures for that year running from about 19.6 to 20.1 percent. That was the highest share since Moody's Analytics, a research company, began keeping track in 1979, and it came to more than 900 million square feet of empty floor. In downtown Manhattan the share was about 23 percent. Axios and ABC News reported these Moody's figures in January 2024.

Builders began turning empty office towers into apartments. In 2024 they had plans under way to make more than 55,300 apartments out of former office buildings, a record and more than four times the number in 2021. The

Washington, D.C., area led, with 5,820 apartments planned. Researchers at the firm RentCafe counted those 2024 plans, as Time reported in January 2024.

Builders had finished, or were working on, 11.8 million square feet of former office space as apartments in 2025, the highest figure on record, according to industry reports from CBRE and Brevitas.

Gentrification, and who can no longer afford to stay

In gentrification, buyers and lenders return to a neighborhood they had avoided for years. New owners fix up the houses, landlords and sellers raise rents and prices, and the people who lived there through the years without investment can no longer afford to stay.

Buyers and lenders have returned to close-in neighborhoods, the ones near downtown, that appraisers had marked red in the 1930s. The work of the National Community Reinvestment Coalition and the Mapping Inequality project documents that pattern.

Washington, D.C., is one documented case. Census figures record the city as 71 percent Black in 1970, when people called it Chocolate City. By 2011 the Black share of the population had fallen below half, to 49.2 percent, for the first time in about fifty years.

U Street. New money went mostly into Shaw, U Street and Columbia Heights, close-in neighborhoods that appraisers had redlined. Around U Street, builders put up more than 2,000 expensive condominiums (apartments that each owner buys) and apartments between 1997 and 2007. The neighborhood went from about 60 percent Black in 2000 to about 20 percent Black in 2010.

Virginia Ali

Who: A co-founder of Ben's Chili Bowl, a diner on U Street in Washington, D.C., who has helped run it since 1958 while the neighborhood around it changed.

When and where: 1213 U Street NW, Washington, D.C., from August 22, 1958.

Ben Ali wrote "Soul Brother" in soap on the diner's front window.

Virginia Rollins came from Chance, Virginia. Her husband, Mahaboob Ali, who went by Ben, had come from Trinidad. On August 22, 1958, the two of them opened a diner at 1213 U Street NW with a bank loan of $5,000.

People then called U Street "Black Broadway." Hundreds of Black-owned businesses, churches and theaters lined it and the streets nearby. At the Lincoln Theatre and the Howard Theatre, Duke Ellington, Louis Armstrong and Billie Holiday performed.

Martin Luther King Jr. was shot and killed in Memphis, Tennessee, on April 4, 1968. James Earl Ray later pleaded guilty to his murder. For the next four days, riots broke out across Washington, and the corner of 14th and U was at the center of them. Thirteen people died, and about 1,200 homes and businesses were damaged.

Open past curfew. Stokely Carmichael led the Student Nonviolent Coordinating Committee, a civil rights group. He asked the Alis to keep the Bowl open past the curfew, an order to stay off the streets at night. According to the shop's own history, they did, and they fed police officers and activists. Ben wrote "Soul Brother" in soap on the front window. Like many other Black business owners, he wrote it to mark the diner as Black-owned and keep rioters from wrecking it, and the diner came through the riots untouched.

> Drug dealing at 14th and U rose sharply in the mid-1970s. From 1986 to 1991, crews digging the Metro, Washington's subway, tore up U Street. From the 1990s, buyers and lenders returned, and the new condominiums went up around the Bowl.
>
> Ben's is still open, and Virginia Ali, in her nineties, is still one of the people who run it. When the diner turned 65 in 2023, she told a reporter: "We really mean something to this community."

Building for heat and water

Daytime air in a city is 1 to 6 degrees Fahrenheit warmer than in the areas around it, according to the Environmental Protection Agency (EPA). At night the air can be up to 22 degrees warmer, and a roof or road in the sun can be 50 to 90 degrees hotter than the air above it.

Why cities run hot. The EPA's guides state the reasons. Roads, sidewalks and buildings soak up much of the sun's heat and hold it. A city has fewer trees and plants than the country around it, so it gets less shade and less cooling from water drying off leaves. Tall buildings and narrow streets block cooling breezes. The EPA's list of ways to cool a city includes planting trees, growing plants on roofs, and building roofs and pavements that reflect sunlight.

In Miami Beach, Florida, streets flood on clear days with no storm, when the tide is at its highest. At those tides the ocean pushes the water of Biscayne Bay back up the storm drains, and bay water pours out of the drains into the lowest streets. Seawater also rises up through the soft, holey limestone under the city. In the fall of 2014, crews began raising streets, including West Avenue and Sunset Harbour, and putting in pumps to push the water back out.

Crews had put in twelve pump stations along the west side of South Beach by 2016 and 2017. The cost was first reported as about $400 million and later as about $600 million, as the project grew. During the King Tides, the name used in Miami Beach for the highest tides of the year, the raised and pumped blocks stayed mostly dry after the work.

The tallest buildings now stand in other countries

The tallest building in the world has stood in Asia since 1998. Chicago's Sears Tower, finished in 1974, was the last building in the United States to be the tallest in the world. It lost that title because of a rule about how to measure height.

In April 1996, members of the Council on Tall Buildings and Urban Habitat ruled that a spire designed as part of a building counts toward its height. Under that rule, the Petronas Towers in Kuala Lumpur, Malaysia, measured 1,483 feet to the tops of their spires, and in 1998 they became the tallest buildings in the world. The Sears Tower's roof and its highest floor that people used were both higher than those of the Petronas Towers.

The Burj Khalifa in Dubai, finished in 2010, stands 2,717 feet (828 meters). That is more than 900 feet taller than the tallest building in the United States.

Workers set the last piece of the spire on One World Trade Center, in New York, on May 10, 2013. That November, members of the Council on Tall Buildings and Urban Habitat ruled that its spire counts toward its height. The building opened in 2014 at 1,776 feet, a height its builders chose for 1776, the year of the Declaration of Independence.

One World Trade Center is the tallest building in the Western Hemisphere, the half of the world that holds North and South America. Mohawk ironworkers worked on its steel, as Mohawk ironworkers had on the towers of the 1930s and on the bridges before them.

THE THREE QUESTIONS, ANSWERED

1. **Why do so many American cities have straight streets that cross in a grid?** Town founders chose the grid on purpose, from Spain's town rules of 1573 to Penn's Philadelphia in 1682. The three men who laid a grid over Manhattan in 1811 wrote that square-cornered houses were "the most cheap to build and the most convenient to live in."

2. **How did people get clean water into crowded cities?** City leaders paid for big waterworks after epidemics and fires: steam pumps in Philadelphia in 1801, the Croton Aqueduct in New York in 1842, and a canal that turned Chicago's river around in 1900.
3. **Who decided which families could live in which neighborhoods?** White owners wrote rules called covenants into their deeds to bar Black buyers, and judges enforced them until 1948. Federal officials refused to back home loans where Black families lived, and after 1949 city officials cleared about 2,000 neighborhoods.

What changed: Builders went from carrying baskets of earth at Cahokia to raising steel towers, and owners, judges and officials wrote rules about who could live where.

Whose land: Every colonial town and boomtown in this chapter went up on a Native nation's land, from Seloy's Timucua town at St. Augustine to the Lenape homeland at Philadelphia and the Potawatomi lands at Chicago.

FIVE DATES TO KEEP

About 1100: Cahokia reaches its peak.

1573: Spain's king orders a plaza and a grid for every new Spanish town.

June 22, 1842: Croton water reaches New York City.

July 25, 1916: New York adopts the first citywide zoning rules.

1948: The Supreme Court rules that courts can no longer enforce covenants.

> **NOT KNOWN:** No builder's, planner's or ruler's name survives from Cahokia.

Where to go: The Tenement Museum at 97 Orchard Street in New York, where staff have recreated the Moores' 1869 apartment.

Next: Chapter 7, Home and Family Life. It asks who lived in these houses and apartments, and how.

Chapter 7: Home and Family Life

CHAPTER 7 OF 37 · HOME AND FAMILY LIFE · 10 ERAS · ABOUT 60 MINUTES

The American home changed shape in every era, and again and again people with power decided which families could have one, and which could stay together.

A Hidatsa woman named Buffalo Bird Woman told the story of her girlhood to a scientist, who published it in 1921. Home was her mothers' earth lodge on the Missouri River, with a floor more than forty feet across and a fire in the center. The women of the family owned it. Her father had four wives, all sisters, and she was taught to call all four her mothers. By 1921, she said, "We no longer live in an earth lodge, but in a house with chimneys."

This chapter describes American homes from the earth lodges and longhouses of the Native nations to the houses where parents worked and children went to school online in 2020. From era to era the houses change: the one-room colonial house, the log cabin, the city tenement, the sod house cut from the prairie, the bungalow and the suburban ranch house. As you read, watch four things: who lived together under one roof, who did the work of the house, whose land it stood on, and who decided which families could live there.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Who lived together under one roof, from the longhouse to today?
2. Who did the work of keeping house, and did stoves, pipes and wires make it lighter?

3. How did lenders and builders keep Black families out of new neighborhoods, and what did those families do?

Five minutes? Read "New home loans, and the red lines" in 1900 to 1950, then the story of Clyde Ross in 1950 to 2000.

Can skip: "Where the log cabin came from", "Bungalows, and houses sold by catalog", "The TV in the living room". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 3 MINUTES

A Native household was built around kin, a person's relatives by birth or by marriage, and in many nations several related families lived under one roof. Each nation built the kind of house that suited its climate and the way its families got their food. Children learned to work by working beside adults, and old people lived in the same household as the young.

Who was in charge of a longhouse?

Women ran the longhouse among the Haudenosaunee, several Native nations joined together in one union. The head of each house was the clan mother. She was the eldest or most respected woman of her clan, a large group of families who come down from the same ancestor. Women owned the house's everyday goods. The women of a longhouse and their children all came down from one woman who lived long ago, and every family traced itself back through the mothers' side.

The longhouse was a long building with a frame of wooden posts, covered with bark, and it held many related families. Two families lived in each section of the house, one on each side of an aisle, and they shared one fire in the middle. By different counts, one house held 30 to 60 people, or 20 families or more.

A woman's daughters and granddaughters lived in the longhouse all their lives. When they married, their husbands came to live with them. A son moved out when he married, into his wife's longhouse, but he still belonged to his mother's.

The earth lodge

Among the Mandan, Hidatsa and Arikara nations on the upper Missouri River, women built the houses and owned them. Their house was the earth lodge, a dome made of timber and packed over with earth. An older woman directed the building, and women kept the lodge in repair.

One earth lodge held about 10 to 20 people, most often sisters and their families. Markers put up by the State Historical Society of North Dakota state that most lodges were 35 to 45 feet across, and that one lodge took about 150 trees to build. A lodge lasted about ten years, and then the women built it again. The large villages had more than 100 lodges each.

Pueblos, wigwams and tipis

Taos Pueblo is a town of many homes joined together and stacked on top of one another, the kind of Native town called a pueblo. It is the northernmost of the nineteen Pueblos of what is now New Mexico. Its people built their homes of adobe, earth mixed with water and straw. They poured the adobe into molds or shaped it into bricks and dried them in the sun.

The two main buildings, the North House and the South House, rise five stories high. By the Pueblo's own estimate, people built them between about 1000 and 1450, and families have lived in them ever since. People have lived at Taos Pueblo without a break for more than 1,000 years.

In the Eastern Woodlands, the forests of the eastern part of the continent, many families lived in wigwams. A wigwam had a frame of saplings, thin young trees, covered with bark or with woven mats. On the Plains, the grasslands in the middle of the continent, families lived in tipis covered with animal hides. A family could take a tipi down and pack it up, so the household could move with the hunt.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

Most of the Europeans who came to this land in the 1500s were soldiers, priests and sailors, so European families were few, and Native households went on living in their own towns.

The newcomers carried diseases that Native people had never had before, and those diseases made Native people sick and killed many of them. About 200,000 Timucua people lived in what is now northern Florida and southern Georgia before the Spanish came. After one outbreak of disease after another, only about 2,000 were left by the 1650s, 1 for every 100 who had lived there. No record counts how many died in the 1500s alone.

St. Augustine, built in Seloy's town

Chapter 6 tells how Pedro Menéndez de Avilés founded St. Augustine in September 1565, inside Seloy, a town of the Timucua people. The town's chief, also named Seloy, at first offered Menéndez his council house, the building where the town held its meetings, and the Spanish used it as their first fort. Within months the Timucua were attacking the newcomers to drive them away. Seloy's town covered more than 12 acres, and its remains lie under what is now the Fountain of Youth Park in St. Augustine.

Few of the newcomers came as families. Of the 800 or so colonists, 26 were women, and an unknown number were enslaved Africans, people the Spanish owned as property and forced to work without pay.

Most Spanish men in St. Augustine had no wife. Most of the men who did marry had wives who were not Spanish, and from 1565 on, many Spanish soldiers married Native women. The Timucua traced their families and their inheritance through the mother's line.

Church officials in the town wrote down the names of the church's members. Their lists are called the Cathedral Parish records, after the parish, the group of people who belong to one church. The records begin on January 24, 1594, and they are the oldest church records that survive in the United States. The

first marriage in them is dated February 2, 1594. The first baptism, the church ceremony that welcomes a person, often a baby, into the church, is dated June 25.

Teresa and Francisco Camacho

Who: One of the mixed Spanish and Native households of early St. Augustine.

When and where: St. Augustine, Florida, 1580.

A Spanish soldier, his Native wife, her sister and her son.

One household in St. Augustine in 1580 held four people: Francisco Camacho, his wife Teresa, Teresa's sister Catalina and Catalina's son Juan. Teresa was a Native woman.

Francisco had come to Florida in the 1560s from San Lúcar de Barrameda, a town near Cádiz in Spain. He was a soldier in a regiment, a unit of the army, and he also worked as a fisherman.

NOT KNOWN: Teresa's nation. The account of this household does not name it.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

At Plymouth in 1620, English colonists built their houses on the site of Patuxet, a Wampanoag village. The usual English house in Massachusetts had one room, where the family lived and worked, and many households also held servants, enslaved people and boys from other families learning a trade.

Why Patuxet's houses stood empty

An English sea captain named Thomas Hunt kidnapped 20 Native people from Patuxet, a village of the Wampanoag nation on Plymouth harbor, in 1614. He also took 7 from Nauset, another Native community, and carried them all to Spain to sell them as slaves.

Then, between 1616 and 1619, a disease killed most of the Native people on the southeast coast of what is now Massachusetts. Estimates of the deaths run from one-third of the people to as many as 90 percent.

One of the kidnapped Patuxet men was Tisquantum, also known as Squanto. He made his way home in 1619 and found the houses empty and the cornfields grown over. The English who founded Plymouth Colony arrived the next year and built their houses at Patuxet. By then he was one of the last of the Patuxet people.

NOT KNOWN: what the disease was. Researchers have proposed several deadly diseases, among them plague, yellow fever and smallpox.

One room, then two

The basic English house in Massachusetts had a single room, called the hall. Next to it stood the chimney bay, the part of the house that held the chimney, the front door and the stairs. The family cooked, kept warm, had light and did its work at the hearth, the open fireplace in the hall that gave the room its heat and light.

The next step up was the hall-and-parlor house, with a second room called the parlor. The hall was still for cooking and work. The parlor was the best room, and it usually held a bed. Colonists went on building one-room houses well into the 1700s.

Births, deaths, servants and apprentices

A New England mother had about 8 babies, on average, and about 6 of them lived to grow up. People in New England lived long lives for the time. In the Chesapeake, the colonies around Chesapeake Bay, about half of all children died before the age of 20. About 1 baby in 4 died as an infant, and about another 1 in 4 before 20. Most children in the Chesapeake lost a mother, a father or both before they reached their teens.

A household also held people who were not family. Indentured servants, who had signed a contract to work for a master for a set number of years, lived and worked in the house as members of the household. Through the 1600s, colonists owned more and more enslaved people, and they forced them to work in their households without pay.

Apprentices. At about 14, and sometimes younger, a boy could leave home for good. His parents and a master signed a written contract called an indenture, and under it the boy had to live with the master and work for him. He served until the age of 21, for as long as 7 years, and learned the master's trade.

The master took the place of a parent. In the indenture he promised to feed the boy, give him a place to sleep, train him in the trade and give him some schooling. About two-thirds of these contracts required the master to teach the

boy reading or writing. At the end, the young man got freedom dues, a payment of clothes, tools or money.

Mary Ring

Who: A widow in Plymouth Colony whose will and list of belongings record what one household owned.

When and where: Plymouth Colony, from 1629 or 1630. She died in July 1631.

Governor Bradford owed her 2 pounds, and Winslow owed her beaver.

After Mary Ring died in July 1631, her belongings were written down one by one, in a list called an inventory. It survives, and it records what one Plymouth household owned.

The inventory lists her books: a Bible, a psalm book with the songs from the Bible's Book of Psalms, and books called *A Plea for Infants* and *Garland of Virtuous Dames*. Her clothes came in violet, red, blue, grey, white and black, and in a mixed color. Her will lists green cloth "to make a coat."

The inventory also lists money owed to her. Governor William Bradford owed her 2 pounds in English money, written in the record as "Due from Gov." Edward Winslow owed her beaver fur, which the record spells the old way: "Bever due from mr Wynslow."

She wrote her own will, the paper that says who gets a person's belongings after death, and signed her name to it. The colony's court officials proved the will on October 28, 1633, more than two years after she died, which means they agreed it was real, so it could be carried out. By then both of the men she had named to oversee the will had died, and her son Andrew was still a child. Another colonist, Thomas Prence, took on the job of looking after Andrew's share.

Her husband, William Ring, died in the city of Leiden, in the Netherlands, sometime between 1620 and 1629. The Rings belonged to a church of English Separatists, people who wanted to worship apart from the Church of England. The church had moved to Leiden, and in 1620 some of its members sailed to America and founded Plymouth.

The Rings had planned to go too, but they were among 20 people who could not sail when their ship, the Speedwell, turned back. Mary Ring came to Plymouth as a widow in 1629 or 1630 with her three children, Elizabeth, Susanna and Andrew. All three married in the colony.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 2 MINUTES

Each room had its own use in the new houses that wealthy colonists built in the early 1700s, but most families still lived in one or two rooms. In every kind of house, women and children made much of what the household used, from cloth to candles, and much of that work went on at the hearth.

A room for every use: the Georgian house

Wealthy colonists built a style of house now called Georgian, with both sides built to match. Its builders took its balanced look from ancient Greek and Roman buildings. A central hall ran through the middle of the house, with rooms opening off it. The formal rooms, the parlors and the dining room, were at the front, and the rooms for work were farther back. Some Georgian houses had four chimneys, one to heat each of the four main rooms.

In a house with separate rooms, the people in a family could be apart from one another and have some privacy. Houses like this belonged to wealthy families.

What a household made at the fire

Around the open fire in the hearth, a household spun and wove cloth and made candles, soap, butter and cheese. Its members preserved food so it would keep, and the cooks worked over the same fire. Women and children did most of this work. The historian Laurel Thatcher Ulrich described it in northern New England in her 1982 book *Good Wives*.

Sarah Kemble Knight

Who: A Boston businesswoman whose journal of a ride to New York records the households where she stayed.

When and where: On the road from Boston to New Haven and New York and back, October 1704 to early 1705.

A bed "as hard as it was high," warmed with a hot stone.

Sarah Kemble Knight lived in Boston, where she ran a business and taught. In October 1704 she set out on horseback for New Haven and New York on legal business, and she kept a journal of the trip. In it she wrote about the road, the inns and the households where she stayed the night.

She stayed in New York for about two weeks and started home on December 21. Near Eastchester, New York, her party got lost in a great storm of wind and snow. One woman would hardly let them through her door, but the woman's son invited them in.

He showed Knight a bed "as hard as it was high," and he warmed it with a hot stone at her feet. The family had nothing in the house but milk. They boiled it and sweetened it with molasses for her.

Her journal stayed unprinted for about 120 years, until Theodore Dwight printed it in 1825.

Why this story is here: Few pieces of writing by American women survive from that time, and her journal is one of them.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 4 MINUTES

When men left home during the Revolutionary War, women ran the households. A household still made most of what it used, and women and children still did most of that work. On the frontier, the edge of the colonists' settlements on land where Native nations lived, families made their homes in log cabins. Families in the older settlements lived in farmhouses.

Where the log cabin came from

The log cabin was the usual first house of a frontier family by the second half of the 1700s. Settlers from Sweden and Finland had brought it to America more than a hundred years earlier. To build one, they cut notches near the ends of the logs so that the logs locked together at the corners.

These settlers came to the colony of New Sweden on the Delaware River from 1638. Among them were the Forest Finns, who were skilled at building with logs. The Nothnagle Log House in Greenwich Township, New Jersey, built in about 1638 to 1643, still stands. A common story says the first English colonists lived in log cabins, but the English at Plymouth and at Jamestown did not build them.

Whose land. New Sweden was built on Lenape land. Peter Minuit's Swedish and Dutch crew sailed up the Delaware River in the spring of 1638 and made agreements with several sachems, or leaders, of the Lenape and Susquehannock nations. With the sachems' permission, the crew built Fort Christina.

Several thousand Lenape lived in separate communities along the river, and people at the time counted them as the owners of the land beside it. The Lenape welcomed the colony because its people brought goods to trade. New Sweden lasted 17 years before the Dutch took control of it.

Abigail Adams

Who: Ran her family's farm, its money and her children's education through the Revolutionary War while her husband, John Adams, was away.

When and where: Braintree, Massachusetts, in the part that is now the city of Quincy, 1774 to 1784.

Movie: *John Adams* (2008), a miniseries made for HBO. It is about John Adams and his family, and Abigail Adams is one of its main characters.

Charles, who was 6, was given smallpox on purpose three times.

Abigail Adams ran the family farm at Braintree, Massachusetts, and managed its money from 1774, while her husband, John Adams, was away for years at a time. He served first in the Continental Congress, the meeting of leaders from the colonies, and then in Europe as a diplomat, a person who represents a country to other governments. Abigail taught the children herself, and she and John wrote each other more than 1,100 letters.

The inoculation. She took all four children to Boston in July 1776 to be inoculated, which meant giving a healthy person smallpox on purpose so that the person got a milder case. A doctor cut the skin with a small blade called a lancet. Then he put in a thread soaked in pus from a smallpox sore.

Caught the natural way, smallpox killed about 30 of every 100 people who got it. Of every 100 people inoculated, about 2 or 3 died. People who lived through smallpox usually did not catch it again, so inoculation gave them that protection at far less risk.

Abigail wrote to John from Boston on July 13, 1776: "I yesterday arrived and was with all 4 of our Little ones innoculated for the small pox." Their doctor was Dr. Bulfinch. She wrote that the children "stood the opperation Manfully," which meant they were brave about it.

Nabby, who was 10, broke out in many painful sores, while 9-year-old Johnny had a light case. Charles was 6, and he had to be inoculated three times before he caught the smallpox. Thomas, the fourth child, showed no sickness at first and had to be inoculated again.

Her years of running the farm alone ended in 1784, when she and Nabby sailed to Europe to join John.

Martha Ballard

Who: A midwife in Maine whose daily diary, kept for 27 years, records the work of an ordinary American household.

When and where: Hallowell, Maine. The diary runs from January 1785 to 1812.

Movie: *A Midwife's Tale* (1997), a documentary made for the PBS series *American Experience*. It is about Martha Ballard.

She wrote down 816 births, each one with a name.

Martha Ballard was a midwife, a woman who helps other women give birth, in Hallowell, Maine. She wrote in her diary nearly every day for 27 years, from January 1785 to 1812: about 10,000 entries over 9,965 days. The diary records 816 births that she helped with.

Around those births, the diary records the daily work of her own household: her garden, spinning, weaving, quilting and brewing, the work her daughters did, the visitors who came and the weather each day.

The historian Laurel Thatcher Ulrich, who wrote *Good Wives*, published a book about the diary, *A Midwife's Tale*, in 1990. Ulrich won the Pulitzer Prize, a yearly American prize for writing, for the book. The whole diary can be read online at DoHistory.org.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 9 MINUTES

Middle-class families in towns and cities, the families in between the rich and the poor, began in the early 1800s to treat the home as a place set apart from paid work. From the 1830s, cooks began to trade the open hearth, the fireplace where food cooked over the fire, for the iron stove. On farms, children's chores came first, and school fitted around them. In the South, enslavers could sell any member of an enslaved family at any time.

The parlor and the home apart from work

In these families the home was the mother's to run, and paid work happened somewhere else. The parlor, the front room where the family received visitors, became the room for showing off the family's best things.

The historian Aileen Kraditor gave these ideas a name in 1968: the cult of domesticity, the strongly held belief that the home was a place set apart from paid work and that it was the mother's to run. Catharine Beecher's 1841 book, *A Treatise on Domestic Economy*, a title that means a long book about running a home, described how to run a home of this kind. Readers used it as a guide.

Was the iron stove better than the fire?

For the woman who did the cooking, the stove was better in some ways and worse in others. It meant less bending and lifting, less smoke, and no ash in the food. But it took hard work to clean, and stoves were drafty and hard to control.

Iron cookstoves spread through American kitchens from the 1830s. Foundries, the workshops where iron was melted and poured into molds, made stoves of many designs. By 1850 most middle-class kitchens in the cities had a stove in place of the open hearth, and poorer families and families far from towns changed over later.

Some writers disliked the change. Henry David Thoreau complained in 1846 that the stove "concealed the fire." He wrote that cooking had become "merely a chemic process," by which he meant a kind of chemistry.

A child's day, and where school fit in

On a farm, a child's chores came first. Country schools, called district schools, usually held two terms a year. The summer term ran from about May to August, for the younger children, and women usually taught it. The winter term ran from about November to April, when older boys were not needed for work on the farm, and men were often hired to teach it.

Children missed school when the weather was bad or when there was work to do at home. The teacher often lived with the students' families, staying with one family and then the next, which people called boarding around.

The rod. At home, parents expected children to obey, and many parents hit their children with a rod, a stick or switch used for punishment. They pointed to a verse in the Bible's book of Proverbs: "He that spareth his rod hateth his son: but he that loveth him chasteneth him betimes."

The verse means that a father who does not use the rod hates his son, and a father who loves his son punishes him early. Some writers of advice books in the 1800s began to tell parents to punish children calmly and firmly instead. One of them told parents never to punish a child in anger.

Home under slavery

Enslavers could break up an enslaved family on any day. They sold enslaved people, and slave traders bought them and moved them. Lawmakers and courts in the slave states did not count the marriages of enslaved people as legal marriages, and enslavers sold husbands and wives apart.

Traders forced more than 1 million enslaved people to move from the Upper South to the Deep South, the states farther south, between about 1790 and 1860. From 1820 they moved about 200,000 people every ten years. They marched them overland in chained lines called coffles, or shipped them by sea to New Orleans, which had the largest slave market in the country.

By the count of the Equal Justice Initiative, an American organization, the traders separated nearly half of the people they moved from a husband, a wife or a parent.

Catharine Beecher

Who: Wrote a book of instructions for running an American home, and argued that keeping house was a skill to be studied and taught in schools.
When and where: Hartford, Connecticut, from 1823. Her *Treatise on Domestic Economy* came out in 1841.

One book on running a home went through about 15 editions.

Catharine Beecher's *A Treatise on Domestic Economy*, published in 1841, was the first American book to describe every part of running a home. Printers issued it in about 15 editions and put out new copies nearly every year for years.

Beecher argued that housekeeping was a profession, a skilled job that people should study and that schools should teach. She had founded the Hartford Female Seminary, a school for girls and young women in Connecticut, in 1823. In 1869 she and her sister Harriet Beecher Stowe wrote another book about the home, *The American Woman's Home*.

Buffalo Bird Woman (Waheenee)

Who: A Hidatsa woman who grew up in her mothers' earth lodge and later told the story of her life to the anthropologist Gilbert Wilson.

When and where: About 1839 to 1932. Born by the Knife River and raised at Like-a-Fishhook village on the Missouri River, in what is now North Dakota.

Her family believed that "an earth lodge was alive and had a spirit."

Buffalo Bird Woman grew up in the 1840s in an earth lodge, a large round house with a frame of timber, covered over with packed earth. Her household held her father, his four wives, her grandmother and her great-grandmother.

Late in her life she told the story of that household to Gilbert Wilson, an anthropologist, a scientist who studies how groups of people live. He interviewed her every summer from 1906 or 1907 to 1918. She spoke Hidatsa and never learned English. Wilson published her story in 1921 as *Waheenee: An Indian Girl's Story*, and her son, Edward Goodbird, drew the pictures for Wilson's books.

She was born in an earth lodge near where the Knife River meets the Missouri, about 1839.

When she was ten days old, an old man named Nothing-but-Water gave her the name Good Way. Later her father gave her the name Waheenee-wea, Buffalo Bird Woman, because she was a sickly child, and people believed a new name could move the gods to help her.

Her father, Small Ankle, was a Hidatsa chief. He had four wives, and they were sisters: her mother, Weahtee, and Red Blossom, Stalk-of-Corn and Strikes-Many Woman. "I was taught to call all these my mothers," she said. "Such was our Indian custom." Her great-grandmother White Corn and her grandmother Turtle lived with the family too.

The smallpox winter. Smallpox, a deadly disease that spreads from person to person, came up the Missouri River in June 1837, before she was born. The American Fur Company's steamboat *St. Peters* carried

passengers sick with it. Francis A. Chardon ran Fort Clark, a trading post near the Mandan and Hidatsa villages, where traders swapped goods for furs. He met the boat 30 miles downstream and heard that people on it were sick.

The boat landed at Fort Clark on June 18 or 19. In less than a day, workers from the boat and the fort unloaded goods and loaded furs, and villagers came and went from the boat.

About 2,000 Mandan people were alive in the spring of 1837. By October, smallpox had killed all but 138 of them. Buffalo Bird Woman's great-grandmother told her: "More than half of my tribe died in the smallpox winter. Of the Mandans only a few families were left alive. All the old people and little children died."

The move. When she was four, the Mandan and Hidatsa chiefs moved their people together to one new village at Like-a-Fishhook Point on the Missouri, to protect them from attacks by the Dakota and the Yanktonai. The village stood by 1845. Women and dogs carried the family goods there, some loads on their backs and some on travois, frames of two poles that the dogs dragged along the ground.

The people built about seventy summer earth lodges at the new village, most of them in the second summer. For the winter, families built small huts in the woods, and the June flood often swept them away.

In the first hard winter at the new village, when she was about six, the family camped at Many-Frogs Brook, three miles away. Smallpox broke out again with the first snow. "My brother, my mother Weahtee, and her sister Stalk-of-Corn, died," she said. Her grandmother Turtle made her a doll of deerskin with eyes of bone beads.

Inside the lodge. The women of a household owned its earth lodge. Her mothers' lodge had a floor more than forty feet across, with the fire in the center. A screen of upright split logs stood between the fire and the door

and kept out drafts and dogs. Her father's bed, of cottonwood planks and buffalo robes, stood in front of the fire, where the oldest person in the family usually slept, because it was the warmest place.

The rest of the family slept in covered beds against the back wall. The buffalo-skin bedding could not be washed, so her mothers aired it on the stage, the raised platform where they dried their corn. The family believed that "an earth lodge was alive and had a spirit."

Later years. Her first husband was Magpie, and her son Goodbird was born in 1869. Federal officials, the officials of the national government, carried out a law of 1887 called the Dawes Act in the late 1880s. They divided reservation land, the land set aside for a Native nation to live on, into allotments, plots that they assigned to one family each, and they sold the land left over.

Native nations held about 138 million acres in 1887 and about 48 million in 1934. Once the reservation was divided, the families of Like-a-Fishhook left the village to live on the plots assigned to them, and by the late 1880s the village was gone. In 1921 she said: "We no longer live in an earth lodge, but in a house with chimneys." She added that "my son's wife cooks by a stove." She still got up at daybreak to hoe her corn and sing to it. She died in 1932.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 8 MINUTES

Where an American family made its home in these years depended on how much money it had and what part of the country it was in. In New York, a working family might rent a tenement flat of small rooms, with shared toilets out in the yard. A middle-class family might have a house with a parlor for guests, a dining room for meals and a paid servant to help run it. On the plains, where few trees grew, settler families cut their houses out of the ground.

Lawmakers and officials also began to decide where children spent their days. State lawmakers required children to go to school, and federal officials took Native children away from their homes to distant schools.

The tenement flat

The tenement at 97 Orchard Street in New York, which Chapter 6 describes, was a building of small apartments, called flats, rented to working families. Families lived in small rooms, and some took in boarders, people who paid to sleep in the family's rooms. They carried water into the flat by hand and shared privies, outdoor toilets, in the yard.

Lawmakers in New York began to change what a tenement had to include. Under the Tenement House Act of 1879, builders added air shafts, narrow gaps between buildings meant to let in air and light. Governor Theodore Roosevelt appointed a commission, a group of people chosen to study the housing laws, in 1900. Lawrence Veiller, its secretary, did most of the investigating and helped write a new law.

New York's state lawmakers passed that law on April 12, 1901. It required a window in every room and a toilet in every new apartment. Owners of old tenements had to give them better light and add one toilet for every two families.

Bigger houses and paid help

Families who could pay for them built houses with a parlor for guests and a separate dining room. City homes got running water inside the house first, and farm families waited decades longer. In 1890, 24 of every 100 American households had running water, and 8 of every 100 had electricity.

Some middle-class homes also had paid help. The census of 1870, the count of the country's people taken every ten years, was the first to record the jobs of working women in full, by a set method. The census takers counted 867,354 women in domestic service, paid work in another family's home. That was about 47 of every 100 women who worked for pay, by far the most common paid job for women.

Sod houses, dugouts and the Dakota land under them

The plains had few trees, so settler families there built with sod, the top layer of prairie soil, held together by the roots of the grass. Settlers used a plow to cut about an acre of ground into strips 12 inches wide and 4 inches thick, and they cut the strips into pieces about three feet long.

Builders laid these sod bricks grass side down, turning each layer lengthwise and then crosswise, to make walls two feet thick. Most early sod houses had dirt floors. Women who lived in them complained about the dirt, the bugs, the snakes, the leaking roofs and the poor light.

Some families dug their home, called a dugout, into the side of a hill or a creek bank. A dugout took less work to build than other kinds of house. Charles and Caroline Ingalls settled in a dugout on Plum Creek, near Walnut Grove, Minnesota, in May 1874. Their crops failed three years in a row, and in 1876 they left. The hollow in the creek bank where the dugout stood is still there, on what was once the Gordon farm.

Whose land. Walnut Grove lies on land the Dakota signed away in 1851 under treaties, written agreements between nations. At Traverse des Sioux on July 23, 1851, three men bargained with the Sisseton and Wahpeton Dakota

for about 24 million acres. Luke Lea spoke for the US government. With him were Alexander Ramsey, the governor of Minnesota Territory, which was not yet a state, and Henry Sibley.

The three men agreed to pay about 7.5 cents an acre. The Dakota believed US officials would take the land by force if they refused. After the treaty was signed, the fur trader Joseph R. Brown had Dakota leaders sign another paper, and no one read it aloud to them or translated it.

Under that paper, traders could take the annuity money, the yearly payments promised to the Dakota, for debts the traders claimed the Dakota owed them. Within ten years, more than 100,000 white settlers moved onto the land.

School laws and the boarding schools

Massachusetts lawmakers passed a law in 1852 that required children aged 8 to 14 to go to school for twelve weeks a year. By 1900, 32 states had such a law, and by 1918 every state had one, Mississippi last. Under these laws, families had to send their children to school for part of the year.

Federal officials took Native children from their families to boarding schools far away. Richard Henry Pratt, an Army officer, opened the Carlisle Indian Industrial School, a boarding school for Native children, on November 1, 1879.

Forced attendance. Members of Congress passed a law in 1891 that gave the Commissioner of Indian Affairs, the federal official in charge of Native affairs, a new power. He could make and enforce rules forcing Native children to attend school. Two years later they allowed officials to hold back food rations, clothing and payments owed to parents who refused to send their children.

At the schools, staff cut the children's hair, took away their clothes and gave them English names. Staff beat children who spoke their own language, locked them up alone, held back their food or washed their mouths out with soap. Survivors and a federal investigation later reported these punishments.

Officials of the US Department of the Interior reported on these schools in 2022 and 2024. They counted 417 federal boarding schools for Native children in 37 states or territories, open between 1819 and 1969, and at least 973 children who died at those schools. Their report states that this count is low.

Nathalie Gumpertz

Who: A tenement mother of four who became a dressmaker after her husband disappeared.

When and where: 97 Orchard Street, New York. Her husband Julius disappeared in 1874. A judge declared him dead in 1883.

Three dresses a week, sewn in the front room of a tenement flat.

Nathalie and Julius Gumpertz were immigrants from East Prussia who lived at 97 Orchard Street. They were living there during the Panic of 1873, a money crash in which many people lost their jobs. One morning in 1874, Julius left for work and never came back, and Nathalie was left with four young children.

She became a dressmaker and worked in the front room of the flat, the parlor. She made about three dresses a week and earned 8 to 9 dollars.

A judge declared Julius legally dead in 1883, which meant that under the law he counted as dead. Because of that, Nathalie could claim 600 dollars that he was due from his father's estate, the money and property his father left when he died. She then moved the family to upper Manhattan.

Later, researchers who trace family histories for the Tenement Museum in New York found that Julius had gone to Cincinnati.

Rachel Calof

Who: A young woman from Russia who came to North Dakota for an arranged marriage and later wrote down what keeping a homestead house was like.

When and where: Near Devils Lake, North Dakota, 1894 to 1904. She wrote her memoir in 1936, and it was published in 1995.

In winter, in-laws and chickens shared their one 12-by-14-foot room.

Rachel Calof was 18 when she traveled from Russia to marry Abraham Calof in 1894. It was an arranged marriage, planned by other people rather than by the couple. Abraham was a homesteader, a settler who claimed land from the US government to live on and farm.

The couple lived in a shanty, a small, roughly built house, 12 feet by 14 feet with a dirt floor. In the winters, Abraham's parents and brothers, and the chickens, shared the one room with the couple to save fuel. Of all the hardships, she wrote, "the lack of privacy was the hardest to bear."

She wrote a memoir, a book about her own life, in 1936, in Yiddish, a language spoken by many Jews in Eastern Europe. It records her years on the homestead from 1894 to 1904. Indiana University Press published it in English in 1995 as *Rachel Calof's Story*.

Whose land. The land around Devils Lake was Dakota land. Under a treaty of 1867, the land south of the lake became a reservation for the Sisseton and Wahpeton Dakota and the Cut Head band of Yanktonai Dakota. The Dakota name for the lake is Mni Wakan, Spirit Water.

Settlers who were not Native illegally claimed 64,000 acres of the reservation, and the Dakota bargained with the US government and accepted 345,000 dollars for that land. Federal officials opened 100,000 more acres of the reservation to settlers in 1904, at about 4 dollars and 50 cents an acre. By 1934 the Dakota owned a little more than 50,000 acres of it.

NOT KNOWN: whether the Calofs' own claim lay on land taken from the reservation. The State Historical Society of North Dakota's history of the reservation does not say.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 12 MINUTES

Running water and electric power reached most American homes between 1900 and 1950, city homes first and many farm homes decades later. After the Great Depression, the hard times of the 1930s, federal officials made home loans easier to pay off, but they usually refused to back loans in the neighborhoods where Black families lived.

Why washday took more than a day

Without running water or electric power, washing a family's clothes by hand took more than one day. The person doing the wash first sorted the clothes and treated the stains, and then the clothes soaked in warm soapy water for one or two days. Next the washer scrubbed them on a washboard, a ridged board set in a tub of warm water and soap.

Then the washer boiled the clothes in a pot with soap and soda to kill lice, stirring them with a wooden stick called a dolly. After rinsing the clothes, the washer hung them out to dry, with the whites in the sun to bleach them. Last came the ironing, with flatirons, solid metal irons heated over the coals and held with a rag around the handle.

Pipes and wires. Water pipes and electric wires reached city homes first and farm homes decades later. In 1940, 74 of every 100 American homes had running water, and by 1950, 83 did. Officials of the Census Bureau, the federal office that counts the country's people and homes, found that more than one home in three had no flush toilet in 1940. Most of the homes without running water were in the country.

Electric power spread the same way. By 1950, 94 of every 100 households had it, but farms came last: fewer than 11 of every 100 farms had electric power in 1935, and about 9 in 10 had it by 1950.

From icebox to refrigerator. In 1930, 14 of every 100 households had a modern refrigerator, and by 1950, 80 did. A family without one used an icebox, a cabinet cooled by a block of ice, and relied on the iceman's deliveries, on milk brought each day and on canned food. The refrigerator ended the iceman's rounds and the daily trip to buy fresh food.

Cowan's argument. The historian Ruth Schwartz Cowan studied what the new machines did to a housewife's work. In her 1983 book *More Work for Mother*, she argued that washing machines, vacuum cleaners and other new conveniences mostly replaced work that servants, children and men had done before. She wrote that a housewife of 1950 kept a middle-class home clean and comfortable by herself, work that a household of 1850 had needed three or four workers to do.

At the same time, families expected clothes washed more often, houses kept cleaner and more cooking done. So, in Cowan's argument, the housewife's own hours of work did not fall. Census counts record one part of the change: the number of domestic servants fell by 32 percent between 1940 and 1950.

Mokyr's answer. Another scholar, Joel Mokyr, agreed that the hours did not fall, and in 2000 he gave a reason. In the late 1800s, scientists showed that germs cause many diseases. Doctors and nurses then told housewives that keeping germs out of the house would keep their families healthy, so, Mokyr wrote, housewives cleaned more.

Bungalows, and houses sold by catalog

The small family house of this era was the bungalow, a house of one main floor with a low roof and a front porch, and sometimes rooms tucked under the roof. In Chicago, more than 80,000 brick bungalows built between 1910 and the mid-1930s still stand.

Sears, Roebuck and Company sold whole houses by catalog from 1908 to 1940. A buyer chose a design, and the house came by railroad in boxcars, as a kit. The average kit held about 25 tons of materials and more than 30,000 parts. Many buyers put the house together themselves with relatives, friends and neighbors, and others hired local carpenters. The first Sears house catalog, in 1908, offered 44 designs priced from 360 dollars to 2,890 dollars.

NOT KNOWN: how many kit houses Sears sold. Nobody kept an official count, and the usual estimate is 70,000 to 75,000, with some estimates as high as 100,000.

The Rogarshevskys and the tailor's disease

When Abraham Rogarshevsky died of tuberculosis on July 17, 1918, his widow kept the family in its tenement home by working for the building and renting out space. The Rogarshevskys were a Jewish family from Lithuania who had lived since about 1908 at 97 Orchard Street in New York.

Tuberculosis, a disease caused by a germ, usually infects the lungs, and it spreads through the air when a sick person coughs or talks. People then called it "the tailor's disease." After Abraham died, his widow, Fanny, became the building's janitor, the worker who cleaned the building and kept it in repair. She also took in boarders, people who paid to live in the family's rooms.

New home loans, and the red lines

A home loan was hard to pay off before the 1930s. Under a mortgage, a loan to buy a house, the lender can take the house if the borrower does not repay it. The usual mortgage ran for 5 to 10 years, and each month the borrower paid only the interest, the fee for borrowing the money.

At the end, the borrower owed the whole amount at once. Buyers usually had to pay about half the price up front, as a down payment. In the Great Depression many borrowers could not pay, and lenders foreclosed, which means they took the houses back.

The 1933 law. Members of Congress passed the Home Owners' Loan Act in June 1933, and under it federal officials set up the Home Owners' Loan Corporation, or HOLC. HOLC officials replaced families' old loans with new loans that ran for 15 years at a fixed rate, which means the interest charge never changed. The family paid the same amount every month, and each payment paid off part of the loan itself.

Members of Congress set up the Federal Housing Administration, or FHA, in 1934. FHA officials insured home loans, which means they promised to repay the lender if the family could not. Those loans ran 20 to 25 years and needed only a small down payment. After the Second World War the 30-year loan became the usual kind.

Graded by color. Chapter 6 tells the story of the HOLC maps. Between 1935 and 1940, HOLC staff graded city neighborhoods with help from local bank loan officers, real estate agents and appraisers, the people whose job is to judge what a property is worth. Each neighborhood got a grade from A, "Best," down to D, "Hazardous," and the staff shaded the D neighborhoods red. Refusing loans in a neighborhood came to be called redlining, after those red areas.

FHA officials used a rating system of their own. They too rated neighborhoods where Black people lived "D," and they usually refused to insure loans there. The story of Clyde Ross, in 1950 to 2000, shows what that meant for one family.

Depression households

Families changed who lived together under one roof during the Great Depression. Couples waited to marry: there were 10.1 marriages each year for every 1,000 Americans in 1929, and 7.9 by 1932. For the first time in US history, parents had too few babies to replace their own generation.

Families doubled up in one home. Young married couples moved back in with their parents, and old parents moved in with their grown children. By 1940, 1.5 million married women lived apart from their husbands.

One room in Bronzeville. In Chicago, Black families who had moved north from the South settled in a South Side neighborhood called Bronzeville. Chapter 6 describes the restrictive covenants, written agreements not to sell or rent to Black people, that white owners signed on many other blocks. Because of those agreements, Black Chicagoans were limited mostly to the Black Belt, an area between 12th and 79th streets on the South Side that took in Bronzeville.

Landlords there split apartments into one-room units called kitchenettes and charged very high rents for them, and Bronzeville held more than 80,000 of them. A whole family lived in one room and shared a bathroom down the hall with everyone else on the floor.

Some buildings had no proper heat. Families lit kerosene lamps, and the stoves they rigged up often overheated and started fires. In one year, about 751 fires broke out in the Black Belt. The writer Richard Wright recorded this life in his 1941 book *12 Million Black Voices*.

Expert advice, and parents' letters about hitting

Many parents of the 1920s and 1930s began to take advice from experts on child development and psychology, the study of the mind and of how people behave. John B. Watson's 1928 book, *Psychological Care of Infant and Child*, sold 100,000 copies within months.

Watson told parents: "Never hug and kiss them. Never let them sit in your lap." He went on: "If you must, kiss them once on the forehead when they say goodnight." He advised them to "shake hands with them in the morning."

Letters about hitting. Parents wrote to Angelo Patri, a popular expert on raising children, for advice from 1924 to 1939. In 2004 three researchers published a study of 147 of these letters that mentioned corporal punishment, hitting a child as a punishment. Most came from middle-class parents.

The parents wrote more about how useful hitting was than about a child's right to be kept safe from harm. The reasons they gave most often were that the child had disobeyed or been rude. One letter in four described an argument about hitting with another adult close to the family.

The teenager, and the war at home

A new word for a stage of life came into use in these years: teenager. More children stayed in high school instead of going to work, and that is part of why people began to see the teenage years as a stage of their own.

Writers had printed "teen ager," as two words, as early as 1913. A 1941 article in *Popular Science* printed it with a hyphen, as "teen-agers," and this is usually named as the first time it appeared in print as one word rather than two. The word spread in the late 1940s, when advertisers used it to sell goods to young people.

The war at home. During the Second World War, individuals and families moved to cities with war factories to take well-paid jobs, and more Americans moved from one part of the country to another than in any earlier period. Richmond, California, grew from fewer than 24,000 people to more than 100,000 during the war.

Six million women worked in war-industry jobs that women had not held before. At home, federal officials limited how much of twenty kinds of goods each family could buy, and families shopped with ration books.

The Baldizzi family

Who: A Sicilian immigrant family who lived through the Great Depression in a tenement flat. Museum staff later rebuilt their apartment from the daughter's memories.

When and where: 97 Orchard Street, New York, 1928 to 1935.

Their apartment was rebuilt from what one daughter remembered.

Adolfo and Rosaria Baldizzi raised their children, Josephine and Johnny, in a flat at 97 Orchard Street from 1928 until 1935. Adolfo had come to the United States from Palermo, in Sicily, in 1923. He was a trained woodworker who made fine furniture, but during the Depression he could find only odd jobs.

Rosaria sewed the linings into coats in a garment factory. In the evenings the family sat at the kitchen table to play cards and listen to the radio. Adolfo built a corner cabinet himself.

Forced out. New York City officials required owners of old tenements to make costly repairs, such as fireproofing, in 1934 and 1935. The owner of 97 Orchard Street chose to empty the apartments rather than pay for the work. The owner evicted the families who still lived there, which means the owner forced them to leave.

Next the owner boarded up the upper windows and sealed off the floors where people had lived, and the Baldizzis had to move. The museum's accounts of the family do not name the owner.

After the Tenement Museum was founded in 1988, Josephine Baldizzi came back to 97 Orchard Street and recorded hours of memories of her childhood there. Museum staff rebuilt the family's apartment from what she remembered.

Theodore and Patricia Bladykas

Who: The first family to move into Levittown, with their 14-month-old twin daughters, Patricia Ann and Betty Ann.

When and where: October 1, 1947, 67 Bellmore Road, Levittown, Long Island, New York.

Levittown's lease allowed only white families, and servants of any race.

Theodore and Patricia Bladykas were the first family to move into a house in Levittown. They moved in on October 1, 1947, with their twin daughters, Patricia Ann and Betty Ann, who were 14 months old. A photographer from the newspaper *Newsday* took their picture that day, when the first 300 families moved into Levittown.

Chapter 6 tells how the company Levitt and Sons, run by William Levitt, built Levittown. The first houses rented for 60 dollars a month, and a renter could buy the house for 7,500 dollars after a year. From 1949 the company sold ranch houses, long, low houses of one story, for 7,990 dollars. Many of the fathers who moved in were veterans just back from the Second World War.

Clause 25. William Levitt and his company rented and sold these houses to white families only. Clause 25 of the Levittown lease, the paper that set the rules for renting, stated that no "person other than members of the Caucasian race," meaning no one who was not white, could live in the house. The one exception was for servants: a white family could employ servants who were not white, and those servants could live with the family in the house.

The justices of the US Supreme Court ruled in 1948, in the case *Shelley v. Kraemer*, that courts could not enforce rules like this. William Levitt dropped the written clause and kept refusing to sell to Black families. His sales contracts forbade buyers to resell their houses to African Americans.

He said that if a Black family bought a house in Levittown, white families would stop buying there. He told the *Saturday Evening Post* in 1954: "We can solve a housing problem, or we can solve a racial problem. But we cannot combine the two."

BY 1950

If you remember one thing: Running water, electric wires and long home loans reached most American families between 1900 and 1950, and FHA officials usually refused to back loans in the neighborhoods where Black families lived.

- In 1890, 24 of every 100 households had running water and 8 had electricity.
- In 1950, 83 of every 100 had running water and 94 had electricity.

Next: The suburbs grow after 1950, and a crowd attacks the house of the first Black family in Levittown, Pennsylvania.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 9 MINUTES

A house in the suburbs became the common picture of American family life after 1950. The share of households that owned their home rose from 43.6 of every 100 in 1940 to 61.9 in 1960. Lenders and sellers kept Black families out of many of the new suburbs, and in Levittown, Pennsylvania, a mob attacked the house of the first Black family to move in.

Inside the house, families planned their evenings around the new television set. Later in the century, more mothers took paid jobs, the divorce rate more than doubled and some parents began to teach their children at home.

Who got to move to the suburbs

Some 76 million babies were born in the United States between 1946 and 1964, the years people call the baby boom. Builders put up more towns like Levittown, including a second Levittown in Pennsylvania from 1952.

Builders, sellers and lenders went on with redlining and whites-only sales for many years after the 1948 Supreme Court ruling. Activists campaigned against these practices. In 1968 members of Congress passed the Fair Housing Act, which made it against the law to refuse to sell or rent a home to someone because of race.

The TV in the living room

Most American families bought their first television set in the 1950s. About 9 of every 100 households had a set in 1950, 64.5 had one by 1955, and 87 by 1960.

The household changes shape

The divorce rate more than doubled between 1960 and 1980, from 9.2 divorces each year for every 1,000 married women to 22.6. The rate reached its peak in 1981 and then began to fall.

More mothers took paid jobs. In 1948, about 17 of every 100 married mothers were in the labor force, which means they worked for pay or were looking for paid work. By 1985 the figure was 61 of every 100, and by 1995 about 70. With both parents at work, more families paid for day care.

Latchkey children. Some children went home after school to an empty house. People called them latchkey children, because they carried their own key to the house.

The counts of them differed widely. Census Bureau researchers found about 2.1 million children aged 5 to 13 regularly home alone in a 1987 study, while advocacy groups, which campaign for a cause, estimated 6 to 7 million. In the fall of 1995 Census Bureau workers counted 6.9 million children aged 5 to 14, or 18 of every 100, who regularly looked after themselves, on average six hours a week.

School comes home

Some parents began to teach their children at home in the 1970s and 1980s instead of sending them to school. Homeschooling had two separate starting points. John Holt wanted to change how schools taught, and he started a newsletter called *Growing Without Schooling* in August 1977. On the religious side, Raymond Moore argued for keeping young children at home in his 1981 book *Home Grown Kids*.

Taught in secret. In many states, homeschooling was against the law, or nearly impossible to do legally, into the 1980s. Most state laws of the 1970s did not say whether it was allowed, and many families taught their children in secret.

A judge in a Massachusetts court ruled in 1978 that homeschooling was legal if the parents were able to teach, covered the required subjects and showed that the children were learning. Over the next fifteen years, judges in other states ruled that homeschooling was legal, each state with its own rules.

In most homeschooling families the mother did the teaching, and many mothers stayed home to do it. Families also met in homeschool groups.

Daisy and William Myers

Who: The first Black family in Levittown, Pennsylvania: a war veteran, a teacher and their three small children, who stayed in their house while crowds attacked it.

When and where: 43 Deepgreen Lane, Levittown, Pennsylvania, from August 13, 1957, to 1961.

Movie: *Crisis in Levittown* (1957), a documentary by Lee Bobker and Lester Becker, filmed while the events were happening.

Crowds of up to 1,000 people stood outside their new house.

William and Daisy Myers and their three small children moved into 43 Deepgreen Lane in Levittown, Pennsylvania, on August 13, 1957. They were the first Black family to live in Levittown. William had served in the Army in the Second World War, and Daisy was a teacher. Lewis Wechsler, a white Jewish friend, helped them arrange to buy the house.

The crowds. Crowds of 200 to 1,000 people gathered on Deepgreen Lane for more than a week. People in the crowds threw rocks through the windows of the house and threw Molotov cocktails, bottles filled with fuel and set on fire. They burned crosses, one of them at the Wechsler house.

Members of the Ku Klux Klan, a group whose members bombed and attacked Black Americans, had used burning crosses as a threat for decades, to make the people who saw them fear they would be attacked. The account of the attacks on Deepgreen Lane does not say who in the crowds burned the crosses there.

Callers threatened the family by telephone. Milk, bread and oil stopped coming to the house, and the family's fire insurance was canceled. On the seventh night more than 500 people gathered before state troopers, the state police, broke up the crowd.

Who organized it. Members of the Levittown Betterment Committee passed around a petition, a paper that many people sign to ask for something, against letting Black families live in Levittown. The

committee's members also organized the harassment of the family, the steady stream of acts meant to frighten them. A judge ordered the Betterment group to stop.

Pennsylvania Governor George Leader sent the state police, and after about six weeks the troopers had ended the open violence. A court found two people guilty of burning the cross on the Wechsler lawn.

Neighbors, church members and Quaker families, members of the Christian church called the Society of Friends, brought the Myers family food and flowers. The family stayed in the house until 1961, when they moved to York, Pennsylvania. Daisy Myers told the story in her memoir *Sticks 'n Stones*, a book about her own life published in 2005.

NOT KNOWN: who stopped the deliveries, which company canceled the insurance, and who the two people found guilty were. The Baltimore Sun's 1997 account names none of them.

Clyde Ross

Who: A Second World War veteran and soup-factory worker who could not get a mortgage and bought his Chicago house on contract.
When and where: North Lawndale, on Chicago's West Side, from 1961.

Miss one payment, and he would lose the house and every dollar.

Clyde Ross was born in 1923 near Clarksdale, Mississippi. In the Second World War he was drafted, ordered into the armed forces, and he served on Guam. He moved to Chicago in 1947 and took a job as a taster at Campbell's Soup.

No loan. Ross tried to get an ordinary mortgage for a house in another neighborhood. A loan officer told him there was no money to lend, and the records do not name the officer or the bank. FHA officials, using a rating system of their own, rated neighborhoods where Black people lived "D" and usually refused to back loans there.

The contract. Ross bought a house in North Lawndale in 1961 for 27,500 dollars. The seller was a speculator, a person who buys property to sell it again at a profit, and had paid 12,000 dollars for the house. Ross bought on contract: the seller kept the deed, the paper that shows who owns a house, until Ross made the last payment.

If Ross missed a single payment, he would lose his 1,000-dollar down payment, every monthly payment he had made, and the house. The journalist Ta-Nehisi Coates cited one estimate that 85 of every 100 Black families who bought homes in Chicago bought them on contract.

The strike. Ross joined the Contract Buyers League, a group of Black homeowners on Chicago's South and West Sides, in 1968, and became its vice president. About 500 families in the league stopped making their payments together, as a strike against the contracts. By July 1971 the league and the sellers had worked out new terms for 155 contracts, saving each family an average of 14,000 dollars.

About 70 league families lost their homes to eviction, and the Chicago Reporter's account does not name who had each family put out. The league also took its fight to court and lost. Coates wrote that the league lost a jury trial in 1976. The Chicago Reporter says its last appeal, its last request for a higher court to change the ruling, was turned down in 1983.

Coates told Ross's story in *The Atlantic* magazine in 2014. Ross was 91, and he still lived in the house and owned it.

DISPUTED: the year and the price. Coates gives 1961 and 27,500 dollars, and a 2014 account on BillMoyers.com gives 1958 and 27,000 dollars.

David and Micki Colfax and their sons

Who: Parents who built their own house on a ranch in California and taught their four sons at home.
When and where: Near Boonville, Mendocino County, California, from 1973.

Three sons taught at home on a California ranch went to Harvard.

David and Micki Colfax taught their four sons at home on a ranch in California, where the family built its own house. Their eldest son, Grant, started public school in St. Louis, but after six weeks his parents took him out, because they found the lessons "very rote and uncreative," rote meaning learned by repeating things over and over.

The family moved to land near Boonville, in Mendocino County, California, in 1973. The land, 40 acres by the Harvard Crimson's count or 50 by the Anderson Valley Advertiser's, had no house, no electricity and no running water. Everyone, the young sons included, helped build the house, the barns and the sheds. The family raised goats, sheep, chickens and pigs and sold them to restaurants in San Francisco.

> Lessons fit around the work of the ranch. "Some days we did a lot of homework, some days we had none," Reed Colfax said later. "It depended on the weather and what had to be done on the ranch." The boys studied four or five days a week, summers included.
>
> Grant, Drew and Reed went on to Harvard University and graduated in 1987, 1990 and 1992. The youngest son, Garth, was still being taught at home in 1989, a year when about 500,000 American children were taught at home by their parents, by a count reported in *The Harvard Crimson*. David and Micki Colfax wrote a book about their method, *Homeschooling for Excellence*.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 7 MINUTES

The median new American house grew to 2,467 square feet by 2015, while the average household shrank to 2.50 people by 2025. In the crash that began in 2007, lenders took back millions of homes from families who could not pay their loans. During the pandemic of 2020, many homes became an office and a school at the same time.

More house, fewer people

The median new house built for one family, the one in the middle when all are ranked by size, grew from 983 square feet in 1950 to a peak of 2,467 square feet in 2015, by Census Bureau figures. That is about two and a half times as large. Over many of the same years, households shrank: the average household held 3.67 people in 1940 and 2.50 people in 2025.

The kinds of households changed too. In 2025, 29 of every 100 households were one person living alone, up from 20 in 1975, and married couples made up 47, down from 66. That year 58 of every 100 young adults aged 18 to 24 lived in their parents' home.

The Census Bureau counted 65 of every 100 households as owning their home in the second quarter of 2026, the months of April, May and June.

How millions of families lost their homes, 2007 to 2010

Lenders foreclosed on about 3.8 million homes between 2007 and 2010. Estimates for the whole crisis run from about 7.7 million to 10 million homes lost, because researchers counted in different ways. Federal Reserve History, a website of the country's central bank, and the Federal Reserve Bank of Chicago list these figures.

The loans. In the years before the crash, lenders made many subprime loans, which cost more and went to borrowers with weaker credit, a weaker record of paying back debts. Because the loans cost more, the monthly payments were bigger.

While house prices kept rising, a borrower who fell behind could sell the house and pay off the loan, or borrow more against the higher price. When prices stopped rising, neither way out worked. Borrowers who could not pay fell further behind, and lenders foreclosed on their homes.

Reporters at the Center for Public Integrity, a news organization, ranked Countrywide Financial the largest subprime lender of 2005 to 2007 in a 2009 report. They found that Countrywide made at least 97.2 billion dollars in high-

interest loans in those years. Angelo Mozilo founded the company and ran it for 39 years.

Foreclosure filings, the papers a lender files to start taking back a home, reached their peak in 2010, at nearly 2.9 million homes. In 2025 there were 367,460, according to ATTOM, a private company that collects property records.

More Americans came to live in households of several generations, such as grandparents, parents and children together. Researchers at the Pew Research Center, which studies American life, counted 7 of every 100 Americans in such households in 1971, and 18 of every 100, or 59.7 million people, in 2021. The number grew faster during the years of the crash than in the years before. When Pew asked people in these households why they lived that way, money was the reason they gave most often.

How many people have no home?

Each January, local volunteers count the people who are homeless on a single night, and officials of the US Department of Housing and Urban Development (HUD), the federal housing department, report the count. The volunteers counted 771,480 people in January 2024, the highest number on record and 18 percent more than a year before.

HUD's report named several likely causes: a shortage of homes people could afford, rising prices, pay that did not keep up for families with middle and low incomes, and the lasting effects of racism. Homeless people in families with children rose 39 percent that year. In 13 communities where many newly arrived immigrants had gone into shelters, family homelessness more than doubled. The next count, in January 2025, was a little lower, at 745,652 people.

2020: office and school at once

Many homes became a workplace and a classroom at once in 2020. The share of workers who worked mainly from home tripled, from 5.7 percent in 2019 to 17.9 percent in 2021, by the Census Bureau's count.

Homeschooling rose too, meaning that the family taught the children, not that teachers at a school taught them online. By the fall of 2020, 11.1 percent of households with school-age children were homeschooling, about twice the share that spring.

Many children did their schoolwork online, and some homes had no broadband, the fast home internet used for online classes. Pew researchers reported that 35 percent of households with children and incomes under 30,000 dollars a year had no broadband, against 6 percent of households with incomes over 75,000 dollars.

NOT KNOWN: how much of the rise in learning at home lasted. In a later federal survey, parents reported that about 5 of every 100 children learned at home in 2022-23, against about 4 before the pandemic, but that survey asked different questions from the one in 2020.

Pierre Solon and Katty Familia

Who: Immigrant parents, from Haiti and the Dominican Republic, who lost their Boston house to foreclosure.

When and where: Hyde Park, Boston, Massachusetts, about 2006 to 2010.

Bought for 584,000 dollars, sold at auction for 115,000.

Pierre Solon, from Haiti, and Katty Familia, from the Dominican Republic, bought a green wooden house in Boston's Hyde Park neighborhood in about 2006 for 584,000 dollars. They borrowed the whole price from Fremont Investment and Loan, a subprime lender, as two mortgages, two separate loans on the same house. Their lawyer, Nadine Cohen of Greater Boston Legal Services, said the payments on the two loans were almost 5,000 dollars a month more than the couple earned.

Each parent worked two jobs, and then each lost one. "Sometimes we don't even have food," Katty Familia said. The couple fell more than 150,000 dollars behind.

Staff at Wells Fargo, the bank that collected their payments, offered lower monthly payments. The couple turned the offer down, because the change would have raised what they owed to more than 600,000 dollars. Wells Fargo's staff then foreclosed, and late in 2009 the family moved out with their children.

The sale. Wells Fargo sold the house at auction, a sale where the highest bidder wins, in November 2010. The buyer was an investor, a buyer who hopes to sell later for more, and the price was 115,000 dollars. Two weeks later that investor sold it to another investor for 270,000 dollars.

The Massachusetts Attorney General, the state's top lawyer, sued Fremont for deceptive lending, lending by misleading borrowers. Fremont sold its loans to investors, then went bankrupt, unable to pay its debts, and closed.

The couple ran a day care center in Boston in 2010. "I worked 20 years in this country for this," Katty Familia said. The reporter Anthony Brooks told their story on the radio program *Morning Edition*, on NPR, in December 2010.

The Munoz family

Who: A Las Vegas family whose four school-age children did school online at the dining room table while both parents went out to work.
When and where: Las Vegas, Nevada, August 2020.

"It was a challenge because we couldn't log in."

Four of the five Munoz children in Las Vegas, Nevada, started the school year in August 2020 on laptops at the dining room table. Both parents worked in the food industry, away from home. While they were at work, the family's 10th-grade son helped the younger children: a fourth-grader with reading and a new middle-schooler with writing. When he had trouble, he emailed the teachers.

The father, Johnathan Munoz, recorded the family's first week as an audio diary for NPR's radio program *Weekend Edition Sunday*. On the second day he said, "it was a challenge because we couldn't log in." The middle-schooler said that one teacher kept marking her absent, and another teacher did not allow a brother or sister to be seen in the background.

THE THREE QUESTIONS, ANSWERED

1. **Who lived together under one roof, from the longhouse to today?** A longhouse held 30 to 60 relatives, and colonial households held servants, apprentices and enslaved people too. By 2025 the average household held 2.50 people.

2. **Who did the work of keeping house, and did stoves, pipes and wires make it lighter?** Women and children did most of it. In Ruth Schwartz Cowan's argument, the machines did not cut a housewife's hours, because families expected more.
3. **How did lenders and builders keep Black families out of new neighborhoods, and what did those families do?** FHA officials usually refused to back loans where Black families lived, and William Levitt sold only to white families. The Myers family stayed through weeks of attacks, and about 500 families in the league Clyde Ross helped lead stopped paying together.

What changed: Households shrank from longhouses of relatives to 2.50 people, and owning a home came to depend on long loans that lenders gave some families and refused others.

Whose land: The colonists' and settlers' houses in this chapter went up on Native land, from Plymouth, built on the Wampanoag village of Patuxet, to the Ingalls family's dugout on land the Dakota signed away in 1851.

FIVE DATES TO KEEP

September 1565: Spanish colonists settle inside Seloy's town.

1841: Catharine Beecher's book on running a home.

November 1, 1879: Richard Henry Pratt opens the Carlisle school.

October 1, 1947: the first families move into Levittown.

1968: members of Congress pass the Fair Housing Act.

NOT KNOWN: No record counts how many Timucua died of disease in the 1500s alone.

Where to go: The Tenement Museum, 97 Orchard Street, New York, where staff rebuilt the Baldizzis' apartment from Josephine's memories.

Next: Chapter 8, Technology. It asks whose names went on American inventions and who did the hard work around them.

PART 3

Making and Building

Chapter 8: Technology

CHAPTER 8 OF 37 · TECHNOLOGY · 10 ERAS · ABOUT 85 MINUTES

Many famous American inventors had help that their patents did not name, and the hardest work around the new machines often fell to people who had no say in it.

The Smithsonian's National Museum of American History holds a strip of paper tape from May 24, 1844. It records the first public message sent from Washington to Baltimore by telegraph, a machine that sent messages over a wire as pulses of electricity. The words were "What hath God wrought" (What has God done).

Samuel Morse sent the message, and the code is named for him. He also held the patents, the government grants that gave him alone the right to make and sell the telegraph for a set number of years. His partner, Alfred Vail, who built the instruments, received the message in Baltimore. In 1911 one of Vail's sons had his father's gravestone changed to read "INVENTOR OF THE TELEGRAPHIC DOT AND DASH ALPHABET."

This chapter follows American tools and machines from fish traps under a Boston street to the AI programs of the 2020s. As you read, notice whose name goes on each invention. A patent could name one man while a partner, a team of workers or an enslaved man did part of the work. In 1858 the government's chief lawyer ruled that an enslaved person's invention could not be patented.

Notice also who did the hard work: Scottish prisoners at an ironworks, enslaved people at furnaces and in cotton fields, children at spinning machines. The last era covers smartphones and AI programs, and what happened when people trusted a machine's answer.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Why did planters enslave far more people after the cotton gin?
2. Why could an enslaved inventor not get a patent?
3. What went wrong when people trusted a computer's answer?

Five minutes? Read "Who could own an invention?" in 1850 to 1900.

Can skip: "The Cambridge printing press", "Tractors replace horses", "What is inside a smoke detector?", "Batteries, printers and gene tools". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

People in North America made their tools from wood, stone, bone, clay and animal skin, and near Lake Superior from copper. With no metal machines, they built traps that caught fish with the tide, fields that grew three crops together and boats of birch bark. The names of the people who first worked out these methods are not recorded. Some of the methods are still in use, and an Ojibwe builder in Wisconsin still makes birchbark canoes.

Spear-throwers, fish traps and fields

Before the bow and arrow, hunters in western North America threw spears with an atlatl, a spear-thrower stick that holds the back end of the spear during the throw.

Hunters across the West began using the bow and arrow about 1,400 years ago, around A.D. 600 to 700. A study published in 2026 in the *Journal of Archaeological Method and Theory* gives that date. South of an east-west line called the 55th parallel, archaeologists, the scientists who dig up and study what people left behind, stop finding atlatls soon after the bow appears. North of that line, hunters used both weapons side by side for more than 1,000 years.

Fish weirs. People built fixed traps called fish weirs, fences of wooden stakes set across the water with bundles of brush woven between the stakes. Fish swam in over the mud flats with the rising tide, and the fence trapped them when the water went out. People then scooped them up with baskets and nets, or caught them by hand.

Lines of wooden stakes from fish weirs lie under Boylston Street in Boston. People built these weirs in channels that filled and emptied with the tide, between about 4,700 and 3,700 years ago. They used them for more than a thousand years, until mud filled the bay around 1550 B.C., about 3,500 years ago.

Native farmers planted corn, beans and squash together in the same field, three crops known as the Three Sisters. They also set controlled fires, started on purpose and kept in bounds, to shape the land.

Crafts, and a calendar made of posts

People made pottery from clay and wove baskets. They tanned animal hides, treating the skins so they stayed soft and did not rot, and they made canoes from the bark of birch trees.

At Cahokia, in what is now Illinois, people built the largest city north of Mexico before 1500. Between about A.D. 900 and 1100, builders there raised five circles of upright wooden posts, one after another.

Each circle had between 24 and 72 posts and measured about 240 to 475 feet (73 to 145 meters) across. The biggest was wider than a football field is long. The posts marked the places on the horizon where the sun rose at different times of the year, so the circles worked as a calendar.

Near Lake Superior, people worked copper for thousands of years. They worked it cold, shaping it without melting it.

Wayne Valliere

Who: An Ojibwe builder of birchbark canoes who has taught more than 100 students and teaches the Ojibwe language.
When and where: Lac du Flambeau, Wisconsin, in the present day.

Spruce roots are the thread that sews his canoes together.

Wayne Valliere builds birchbark canoes, the same kind of boat people built in North America before 1500. He is a member of the Lac du Flambeau Band of Lake Superior Ojibwe, in Wisconsin. A profile of him by the National Endowment for the Arts, a US government agency that gives money and honors to artists, describes the Ojibwe way of building canoes as handed down over many generations.

Valliere began learning at 16 from elders, among them Joe Chosa, Marvin DeFoe and Ojaanimigiizhig. He also studied old objects kept in museums, along with writings and photographs.

Valliere builds each canoe from birchbark, cedar, spruce roots and pitch. The hull, the body of the boat, is thick birchbark. Ribs of straight-grained cedar hold the hull in shape, and spruce roots sew the pieces of bark together. To seal the seams against water, he mixes pitch, a sticky tree sap, with oak ash and deer tallow, the fat of a deer. Each material is gathered in a different season of the year.

More than 100 students have learned from him. At least one of them now builds canoes without his help, and a second is learning as an apprentice, working beside him. Valliere also teaches the Ojibwe language at Lac du Flambeau Public School.

Valliere's National Heritage Fellowship, which he received from the National Endowment for the Arts in 2020, is the highest honor in the United States for folk and traditional arts, the crafts and music that families and communities hand down.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 1 MINUTE

European metal reached Native towns on the East Coast before most Europeans did. Native smiths, people who shape metal into tools, cut up European copper and brass, a yellow metal made by melting copper and zinc together, and made tools of their own design from it.

Copper kettles cut into arrow points

Copper and brass from Europe reached the East Coast through trade with Europeans along the shore. Both metals had been made in European furnaces from rock dug out of the ground. Native traders passed the metal from one group to the next, so it spread along the East Coast ahead of most Europeans. In 1524 Verrazzano, a European sailing along the Northeast coast, wrote that the Native people there had sheets of worked copper.

Some of the metal came as kettles, large cooking pots. Native smiths cut the kettles apart and hammered the pieces into arrow points, knives, pipe stems, bells and ornaments. They took the new metal and made it into the tools and goods they already used.

Spanish expeditions, groups of men sent out to explore, crossed parts of what is now the United States in the 1500s, through lands where Native nations lived. The men on these expeditions carried iron weapons and tools. They left behind no lasting trade in tools.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 9 MINUTES

English colonists used running water to drive machines. They dammed streams to turn waterwheels, and the wheels drove grist mills, which ground grain into flour, and sawmills, which cut logs into boards. At ironworks, places where workers made iron from rock dug out of the ground, waterwheels worked the bellows and the hammers.

The first ironworks begun in the English colonies stood on Powhatan land in Virginia. The first one that ran for years stood on Pawtucket land in Massachusetts. Its workers were skilled English ironworkers, nearby farmers, at least two Native woodcutters, and Scottish prisoners of war whom the company's agents forced to work there for seven years.

Falling Creek, 1619 to 1622

Powhatan warriors destroyed the ironworks at Falling Creek, Virginia, in 1622, three years after Virginia Company officers sent the first ironworkers there. It was the first ironworks begun in the English colonies. Colonists built it at the falls of the James River, where the river drops over rocks, near present-day Richmond. In 1619 officers of the Virginia Company, the English company that ran the colony, hired Captain Benjamin Bluett to run the ironworks and sent workers with him.

Bluett died on the voyage or soon after he arrived. Others of his men died too, of what colonists called seasoning, the sickness that killed between 50 and 90 percent of early newcomers, according to Chesterfield County's history of the site. The men who lived could not finish the furnace, the tall oven where iron is melted out of rock.

Company officers hired John Berkeley to take over in 1621. He sailed with his son Maurice and 25 other men, according to the county, and he promised iron by June 9, 1622.

Why the Powhatan attacked. Like the colonists' tobacco farms, the ironworks stood on Powhatan land. Opechancanough, a Powhatan leader, planned an attack across the colony to force the English to leave Powhatan territory, as the county's history states it. From 1618 to 1620, English tobacco planters, owners of large farms called plantations, had taken Powhatan land without paying for it. Virginia Company officials had pressed to take Powhatan children for English schooling.

The attack. Powhatan warriors attacked the ironworks on March 22, 1622. They killed 27 English people there, John Berkeley among them. Two children at Falling Creek survived. The warriors left the works in ruins. Across the colony that day, Powhatan warriors killed about 350 English colonists.

Maurice Berkeley was away from the works and lived. He tried to start the ironworks again and failed. Another Englishman tried from 1634 to 1636 and failed too.

Whether Falling Creek ever made iron is disputed. Virginia's official list of historic places states that workers produced iron there in 1620, and it calls Falling Creek the first successful ironworks in English North America. The county's history states that Bluett's men could not finish the furnace, and that in 1621 Berkeley was still promising iron for the next year. Either way, the first ironworks in the English colonies that ran for years was the one at Saugus, in Massachusetts.

Seven waterwheels at Saugus

The first ironworks in the English colonies that ran for years stood on the Saugus River in Massachusetts. By 1643 John Winthrop Jr. had gathered about two dozen investors for it, people who put in money hoping for a profit. They formed the Company of Undertakers of the Iron Works in New England, using undertakers in an old sense, people who take on a big job. The works ran from 1646 to about 1670.

Seven waterwheels drove three kinds of machine. The first was a blast furnace. Air blown into its fire made the fire hot enough to melt iron out of rock, about 3,000 degrees Fahrenheit. The air came from bellows, giant bags that squeeze air into a fire, and these bellows were 18 feet long.

Next came a forge, where 10 to 12 men hammered the iron. The last machine was a rolling and slitting mill, which pressed iron into flat sheets and cut it into thin rods.

The ironworks burned more than 3,600 cords of wood a year, each cord a stack 8 feet long, 4 feet wide and 4 feet high. Set end to end, one year's cords would have made a stack more than 5 miles long. Workers cut the wood with axes and saws made at the works.

The Saugus works closed because of debt, high costs and competition from iron brought in from overseas. The men who had lent money sued. Some of the ironworkers, such as James Leonard, went on to run forges in other places. The works have been rebuilt on the old site, which is now the Saugus Iron Works National Historic Site.

Who did the work at Saugus?

About 100 people worked at the Saugus ironworks. The company's managers brought skilled ironworkers over from the iron-making parts of England, and colonists from nearby farms did the unskilled work. Company records show that at least two Native people cut wood for the same wages as the other workers. The records do not give their names.

The workers lived in a village the company owned, called Hammersmith after the English town that many of the ironworkers came from. The works stood on the land of the Pawtucket, the Native people who lived there when the English arrived. Saugus had been a Native settlement, and the English first called it Lynn.

The Scots. Some of the workers were prisoners of war. In September 1650, Oliver Cromwell's English soldiers defeated a Scottish army at Dunbar, in Scotland, and captured Scottish soldiers. Members of England's Council of State, the leaders who ran England's government at the time, ordered 150 of the prisoners handed over to agents of two of the ironworks company's investors.

The agents shipped the prisoners across the ocean on the ship *Unity*, which left Gravesend, England, on November 11, 1650, and reached Boston in December. How many died on the voyage is not known. The company kept 62 of the prisoners for its ironworks, and about 36 of them went to work at Saugus, though a National Park Service history gives about 35. The agents sent others to mills in Maine and New Hampshire and sold the rest to farmers and merchants in New England.

The company held the Scots at Saugus to seven years of forced labor under indentures, written contracts that required a person to work for a master for a set number of years. The Scots cut wood, worked as colliers, who make charcoal, and did other labor. They received clothing, food and tobacco.

Some of the Scots are known by name. A list of 35 Scots at the works in 1653 includes James Adams, John Clark, Alexander Innes, Peter Grant, John Stewart and Thomas Tower. A November 1653 list of the property of the works

includes Alexander Innes, with a value of 10 pounds. The Scottish Prisoners of War Society prints these lists from the company's record books.

The danger. Flying sparks and pieces of hot metal were a constant danger to the men at the forge. The forge hammer weighed 500 pounds, and its noise cost many workers their hearing. The surviving records of the works do not give a count of deaths.

The Cambridge printing press

The first printing press in the English colonies, a machine that presses paper hard onto metal letters covered in ink, arrived in Cambridge, Massachusetts, in 1638. The Reverend Jose Glover, a minister, bought the press and hired a locksmith named Stephen Daye to run it. Glover died on the voyage across the ocean. His widow, Elizabeth Glover, owned the press, and Daye ran it.

Daye printed the *Bay Psalm Book* on the press in 1640. It was a book of psalms, the religious songs of the Bible, and the first book printed in what is now the United States.

Joseph Jenks

Who: A London sword maker who ran the blacksmith shop at the Saugus ironworks and asked the colony to protect his machines from copiers.

When and where: Saugus, then part of Lynn, Massachusetts. At the works from 1646. Died in 1683.

The colony gave Jenks 14 years of protection from copiers.

Joseph Jenks wanted to stop other men from copying his machines. In 1646 Massachusetts leaders gave him a patent for his water-driven mills. A National Park Service page about his shop states that US Patent Office officials credit him with the first patent for a machine in what is now the United States.

Jenks learned his trade in England. In the 1630s he worked for a sword maker whose sword mill at Hounslow ran on water power. A sword marked with Jenks's name as its maker survives in a museum in Wales.

The petition. In May 1646 Jenks asked the Massachusetts General Court, the leaders who made the colony's laws, for the only right to build water-driven mills for 14 years. The mills would make scythes, long curved blades for cutting grass. He also asked to build "a new Invented Saw Mill" and other machines for making tools with edges. His written request survives in the Massachusetts Archives, dated May 10, 1646.

In it he explained why he wanted protection. Without it, another man would see his machine and copy it, and Jenks would lose the profit. In his own spelling: "Another when he seeth it makes the like," and "soe I loose the benefit." The court's magistrates, the leaders who sat as its judges, granted his request.

The shop. The agent in charge of the ironworks let Jenks build a water-driven hammer at the tail of the blast furnace on January 20, 1647. It ran on the water that had already turned the furnace wheel. The company owned the shop, and Jenks paid rent.

There he made saw blades, felling saws for cutting down trees, and steelyards, a kind of weighing scale. He drew iron into fine wire, pulling it through small holes to make it thin. In 1652 he sent two saw blades for a water-powered sawmill that John Winthrop Jr. ran in Connecticut.

When the ironworks company went bankrupt, unable to pay its debts, Jenks bought a share of his shop in September 1656 and the rolling and slitting mill that October, with borrowed money. By October 1667 he had little money left, and he asked the court for 50 pounds to start making iron wire. He died in March 1683.

What the ground showed. An archaeologist dug up the site of Jenks's shop in 1952. He found waterwheels, the supports of a water-driven hammer, an anvil base and a stone forge.

NOT KNOWN: whether Jenks made the dies, the stamps, for the first silver coins made in New England in 1652, as a marker put up in 1898 states, because no document from the time shows that he did.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 6 MINUTES

Iron furnaces and forges went up across Pennsylvania, Maryland and Virginia, and in Maryland many of the ironworkers were enslaved people or convicts. At the Baltimore Iron Works, which opened in 1731, 42 of the first 89 workers, almost half, were enslaved. Waterwheels still drove the machines, and the furnaces still burned charcoal. In Philadelphia, the printer Benjamin Franklin designed a new kind of stove in 1741 or 1742 and refused to patent it.

How the Franklin stove saved heat

Benjamin Franklin designed a stove that sent more of a fire's heat into the room and less of it up the chimney. He made it in 1741 or 1742. The Franklin Institute, a science museum in Philadelphia, states 1742 in its history of his inventions.

Franklin's stove was a fireplace lined with metal that stood a few inches out from the chimney. At the back was a hollow iron wall, called a baffle. Air from the room flowed into the baffle, picked up the fire's heat and came back out into the room.

Behind the baffle was a U-shaped passage called an inverted siphon. The smoke had to go up over the baffle, down behind it and only then up the chimney. On that longer path, the iron took in more of the smoke's heat. The stove made less smoke than an ordinary fireplace, too.

Franklin refused to patent the stove. He gave his reason later in his autobiography, the story of his life that he wrote himself. "As we enjoy great Advantages from the Inventions of others," he wrote, "we should be glad of an Opportunity to serve others by any Invention of ours." He added, "and this we should do freely and generously." Everyone gains from other people's inventions, he meant, so people should share their own for free. He never patented any of his inventions.

Enslaved people and convicts at the Maryland furnaces

Many of the workers at the Maryland ironworks were enslaved people or convicts. In 1719, investors in Britain set up the Principio Company in Cecil County, Maryland. In 1731 Dr. Charles Carroll and four other Maryland planters, two of them also named Carroll, founded the Baltimore Iron Works on the Patapsco River. Dr. Carroll put in 2,200 acres of land and served as the first manager. The five partners supplied the money and the enslaved workers.

Whose land. Susquehannock leaders had signed away the Patapsco valley in 1652, though the Piscataway lived in the region too. Five Susquehannock war chiefs signed that treaty, a written agreement between nations, with Maryland colonial officials. In it they gave up their claim to a long stretch of the Chesapeake Bay shore that includes the valley. Emma Bilski, a history graduate student at Johns Hopkins University, points out that the land was not really the Susquehannock's to give away.

Convicts. The Baltimore Iron Works opened with 89 workers, and 42 of them were enslaved. Over the years, many other workers there were convicts, people found guilty of crimes in Britain. Under a British law of 1718, English judges sentenced many such people to be shipped to the colonies. Merchants who held contracts with the British government carried them across the ocean and sold their labor to colonists, most often for seven years. Iron makers were among the buyers.

The managers of the Baltimore Iron Works preferred enslaved workers to convicts. Many of the enslaved ironworkers were Igbo people from West Africa, who brought their own skill at working metal. By 1785 an advertisement for the works listed a workforce of "more than 200 Negroes," using a word of that time for Black people.

The work. The workers hauled charcoal, oyster shells and iron ore to the top of the furnace. They worked 12-hour shifts, day and night, six or seven days a week.

The owners lived away from the works and often quarreled, and they refused to send the food and workers they had promised. In 1775 the manager, Clement Brooke, wrote to the partners: "I cannot do my job unless you send

more slaves and more corn." The Mount Clare Museum's history of the works states that the workers and the animals were starving.

Each of the five owners took one fifth of the iron. In good years the partners earned 55 percent on their money each year. The works closed in 1799. In 1810 the 30 heirs of the original owners, the people who had inherited their shares, had the land that was left sold at auction. It came to more than 30,000 acres. The heirs had 200 enslaved people sold at the same auction.

Some workers ran away. In August 1754 the *Maryland Gazette* newspaper printed a notice for the capture of people who had escaped. Others worked slowly.

An enslaved blacksmith named Anthony and an indentured servant named Thomas Livy were jailed for robbing a store in the spring of 1771. They were caught with the stolen goods, most likely food. The Mount Clare Museum's account of the case does not say who caught them or who jailed them. The overseer, the man in charge of the workers, was William Hammond. He wrote about Anthony: "We shall feel the loss of Anthony's time very much, I cannot tell how we can carry on the Forge business without him."

Benjamin Franklin

Who: A Philadelphia printer who designed the Franklin stove and, later, the lightning rod, and refused to patent either one.

When and where: Born in Boston in 1706. Worked in Philadelphia. Died there in 1790.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS. It is about Franklin's life.

A London ironmonger patented a copy of Franklin's stove.

Benjamin Franklin made his living as a printer in Philadelphia. He printed a newspaper and a yearly almanac, a book of calendars, weather guesses and sayings.

Franklin gave the model of his stove to an old friend, Robert Grace, who owned an iron furnace in Pennsylvania. Grace cast the iron plates for the stoves there, and he made money on them, because more and more people wanted one. To help sales, Franklin wrote a pamphlet in 1744 that explained how the stove worked.

Governor Thomas of Pennsylvania liked the stove so much that he offered Franklin a patent, which would have let only Franklin sell the stoves for a set number of years. Franklin turned the offer down.

In London an ironmonger, a seller of iron goods, copied much of Franklin's pamphlet. He made small changes to the stove that "rather hurt its operation," took out a patent on it in England and, Franklin wrote, "made, as I was told, a little fortune by it." Other people patented Franklin's inventions too. Franklin never challenged them, he wrote, "having no desire of profiting by patents myself, and hating disputes."

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 10 MINUTES

Machines began to do work that had taken many hands, and after one of them, the cotton gin, planters enslaved far more people. Eli Whitney built the gin in 1793. One small gin could clean about 50 pounds of cotton a day, work that took several hundred hours by hand.

Planters grew far more cotton, counted in bales, large bundles pressed tight and tied: fewer than 9,000 bales a year around 1790, more than 200,000 by 1800. To grow it, they held far more people in slavery, about 700,000 in 1790 and nearly 4 million by 1860.

Other machines came into use in the same years. Benjamin Franklin's lightning rods went up on Philadelphia roofs in the 1750s, and by 1755 the first steam engine in America was pumping water from a New Jersey mine. Samuel Slater's cotton-spinning mill began work at Pawtucket, Rhode Island, in 1790, the start of the factory cloth industry in the United States. Slater hired children to run its machines.

Franklin's lightning rod, step by step

Franklin described a way to protect buildings from what he called "electrical fire" in a letter of 1750 to Peter Collinson. After lightning tests in France in 1752, and then the kite test that Franklin described, the first lightning rods went up on buildings in Philadelphia.

Franklin printed instructions for making one in *Poor Richard's Almanack* for 1753. Readers were to take a small iron rod and push one end three or four feet into moist ground, with the other end standing six or eight feet above the top of the building. A foot of brass wire, sharpened to a fine point, went on the top end. Small staples held the rod to the house.

When lightning struck, it would hit the point and pass through the metal into the ground, "without hurting any Thing," Franklin wrote. Pointed rods soon stood on buildings throughout the colonies.

The first steam engine in America

The first steam engine in America pumped water out of a mine. It was ordered from England in 1748 for Colonel John Schuyler's copper mine, in what is now North Arlington, New Jersey. The parts arrived in 1753. An engine builder named Josiah Hornblower put it together, and it was pumping by 1755.

It was a Newcomen engine, named for Thomas Newcomen, who built the first one in England in 1712. A boiler filled a large tube, called a cylinder, with steam. Then a spray of cold water turned the steam back into water, which left the cylinder nearly empty. The weight of the air outside pushed a piston, a tight-fitting plug, down into the cylinder. The piston pulled one end of a big rocking beam, and the other end of the beam worked the pump in the mine.

The cotton gin and slavery

The cotton gin cleaned cotton so fast that planters grew far more of it, and they held far more people in slavery to grow and pick it. Upland cotton has sticky seeds caught in its fiber. Before 1793, enslaved people pulled the seeds out by hand, and one worker needed many hours to clean a single pound. Planters could grow only as much cotton as their workers could clean.

Eli Whitney's cotton gin did the cleaning by machine. It used two cylinders that combed the cotton through small holes. The seeds could not pass through the holes and stayed behind. A history of the gin by the Eli Whitney Museum states that one small gin could clean 50 pounds of cotton a day. By hand, that much cotton took several hundred hours of work.

Planters used the gin to grow far more cotton. Across the United States they grew fewer than 9,000 bales of cotton a year around 1790 and more than 200,000 bales by 1800. By 1860 the cotton crop was more than 400 times as large as in 1790.

More people enslaved. With the gin cleaning cotton so fast, planters wanted far more enslaved people to grow and pick it. The 1790 census, the government's count of everyone in the country, recorded 697,897 enslaved people in the United States. By 1860 there were nearly 4 million, more than five times as many, and about 2.5 million of them lived in the cotton-growing regions from eastern Maryland to Texas. Slaveholders spread slavery west across the South.

Enslaved people picked the cotton by hand in the summer sun, about 200 pounds each a day. Solomon Northup was a free Black man from New York. Kidnappers seized him in Washington, D.C., in 1841 and forced him into slavery. Slaveholders held him for twelve years. He picked cotton on Edwin Epps's plantation in Louisiana until he was rescued in 1853.

Northup described the rule in his book *Twelve Years a Slave*, published that year. "An ordinary day's work is two hundred pounds," he wrote. "A slave who is accustomed to picking, is punished, if he or she brings in a less quantity than

that." Each night the cotton was weighed at the gin-house, the building where the gin stood. "After weighing, follow the whippings," Northup wrote.

The punishment was the lash, one stroke of a whip on a person's bare body. Northup wrote that twenty-five lashes were "deemed a mere brush," thought of as a small punishment. Fifty was "the ordinary penalty," and one hundred was "called severe." Northup described Epps himself seizing the whip and lashing the people he enslaved.

Patsey. Epps once forced Northup to whip an enslaved woman named Patsey, and then took the whip himself. Northup wrote that her back was "covered with long welts," raised and swollen stripes, and that "the lash was wet with blood," meaning the whip itself. Epps then had her washed with salt and water.

Enslaved people ran the gins and the cotton presses too, the machines that squeezed cotton into bales. The machines had many moving parts that could catch and injure a worker. The tiny cotton fibers the gins threw into the air damaged the workers' lungs.

The people who owned the plantations kept the profit. With the gin, Southern plantation owners gained money and political power. Their cotton supplied cloth mills in the Northern states and in Britain. By 1830, cloth and other finished cotton goods were the largest group of factory-made goods the country sold to other countries.

Cotton land. Planters wanted new land for cotton. The Eli Whitney Museum's history of the gin states that this demand was "a major factor" in the removal of five Native nations from their homelands in the Southeast: the Cherokee, Chickasaw, Choctaw, Muscogee (Creek) and Seminole.

President Andrew Jackson signed the Indian Removal Act on May 28, 1830. Under it, the president could trade land west of the Mississippi River for the lands of Native nations inside the states. US officials then forced the five nations west to Indian Territory, land that is now part of Oklahoma. At least 60,000 people were forced to make the journey, and more than 8,000 of them died on the way.

US Army soldiers under General Winfield Scott began forcing the Cherokee out of their homeland in 1838. Scott was sent to another post soon after the removal began. The soldiers first held the Cherokee in crowded, dirty camps, where many died.

About 4,000 Cherokee died on the march west that the soldiers forced them to make in the fall and winter of 1838 and 1839. On the march they faced heavy rain, rivers blocked by ice and too little food. Many died of illness, and some died of disease after drinking dirty standing water. White landowners took the land the five nations had been forced to leave.

Eli Whitney

Who: The builder of the cotton gin, patented in 1794, and the subject of a famous myth about machine-made gun parts.
When and where: Georgia and New Haven, Connecticut. Born 1765, died 1825.

Workers at Whitney's gun factory never made parts that fit any gun.

Eli Whitney graduated from Yale College in 1792 and traveled south to work as a tutor, a private teacher. On the way, Catherine Littlefield Greene invited him to her plantation, Mulberry Grove, north of Savannah, Georgia. She was the widow of General Nathanael Greene, who had died in 1786 and left her dozens of enslaved people. Enslaved workers on the plantation grew mostly rice and some cotton.

There, in 1793, Whitney built the machine that pulled cotton fiber away from its seeds. He applied for a patent in 1794, and the patent was granted on March 14, 1794.

Catherine Greene's part. Whitney held the patent. In 1870 the women's rights activist Matilda Joslyn Gage wrote that Catherine Greene invented the cotton gin. The Eli Whitney Museum states that it "has been suggested that Catherine Greene also contributed ideas to the design."

NOT KNOWN: how much of the design was Catherine Greene's.

The gun parts. Whitney signed a contract in 1798 to make muskets for the federal government. He promoted the idea of interchangeable parts, gun parts made by machine so that any part would fit any gun of the same model. According to a famous story, he showed government officials such parts in 1801.

The historian Robert S. Woodbury showed in 1960 that Whitney did not start the idea, and that the credit people gave him for it rests on a myth. Gunmakers at French armories, factories that made weapons, had worked on the idea before Whitney. Workers at Whitney's own factory never made parts that truly fit any gun.

The best-documented first American use of interchangeable parts in a factory came at John H. Hall's rifle works at the Harpers Ferry armory. Hall's workers were putting rifles together from interchangeable parts by 1819.

Samuel Slater

Who: An English mill worker who rebuilt England's spinning machines from memory at Pawtucket and hired children to run them.

When and where: Trained in Derbyshire, England. The mill ran at Pawtucket, Rhode Island, from December 1790.

He crossed the ocean with England's spinning machines stored in his memory.

Samuel Slater rebuilt English cotton-spinning machines from memory in the United States. In England, Richard Arkwright had patented a spinning machine in 1769, called the water frame because a waterwheel drove it. Arkwright and his partners built a mill several floors high at Cromford, in Derbyshire, with waterwheels to drive the machines. He moved cotton spinning out of homes and into powered mills with hundreds of workers, and other mill owners copied his system.

Slater trained in a mill in Derbyshire that used Arkwright's machines. Under British law, machines for making cloth could not leave the country, and skilled cloth-mill workers could not move abroad. In 1789 Slater left England without telling officials that he was a trained mill worker.

Pawtucket. Moses Brown hired him in December 1789, and Brown's family firm, Almy & Brown, put up the money and the building. With local mechanics, people who build and repair machines, among them the Wilkinson family, Slater rebuilt two kinds of machine from memory. Carding machines combed raw cotton so the fibers lay straight, and spinning machines twisted the fibers into thread, called yarn. The machines at Pawtucket spun their first yarn in December 1790.

The children. Slater had worked in a factory for part of his own childhood. At Pawtucket he hired children to run the machines, which were built for children to run. Most of the children at Slater's mill were about 10 years old, and some were as young as six. They were paid by the hour, and they earned much less than adults.

> A Boston politician in 1801 described mills that employed "children from four to Ten years old." In the mill villages that grew up later, the child workers were 8 to 14 years old. The names of the first children who worked for Slater are not recorded.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 8 MINUTES

The men whose names went on the patents of these years had help. Samuel Morse, Charles Goodyear, the sewing machine maker Elias Howe and the reaper maker Cyrus McCormick each held a patent, a government grant of the only right to make and sell an invention for a set number of years. Morse's partner Alfred Vail built the telegraph instruments. Jo Anderson, a man enslaved by the McCormick family, worked on the first McCormick reaper.

Inventors in the United States built machines to cut grain, plow prairie soil and sew cloth between 1831 and 1846. Goodyear found a way to treat rubber with sulfur so that heat did not melt it. People in Philadelphia made a new French way of taking photographs work in 1839, within weeks of hearing about it. By 1844 Morse's telegraph line ran 40 miles, from Washington to Baltimore.

How the telegraph sent a message

The electric telegraph sent messages as pulses of electricity through a wire. At the receiving end, each pulse worked an electromagnet, a magnet that works only while electricity flows through it. The magnet moved an arm with a pen-like point, called a stylus.

A clockwork motor, which ran on gears like the inside of a wind-up clock, pulled a strip of paper tape past the stylus. For each pulse, the stylus pressed a small dent into the tape, a short one for a dot or a longer one for a dash. Every letter and number had its own pattern of dots and dashes, and the patterns are called Morse code.

Morse asked Congress for $30,000 in 1843 to build a telegraph line from Washington to Baltimore. Members of the House and then senators voted for the money, and President John Tyler signed the bill.

Ezra Cornell, a man hired to build the line, was supposed to lay the wire underground. When he ran into bad wire, he suggested stringing the wires overhead on trees and poles instead. A signal in a long wire grows weaker as it goes, and Leonard Gale showed Morse how to boost it at points along the line with a device called a relay.

The first message. Morse sent the first public message over the line from the US Capitol in Washington on May 24, 1844, and Alfred Vail received it in Baltimore. The words were "What hath God wrought," from the Bible, in the book of Numbers, chapter 23, verse 23. They mean "What has God done."

Annie G. Ellsworth chose the words. Her father was the commissioner of the Patent Office, the head of the government office that grants patents. The paper tape with the message still exists, and the Smithsonian's National Museum of American History holds it.

Samuel Morse

Who: The inventor who held the patents on the electric telegraph and sent the first public message over the Washington to Baltimore line.

When and where: The story is that the idea came to him in 1832. The first public message went from Washington to Baltimore on May 24, 1844.

Morse got the fame. Alfred Vail built the instruments.

Samuel Morse held the patents on the American electric telegraph and got the fame for it. According to a Library of Congress history, the idea of sending messages over a distance by electricity came to Morse in 1832, during a conversation on a ship coming home from Europe.

Alfred Vail built and improved the instruments in the shop at the Speedwell Ironworks. The same Library of Congress history identifies hiring Vail as one of the keys to Morse's success.

The code. Who worked out the dot and dash code is still argued. Morse held the patents, and people call it Morse code. Starting in 1887, Vail's son Stephen Vail sent letter after letter to newspaper editors claiming the credit for his father. In 1911 another son, J. Cummings Vail, had Alfred's gravestone changed to read "INVENTOR OF THE TELEGRAPHIC DOT AND DASH ALPHABET."

The writer Joseph Connor, in a 2020 article in *American History* magazine, credits Vail with the practical version, which gives the shortest codes to the letters people use most. According to Connor, Vail learned which letters were most common from printers, who kept the metal type for those letters closest at hand.

Sewing machines, rubber and the camera

Elias Howe patented a sewing machine on September 10, 1846. It sewed a lockstitch, in which two threads lock together through the cloth. Isaac Singer made a more practical machine, and it sold better than Howe's. Howe sued the makers who used his invention. In 1854 judges ruled that Howe's patent was good, and the makers had to pay him royalties, fees for using a patent. At the peak, the fees paid to Howe reached as much as $4,000 a month.

The Combination. Howe and the biggest makers, Singer, Wheeler & Wilson, and Grover & Baker, pooled their patents in 1856, so each member could use the others' patented inventions. The members of their group, called the Sewing Machine Combination, controlled the sewing machine trade until 1877.

Rubber on a hot stove. A piece of Charles Goodyear's mix of rubber and sulfur landed on a hot stove in Woburn, Massachusetts, in 1839. The rubber charred like leather instead of melting. It took Goodyear five more years to learn to make the change happen every time. He patented the process in 1844, and rubber treated this way is called vulcanized rubber.

The accounts of how the piece reached the stove differ. Mass Moments, a Massachusetts history site, states that he either dropped it or placed it there. A speech in his honor printed in 1860 states that the piece was in his hand and was thrown into the stove "by a violent gesture." The encyclopedia Britannica's account states that it flew from his hand while he was trying to sell his rubber.

The camera. François Arago announced the daguerreotype, an early way of making photographs invented by the French artist Louis Daguerre, at a meeting of the French Academy of Sciences in Paris on August 19, 1839. The news reached the United States in late August and September. Within weeks, people in Philadelphia had made the process work for themselves.

Robert Cornelius of Philadelphia made a photograph of himself in October or November of 1839. It is the oldest surviving portrait photograph made in America, and the Library of Congress holds it.

Cyrus McCormick and John Deere

Who: Two makers of farm machines: McCormick's reaper cut grain, and Deere's steel plow cut through sticky prairie soil.

When and where: The reaper at Walnut Grove and Steele's Tavern, Virginia, 1831. The plow at Grand Detour, Illinois, 1837.

An enslaved man carried the grain that tested the first reaper.

Cyrus McCormick held the patent on the McCormick reaper, a machine that cuts ripe grain, and he built the business that sold it. Other people worked on the first one.

His father, Robert McCormick, tried for several years to build a reaper at Walnut Grove, the family farm in Rockbridge County, Virginia. In 1831 he gave up. Within six weeks, Cyrus showed a working reaper by cutting oats at nearby Steele's Tavern. A blacksmith named John McCown worked on the machine. So did Jo Anderson, a man the McCormicks enslaved.

Jo Anderson's own words. Anderson was born on Robert McCormick's plantation in about 1807. In 1885 a white interviewer, William J. Hanna, wrote down Anderson's words in dialect spelling, which tries to show how a person's speech sounded. Hanna recorded Anderson as 78 years old and unable to walk.

"I was born at old Massa Rob't McCormick's house," Anderson said. "I was his slave, but when a baby was given to Massa Cyrus." Massa meant master. Robert McCormick owned Anderson from birth and gave him to his son Cyrus while Anderson was still a baby.

Anderson said he carried grain to the blacksmith shop to test the machine: "I fotched loose grain to the shop so he could see how it cut it." He also worked as "blower and striker for the blacksmith," the helper who pumps the bellows, the big bag that blows air onto the fire, and swings the heavy hammer.

Anderson gave Cyrus the credit for the reaper and said Robert "tried it and gave it up." He said Cyrus freed him before the Civil War.

The business. Another inventor, Obed Hussey, patented a reaper in December 1833. McCormick patented his own in 1834 and printed a warning against Hussey's machine in *Mechanics' Magazine*. He made his first sales in 1840 and moved to Chicago in 1847. In 1859 he and his brothers made and sold more than 5,000 reapers.

The steel plow. John Deere made plows at Grand Detour, Illinois. The sticky prairie soil there clogged iron plows. In 1837 Deere built a plow with a polished steel moldboard, the curved blade that turns the soil over. The sticky soil slid off the smooth steel, so the plow scoured, or cleaned, itself as it moved. By 1846 Deere was selling nearly 1,000 plows a year.

Whose land. Ho-Chunk people, long called the Winnebago in English, had lived in a village at the bend of the Rock River where Grand Detour stands. Settlers who came later said they could still see signs of that village.

US officials pressured the Ho-Chunk into selling more of their land in 1832. That year Ho-Chunk leaders signed a treaty with two men sent to make it for the United States, General Winfield Scott and John Reynolds, the governor of Illinois. In it the Ho-Chunk gave up their land along the Rock River and across southern Wisconsin, and kept only their land farther north. US officials agreed to pay them $10,000 a year for 27 years and hoped they would move west to Iowa.

The records do not make clear whether this treaty or an earlier one covered the exact spot where Grand Detour stands. Five years after this treaty, Deere built his steel plow there, on land where Ho-Chunk people had lived.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 16 MINUTES

Inventors after 1850 worked with patent lawyers and teams of workers, and US officials decided who could own an invention at all. In 1858 the US attorney general, the government's chief lawyer, ruled that an invention by an enslaved person could not be patented. According to the law scholar Kara Swanson, after that ruling free Black inventors could not get patents either.

Alexander Graham Bell received the first telephone patent in 1876. Thomas Edison's team at Menlo Park, New Jersey, made a long-lasting electric lamp in 1879, building on 40 years of work by other inventors.

Who could own an invention?

Only the person who made an invention could get a patent for it. In 1858 the government's chief lawyer ruled that an enslaved inventor could not get one, and that his owner could not get one either.

Ned's invention. An enslaved blacksmith named Ned, near Holmesville in Pike County, Mississippi, had invented a new farm tool by August 1857. It was a "double Cotton Scraper, and two plows" that could "Scrape both Sides of the Cotton ridge at the same time, and plough out the middles," meaning both sides of a raised row of cotton and the low strips between the rows.

Everything known about Ned comes from the letters of Oscar J. E. Stuart, a white planter and lawyer who claimed to own him. Ned's second name, if he had one, is not recorded. How his life ended is not known.

Stuart applied for a patent on Ned's invention on November 15, 1857. He swore that he owned Ned and that Ned was the inventor. Stuart threatened Ned, too. If Ned wrote to the Patent Office himself, Stuart said, he would "correct" Ned "according to our Southern usage," and to correct meant to punish. Stuart made the threat in a letter he later sent to the secretary of the interior, one of the president's top officials. He did not write in it what the punishment would be.

The patent commissioner, Joseph Holt, sent the application back. Under the law, the inventor had to swear an oath, a solemn promise before the law, that he had made the invention, and Holt decided that an enslaved man could not take the oath. Stuart complained to Jacob Thompson, the secretary of the interior. Thompson sent the question to the attorney general, Jeremiah S. Black.

The ruling. Jeremiah Black ruled in 1858 that "a machine invented by a slave, though it be new and useful, cannot, in the present state of the law, be patented." He based his ruling on the *Dred Scott* decision of 1857, in which the justices, the judges of the Supreme Court, ruled that African Americans were not citizens. Without citizenship, Jeremiah Black reasoned, an enslaved inventor could not swear the oath. The owner could not get the patent either, because only the "original and first inventor" could.

Free Black inventors had received patents before this. The law scholar Kara Swanson writes that Jeremiah Black's opinion "created a formal racial barrier" to the patent system, a bar written into the rules. After it, free Black inventors could not get patents either.

Stuart asked Congress twice for a patent and failed both times. In 1859 Senator Albert Gallatin Brown of Mississippi backed a bill that would let enslavers patent the inventions of the people they enslaved, but senators never moved the bill forward. Stuart sold the "Stuart Double Plough and Scraper" anyway, without a patent.

A propeller for boats. Benjamin Montgomery, enslaved in Mississippi by Joseph Davis, invented a better propeller for boats. In the late 1850s Joseph Davis tried to patent it through his brother, Jefferson Davis, then a US senator from Mississippi. Patent Office officials turned him down for the same reasons they had given Stuart: Joseph Davis was not the inventor, and an enslaved inventor could not swear the oath.

The Confederacy. Delegates from seven Southern states that had broken away from the United States met in Alabama in February 1861. There they set up their own government, the Confederate States of America, also called the

Confederacy, and chose Jefferson Davis as its president. On May 21, 1861, he signed a Confederate patent law under which enslavers could patent the inventions of the people they enslaved.

Benjamin Montgomery was free by June 1864, when he applied for a patent on his propeller in his own name. No patent was ever issued, and the records do not say why.

Patents again. At the end of the Civil War in 1865, members of Congress and lawmakers in the states added the 13th Amendment, a change to the Constitution, and with it ended slavery everywhere in the country, except as a punishment for a crime. Under the 13th Amendment and the amendments that followed it, Black inventors could get patents again.

Counting Black inventors. Henry E. Baker, a Black patent examiner who checked patent applications for the government, published a count of the patents Black inventors had received. He wrote it in 1913, to mark fifty years since the Emancipation Proclamation of 1863, President Abraham Lincoln's order declaring free the enslaved people in the Confederate states.

Baker called the pamphlet *The Colored Inventor*, using a word of the time for Black Americans. The publishers of *The Crisis*, the magazine of the NAACP, a group that works for the rights of Black Americans, printed it.

The Patent Office's records did not show an inventor's race. To find Black inventors, Patent Office staff wrote to thousands of patent lawyers, to newspapers and to factory owners, then checked each answer against the records. Baker counted about 800 patents granted to Black inventors. He judged that the real number was at least twice that, because many lawyers said they could not remember the names of their Black clients.

The telephone, 1876

A telephone turns the sound of a voice into electric current and back into sound. In Bell's own description from 1876, the voice makes a thin sheet, called a membrane, shake in time with the sound. The shaking makes the electric current in the wire grow stronger and weaker in the same pattern. At the other end, the changing current makes a second sheet shake, and the listener hears the voice.

Bell's lawyer filed an application for a patent called "Improvement in Telegraphy" on the morning of February 14, 1876. It was the fifth filing at the Patent Office that day. A few hours later, papers from Elisha Gray arrived as the 39th filing. Gray filed a caveat, a notice that he was working on an invention and planned to apply for a patent. Both papers described a liquid transmitter, a sending part that used a liquid. On the advice of his lawyers, Gray withdrew.

Patent Office officials issued patent number 174,465 to Bell on March 7, 1876. On March 10 Bell spoke the first sentence ever sent by telephone. He spoke to his assistant, Thomas A. Watson, who was in the next room of Bell's laboratory in Boston. Bell's notebook records the words "Mr. Watson," then "come here," then "I want to see you."

Bell filed first and held the patent. People have argued ever since about whether Bell or Gray deserved the credit.

Alexander Graham Bell

Who: A Boston inventor whose lawyer filed for the telephone patent a few hours before a rival's papers arrived.

When and where: Boston, 1876.

Bell's first working telephone used a sending part like his rival's.

Alexander Graham Bell was a professor at Boston University when he worked on the telephone. He hired Thomas A. Watson, who had worked in a Boston machine shop since 1872, as his assistant.

The telephone Bell spoke through on March 10, 1876, had a liquid transmitter like the one Elisha Gray had described in his caveat, which was supposed to stay secret. Benjamin Lathrop Brown studied whether Bell had copied Gray, and he concluded that Bell and his lawyers did not.

Brown published his study in November 2020 in an engineering journal, the *Proceedings of the IEEE*, as "The Bell Versus Gray Telephone Dispute: Resolving a 144-Year-Old Controversy." He based his finding on letters, notes kept by a man who worked with Bell, and the engineering details of the two designs. He was answering several people who had claimed that Bell saw Gray's papers on a trip to Washington and copied the idea.

Emma Nutt

Who: The first woman telephone operator.

When and where: Boston, hired September 1, 1878.

Her pay as the first woman telephone operator: $10 a month.

Emma Nutt left a job at a telegraph office on September 1, 1878, to work for the telephone dispatch company in Boston. She became the first woman to work as a telephone operator, the person who connected each caller to the person being called. Her pay was $10 a month for a 54-hour week, less than 5 cents an hour. Her sister, Stella, started work as an operator the same day.

The first operators had been teenage boys, who were rude to callers and played pranks on them. The telephone companies' managers replaced the boys with women. By the late 1880s, almost every telephone operator was a woman. It was one of the first big jobs in a new technology open to women.

Emma Nutt worked as an operator for more than 30 years. The New England Historical Society, *Boston Magazine* and *Time* give the exact length as anything from about 33 to about 37 years.

Edison's team at Menlo Park

An electric lamp makes light when an electric current heats a thin thread inside it, called a filament, until the filament glows. Inventors had worked on electric lamps for 40 years before Edison's team made its lamp in 1879. British inventors showed arc lamps, which make light from a spark between two rods, starting in 1835. Joseph Swan in England patented a lamp design before Edison did, and so did William Sawyer and Albon Man.

Edison ran a laboratory at Menlo Park, New Jersey, with a team of workers. Among them were Charles Batchelor, John Kruesi and Francis Upton. In October 1879 the team made a lamp with a filament of cotton thread that had been baked into carbon. It burned for about 14.5 hours. Edison showed the lamps to the public at Menlo Park on New Year's Eve, 1879. The team kept testing filaments and settled on one made of bamboo. It let Edison's lamps burn for up to 1,200 hours, 50 full days.

Lighting a district. Edison's team built the other parts needed to light a whole district: the dynamo, a machine that makes electricity when it is turned, the wiring, and a meter to measure how much electricity each customer used. The Pearl Street station at 257 Pearl Street in Manhattan began supplying electricity on September 4, 1882, to the first district of paying customers.

The Menlo Park team built other machines too. Two years before the lamp, in early December 1877, John Kruesi built a phonograph, a machine that records sound and plays it back, to Edison's design. The first one recorded on a sheet of tinfoil, and on December 6, 1877, Edison recorded himself saying "Mary had a little lamb."

Thomas Edison

Who: An inventor whose team at Menlo Park made a long-lasting electric lamp, the phonograph and the system that brought electric light to paying customers.

When and where: Menlo Park and West Orange, New Jersey. Born 1847, died 1931.

Movie: *Edison* (2015), a documentary in the PBS series *American Experience*. It is about Edison's life and work.

Edison's West Orange laboratory had room for 20 projects at once.

Thomas Edison worked with a team. In 1876 he moved his staff of assistants to Menlo Park, New Jersey, and set up a laboratory with all the equipment needed to work on any invention. The National Park Service calls it the first research laboratory of its kind anywhere, the model for later ones.

In November 1887 Edison opened a much bigger laboratory in West Orange, New Jersey, less than a mile from his home. It had five buildings, with machine shops, a library and separate rooms for work in physics, chemistry and metals. Because the laboratory was so large, Edison and his staff could work on as many as 10 or 20 projects at once.

Edison first showed motion pictures in 1891. Two years later he began making movies to sell, in a building on the laboratory grounds called the Black Maria. Factories to make Edison's inventions grew up around the laboratory, and at the peak, during World War I, 10,000 people worked there.

Lewis Latimer

Who: A self-taught draftsman who drew the telephone patent and patented a better way to make the carbon filaments inside electric lamps.
When and where: Boston and New York. Born 1848, died 1928.

The son of two people who escaped slavery drew the telephone patent.

Lewis Latimer's parents had freed themselves from slavery in Virginia by escaping, and he was born in Chelsea, Massachusetts, on September 4, 1848. He taught himself to be a draftsman, someone who makes exact drawings of machines and buildings. While he worked at a patent law firm, he made the patent drawings for Bell's 1876 telephone application.

The filament. Latimer patented a better way of making the carbon filaments that glow inside electric lamps. The patent, number 252,386, was issued on January 17, 1882, for a "Process of Manufacturing Carbons." His method made filaments that were more even and lasted longer.

He received his filament patent while working at the U.S. Electric Lighting Company of Hiram Maxim. In 1884 he went to work for Edison's company, where he made patent drawings and testified in court as an expert on patents. He also oversaw lamp factories and the setting up of electric lighting in New York, Philadelphia, Montreal and London.

Latimer became one of the 28 first members of the Edison Pioneers, a group of people who had worked closely with Edison before 1885, on January 24, 1918. He was its only Black member. He died in Flushing, in Queens, New York, on December 11, 1928, at the age of 80. The house in East Flushing where he lived from 1903 is now the Lewis Latimer House Museum.

Granville T. Woods

Who: A Black inventor who patented a way to send messages between moving trains and railroad stations.

When and where: Cincinnati, Ohio. Patent issued November 29, 1887.

People on Edison's side claimed his inventions twice. Woods won both hearings.

Granville T. Woods invented a way for moving trains and stations to send messages to each other. He patented it as the Synchronous Multiplex Railway Telegraph on November 29, 1887, while working in Cincinnati. With it, the people who directed train traffic, called dispatchers, could know where the trains were.

Woods's telegraph worked by induction, in which a changing electric current in one wire makes a current flow in another wire nearby, without the two touching.

Twice, people on Edison's side claimed that inventions Woods had patented were theirs. Each time Patent Office officials held a hearing, called an interference proceeding, to decide who had invented first. Woods won both times. Edison offered him a job, and Woods turned it down. Over his career Woods received dozens of patents for electrical and railroad inventions.

Nikola Tesla

Who: A Serbian immigrant inventor whose induction motor used alternating current to make a shaft turn.

When and where: New York. Patent issued May 1, 1888.

Westinghouse paid him $60,000 and promised $2.50 a horsepower.

Nikola Tesla patented a motor that ran on alternating current, or AC, electric current that switches direction back and forth many times each second.

Other motors carried current to their turning part through brushes, sliding electrical contacts. Tesla's motor worked without brushes because it used induction, the same effect Woods used for his train telegraph.

Tesla was a Serbian immigrant who came to the United States in 1884. He filed for the motor patent in October 1887. The patent, number 381,968, was issued on May 1, 1888.

The deal. Westinghouse was a company that built electric generators and motors. In July 1888 it bought a license, the right to use Tesla's patents on AC motors. Tesla received $60,000 in cash and in stock, shares in owning the company. Under the deal he was also to get $2.50 for each horsepower, the measure of a motor's power, of the motors the company sold.

At her first pay of $10 a month, Emma Nutt, the first woman telephone operator, would have had to work 500 years to earn $60,000.

The typewriter and barbed wire

Christopher Latham Sholes, Carlos Glidden and Samuel Soule patented a typewriter on June 23, 1868. E. Remington & Sons began making it on March 1, 1873. The Sholes & Glidden Type-Writer went on sale in 1874 for $125. Its keyboard began with the letters Q, W, E, R, T and Y across the top row of letters. That arrangement, called QWERTY, is still used on keyboards.

Barbed wire. Joseph Glidden, a farmer from De Kalb, Illinois, received patent number 157,124 for barbed wire on November 24, 1874. He was a different man from the Carlos Glidden of the typewriter. Joseph Glidden's barb was a short piece of wire that locked onto a wire of two strands, and he built machines to make the wire in large amounts. Nine wire-fence designs were patented, and Glidden's was the one that sold well.

With barbed wire, people could fence land where there was little wood to build fences. In the West, landowners fenced off land and water that had been open to all. Some were homesteaders, families who had claimed farms, and some were ranchers. Their fences ended the open range, the unfenced land where cattle had grazed freely.

Range wars. Other cattlemen had grazed their herds on the open range, treating it as land for everyone's use. In Texas, New Mexico, Colorado and Wyoming, they found their old grazing land fenced off. They first asked officials for the right to use it. Then they fought what the National Archives calls "fierce range wars" against the farmers who owned the fenced land.

Native peoples who moved with the seasons had always used these lands too. The fences blocked them from more of those lands, according to the National Archives, and they called barbed wire "the Devil's rope."

BY 1900

If you remember one thing: Inventing became the work of teams and patent lawyers, and the end of slavery changed who could own an invention.

- In 1858: an enslaved blacksmith like Ned could not get a patent for his own cotton scraper, and the man who claimed to own him could not get one either.
- In 1887: Granville T. Woods, a Black inventor, patented his railway telegraph in his own name.

Next: After 1900, machines moved into American factories and homes, and two bicycle builders from Dayton, Ohio, flew.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 10 MINUTES

Americans brought machines into their factories, farms and homes in these fifty years. Workers at Henry Ford's car plant in Michigan started building car frames on a moving assembly line on October 7, 1913. Electric refrigerators and radios went into American homes, tractors began to replace horses on farms, and chemists made new materials, starting in 1907 with Leo Baekeland's Bakelite, the first plastic made entirely from chemicals.

The airplane and the electronic computer both date from these years. Wilbur and Orville Wright flew a powered airplane in North Carolina on December 17, 1903. In February 1946 engineers at the University of Pennsylvania showed ENIAC, the first general-purpose electronic computer, one that could be set up to solve many kinds of problems.

Scientists at Bell Labs, the research laboratory of the telephone company AT&T, made the first working transistor in December 1947. It was a small part that could control the flow of electricity and make a weak signal stronger. Transistors later replaced vacuum tubes, glass tubes with the air taken out, like light bulbs, in machines like ENIAC.

The Wright brothers

Who: Wilbur and Orville Wright, bicycle builders from Dayton, Ohio. They invented an airplane with an engine that a pilot could steer and control.

When and where: Near Kill Devil Hills, North Carolina, December 17, 1903.

Movie: *Wright Brothers' Flying Machine* (2003), a documentary in the PBS series *NOVA*, first shown on November 11, 2003. It is about the brothers' flying machine.

The first photograph of a flight was the photographer's first photograph ever.

The Wright brothers made four flights in an airplane with an engine near Kill Devil Hills, North Carolina, on December 17, 1903. Orville flew first. He stayed in the air for 12 seconds and covered 120 feet. On the fourth flight of the day, Wilbur flew 852 feet in 59 seconds.

Five people watched. One of them, John T. Daniels of the Life-Saving Station at Kill Devil Hills, squeezed the camera's shutter bulb and took the photograph of the first flight. It was the first photograph he had ever taken.

The brothers worked out how to steer an airplane on gliders, which have no engine, in 1901 and 1902. Besides going forward, an airplane can move in three other ways, and the Wrights built a control for each.

When the wing tips move up and down, the airplane rolls. The Wrights controlled roll with cables that twisted the tips of the wings. To control pitch, the nose moving up and down, they added a movable part at the front, called an elevator, in 1901. Yaw is the nose swinging from side to side. In 1902 they added a movable upright part at the back, called a rudder, to control it.

To test the shapes of wings, they built their own wind tunnel, in which a fan blows a steady stream of air past a model. They built a light gasoline engine, too, in the workshop of their bicycle shop in Dayton.

The first death. Army officers were testing the Wright airplane at Fort Myer, Virginia, on September 17, 1908. Orville flew it with Lieutenant Thomas E. Selfridge of the Army Signal Corps as his passenger. The Signal Corps, the Army's communications branch, was then in charge of the Army's first aircraft.

One of the propellers split and hit a wire, and the plane dived into the ground. Selfridge's skull was broken. He never woke up, and he died that evening, the first person killed in an airplane crash. Orville broke a leg and several ribs and spent seven weeks in the Army hospital.

Henry Ford

Who: The carmaker whose workers at Highland Park, Michigan, built the Model T on a moving assembly line.

When and where: Highland Park, Michigan. The moving chassis line started on October 7, 1913.

Movie: *Henry Ford* (2013), a documentary in the PBS series *American Experience*, directed by Sarah Colt. It is about Ford's life and his company.

A motor and a rope pulled each car frame past 140 workers.

At Henry Ford's plant in Highland Park, Michigan, the time it took to build the frame of a car fell from more than 12 hours to about 93 minutes. The workers got that speed by building on a moving assembly line. On a moving line, a motor pulls the car or part past the workers, and each worker adds parts or does one task as it goes by.

Ford's workers tried the line first on one part. In the spring of 1913 they put together the flywheel magneto, an engine part that makes electricity, on a line, with the job split into 29 steps done by 29 men along a moving belt.

The chassis line started on October 7, 1913. Each chassis, the frame of the car with its wheels, moved along a line 150 feet long. At first the time to build one fell to under 3 hours.

Five dollars a day. Ford announced a pay of $5 for an eight-hour day in January 1914. Before that, workers had earned about $2.34 for nine hours, so the new pay was more than double. Part of his reason was to keep workers who hated the pace of the line.

Ford's workers built cars in a year when about 23,000 workers in American industry died on the job, about 63 a day. Staff at the Bureau of Labor Statistics, a federal office that gathers facts about work, made that count for 1913. It covers every kind of industrial work across the country and gives no number for Ford's plant.

Radios, refrigerators and plastic

Lee de Forest's Audion of 1906 made weak radio signals stronger. The Audion was a vacuum tube. Inside its glass were a thin wire called a filament, a metal plate, and a bent wire between them called the grid. A small electric current on the grid controlled a bigger current between the other two parts. The Audion could pick up radio signals too, and tubes like it made radios for the home practical.

Philo Farnsworth, age 21, sent the first all-electronic television picture from his lab on Green Street in San Francisco on September 7, 1927. The picture was a straight line, made with his own camera tube, called the image dissector.

The refrigerator. The General Electric company began selling the Monitor Top, an electric refrigerator for the home, the same year. It cost about $300, and by the middle of 1929 buyers had bought more than a quarter of a million of them. It was the first home electric refrigerator sold in large numbers.

The researcher Emanuela Cardia studied what American households owned, using the census, the government's count of everyone in the country, taken every ten years. In 1930, 14 percent of households had a mechanical refrigerator, one that kept itself cold with a motor instead of a block of ice. By 1940 the share was 44 percent, and by 1950 it was 80 percent, four homes in five.

Plastic. Leo Baekeland, a chemist born in Belgium who lived in the United States, made Bakelite in 1907 from two chemicals, phenol and formaldehyde. It was the first fully synthetic plastic, made entirely from chemicals rather than from anything that grew. He filed for a patent in July 1907 and received it on December 7, 1909.

Nylon, a strong thread-like material made from chemicals, came from Wallace Carothers's work at the DuPont chemical company, which he joined in 1928. Gerard Berchet made the first half ounce of nylon on February 28, 1935, and DuPont officials announced it to the public on October 27, 1938.

Tractors replace horses

Census takers counted 246,000 tractors on American farms in 1920, and about 26 million horses and mules, more than 100 for every tractor. The Fordson tractor of 1917 was cheap and made in large numbers. About three out of every four American tractors built in the 1920s were Fordsons.

The International Harvester company began selling the Farmall in 1924. It could do the jobs other tractors did, and it could also cultivate, breaking up the soil and clearing weeds between rows of growing crops. Cultivating was the last farm job that horses still did.

The Census of Agriculture of 1954 was the first to record more tractors than horses and mules on American farms: about 4.6 million tractors and about 4 million horses and mules.

The first computers and the transistor

ENIAC, the first general-purpose electronic computer, was shown to the public at the University of Pennsylvania in February 1946. John Mauchly and J. Presper Eckert designed it at the university's Moore School, and the US Army paid to build it. It was built to work out artillery firing tables, charts that told soldiers how to aim their big guns.

ENIAC had 17,468 vacuum tubes, weighed more than 27 tons, and filled 1,800 square feet. It could not store a program. For each new set of calculations, its programmers, a team of six women, moved its switches and plugged its cables into new places by hand.

The transistor. At Bell Labs, a group of scientists led by William Shockley looked for a replacement for vacuum tubes, which often failed. On December 16, 1947, John Bardeen and Walter Brattain placed two gold contacts, very close together, on a small slab of germanium, a chemical element. The electric push, or voltage, on one contact controlled the flow of electricity, or current, through the other.

The device made a signal up to 100 times stronger. It was the first transistor. Workers at Bell Labs chose the name "transistor" in a vote, and the company's officials announced it to the public on June 30, 1948. Bardeen, Brattain and Shockley shared the Nobel Prize in Physics in 1956.

The six ENIAC programmers

Who: The six women who programmed ENIAC, the first general-purpose electronic computer, and were left out of its celebration.

When and where: University of Pennsylvania, Philadelphia, 1945 and 1946.

Movie: *The Computers* (2014), a short documentary first shown at the Seattle International Film Festival in 2014. The six programmers are its subject.

Six women programmed ENIAC. None was invited to its dinner.

The six were Jean Jennings Bartik, Betty Snyder Holberton, Kathleen McNulty Mauchly Antonelli, Marlyn Wescoff Meltzer, Frances Bilas Spence and Ruth Lichterman Teitelbaum. No one invited them to the dinner held for the machine's public showing in 1946. The records do not say who made the guest list.

At first the six had only drawings of the machine's wiring to learn from. They were hired to work out the paths of artillery shells for the Army, and later they also ran calculations for the scientists at Los Alamos, the laboratory in New Mexico where the atomic bomb was built.

Their story went untold for decades, until Kathy Kleiman learned about the six while she was researching her college thesis, a long paper written at the end of college. She started the ENIAC Programmers Project to record their story. In 1997 the group Women in Technology International named all six to its Hall of Fame. Four of them were there to accept. Ruth Teitelbaum had died, and her husband, Adolph, accepted for her. Frances Spence is not named among those who were there.

Ernest Lawrence

Who: A scientist who built the cyclotron, a machine that whirls particles in a spiral and uses them to smash atoms.

When and where: Berkeley, California, from 1930 and 1931.

One of his machines had a magnet that weighed 220 tons.

Ernest O. Lawrence's first cyclotron was small enough to hold in one hand. He built it at Berkeley, California, in 1930 and 1931, out of glass, sealing wax and bronze. It sped up hydrogen ions, hydrogen atoms with an electric charge, to an energy of 80,000 electron volts, a very small unit of energy used for particles.

Each machine Lawrence built after that was bigger. The first model was followed by machines 11 inches, 27 inches and 37 inches across. The 60-inch cyclotron of 1939 had a magnet that weighed 220 tons. Inside each machine, particles whirled in a spiral and then struck atoms and broke them apart.

Scientists used cyclotrons to make elements that do not occur in nature. They made radioactive materials for use in medicine, too, materials whose atoms break down and give off energy and tiny particles. Lawrence won the Nobel Prize in 1939. One later machine at Berkeley, the 88-Inch Cyclotron, still runs.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 11 MINUTES

Computers shrank from machines that filled a room to machines that sat on a desk at home, and people linked them into networks. Jack Kilby of Texas Instruments built the first integrated circuit, a whole electronic circuit on one small chip, in 1958. The Altair 8800, a computer sold as a kit of parts, was announced in the magazine *Popular Electronics* in January 1975, and IBM began selling the IBM PC in 1981. The IBM PC became the standard office computer.

A student at the University of California, Los Angeles, or UCLA, sent the first message between two computers on ARPANET, a network that linked computers at universities, on October 29, 1969. Martin Cooper of Motorola made the first call on a handheld cell phone four years later. All 24 satellites of the Global Positioning System, or GPS, were working by 1995.

Grace Hopper

Who: A mathematician and Navy officer whose A-0 compiler let people write instructions for a computer in words closer to English.

When and where: Harvard University from 1944, then Remington Rand, the company that made the UNIVAC computer. Born in New York in 1906, died in 1992.

Movie: *The Queen of Code* (2015), a short documentary directed by Gillian Jacobs, part of the FiveThirtyEight series *Signals*. It is about Hopper's life and work.

At 79 she was the oldest officer still serving in the Navy.

Grace Hopper's A-0 compiler, built in 1951 and 1952, was a program that takes instructions written closer to human language and translates them into instructions the computer can carry out.

Hopper trained as a mathematician. During World War II she served as a lieutenant in the WAVES, the women's branch of the Navy. In July 1944 she was assigned to the Harvard Mark I computer, and she became one of its first programmers. In 1946 she wrote the first long manual on how to program a computer.

She built the A-0 compiler while working on the UNIVAC computer at the Remington Rand company. From 1955 to 1959 she worked on FLOW-MATIC, a programming language for business. Like other programming languages, it was a set of words and rules for writing instructions a computer can follow, and its words were English words. Later, the designers of COBOL, another business programming language, drew on FLOW-MATIC.

Hopper retired from the Navy in 1986 as a rear admiral, one of the Navy's highest ranks. She was 79, and at that time she was the oldest officer still serving in the Navy.

Who invented the chip?

Two engineers at two different companies, Jack Kilby and Robert Noyce, each made a chip. The encyclopedia Britannica and the German Patent and Trade Mark Office both name the two men as its inventors. A chip, or integrated circuit, puts a whole electronic circuit, the path electricity flows through and the parts along it that do jobs such as switching it on and off, onto one small piece of material.

Kilby, of Texas Instruments, showed the first integrated circuit on September 12, 1958. He made it from germanium and connected its parts with wires by hand.

Noyce, of Fairchild Semiconductor, designed a chip made of silicon, another chemical element, in 1959. On Noyce's chip the wiring lay flat and was printed onto the surface, so factories could make chips in large numbers. Every later chip was built in Noyce's flat form. Silicon Valley, the area south of San Francisco where many computer companies started, is named for this element.

Kilby received the Nobel Prize in Physics in 2000. Noyce had died in 1990. Kilby said in public that Noyce deserved to share the prize.

Martin Cooper

Who: A Motorola engineer who made the first call on a handheld cell phone.

When and where: A street in Manhattan, New York City, April 3, 1973.

The first handheld cell phone call went to his rival.

Martin Cooper, an engineer for the Motorola company, made the first call on a handheld cell phone while walking along a street in Manhattan on April 3, 1973. He called Joel Engel, his rival at Bell Labs.

The phone Motorola sold to the public came 10 years later. The DynaTAC 8000X went on sale in 1983. It cost $3,995 and weighed 28 ounces, almost 2 pounds. One charge of its battery gave about 30 minutes of talking.

The personal computer

The Altair 8800, a computer sold as a kit, a box of parts that the buyer puts together, was announced in the magazine *Popular Electronics* in January 1975. About 30 people came through a rainstorm to Gordon French's garage in Menlo Park, California, on March 5, 1975, to see an Altair. That meeting was the first of the Homebrew Computer Club, a group of people who built their own computers.

Steve Jobs, Steve Wozniak and, for a short time, Ron Wayne founded Apple Computer on April 1, 1976. The Apple II, which came out in June 1977, was a finished computer that people could plug in at home. IBM brought out the IBM PC on August 12, 1981, and its design became the standard for computers in offices.

Lee Felsenstein

Who: An engineer who ran the meetings of the Homebrew Computer Club and designed two early small computers, the Sol-20 and the Osborne 1.

When and where: Berkeley and the San Francisco Bay Area, California, from 1973. Born in Philadelphia in 1945.

He put a public computer terminal in a Berkeley record store.

Arrested at Sproul Hall. Nine years before he set up that terminal, Lee Felsenstein was a student at the University of California, Berkeley. He took part in the Free Speech Movement of 1964, a protest by Berkeley students for the right to speak and organize about politics on campus. He was at the Sproul Hall sit-in, where students sat inside a campus building and refused to leave. On December 3, 1964, hundreds of police officers went into the building and arrested nearly 800 students, Felsenstein among them.

Community Memory. Felsenstein earned a degree in electrical engineering and computer science at Berkeley in 1972. The next year he and four partners, among them Efrem Lipkin and Jude Milhon, set up a computer terminal that anyone could use, a keyboard and a printer or screen connected to a computer somewhere else. They called the project Community Memory and put the terminal in a Berkeley record store, Leopold's Records, next to the store's paper bulletin board.

People typed notes about music, politics, housing, services, women's groups and technology, and other people read them. The Computer History Museum's profile of Felsenstein describes it as one of the earliest online communities. The last version of the project closed in 1992.

Community Memory ran on a large computer called an SDS-940, which was donated for the project. It was a time-sharing computer, one that many people could use at once from different terminals. The project's

team worked with Resource One, a nonprofit group, run for a cause rather than for profit. Three students who had dropped out of computer science at Berkeley had started Resource One.

Homebrew. Felsenstein was one of the first members of the Homebrew Computer Club, and he ran its open meetings, keeping order with a blackboard pointer.

With Gordon French and Bob Marsh, at a company called Processor Technology, he designed the Sol-20, one of the first small computers sold with its own case and keyboard. More than 10,000 were sold from 1977 to 1979. He then designed the Osborne 1 for Adam Osborne's company, a portable computer with a 5-inch screen. It cost $1,795, and more than 125,000 were sold in 1982.

His motto, as the Computer History Museum records it, is "To change the rules, change the tools." In 2016 the museum's leaders gave him their Fellow Award for his influence on early personal computing.

Steve Jobs and Steve Wozniak

Who: The founders of Apple Computer: Wozniak designed its first two computers, and Jobs made the first sale.

When and where: Jobs's garage in California, from 1976.

Movie: *Steve Jobs* (2015), directed by Danny Boyle and written by Aaron Sorkin. It is a drama, not a documentary. Actors play the real people, and it is based on Walter Isaacson's biography of Jobs. *Steve Jobs: The Man in the Machine* (2015), directed by Alex Gibney, is a documentary about Jobs.

A Volkswagen and a calculator paid for the first Apple computer.

Steve Wozniak designed Apple's first two computers, and Steve Jobs found the first buyer. The two met while they were both working at the Hewlett-Packard company. In 1975 Wozniak began developing the Apple I. He later said that the Homebrew Computer Club was where the Apple I got its start.

To pay for the first working model, Jobs sold his Volkswagen and Wozniak sold his scientific calculator, for $1,300 in all. On April 1, 1976, they founded Apple Computer, with Ron Wayne as a partner for a short time. Jobs and Wozniak built the first Apple I computers in Jobs's garage.

On his first sales call, Jobs got an order for 50 of them at $500 each, $25,000 in all, from a store called the Byte Shop. The Apple I came without a case, a keyboard, a screen or a power supply. Buyers added their own.

The Apple II. Wozniak designed the Apple II in 1977. Its electronics, keyboard and power supply came together in one case, and it could show color pictures. The programming language BASIC came stored in its permanent memory, a part that keeps what is stored in it even when the power is off.

> A floppy disk drive for storing files became available for it in 1978, and in 1979 VisiCalc came out, a spreadsheet program for working with tables of numbers. With those two, the Apple II sold in large numbers. Apple's sales grew from $7.8 million in 1978 to $117 million in 1980, 15 times as much in two years.

How the internet began

The internet began with ARPANET, a computer network paid for by the Department of Defense to link computers at universities. On October 29, 1969, Charley Kline, a student programmer in Leonard Kleinrock's lab at UCLA, tried to log in to a computer at Stanford Research Institute. He typed "L" and "O," the first two letters of LOGIN, and then the system crashed. So the first message ever sent on the network was "LO." About an hour later the full login worked.

The computers on ARPANET began using TCP/IP, the internet's shared set of rules for moving data between computers, on January 1, 1983.

The web. Many people use "the web" and "the internet" to mean the same thing, but they are two different things. The internet is the network of linked computers. The World Wide Web is a system of pages linked to one another, which people read over the internet.

A British computer scientist, Tim Berners-Lee, invented the web at CERN, a European physics laboratory in Switzerland. He proposed it in 1989 and opened it to the public on August 6, 1991. Americans built the program that let ordinary people use the web easily. Marc Andreessen, Eric Bina and others at the University of Illinois released Mosaic, the first widely used graphical browser, a program that shows web pages with pictures, on April 22, 1993.

GPS. The Global Positioning System, or GPS, is a set of satellites owned by the United States. Each satellite sends out a signal that gives its position and the time, and a GPS receiver picks up these signals and uses them to work out where it is. The first GPS satellite went up on February 22, 1978, and the full set of 24 was working in 1995.

Until 2000, under a policy called Selective Availability, US government officials made the GPS signals for the public less exact on purpose, for national security. President Bill Clinton ordered the policy ended in May 2000. After that, ordinary GPS receivers could find their place to within about 10 to 20 meters (about 30 to 65 feet) or better, close enough to give driving directions turn by turn.

What is inside a smoke detector?

The ionization smoke detector, a cheap alarm made in large numbers for homes, holds about a third of a millionth of a gram of americium-241. Americium is a radioactive element, one whose atoms break down and give off energy and tiny particles, and scientists discovered it in 1944 and 1945.

The americium gives off tiny particles called alpha particles. The particles knock bits of electric charge loose from the air in a small chamber inside the detector, so a very small electric current can flow through the air. When smoke enters the chamber, it disturbs the current, and the alarm goes off.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 11 MINUTES

Nine in ten American adults carried a smartphone by 2025, a survey by the Pew Research Center found, and new programs could write answers and match faces, sometimes wrongly. Apple began selling the iPhone in 2007. In 2022 the company OpenAI released ChatGPT, a program that writes answers to typed requests, and by February 2026, 44 percent of American adults told Pew they had used it.

ChatGPT is an AI program. AI, short for artificial intelligence, is a name for computer programs that do tasks such as recognizing a face or writing a paragraph, and these programs make mistakes. In 2020 Detroit police arrested the wrong man after a face-recognition search, a computer comparison of a photo of a face with a collection of photos, returned a false match.

The smartphone

Steve Jobs of Apple announced the iPhone on January 9, 2007. It went on sale on June 29, 2007, for $499 or $599, with a phone contract, a promise to pay a phone company for service every month. On September 10, 2007, Apple officials announced that the company had sold its one millionth iPhone the day before, 74 days after the phone went on sale.

A smartphone puts a computer, a camera, a phone, a GPS receiver and a music player into one machine that fits in a pocket. Social media apps run on these phones.

Researchers at the Pew Research Center, a group that runs large surveys, have asked Americans whether they own a smartphone since 2011. In their first count, in 2011, 35 percent of adults owned one, about one in three. In a survey of 5,022 adults from February to June 2025, 91 percent did, and 98 percent owned some kind of cell phone.

Older people were less likely to own a smartphone. Among adults aged 18 to 29, 97 percent had one, against 78 percent of those 65 and older.

For some Americans, the phone is the only way to get online. In the same 2025 survey, 78 percent of adults had broadband at home, a fast internet connection that is always on. Among adults in households earning less than $30,000 a year, 34 percent reached the internet only through a smartphone. Among those earning $100,000 or more, 4 percent did.

Batteries, printers and gene tools

The battery in an electric car is a lithium-ion battery, a kind that can be recharged many times. Scientists in three countries worked on it, starting in the 1970s, when M. Stanley Whittingham began work on rechargeable lithium batteries for the company Exxon in New Jersey.

John Goodenough, an American chemist then working at Oxford in England, found the material for the battery's cathode, its positive end, in 1980: lithium cobalt oxide. Akira Yoshino in Japan built a safe early model with a carbon anode, the negative end, in 1985. The Sony company in Japan began selling the first lithium-ion batteries in 1991. Whittingham, Goodenough and Yoshino shared the Nobel Prize in Chemistry in 2019.

3D printing. A 3D printer builds a solid object out of many thin layers, one on top of another. Chuck Hull invented stereolithography, a method of 3D printing in which the machine hardens each thin layer in turn, in 1983 and 1984. He applied for a patent on August 8, 1984, and received it on March 11, 1986. In the 2010s, 3D printers spread to factories and to hobbyists' desks.

Gene tools. CRISPR is a tool for changing genes, the instructions inside living cells that shape how a living thing grows and works. Chapter 9 tells how the scientists Jennifer Doudna and Emmanuelle Charpentier made it into that tool in 2012.

Limor Fried

Who: An engineer who founded Adafruit Industries, a company that makes electronics kits and teaches people to build with them.

When and where: MIT in Cambridge, Massachusetts, then New York City, from 2005.

Adafruit's designs are open source: anyone may copy and change them.

Adafruit Industries began in 2005 in Limor Fried's dorm room at the Massachusetts Institute of Technology, or MIT, a university in Cambridge, Massachusetts. She had earned a bachelor's degree from MIT in 2003, and she finished a master's degree in engineering there in 2005. Adafruit sells electronics kits along with lessons on how to build them, and it shares its designs as open source, free for anyone to copy and change.

According to the company's website, Fried was the first woman engineer on the cover of *Wired* magazine, and women own all of the company. Adafruit's workers make its products in the company's factory in New York City. In 2024 Adafruit moved to Industry City in Brooklyn. The company's website states that it has more than 100 employees.

How AI programs work, and why they make mistakes

One kind of AI program, a neural network, learns from examples instead of following step-by-step instructions written by a person. To train a network to name what is in photographs, a computer shows it a huge number of photos whose right answers are already known.

Each time the network gives an answer, the computer compares it with the right answer and adjusts the network's settings a little, so that the next answer comes closer. After enough examples, the network can name what is in photos it has never seen, though it still makes mistakes.

A contest. Alex Krizhevsky, Ilya Sutskever and Geoffrey Hinton of the University of Toronto won ImageNet in 2012 with a neural network called AlexNet. ImageNet was a contest that scored computer programs on naming what is in photographs. Each program gave its five best guesses for each picture. AlexNet missed with all five on about 15 of every 100 pictures, and the second-place program missed on about 26 of every 100. After AlexNet's win, neural networks came into wide use, a time called the deep-learning era.

ChatGPT and programs like it produce text, pictures and computer code from requests typed in plain language. OpenAI released ChatGPT on November 30, 2022. Five days later, OpenAI's chief executive, Sam Altman, posted online that it had "crossed 1 million users." Analysts at the bank UBS estimated that by the end of January 2023, about 100 million people a month were using it.

Why they make mistakes. Staff at the National Institute of Standards and Technology, a federal agency, published a report in July 2024 on how large language models, programs that write text, work and why they make mistakes. A program of this kind predicts the next word in a sentence, over and over. That kind of guessing can produce true statements, and it can also produce false ones. The report states that the programs give false answers in a confident way, and that people who believe them can be misled.

Fake cases in court. Two lawyers in a federal court case in New York cited court decisions in 2023 that ChatGPT had made up. Lawyers cite, or point to, earlier decisions to show a judge how courts have ruled in cases like theirs.

Roberto Mata had sued the airline Avianca, saying a metal serving cart struck his knee on a flight. On March 1, 2023, his lawyers, Steven A. Schwartz and Peter LoDuca, filed a court paper that cited earlier decisions to support Mata's side. ChatGPT had made up those decisions and the quotes from them.

Schwartz later said that he asked ChatGPT whether one case was real, and it answered that the case "does indeed exist." In written orders, the judge then asked whether the cases existed, and the lawyers kept standing by them. On June 22, 2023, Judge P. Kevin Castel found that the lawyers had acted in bad faith, meaning dishonestly. He ordered the two lawyers and their law firm to pay a penalty of $5,000.

Karla Ortiz

Who: A San Francisco concept artist whose designs went into Marvel films and who told US senators how AI image programs affected artists.
When and where: San Francisco and Washington, D.C., from 2022.

"I am no longer certain of my future as an artist."

Karla Ortiz is a concept artist, an artist who draws the first designs for characters and scenes. Her designs went into Marvel films, including *Doctor Strange*, *Black Panther* and *Avengers: Infinity War*. She worked on the video game *Final Fantasy 16* and the card game *Magic: the Gathering*, too.

Ortiz first saw an AI image program in April 2022. A website showed pictures made by a machine that copied the styles of named artists, her friends among them. No one had asked them. By August and September of 2022, the programs Midjourney, Stable Diffusion and DALL-E were in wide use.

The lawsuit. Ortiz, Sarah Andersen, Kelly McKernan and other artists sued Stability AI, Midjourney and DeviantArt in federal court on January 12, 2023. They said the companies had broken copyright law, the law that protects an artist's right to decide who copies their work.

Her testimony. Ortiz gave written testimony, a statement to lawmakers, to a subcommittee of the US Senate Judiciary Committee on July 12, 2023. In it she explained how the popular image programs were built. Their makers trained them on a collection of 5.8 billion pictures with captions, "taken indiscriminately from the web," meaning without anyone choosing which ones.

People at a nonprofit group called LAION, which the company Stability AI funded, built the collection. Ortiz wrote that the collection "includes almost all of my fine art work."

She described what she had seen in her own work. She had been part of three productions where generative AI, AI that makes new pictures, text or sound, had been "utilized," or used, "at different levels." "Some of my peers have lost jobs, some have had their duties lessened (and of course, their proposed pay)," she wrote.

She also wrote, "I am no longer certain of my future as an artist." She worked with researchers at the University of Chicago on Glaze, a program meant to protect artists' pictures from having their style copied.

US District Judge William Orrick ruled on August 12, 2024, that the artists' main copyright claims could go forward toward a trial. As of October 2, 2026, the case had not gone to trial. On September 28, 2026, Judge Orrick changed the schedule so that the next major motions in the case, formal requests to the judge, are to be heard by September 29, 2027.

Arrested by a false match

Detroit police officers arrested Robert Williams, a Black man, at his home in Farmington Hills, Michigan, in January 2020, after a face-recognition search matched him by mistake. They arrested him in front of his wife and two young daughters and in view of his neighbors.

The software, which names possible matches for a face from a collection of photos, had matched a blurry picture from a store's security video to his expired driver's license photo. The video showed a theft of watches from a Shinola store in Detroit in 2018. Williams was not the man in the video.

Police used the match to build a photo lineup, a set of photos shown to someone who might pick out the thief. They showed it to a contractor hired to prevent theft at the store, who had not seen the theft and knew it only from the video.

Thirty hours. Detroit police held Williams for 30 hours. The ACLU, the civil rights group whose lawyers represented him, described the place he was held as "an overcrowded, dirty cell." Wayne County prosecutors dropped the charges, but they kept the right to bring them again.

The county's prosecutor, Kym Worthy, apologized. "This case should not have been issued based on the DPD investigation, and for that we apologize," she said, using the initials of the Detroit Police Department. His was the first publicly reported case in which police wrongly arrested someone after a false face-recognition match.

At least three Detroit arrests of this kind are publicly known, according to reporting by Michigan Public in 2024. In 2023 Detroit police wrongly arrested Porcha Woodruff, who was pregnant, for a carjacking, stealing a car from its driver.

The settlement. Williams and lawyers for the City of Detroit settled his lawsuit on June 28, 2024. Under the settlement, Detroit police may not arrest anyone based on a face-recognition result without other evidence, and they

may not build a photo lineup from a face-recognition match alone. They must train officers, including on the higher rate of wrong matches for people of color, and they must review cases back to 2017.

AI at work, by the numbers

The share of Americans who have used ChatGPT has grown in each Pew survey. Researchers at the Pew Research Center found in February 2026, in a survey of 5,119 American adults, that 44 percent had used it, up from 18 percent in 2023 and 34 percent in 2025.

About half of adults in the 2026 survey used some AI chatbot, a program that answers typed questions in sentences. Among adults with jobs, 38 percent used chatbots for tasks at work. Forty percent of adults expected AI to have a bad effect on society over the next 20 years.

Some employers say AI is the reason they are cutting jobs. Staff at Challenger, Gray & Christmas, a company that helps laid-off workers find new jobs, count the job cuts that American employers announce and the reasons the employers give.

From January through August 2026, employers named AI as the reason for 116,175 announced job cuts. That was about 22 percent of all the cuts they announced, more than one in five and more than for any other reason. These numbers are employers' own statements, not a government count of jobs lost to AI.

THE THREE QUESTIONS, ANSWERED

1. **Why did planters enslave far more people after the cotton gin?** One gin cleaned about 50 pounds of cotton a day, work that took several hundred hours by hand. Planters grew far more cotton and enslaved far more people to grow and pick it, nearly 4 million by 1860.
2. **Why could an enslaved inventor not get a patent?** Only the inventor could get a patent, and only by swearing an oath. In 1858

Attorney General Jeremiah Black ruled that an enslaved man was not a citizen and could not swear it, and that the enslaver could not take the patent instead.

3. **What went wrong when people trusted a computer's answer?** In 2023 two lawyers cited court decisions that ChatGPT had made up, and a judge ordered them and their law firm to pay a $5,000 penalty. In 2020 Detroit police held Robert Williams for 30 hours after a face-recognition search matched him by mistake.

What changed: Work done by hand moved to machines run by water, then steam and electricity, then pocket-sized computers.

FIVE DATES TO KEEP

1646: Joseph Jenks gets a patent for his water-driven mills.

1793: Eli Whitney builds the cotton gin.

May 24, 1844: Morse sends the first public telegraph message.

December 17, 1903: The Wright brothers make the first powered flights.

November 30, 2022: OpenAI releases ChatGPT.

> **NOT KNOWN:** Ned's second name, if he had one, was never recorded, and nobody knows how his life ended.

Where to go: The Saugus Iron Works National Historic Site, in Saugus, Massachusetts, where the 1640s ironworks stands rebuilt.

Next: Chapter 9, Science. It follows Americans who measured the world and the people some scientists studied without asking.

Chapter 9: Science

CHAPTER 9 OF 37 · SCIENCE · 10 ERAS · ABOUT 95 MINUTES

Science in America grew from a few people watching the sky into labs with thousands of workers, and along the way many scientists used people who never agreed to be studied.

A dead moose reached General John Sullivan in New Hampshire on April 3, 1787, badly rotted. Thomas Jefferson had asked for its skin, skeleton and horns. He wanted to show a French scientist named Buffon that American animals were not small and weak. The antlers could not be saved, so Sullivan sent another animal's antlers and wrote that they "may be fixed on at pleasure." In the book where he argued with Buffon, Jefferson also called Black people inferior to white people. He called that claim "a suspicion only."

This chapter follows American science from the sunrise posts at Cahokia to the James Webb Space Telescope. Most of it is people measuring things: a comet, the speed of light, the carbon dioxide in the air. Watch also for the people who were measured. From the 1830s to the 1970s, scientists and doctors dug skulls out of graves, had enslaved people photographed as "evidence" about race, and injected hospital patients with plutonium. The last eras show what families and Native nations did about it. Watch, too, who gets the credit: more than once it went to someone other than the person who did the work.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did American scientists learn how far away the stars are?
2. Why did scientists collect human skulls and brains, and where are those remains now?

3. Who did the work but was left out of the credit?

Five minutes? Read "How did Henrietta Leavitt measure space?" in 1900 to 1950, then "The shape of DNA, and who got the credit" in 1950 to 2000.

Can skip: "Charting the winds at sea", "The physics inside the transistor, 1947", "Heavy elements, made by many countries", "Computers that predict the shapes of proteins". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

The people of Native nations here watched the sky for many generations and learned where the sun rose at each time of year. They studied plants, fire, the weather and the tides as well. Each generation taught what it knew to the next.

They marked what they knew about the sky with posts and with carvings in rock. At Cahokia, people set up circles of wooden posts that marked where the sun rose. At Chaco Canyon, sunlight falls on two carved spirals in set places at certain times of year.

Woodhenge at Cahokia

The people of Cahokia, in what is now Illinois, tracked the sunrise with circles of upright wooden posts between about the years 900 and 1100. Chapter 8 tells how they built the circles. The place where the sun comes up moves along the horizon over a year, and the posts marked that movement. The circles are known today as Woodhenge. Nations such as the Chickasaw and the Osage descend from the people who lived at Cahokia.

The posts marked the sunrise on the solstices, the longest and the shortest days of the year. They also marked it on the equinoxes, the two days each year when day and night are about the same length.

How does the Sun Dagger at Chaco Canyon work?

Sunlight slips past three slabs of sandstone and lands on two spirals carved into the rock. The slabs lean against a cliff near the top of Fajada Butte, a steep hill with a flat top in Chaco Canyon, in what is now New Mexico. The canyon was a center for the ancestral Pueblo people from 850 to 1250. Their descendants today include the Hopi, the Pueblo peoples of New Mexico and the Navajo Nation.

The daggers. The light falls on the spirals as thin blades, called daggers, and they land in set places at the solstices and the equinoxes. Researchers in a group called the Solstice Project argue that the spirals also mark a cycle of the moon. Over 18.6 years, the points where the moon rises and sets swing out to their widest and back again. Other researchers who study ancient astronomy still debate that claim.

Worn away. Anna Sofaer, a volunteer making a record of rock art, recorded the daggers at the summer solstice of 1977. They no longer form the way she saw them. By the summer solstice of 1989, two of the three slabs had shifted. Park officials had limited visits to the butte, but visitors walking there had made the ground wear away faster.

Knowledge of living things

Native nations built up knowledge of ecology, the ways living things depend on each other and on the land, by watching closely over many generations. Scientists today call it Traditional Ecological Knowledge, or TEK for short. Part of it is knowledge of how fire changes the land and the living things on it.

The Ecological Society of America, a group of scientists who study ecology, has a section for TEK. A botanist, or plant scientist, named Robin Wall Kimmerer helped to found it.

Robin Wall Kimmerer

Who: A botanist of the Citizen Potawatomi Nation who uses Native knowledge and laboratory science together in her work.

When and where: The present day. The State University of New York's College of Environmental Science and Forestry.

Her 2013 book has been a New York Times bestseller since 2020.

The book is *Braiding Sweetgrass*, and it has been on the list since February 2020. Kimmerer is a member of the Citizen Potawatomi Nation. In her work she studies plants in two ways together. One is the knowledge that Native nations have built up and taught. The other is the science of the laboratory.

Sweetgrass at a Mohawk farm. In a study published in 2005, Kimmerer and a fellow researcher worked to bring back sweetgrass, a plant used to make baskets, at Kanatsiohareke, a Mohawk farm. Members of the Mohawk community chose the spot, because sweetgrass had grown there in the past. The researchers then tested four ways of planting it. The sweetgrass grew best beside a crop called hairy vetch.

She earned a PhD in botany, the highest degree a university gives, at the University of Wisconsin. She teaches at the College of Environmental Science and Forestry, part of the State University of New York, where she

> founded the Center for Native Peoples and the Environment. In 2022 the MacArthur Foundation named her a MacArthur Fellow.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 1 MINUTE

Europeans who crossed the ocean in the 1500s studied this land only on short visits. They collected what they found, described it in writing and published their descriptions in Europe.

Thomas Hariot's report

Thomas Hariot, an English mathematician, spent a year on Roanoke Island and wrote down the plants, the animals and the foods he found. The island lies among the shallow waters of the Outer Banks, in what is now North Carolina. Hariot went there in 1585 and 1586 with the expedition that Walter Raleigh sent.

He also wrote about the Native nations who lived there, such as the Secotan. They spoke Algonquian languages, a group of languages related to each other.

The book. Hariot published *A Briefe and True Report of the New Found Land of Virginia* in 1588. It was the first book in English about North America written by someone who had been there. A publisher named Theodor de Bry printed it again in 1590, with pictures made from drawings by John White.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 3 MINUTES

A few colonists kept careful records of the sky and the weather in the 1600s, and some of them still read the sky as a message from God. English colonists in New England founded Harvard, the first college in their colonies, in 1636, and printed their first almanac three years later. One of them, Increase Mather, measured comets but still wrote that they were warnings from God.

A college, an almanac and a telescope

Members of the Massachusetts Bay General Court, the colony's lawmakers, voted in 1636 to found a college. It was the first college in the English colonies. John Harvard died in 1638 and left the college his books and half of everything else he owned. On March 13, 1639, the same lawmakers voted to name the college Harvard, after him.

The almanac. That same year a sailor named William Pierce worked out an almanac, a yearly booklet with a calendar and tables of the sun and moon. Its title was *An Almanack for New England for the Year 1639*. Stephen Daye printed it at Cambridge, in Massachusetts, on the first printing press in the colonies. It was one of the first two things printed there.

For the next two hundred years, ordinary families learned about astronomy, the study of the sun, the moon, the planets and the stars, from almanacs.

The telescope. John Winthrop Jr., a governor of Connecticut, visited London from 1661 to 1663. While he was there, members of the Royal Society, a group of scientists in London, elected him a fellow, or full member. He was one of the first colonists to join. In about 1672 he gave Harvard his telescope, which was 3.5 feet long. It was the college's first scientific instrument.

The comet of 1680

Thomas Brattle followed the Great Comet of 1680 with a telescope from Boston. He had finished his studies at Harvard in 1676. The comet showed in the sky in November and again in December. Brattle worked out that the two sightings were one comet, which had swung around the sun in between.

A warning and a measurement. Increase Mather wrote a book about comets in 1683, called *Kometographia*. In it he listed comets as warnings sent by God. Yet he measured comets with parallax, which means looking at an object from two different places. A near object seems to shift against the stars far more than a distant one. His measurements showed that comets were distant bodies, not vapors, a kind of gas.

That same year Mather founded the Boston Philosophical Society, modeled on the Royal Society in London. People then called the study of nature natural philosophy, so a philosophical society was a group for studying nature. Mather's group met for about three years.

The English scientist Isaac Newton published his book the *Principia* in 1687. In it Newton set out his laws of motion and of gravity, and he wrote about Brattle's New England observations of the comet of 1680.

Rev. John Campanius Holm

Who: A chaplain in the colony of New Sweden who kept the first known weather record in what is now the United States.

When and where: Near what is now Wilmington, Delaware, 1644 and 1645.

Twice a day, with no instruments, he wrote down the weather.

John Campanius Holm kept the first known record of the weather in what is now the United States. He wrote it down twice a day through 1644 and 1645. He followed the same plan day after day, and he had no instruments at all.

Holm was a chaplain, a minister who serves people far from home. He served New Sweden, a Swedish colony on the Delaware River, near what is now Wilmington, Delaware.

Officials of the National Oceanic and Atmospheric Administration, the US government's weather and ocean agency, now give the John Campanius Holm Award. It goes to volunteers who take weather readings, up to 25 people each year.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 3 MINUTES

Colonists who studied nature began to share their work in these years, with each other and with scientists in London. A farmer named John Bartram and Benjamin Franklin of Philadelphia got them started. Bartram traveled through the colonies from 1730 to collect and study American plants. Franklin organized a society in Philadelphia for this kind of work in 1743. From 1747 he ran experiments with electricity and mailed the results to London. Scientists in Britain read those letters, and Franklin became the first American scientist known outside the colonies.

The American Philosophical Society, 1743

Benjamin Franklin organized the American Philosophical Society in Philadelphia in 1743. It is the oldest learned society in the United States, a group of people who meet to share and discuss what they have found out.

The botanist John Bartram first suggested the idea in 1739. Franklin started the society with a pamphlet, a short printed booklet. It was titled *A Proposal for Promoting Useful Knowledge among the British Plantations in America*, and in that title the word plantations means colonies.

The society grew out of the Junto, a club Franklin had started in 1727 with about twelve friends, most of them tradesmen. Its members met on Friday nights to argue about right and wrong, about government and about nature. Franklin meant the new society to be an American answer to the Royal Society in London.

Benjamin Franklin

Who: A Philadelphia man whose experiments with electricity made him the first American scientist known in other countries.

When and where: Philadelphia, experiments from 1747 to 1751.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS. It is about Franklin's life.

Scientists still say "positive" and "negative" because Franklin chose those words.

Benjamin Franklin ran experiments with electricity in Philadelphia from 1747 to 1751. He reported his results in letters to Peter Collinson, a member of the Royal Society in London.

Franklin thought of electricity as a single fluid. He called an object positive when it held more of this fluid than normal, and negative when it held less. He argued that electric charge is never made or destroyed. It only moves from one object to another, an idea scientists call the conservation of charge. He also proposed that lightning is electricity.

His letters came out in London in April 1751 as a book, *Experiments and Observations on Electricity*. In 1753 members of the Royal Society gave him the Copley Medal, their highest honor. He was the first person from outside Britain to receive it, and the first American to be known in other countries as a scientist.

John Bartram

Who: A Quaker farmer who studied plants, built the oldest surviving botanic garden in America, and first suggested the American Philosophical Society.

When and where: His farm at Kingsessing, on the Schuylkill River, from 1728. He lived from 1699 to 1777.

He and his sons gave science more than 200 new American plants.

Scientists first learned of more than 200 American plants through John Bartram and his sons. Bartram was a farmer and a Quaker, a member of a Christian group also called the Society of Friends.

He bought a farm of 102 acres at Kingsessing, on the Schuylkill River, in 1728. There he built a botanic garden, where plants are grown so they can be studied. It is the oldest botanic garden in America that survives today.

He traveled from 1730 to 1765 to collect plants, from New York as far south as Florida. The idea that became the American Philosophical Society was his, in 1739. King George III named him the King's Botanist for North America in 1765.

Carl Linnaeus, the Swedish botanist who made the system scientists use to name living things, reportedly called Bartram "the greatest natural botanist in the world."

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 7 MINUTES

Scientists in Europe began reading and reprinting American work after 1750. Benjamin Franklin designed the 1752 test that showed lightning is electricity. Men in France ran it first, and Franklin wrote that he then ran it with a kite. In 1769 four men at Norriton timed the planet Venus as it crossed the sun, and members of the Royal Society in London reprinted their results.

Thomas Jefferson used evidence in his book *Notes on the State of Virginia*, and later a moose, to argue with a scientist in France about the size of American animals. In that same book he wrote that Black people were inferior to white people, meaning less able, in body and mind. He called the claim "a suspicion only." Benjamin Banneker, a free Black farmer who taught himself astronomy, sent Jefferson an almanac he had calculated as proof against it.

Who ran the lightning test first?

Men in France ran Franklin's lightning test before Franklin did. Franklin had published a plan for a test that would show whether lightning is electricity. Thomas-François Dalibard followed the printed plan at Marly-la-Ville on May 10, 1752, with a tall iron rod. He reported the test to the French Academy, a society of scholars, on May 13. The test showed that lightning is electricity.

The kite. Franklin wrote that he ran his own test in Philadelphia with a kite. He first described it in print on October 19, 1752, in the *Pennsylvania Gazette*, a newspaper. Nobody recorded the exact day or the exact spot. The date most often given, June 1752, comes from an account Joseph Priestley wrote in 1767.

Few writers have doubted that the kite flight took place, and no record from the day settles the question either way. One who did doubt it, Tom Tucker, argued in a 2004 book called *Bolt of Fate* that Franklin never flew the kite at all.

Timing Venus, 1769

Four men at Norriton, in Pennsylvania, timed the planet Venus as it passed across the face of the sun on June 3, 1769. An event like this is called a transit of Venus. Astronomers in many parts of the world timed the same transit. They planned to use the times to work out the distance from Earth to the sun.

Members of the American Philosophical Society chose teams to watch from three places. It was the first large, organized science project in the colonies.

Norriton. The Norriton team worked at the home of David Rittenhouse, in what is now Montgomery County, Pennsylvania. Rittenhouse built most of the instruments they used. He, William Smith, John Lukens and John Sellers made the timings. Their results filled the first volume of the society's *Transactions*, its printed record of research, which came out in 1771. Members of the Royal Society in London reprinted the results.

David Rittenhouse

Who: A Pennsylvania instrument maker and astronomer who taught himself both trades. One of the four men who timed Venus at Norriton in 1769.

When and where: Norriton, Pennsylvania, in 1769, and Philadelphia. He lived from 1732 to 1796.

He taught himself to build machines that showed the planets moving.

David Rittenhouse taught himself to make scientific instruments and to study the stars. He built orreries, machines that show the planets moving around the sun. When an orrery's gears turn, small models of the planets move along their paths.

He followed Franklin as president of the American Philosophical Society in 1791. Later he became the first director of the United States Mint, where the country's coins are made.

Jefferson, Buffon and the moose

A scientist in France named Buffon taught that animals and people grew "degenerate" in the Americas, by which he meant smaller and weaker. Thomas Jefferson argued against him with evidence in his book *Notes on the State of Virginia*. Jefferson wrote the book to answer a list of questions a French official had sent. He called each chapter a Query, an old word for a question.

A claim with no evidence. In the chapter called Query XIV, Jefferson wrote that Black people "are inferior to the whites in the endowments both of body and mind." Inferior means lower or less able, and endowments here means natural abilities. He called the claim "a suspicion only." In reason, he wrote, Black people were "much inferior, as I think one could scarcely be found capable of tracing and comprehending the investigations of Euclid," a mathematician of ancient Greece.

Jefferson himself enslaved more than 600 people during his life.

The moose. Jefferson's other evidence against Buffon was a moose. He was then the United States minister in Paris, the country's official representative to the French government. On January 7, 1786, he wrote to John Sullivan of New Hampshire, a former general and governor. He asked for "the skin, the skeleton, and the horns of the Moose."

Sullivan's party of men killed a moose in Vermont. Its body reached Sullivan on April 3, 1787, badly rotted. The skull and antlers could not be saved, so Sullivan sent the antlers of another animal. He wrote that they were "not the horns of this moose but may be fixed on at pleasure," meaning Jefferson could attach them however he liked.

The shipment reached France in about late September 1787. Around October 1, Jefferson gave Buffon the moose's bones and skin, along with the other animal's antlers. Jefferson wrote that the moose "convinced Mr. Buffon. He promised in his next volume to set these things right." Buffon died in April 1788 without printing a correction.

Benjamin Banneker

Who: A free Black tobacco farmer who taught himself mathematics and astronomy and calculated almanacs for the years 1792 through 1797.

When and where: Baltimore County, Maryland, where he was born on November 9, 1731. He died in 1806.

He sent Thomas Jefferson a handwritten almanac as proof.

Benjamin Banneker taught himself mathematics and astronomy from books and instruments that he borrowed. He was a free Black tobacco farmer in Baltimore County, Maryland. For six years of printed almanacs, 1792 through 1797, he worked out where the sun, the moon and the planets would be on each day.

He correctly predicted the solar eclipse of April 14, 1789, when the moon passed between the earth and the sun. Better-known almanac makers had calculated it differently.

The letter. On August 19, 1791, Banneker sent Jefferson his almanac in manuscript, written by hand, as proof against Jefferson's claim about Black people. In the letter that went with it, he challenged Jefferson about slavery. "However variable we may be in society or religion," he wrote, "however diversified in situation or colour, we are all of the same family."

Jefferson wrote back on August 30, 1791: "no body wishes more than I do to see such proofs as you exhibit (show), that nature has given to our black brethren (brothers), talents equal to those of the other colours of men." Jefferson sent the almanac on to a man named Condorcet in Paris.

The almanacs sell. Banneker's first almanac, for 1792, went on sale in December 1791. Goddard & Angell of Baltimore printed it, and it sold in Baltimore, Philadelphia and Alexandria. His Quaker neighbors, Joseph and George Ellicott, had already interested other Quakers in his work, and the abolition societies of Baltimore and Philadelphia, groups that worked to end slavery.

Members of the abolition societies of Pennsylvania and Maryland promoted the almanacs. Several printers published them, and they sold in the United States and in England. The 1792 almanac opened with support from James McHenry, a Maryland politician, who used the word of the time for a Black person: "I consider this Negro as fresh proof that the powers of the mind are disconnected with the colour of the skin."

Jefferson, later. Banneker died in 1806. Three years later, on October 8, 1809, Jefferson wrote to Joel Barlow: "we know he had spherical trigonometry enough to make almanacs, but not without the suspicion of aid from Ellicot, who was his neighbor & friend, & never missed an opportunity of puffing him." Spherical trigonometry is the mathematics of angles and distances on a sphere, such as the sky, and puffing meant praising someone too much. Jefferson was hinting that Ellicott had helped with the mathematics. He himself called it a suspicion.

Jefferson's fossil, 1797

Jefferson presented a paper about a fossil animal named Megalonyx, which means "giant claw," to the American Philosophical Society on March 10, 1797. The paper was printed in 1799. It was the first fossil animal from the United States to get a genus name, the name for a group of closely related kinds of animals or plants.

Caspar Wistar wrote a second paper to go with Jefferson's. With it, Wistar began the study of paleontology, ancient life through fossils, in the United States.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 10 MINUTES

Americans set up their own places for science between 1800 and 1850. Benjamin Silliman, Yale's professor of chemistry from 1802, founded the country's first lasting science journal, a magazine where scientists publish their research, in 1818. President James K. Polk signed a law in 1846 to set up the Smithsonian Institution in Washington, paid for by an Englishman who never visited the country. Its first head, Joseph Henry, set up a network of volunteers who reported the weather.

In Philadelphia in the same years, a doctor named Samuel George Morton collected hundreds of human skulls. Some of the men who supplied him robbed graves to get them. Morton measured the skulls and used the numbers to rank the races of people. The idea that skull size shows the intelligence or worth of a group of people is false.

A professor, a fallen stone and a journal

Benjamin Silliman became Yale's professor of chemistry, the study of what things are made of and how they change, in 1802. His job covered natural history too, the study of plants, animals and rocks. He gave his first lectures in 1804.

The Weston meteorite. A meteorite, a rock from space, fell at Weston, Connecticut, on December 14, 1807. Silliman and James Kingsley wrote down what was known about the fall. Then they ran chemical tests to learn what the rock was made of. It was the first meteorite fall in the Americas that scientists recorded and studied in this way.

Silliman founded the *American Journal of Science* in 1818. It was the first science journal in the country that lasted, and for decades people called it "Silliman's Journal."

Who found induction first?

Michael Faraday in London was the first to publish the discovery of electromagnetic induction, the making of an electric current with a magnet. He published it in 1831, and he keeps the credit. Joseph Henry, in Albany, New York, had found the same effect on his own but published later.

Self-induction. Henry has the credit for a related discovery, self-induction, which he published in Silliman's journal in July 1832. When the electric current in a coil of wire changes, the coil makes its own push of electricity against that change. Scientists measure the strength of self-induction in a coil with a unit called the henry, named after him.

Henry was a teacher at the Albany Academy, a school in Albany, and his best years of research there ran from 1826 to 1832. He built the strongest electromagnets of his day. An electromagnet is a magnet made by sending electricity through a coil of wire.

Samuel Morton's skulls

Samuel George Morton, a Philadelphia doctor, collected human skulls and used them to rank the races of people. He lived from 1799 to 1851 and belonged to the Academy of Natural Sciences of Philadelphia, a society of scientists. He prepared a lecture on how skulls differ in 1830 and began to collect them in the early 1830s. When he died in 1851, he owned 867 human skulls.

Where they came from. He got the skulls through 138 contacts: scientists, traders, military men and missionaries, people sent by churches to spread their religion. Army surgeons at far-off posts were his most useful suppliers. Some of his collectors robbed graves. About a dozen skulls came from a potter's field in Philadelphia, a burial ground for poor people, where poor Black Philadelphians were buried.

Morton himself got the remains, what was left of the bodies, of at least 14 Philadelphians, Black and white, while he worked as a doctor at the city's almshouse, a public home for poor people. A 2021 report for a University of Pennsylvania project does not name who dug up their bodies, and a Philadelphia news station reported that year that the Philadelphia skulls were likely bought from grave robbers.

A doctor in Havana, José Rodríguez Cisneros, dug up the graves of enslaved Africans in Cuba in 1840 and shipped about 50 of their skulls to Morton. More skulls came from battlefields and from gallows, the frames on which people were hanged. Many of the skulls were those of Native Americans.

The measuring. Morton filled each skull with peppercorns, and later with lead shot, which means tiny balls of lead. Then he poured them out and measured how much the skull had held. He believed that a bigger skull meant a more intelligent person. He ranked the races by the average size of their skulls, with white Europeans at the top.

His book *Crania Americana*, Latin for "American skulls," came out in 1839 and made him famous in other countries. The Penn Museum's own account states that Morton is sometimes called the "father of scientific racism."

Scientific racism is the use of the look of science to claim that some races are better than others.

Used to defend slavery. Two of Morton's followers, the doctor Josiah Nott and George Gliddon, used his work to defend slavery. In 1854 they published a book in Morton's honor called *Types of Mankind*. Nott argued in it that Black people were a separate species, a separate kind of living thing, naturally and forever below white people. His aim was to show that freeing enslaved people would be a disaster for both races. Nott wrote to protect his clients, who were slaveholders.

Disputed. Scholars still argue about how carefully Morton measured. Stephen Jay Gould of Harvard wrote in 1978, and again in a 1981 book, that Morton's numbers were biased, meaning his mistakes leaned toward the answer he wanted. In 2011 six scholars led by Jason E. Lewis measured 308 of the 670 skulls Morton had published, and they found his errors small and random. A 2016 paper argued against parts of their work.

KNOWN: Morton's main idea, that skull size ranks the intelligence or worth of groups of people, is false, and the argument is only about how carefully he measured.

The skulls today. The Penn Museum, at the University of Pennsylvania, holds Morton's skulls. Museum staff took them off a classroom display in 2020. On April 12, 2021, the museum's director, Christopher Woods, apologized for "the unethical possession of human remains in the Morton Collection." Unethical means wrong. He announced a plan to return the remains.

On the order of a Philadelphia court, museum staff buried the skulls of 19 Black Philadelphians from the collection in January 2024. They buried them at Eden Cemetery in Collingdale, Pennsylvania, one of the oldest Black burial grounds near Philadelphia. A group called the Black Philadelphians Descendant Community Group objected. Its members said that the Black community, not the museum, should decide what happened to the remains.

James Smithson

Who: An English chemist who left his fortune to the United States to found the Smithsonian Institution. He never set foot in the country.

When and where: Died in Genoa, Italy, on June 27, 1829. The Smithsonian was founded in Washington on August 10, 1846.

More than 100,000 gold coins crossed the ocean to found the Smithsonian.

James Smithson, an English chemist, paid for the Smithsonian Institution, even though he never set foot in the United States. He died in Genoa, Italy, on June 27, 1829.

His will left his money to his nephew, with a condition. If the nephew died without heirs, meaning children or other family to inherit the money, it was to go to the United States. The will said the money was "to found at Washington, under the name of the Smithsonian Institution, an establishment (a place set up for a purpose) for the increase & diffusion (spreading) of knowledge."

NOT KNOWN: why Smithson left his fortune to a country he had never seen. He never explained it.

The nephew died without heirs in 1835. In September 1838, more than 100,000 gold coins called sovereigns reached the mint in Philadelphia, where the country's coins are made. Workers there turned them into American coins worth more than $500,000. Members of Congress then argued for eight years about what to do with the money. President James K. Polk signed a law to set up the Smithsonian on August 10, 1846.

Joseph Henry

Who: A teacher at the Albany Academy who discovered self-induction and became the first Secretary, or head, of the Smithsonian Institution.

When and where: Albany, New York, for his research of 1826 to 1832. Princeton from 1832. Washington from 1846.

About 150 volunteers sent him the weather from where they lived.

Joseph Henry, the first Secretary, or head, of the Smithsonian Institution, drew the first weather maps of the whole country. From 1849 he ran the Smithsonian Meteorological Project, a study of the weather. About 150 volunteers wrote down the weather where they lived. They sent their reports by mail, and by telegraph at no charge. A telegraph sent messages along a wire as bursts of electricity.

A decade later, about 600 observers were sending reports. The project ran from 1849 to 1870, and it led to the National Weather Service, the weather agency of the United States government today.

How he got the job. Henry discovered self-induction while he taught at the Albany Academy, and he became a professor at Princeton in 1832. On December 3, 1846, he won seven of the twelve votes cast by the Smithsonian's Board of Regents, the group that runs it. He held the job for 32 years, until he died in 1878.

Charting the winds at sea

Matthew Fontaine Maury made charts, or maps for sailors, of the winds at sea and of the currents, the streams of moving water inside the ocean. He built them from thousands of old ships' logs. A log is the daily record a ship's crew keeps of its position, the wind and the sea.

Maury ran the Navy's Depot of Charts and Instruments, where old logs were stored, from 1842. He went through thousands of them for facts about winds and currents. In 1847 he issued the first Wind and Current Chart of the North Atlantic. He then collected logs from ship captains around the world, all kept in the same format. Captains who used his charts cut their sailing times.

He joined the Confederacy. Virginia's leaders took the state out of the United States in April 1861. Maury then resigned from the US Navy and joined the Confederacy, the group of Southern states that broke away from the United States and fought against it in the Civil War. Before the war, Maury had wanted slavery to spread into the American West and also into Cuba and Brazil.

Maria Mitchell

Who: A librarian and astronomer on Nantucket who found a comet in 1847. She was the first American and the first woman to win the King of Denmark's gold medal for finding a comet.

When and where: Nantucket, Massachusetts. She found the comet on October 1, 1847.

From a Nantucket bank roof, she found a comet nobody had charted.

Maria Mitchell was sweeping the sky with a small telescope on October 1, 1847, moving it slowly across the stars. She was on the roof of the Pacific National Bank building on Nantucket, an island off Massachusetts, where her father worked. She found a comet, a frozen body that travels around the sun, that no chart of the sky showed. It is known as "Miss Mitchell's Comet."

The King of Denmark offered a gold medal for each new comet found with a telescope. Mitchell won it, the first American and the first woman to receive it. An Italian astronomer named de Vico saw the same comet two days after she did.

Library by day. Mitchell had been the first librarian of the Nantucket Atheneum, a library on the island, since 1836. For the 20 years she held that job, she read in the library by day. At night she and her father watched the sky from the roof of the bank, where he was in charge.

She became the first woman elected to the American Academy of Arts and Sciences, a society of scholars, in 1848.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 14 MINUTES

Louis Agassiz, the most famous scientist in America, used his fame in these years to push a false claim about race. In 1850 he had seven enslaved people in South Carolina photographed, with their clothes taken off, as "evidence" that the races of people were created separately.

Officials of an Army museum in Washington asked Army doctors, from 1868, to send them the skulls of Native Americans, and scientists there measured the skulls to rank the races. Agassiz attacked Charles Darwin's book *On the Origin of Species*, and the botanist Asa Gray defended it.

Other American scientists measured light, energy and the stars with new care. Albert Michelson measured the speed of light in 1879 to within about 0.05 percent of the value used today. Josiah Willard Gibbs of Yale founded the science of energy in chemical changes with a paper published in 1876 and 1878. Williamina Fleming, first hired as a maid, sorted more than 10,000 stars at Harvard's observatory.

The argument over Darwin's book

Charles Darwin's book *On the Origin of Species* came out in London in November 1859. Darwin argued that species, the different kinds of living things, were not each created separately. He wrote that species change over time, and he called the way they change natural selection.

How it works. Some living things have a trait, a feature such as color or size, that helps them survive and have young where they live. They have more young, and the young are likely to have the trait too. In time, the trait spreads through the group.

Two sides at Harvard. Copies of the book reached Harvard quickly, and two scientists there took opposite sides. Asa Gray, a botanist, defended Darwin's theory. Gray had arranged for the book to be published in America. Louis Agassiz, who studied animals and was the most famous scientist in America, attacked it. He insisted that every species had been created separately.

The two men argued it out at the American Academy of Arts and Sciences in early 1860, after Agassiz opened his attack there on January 10. Gray kept defending Darwin in essays in the *Atlantic Monthly*, a magazine. He collected them in 1876 in a book called *Darwiniana*. In it he argued that a person could accept science and keep a religious faith at the same time.

Agassiz and the fifteen photographs

Louis Agassiz used his standing as America's most famous scientist to push a racist idea called polygenism, the false claim that the races of people were created separately. In the winter of 1850, Agassiz hired a photographer named Joseph T. Zealy to photograph enslaved people in South Carolina as "evidence" for it.

On a tour of plantations, the large farms worked by enslaved people, Agassiz looked for people who had been born in Africa. He thought that people born in Africa were racially "pure." He examined them himself. He left instructions with Robert W. Gibbes, a doctor in Columbia, South Carolina, to collect photographs as evidence. Gibbes arranged for Zealy to photograph the people Agassiz had examined.

Zealy made 15 daguerreotypes, an early kind of photograph made on a polished metal plate. The pictures show seven people: Renty Taylor, his daughter Delia, Alfred, Drana, Fassena, Jack and Jem.

Found again. Elinor Reichlin found the daguerreotypes at Harvard's Peabody Museum in 1976. They are the earliest known photographs of enslaved people in America.

The accounts of how the people were posed differ. In 1977 Reichlin wrote that each person had been posed naked. News reports in 2025 said that Renty and Delia were posed with no shirts on and photographed from several angles. Both accounts agree that the people were photographed with their clothes off, at least from the waist up. Reichlin's account does not make clear whether Gibbes or Zealy did the posing.

Who they were. B. F. Taylor enslaved Renty on his plantation, called Edgehill. Delia was Renty's daughter, born in America to parents from Africa. Jack worked in Taylor's fields as a driver, an enslaved man put in charge of other enslaved workers. F. W. Green of Columbia enslaved Jem. Reichlin's account does not name who enslaved Alfred, Drana and Fassena.

The lawsuit. Tamara Lanier, who identifies Renty as her great-great-great-grandfather, sued Harvard over the pictures in 2019. She claimed the images belonged with Renty's family, asked for money in damages, and asked Harvard to admit its part in slavery. In 2022 the judges of the Supreme Judicial Court of Massachusetts, the state's highest court, let her claim for emotional distress, harm to a person's mind and feelings, go forward.

Lanier and Harvard's lawyers settled the case on May 28, 2025. Harvard paid her an amount that was not made public, and Harvard's leaders agreed to give up the images. Lanier's lawyer said that Harvard still had not publicly accepted her family tie to Renty.

Harvard's leaders handed the pictures over in December 2025, from the Peabody Museum to the International African American Museum in Charleston, South Carolina. Harvard's statement said the move would put them "in the appropriate context and increase access to them for all Americans." Museum staff there unveiled them to the public on March 11, 2026.

Why did Army doctors send skulls to Washington?

Scientists at the US Army Medical Museum in Washington measured the skulls of Native Americans to rank the races. From the 1860s, Army doctors and other collectors sent them the skulls, and the collectors took many of them from graves and battlefields.

One man's remains. The museum got the remains of a Dakota man killed in May 1864 near an Army post in rural Minnesota. Militiamen, part-time citizen soldiers who were fighting the Native people there, shot him twice. One bullet shattered his skull. The other went through his mouth or neck.

Soldiers dragged his body to a nearby fort, where settlers beat it. Someone cut off his scalp, the skin and hair of the top of the head, and carried it away to keep. Someone buried the body in a shallow grave. A few months later, his skeleton was dug up again.

He was about 25 to 35 years old, and nobody recorded his name. The historian Samuel Redman, who told this man's story in 2016, does not name the militiamen, the settlers or the person who dug him up. Alfred Muller, an Army doctor with the title of acting assistant surgeon, examined the man's remains and sent them to the Army Medical Museum. They ended up at the Smithsonian.

The orders. Officials in the Army's Surgeon General's Office, which ran the Army's doctors, sent out a letter called Circular No. 2 in 1867. In it they asked Army medical officers to collect skulls, along with Native weapons, clothing, tools, food and medicine. From 1868, officials at the Army Medical Museum asked Army doctors in "Indian country," the lands where Native nations lived, to send them Native American skulls.

The museum's scientists did craniometry, which means measuring skulls. Craniometry was part of a false "racial science." People who did it used the measurements to sort humans into races, then ranked the races by how intelligent they believed each one was. George A. Otis, the museum's curator, the person in charge of its collection, collected and measured hundreds of the skulls.

Redman's history of these collections tells how the collectors got the skulls. They dug some out of graves, sometimes months after the burial, and emptied whole cemeteries. Others came from battlefields, from people who had just been killed there. Redman's account does not say who did the killing. Some skulls arrived at the museum without anyone asking for them.

Mulberry Creek, 1869. One of the collectors was B. E. Fryer, the Army surgeon at Fort Harker in Kansas. In late January 1869, US soldiers and Kansas settlers attacked a party of Pawnee men at a farm near Mulberry Creek, in Kansas. James Riding In, a Pawnee historian, calls it a massacre. The Pawnee said the soldiers fired first, and Army officers said the Pawnee did.

Two soldiers were wounded. The soldiers and settlers killed eight or nine Pawnee men. One of them was a man whom settlers captured and then killed, and the reason given was that he was "trying to escape." Five men escaped and hid their dead friends' bodies from the soldiers. Three of those five later died of exposure, from cold out in the open.

In all, as many as twelve Pawnee men may have died because of the attack: eight or nine at the farm, the captured man among them, and three more from the cold.

Fryer sent a civilian to cut off the dead men's heads on January 30. Over the next weeks, Fryer or men he sent searched for the hidden bodies. On March 11, 1869, Fryer shipped 26 Native skulls to Washington, and six of them were Pawnee. He wrote to Otis that two of the skulls were damaged because soldiers "shot into the bodies and heads several times after the fight."

Fryer sent Otis the remains of at least 42 people from 1868 to 1872. They were Cheyenne, Wichita, Caddo, Osage, Kansa and people of other nations. Riding In told what Fryer did in a 1992 article, quoting Fryer's letter to Otis.

Moved to the Smithsonian. The museum's collection held about 3,000 skulls by about 1900. Army officials moved the Native remains to the Smithsonian's national museum in 1898 and again in 1904. The only ones they kept back were those of interest for the study of surgery. One record counts 2,000 skulls in the transfer.

Colleges and farm research in every state

The Morrill Act became law on July 2, 1862. Under it, members of Congress gave each state 30,000 acres of public land for each of its senators and representatives. The states sold the land and used the money to start colleges that taught farming and the skills of machines and building. These are called land-grant colleges, and through them students in every state could study science.

Whose land. The land had been taken from Native nations. The reporters Robert Lee and Tristan Ahtone counted about 10.7 million acres of it. US officials had taken it from nearly 250 Native nations, bands and communities, in more than 160 land deals backed by violence. For all of it, US officials paid less than $400,000.

Under the Hatch Act of 1887, members of Congress set aside federal money for an agricultural experiment station in every state, a place where scientists run tests to improve farming. Scientists at the stations did research for the public in every state, including places far from the old college towns.

Maria Mitchell's eclipse trip, 1878

Maria Mitchell led a team of women about 2,000 miles by train to Denver in 1878 to watch a total solar eclipse, when the moon blocks all of the sun's light for a short time. The eclipse took place on July 29, 1878. Her team was made up of students and graduates of Vassar College, a college for women. The women ran the trip themselves, and reporters for newspapers across the country followed it.

Mitchell had become a professor at Vassar in 1865. She was the first American woman to be a professor of astronomy.

Josiah Willard Gibbs

Who: A Yale physicist whose long paper of 1876 and 1878 founded chemical thermodynamics, the science of energy in chemical changes.
When and where: Yale, in New Haven, Connecticut. Professor from 1871.

Yale paid him nothing for his first nine years as professor.

Josiah Willard Gibbs founded chemical thermodynamics. With its rules, chemists can work out from the energy in a chemical change whether the change will happen on its own.

He published this work in two parts, in 1876 and 1878. It came out in the *Transactions of the Connecticut Academy*, a journal that was little known, and it was very hard to follow.

A model in the mail. Scientists in Europe took notice of Gibbs's work before scientists in America did. In 1873 Gibbs had published shorter papers that described a curved surface in mathematics. In 1874 the Scottish physicist James Clerk Maxwell, a scientist who studied matter and energy, built a model of that surface with his own hands. He shaped it in clay, made copies in plaster and mailed one to Gibbs in New Haven.

No pay. Gibbs had earned the first American doctorate in engineering, at Yale in 1863. A doctorate is the highest degree a university gives. He was Yale's professor of mathematical physics from 1871, and for his first nine

years in that job he received no pay. He lived on money he had inherited. When leaders of Johns Hopkins University offered him a job in 1880, Yale's leaders began to pay him so that he would stay.

He received the Copley Medal, at that time the top science honor in the world, in 1901.

Albert Michelson

Who: An immigrant from Prussia, raised in mining towns in the West, who measured the speed of light to within about 0.05 percent of today's value.
When and where: Annapolis, Maryland, in 1879. Cleveland, Ohio, in 1887.

His speed of light was off by only 1 part in 2,000.

Albert Michelson measured the speed of light at Annapolis, in Maryland, in 1879. He got 299,864 kilometers per second, in air, and some books print his figure as 299,910. His result came within about 0.05 percent of the value scientists use today. That is an error of about 1 part in 2,000.

Michelson was born on December 19, 1852, in Strelno, a town in Prussia, a German kingdom. The town is now Strzelno, in Poland. His parents brought him to the United States in 1855, when he was 2. He grew up in mining towns in California and Nevada, and he graduated from the US Naval Academy at Annapolis.

No ether. Michelson and the chemist Edward Morley ran the test now called the Michelson-Morley experiment in Cleveland, Ohio, from April to July 1887. Scientists then thought that light traveled as waves through an unseen substance they called the ether. Michelson and Morley found no trace of the ether. A result like this, where the test finds nothing, is called a null result.

Their null result was an early clue for the theory of relativity, a new account of space, time and light that Albert Einstein put forward in 1905. Michelson became the first American to win a Nobel Prize in science,

in 1907.

Williamina Fleming

Who: An immigrant from Scotland, hired as a maid in the house of the Harvard College Observatory's director, who went on to classify more than 10,000 stars.

When and where: Harvard College Observatory, from about 1879.

She started as a maid in the observatory director's house.

Williamina Fleming, an immigrant from Scotland, took a job in about 1879 as a maid in the house of Edward Pickering. He was the director of the Harvard College Observatory, a building for studying the sky. In 1881 she moved onto the observatory's staff, and she sorted more than 10,000 stars by type for the Draper Catalogue, a list of stars published in 1890.

She was one of the observatory's "computers." At that time a computer was a person whose job was to do calculations and measurements. Fleming studied photographic plates, glass sheets that hold photographs of the night sky. On a plate from 1888 she spotted the Horsehead Nebula, a cloud of gas and dust in space.

Fleming discovered 59 nebulae and 10 novae, stars that suddenly grow much brighter for a time. She also found more than 310 variable stars, stars whose brightness changes. In 1899 she became Curator of Astronomical Photographs, the person in charge of the observatory's photographs of the sky.

The Chest of 1900. Harvard's time capsule of 1900, a box of papers sealed to be opened in the future, holds an entry by Fleming. It records that she earned $1,500 a year, while men in similar jobs earned $2,500. After talking about women's pay with Edward Pickering, the director, she wrote of him: "Does he ever think that I have a home to keep and a family to take care of as well as the men?"

BY 1900

If you remember one thing: After 1850 some American scientists measured light and the stars with new care, while Louis Agassiz and the Army's museum scientists used photographs and skulls to rank the races.

- 1850: Agassiz has seven enslaved people in South Carolina photographed as "evidence" for his false claim.
- March 11, 1869: Army surgeon B. E. Fryer ships 26 Native skulls to Washington, six of them Pawnee.
- 1879: Albert Michelson measures the speed of light to within about 0.05 percent.

Next: In the next fifty years American astronomers measured how far away the galaxies are, and the men who ran a new office in New York called their work a science of who should have children.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 25 MINUTES

American scientists measured distances across the universe and ran the first controlled nuclear chain reaction in these fifty years, and some of them used people as research material without asking them. Henrietta Leavitt found a rule for measuring space in 1912, and Edwin Hubble used it to show in 1929 that the galaxies are moving apart. Enrico Fermi's team in Chicago ran the chain reaction on December 2, 1942. Fermi, Albert Einstein and Emilio Segrè all came to American labs from Europe in the 1930s.

The staff of the Eugenics Record Office in New York collected family records from 1910 to 1939 to claim that poverty and behavior are inherited. At the Smithsonian, Aleš Hrdlička collected human brains and bones to rank the races. Doctors working for the Manhattan Project, the secret program that built the atomic bomb, injected 18 hospital patients with plutonium from 1945 to 1947 to learn where it goes in the human body.

The charge of an electron and the place of a gene

Robert Millikan measured the electric charge of a single electron in experiments with drops of oil, from 1909 to 1913. An electron is one of the tiny particles inside every atom, and it carries electricity. Millikan showed that electric charge comes in exact, equal pieces, and he won the Nobel Prize in Physics in 1923.

The Nobel Prizes were first given in 1901 under the will of Alfred Nobel, a Swedish inventor. Each year they go to people for work in physics, chemistry, medicine, writing and peace, and later also economics.

The fly room. Thomas Hunt Morgan found a fruit fly with white eyes in his lab at Columbia University in New York in 1910. People called the lab the "fly room," and after that fly Morgan and his team spent 17 years working there. They proved that genes sit in a line along the chromosomes. A gene is a piece of the instructions, passed from parents to children, that shapes a living thing, and a chromosome is a thread inside a cell that carries genes.

Morgan won the Nobel Prize in Physiology or Medicine in 1933. It was the first Nobel Prize for genetics, the study of how living things pass on their traits.

Frank Chapman and the first Christmas Bird Count

Who: An ornithologist, a scientist who studies birds, at the American Museum of Natural History. He proposed counting birds at Christmas instead of shooting them.

When and where: Across North America, from Toronto to Pacific Grove, California, on December 25, 1900.

On Christmas Day 1900, 27 people counted birds instead of shooting them.

Hunters had a Christmas custom called the "side hunt." In a side hunt, they shot at every bird and animal they could reach. Frank M. Chapman proposed that people count the birds instead.

Chapman worked at the American Museum of Natural History in New York. He had founded a bird magazine called *Bird-Lore* and was its editor.

The 27 bird-watchers ran 25 separate counts that day, from Toronto in Canada to Pacific Grove in California. Together they counted about 18,500 birds of 90 species.

The count has run every winter since 1900. It is one of the longest-running records of citizen science, research done by ordinary volunteers, in the world.

Robert Goddard

Who: A physics teacher at Clark University who built and flew the first rocket that burned liquid fuel. The New York Times mocked his rocket science in an editorial in 1920 and printed a correction in 1969.

When and where: Worcester and Auburn, Massachusetts. The first flight was on March 16, 1926.

His first liquid-fuel rocket flew 2.5 seconds and landed 184 feet away.

Robert Goddard launched the first rocket that ran on liquid fuel at Auburn, Massachusetts, on March 16, 1926. It rose 41 feet, flew for 2.5 seconds and came down in a farm field 184 feet away.

Goddard grew up in Worcester, Massachusetts, and began teaching physics at Clark University there in 1914. He later ran its physics department, and he became a full professor in 1934. In all he spent 29 years in Clark's physics department.

The editorial. The Smithsonian Institution published his paper *A Method of Reaching Extreme Altitudes*, about reaching very great heights, in January 1920. On January 13, 1920, the editors of the New York Times answered it with an editorial, an article giving the newspaper's own opinion. Its title was "A Severe Strain on Credulity." Credulity means a willingness to believe things.

The editors mocked Goddard for thinking that a rocket could push itself forward in a vacuum, a space with no air in it, like outer space. They wrote that he lacked "the knowledge ladled out daily in high schools."

The correction. The three Apollo 11 astronauts were on their way to the Moon on July 17, 1969, when the Times editors printed a correction. It read: "...it is now definitely established that a rocket can function in a vacuum as well as in an atmosphere. The Times regrets the error."

How did Henrietta Leavitt measure space?

Henrietta Swan Leavitt found that a kind of blinking star shows how bright it truly is, and that let astronomers measure how far away stars are. She was one of more than 100 women the Harvard College Observatory hired as "computers" to study photographs of the stars. She was paid 30 cents an hour, five cents more than most of the others. She had been deaf since an illness in her twenties.

The blinking stars. Leavitt studied a kind of variable star called a Cepheid, which grows brighter and dimmer over and over, in a steady rhythm. In 1912 she published a paper on 25 Cepheids in the Small Magellanic Cloud, a patch of stars in the southern sky. She showed that the time a Cepheid takes for one blink tells how bright it truly is.

Astronomers compare that true brightness with how bright the star looks from Earth. The dimmer it looks compared with its true brightness, the farther away it is. With Leavitt's rule, Cepheids became markers for measuring distance across the universe. Her rule is called the period-luminosity law: the period is the time of one blink, and luminosity means true brightness.

Leavitt died on December 12, 1921. In 1925 a Swedish mathematician who did not know she had died wrote to begin nominating her for a Nobel Prize.

Edwin Hubble

Who: An astronomer who showed that there are galaxies far outside our own and that the universe is expanding.
When and where: Mount Wilson Observatory, California, from 1923 to 1929.

On one glass plate, Hubble wrote "VAR!" beside a star in Andromeda.

Edwin Hubble found a Cepheid star on a photograph of the Andromeda "nebula," a faint cloudy patch in the sky, on the night of October 4 to 5, 1923. He was working with the Hooker telescope at Mount Wilson, which has a main mirror 100 inches across. The photograph was on a glass plate, and Hubble marked the plate "VAR!" for variable star.

Using Leavitt's law, Hubble worked out how far away the star was. His answer was about 900,000 light-years, each one the distance light travels in a year. At that distance Andromeda lay far outside the Milky Way, our own galaxy, so it had to be a separate galaxy, a huge group of billions of stars. He announced the result at a meeting of the American Astronomical Society on January 1, 1925.

The universe is expanding. In March 1929 Hubble published his finding that the farther away a galaxy is, the faster it is moving away from us. He used measurements of the galaxies' light made by Milton Humason.

Georges Lemaître, a Belgian scientist, had already worked out and published the expansion of the universe in 1927. His paper appeared in a journal that few people read. In 2018 the members of the International Astronomical Union, the world society of astronomers, renamed Hubble's law the Hubble-Lemaître law.

BY 1930: Astronomers had shown that Andromeda is a separate galaxy and that the galaxies are moving apart, and a rocket on liquid fuel had flown in a Massachusetts field. In Washington and in New York, other scientists were

collecting brains, bones and family records to rank people.

Aleš Hrdlička's brain collection

Aleš Hrdlička collected human brains and bones for the Smithsonian to try to prove that the races differ in their bodies. From 1903 into the early 1940s he ran the physical anthropology division, the study of human bodies and bones, at the Smithsonian's National Museum of Natural History in Washington. Hrdlička believed that white people were superior to other races. Scientists have since shown his theories about the races' bodies to be false.

The brain collection. Hrdlička began what he himself called the "racial brain collection" in 1903. Reporters at the Washington Post looked into his collecting and published what they found in August 2023. They reported that the museum held at least 255 brains, and that Hrdlička or people working at his direction collected most of them.

Collectors took most of the remains without the consent of the dead people or their families. Consent means agreeing to something after being told what it is. Many of these people had died in hospitals, were poor, or had no relatives nearby to claim and bury them. Collectors dug up burial grounds as well.

Kodiak Island. In the 1930s Hrdlička and a small team dug up the remains of about 1,000 people from the Uyak site on Kodiak Island, in Alaska, and shipped them to the Smithsonian. The people of Larsen Bay, who are Alutiiq, asked the Smithsonian for their dead in 1987. Museum staff sent the remains back to Larsen Bay in September 1991. It was one of the first returns of Native American remains in the country.

The Post's reporters found that in 2023 the museum held more than 30,700 human remains. More than 19,000 of them, about 62 percent, or three of every five, were collected while Hrdlička led the division.

The Eugenics Record Office

The staff of the Eugenics Record Office at Cold Spring Harbor, New York, collected family records from 1910 to 1939 and used them to argue that some people should not have children. Eugenics was the claim that a country should decide which of its people may have children, and stop the rest. The men who ran the office presented it as the science of heredity, the passing of traits from parents to children.

Who paid for it. The biologist Charles B. Davenport directed a research station at Cold Spring Harbor that belonged to the Carnegie Institution of Washington, a private group that paid for scientific research. In 1910 Davenport persuaded Mary Harriman, the widow of a railroad owner, to give $10,000. She bought an 80-acre farm next to the station and built an office on it. The Eugenics Record Office opened there in 1910, with Harry H. Laughlin in charge.

Door to door. Staff at the office ran summer courses that trained field workers, and photographs of the courses survive from 1913 to 1922. The field workers went door to door and filled out forms of questions about families. By 1924 the office's files held 750,000 index cards, along with family trees and reports.

Davenport, Laughlin and their workers traced traits through families, such as blindness and musical ability. They also traced what they called "feeblemindedness," their label for people they judged to be of low intelligence. They treated poverty and behavior as traits that parents pass to their children.

Laughlin used the office's records to push for laws to keep immigrants out and to sterilize people labeled "defective." To sterilize a person is to operate on the body so that the person can never have a child. In a woman, for example, a doctor cut out a piece of each of the two tubes that carry eggs to the womb. It cannot be undone.

The critics. Scientists who studied heredity, among them Thomas Hunt Morgan, Raymond Pearl and Herbert Jennings, pointed out flaws in eugenics research. They showed that the eugenicists' experiments were badly designed

and that the eugenicists used the new science of genes too simply. They also showed that the work was racist and unfair to poor people. In 1935 leaders of the Carnegie Institution gathered a panel of scientists to judge the office's work, and the panel found that almost none of it had any scientific worth.

Nazi Germany. In the 1930s Americans learned what Nazi Germany's leaders were doing with eugenics. Under a German law of July 14, 1933, judges and doctors sat on special courts, each made up of a judge and two doctors. By 1945 the judges and doctors on these courts had forced about 400,000 people to be sterilized.

Doctors usually cut the tubes that carry sperm in men, and tied or cut the tubes that carry eggs to the womb in women. The forced operations killed hundreds of people, most of them women.

Vannevar Bush, the president of the Carnegie Institution, cut off the office's money in 1939, and it closed in December 1939. Its records went to the University of Minnesota in 1948. Staff at Cold Spring Harbor Laboratory now publish this history on the laboratory's archive website, under the heading "Good genes, bad science."

Albert Einstein

Who: A physicist who moved to America in 1933, the year the Nazis took control of Germany. He became a US citizen in 1940.

When and where: Princeton, New Jersey, from October 1933.

In 1946 Einstein called racism "a disease of white people."

Albert Einstein arrived in the United States on October 17, 1933, the year the Nazis took control of Germany. He joined the new Institute for Advanced Study in Princeton, New Jersey, as one of its first professors.

He had done his most famous physics, the theory of relativity, in Europe between 1905 and 1915. Relativity explains how space, time and gravity are tied together.

The letter. On August 2, 1939, Einstein signed a letter to President Franklin Roosevelt. The physicist Leo Szilard wrote it, with Edward Teller and Eugene Wigner. The letter stated that Germany might build atomic bombs. Historians at the Atomic Heritage Foundation, a group that records the history of the bomb, trace the start of the Manhattan Project back to this letter.

Einstein became a citizen of the United States on October 1, 1940. He kept his Swiss citizenship.

At Lincoln. The leaders of Lincoln University, a Black university in Pennsylvania, gave Einstein an honorary degree in May 1946. An honorary degree is one a college gives to honor a person's life and work. At Lincoln he called racism "a disease of white people." He said, "I do not intend to be quiet about it."

Emilio Segrè

Who: An Italian physicist who lost his job at home in 1938 under Mussolini's laws against Jews, stayed at Berkeley, and won a Nobel Prize.

When and where: Berkeley, California, from the summer of 1938.

Italian officials took his job while he was visiting Berkeley.

Emilio Segrè was visiting Ernest Lawrence's Radiation Laboratory at the University of California, Berkeley, in the summer of 1938. That year Benito Mussolini, who ruled Italy, put antisemitic racial laws, laws hostile to Jews, into force. Italian officials used those laws to take away Segrè's job as a professor in Palermo, Italy.

Segrè stayed in America. Lawrence gave him a job as a research assistant, at low pay.

Segrè later helped discover the elements technetium and astatine, and plutonium-239, one form of plutonium. With Owen Chamberlain he discovered the antiproton. A proton is a tiny particle with a positive electric charge, found in the center of every atom, and an antiproton matches it but has a negative charge. Segrè and Chamberlain shared the Nobel Prize in Physics in 1959.

BY 1939: Einstein, Fermi and Segrè had come to American labs from Europe, the Eugenics Record Office had lost its money, and Einstein had signed a letter warning President Roosevelt that Germany might build atomic bombs.

Splitting the atom, and the big laboratories

Two chemists in Berlin, Otto Hahn and Fritz Strassmann, discovered nuclear fission in December 1938. Fission is the splitting of the center of an atom, called the nucleus, into two pieces, and the split gives off energy. In January 1939 Lise Meitner and her nephew Otto Frisch explained what the chemists' results meant. Meitner was a Jewish refugee, a person who flees their home country to be safe, living in Sweden. In 1944 the Nobel judges gave the prize for the discovery to Hahn alone and left Meitner out.

Chicago Pile-1. News of fission reached America in January 1939. On December 2, 1942, Enrico Fermi's team of 49 people ran the first controlled nuclear chain reaction. In a chain reaction, each atom that splits sets off more atoms splitting. Controlled means the team could keep it steady and stop it. The team's reactor, a machine built to run a chain reaction, was called Chicago Pile-1.

The reactor stood under the west stands of Stagg Field, an unused football field at the University of Chicago. The reaction kept itself going for 28 minutes and made about half a watt of power.

Fermi was an Italian physicist. He won the Nobel Prize in 1938 and sailed straight from the ceremony in Stockholm to New York. His wife, Laura, was Jewish, and Mussolini had just put his new laws against Jews into force.

The big labs. Chicago Pile-1 belonged to the Manhattan Project. The project's leaders set up three large laboratories: the Metallurgical Laboratory in Chicago, Clinton Laboratories at Oak Ridge in Tennessee, and Los Alamos in New Mexico. They were the start of the national laboratories, the government's big science labs.

Hiroshima and Nagasaki. American bomber crews dropped the project's two atomic bombs on the Japanese cities of Hiroshima and Nagasaki in August 1945. Researchers at the Radiation Effects Research Foundation, a research group that Japan and the United States run together, estimate that within two

to four months the bombs killed 90,000 to 166,000 people in Hiroshima and 60,000 to 80,000 in Nagasaki. The exact numbers are not known, and a US study in 1946 gave lower counts.

The lab at Berkeley. An older lab came before these, the Radiation Laboratory at the University of California, Berkeley. Ernest Lawrence built it around his cyclotrons, machines that speed tiny particles around in a circle and smash them into atoms. From 1931 the lab was housed in a converted campus building, and it became a separate laboratory on July 1, 1936. In 1939 Lawrence won the first Nobel Prize at Berkeley.

Glenn Seaborg, a chemist who found new elements with the Berkeley lab's cyclotrons, redrew the periodic table, the chart of all the chemical elements, before the war ended. He pulled a row of heavy elements out of the main table and set it as its own row at the bottom. That row is called the actinides. With his layout, chemists could predict how elements that nobody had made yet would behave.

After the war, American scientists built their labs on the Berkeley plan of big machines run by big teams.

Plutonium injected into 18 patients

Doctors working for the Manhattan Project injected 18 hospital patients with plutonium between April 1945 and July 1947. Plutonium is a radioactive metal, one that gives off radiation, which is invisible energy that can damage or kill the cells of the body. Scientists made plutonium during the war and used it in atomic bombs.

Once plutonium is in the blood, it collects in the bones, the liver and the spleen, an organ that cleans the blood. There it keeps giving off radiation that kills cells. When a person breathes it in, it scars the lungs and can cause cancer.

Why they did it. The doctors wanted to know where plutonium goes in a human body and how fast the body gets rid of it in urine. Workers on the bomb could take some in by accident, and the doctors wanted a way to judge how much a worker had taken in. Four men led the program: Wright Langham of Los Alamos, Joseph Hamilton of the University of California in San Francisco and Berkeley, Hymer Friedell of Oak Ridge, and Stafford Warren, the head of the project's medical section.

The doctors injected one patient at Oak Ridge, three in Chicago, 11 in Rochester, New York, and three at the University of California hospital in San Francisco. Doctors in the program also injected six people with uranium, five with polonium and at least one with americium, all of them radioactive metals. In all they injected about 30 civilians, people who were not in the armed forces.

Ebb Cade. Cade, a 53-year-old Black cement mixer, was hurt in a car accident at Oak Ridge on March 24, 1945. On April 10, 1945, a doctor injected him with 4.7 micrograms, or millionths of a gram, of plutonium.

The doctors later blamed each other for the injection. Dr. Joseph Howland, an Army doctor, said he gave it only after his boss, Hymer Friedell, ordered him to in writing, and that Cade never gave his consent. Friedell said he gave no

such order and that another doctor, Dwight Clark, gave the injection. A federal committee set up in 1994 to look into these experiments could not tell which account was right.

Doctors did not set Cade's broken arm and leg until April 15, five days after the injection, when they also took samples of his bone. Someone pulled out 15 of his teeth, and they were tested for plutonium. The committee's report does not name who pulled them. Its members could not find out whether the teeth were pulled mainly because they were decayed or for the test. Cade died of heart failure on April 13, 1953.

Albert Stevens. Doctors at the San Francisco hospital told Stevens, a 58-year-old house painter, that he had stomach cancer that would kill him. They injected him with plutonium on May 14, 1945, as part of Joseph Hamilton's program. The federal committee's report does not identify the doctor who gave the injection. When surgeons operated, they found a harmless ulcer, a sore in the stomach, and no cancer.

The doctors told Stevens only about "a new substance." Members of the federal committee later found that he was almost certainly never told it was plutonium. He died of heart failure in 1966, 21 years later.

Simeon Shaw. One patient came from Australia. In April 1946 officials of the Red Cross and the US Army arranged for Simeon Shaw, a 4-year-old boy with bone cancer, and his mother to fly on an Army plane to San Francisco. Within days, doctors at the university hospital injected him with a liquid that held plutonium and two other metals, yttrium and cerium, under Joseph Hamilton's direction.

His medical file holds a consent form for an operation. A witness signed it a week after the injection, stating that his mother agreed. The committee found that the form probably covered a bone test done that week, not the injection itself. Surgeons cut out a piece of his bone tumor to see how much of the metals it had taken up. He went home to Australia about a month after the injection, and nobody followed up on him. He died in January 1947.

Eda Schultz Charlton. Charlton, 49, entered Strong Memorial Hospital in Rochester on November 2, 1945. Three weeks later doctors in the hospital's research ward, run by Dr. Samuel Bassett, injected her with 4.9 micrograms of plutonium. No doctor had ever found that she was dying of any illness. She lived until 1983.

Elmer Allen. Allen was a Black railroad porter from Italy, Texas, a worker who carried passengers' bags on the trains. He was 36, and his doctors believed he had bone cancer. On July 18, 1947, doctors at the University of California hospital injected him with plutonium. The researchers never expected the injection to help him. Soon afterward, a surgeon cut off his left leg at the middle of the thigh. A test of his tumor showed a slow-growing bone cancer called chondrosarcoma.

Two doctors signed a note saying the experiment had been explained to him and that he agreed. The committee's members found it unclear whether he was told the injection was not meant to help him. According to later newspaper reporting, he died in 1991 without ever learning what had been done to him. In 1995 his daughter, Elmerine Whitfield Bell, told the committee: "We contend that my father was not an informed participant in the plutonium experiment."

Trinity and the people downwind

Manhattan Project scientists exploded the first atomic bomb at a test site called Trinity, in New Mexico, on July 16, 1945. The project's leaders decided not to move the people who lived nearby. According to the National Park Service, they worried that moving people would make them suspicious or cause panic. The nearest ranchers lived 13 miles from the site, and tens of thousands of people lived within 50 miles.

Secrecy first. General Leslie Groves, the Army officer in charge of the project, wanted the test kept secret above all. Under his rules, nobody was to be protected unless people had already been badly hurt. When the project doctor James Nolan brought him safety plans, Groves asked him, "What's the matter with you, are you a Hearst propagandist?" William Randolph Hearst owned a chain of newspapers known for stories written to shock and excite readers, and a propagandist spreads one side's story.

The scientists Joseph Hirschfelder and John Magee warned of "the definite danger of dust containing active material." Robert Oppenheimer, the director of the Los Alamos lab, approved a plan to move people only after they had taken in 60 to 100 roentgens of radiation. A roentgen is a unit for measuring radiation. Nobody was moved.

The fallout. Fallout is radioactive dust that falls back to the ground after a nuclear explosion. The fallout from Trinity spread over an area about 250 miles long and 200 miles wide. It fell heaviest on Chupadera Mesa, a flat-topped highland 30 miles away, and it fell across Lincoln, Socorro, Otero and Sierra counties. People there ate vegetables and drank water that had fallout in them.

The Ratliff family, who lived near a place called Hot Canyon, took in about 47 roentgens in two weeks. The allowed amount was 1.4, so they took in more than 30 times the limit. Nobody warned them.

After the test, Groves put out a statement to the press. It said that an ammunition dump had exploded and that nobody had been hurt.

Stafford Warren, the project's chief medical officer, reported to Groves in writing on July 21, 1945. He wrote that the dust "was potentially a very serious hazard over a band almost 30 miles wide extending almost 90 miles northeast of the site." He advised that future tests take place in an area "with a radius of at least 150 miles without population," meaning with nobody living within 150 miles.

NOT KNOWN: how many people the Trinity fallout made sick or killed, because no government official ever counted them. The National Park Service states that the exposure is "linked to cancer, stillbirth, and birth defects." A stillbirth is a baby born dead, and a birth defect is a problem in a baby's body that begins before it is born.

The physics inside the transistor, 1947

Chapter 8 tells how John Bardeen and Walter Brattain built the first transistor, a small solid part that can make an electrical signal stronger, at Bell Labs, the research laboratory of the telephone company AT&T, on December 16, 1947. The physics that led to it started with a design that failed.

William Shockley, the head of their group, designed an amplifier, a device to make a signal stronger, out of a solid crystal in April 1945. It did not work. A year later Bardeen suggested a reason: electrons sitting on the surface of the crystal might be blocking the electric push from outside, so that it could not reach into the crystal.

Bardeen and Brattain set out to study those surface electrons, and that work led them to the transistor. Bardeen explained how the electrons behave at the surface using quantum mechanics, the branch of physics that describes very tiny particles. Shockley then designed a second kind, the junction transistor, and the three men shared the Nobel Prize in Physics in 1956.

Barbara McClintock

Who: A scientist who studied the chromosomes of corn and discovered that genes can move from one place to another.

When and where: Cold Spring Harbor, New York. Her key experiments began in 1944.

In corn, she found genes that move from place to place.

Barbara McClintock discovered that some genes move from one place to another on the chromosomes, which is called transposition. She found it in maize, which is corn, in experiments she began in 1944. She called the moving pieces "controlling elements."

McClintock earned a PhD at Cornell University in 1927 and studied the chromosomes of corn under the microscope. She came to Cold Spring Harbor in 1941 or 1942. The Eugenics Record Office there had closed in December 1939.

She first described the moving genes in 1948. In 1950 she published a paper about mutable loci, places on a chromosome that can change, called *The Origin and Behavior of Mutable Loci in Maize*. She presented the work at a meeting of scientists at Cold Spring Harbor in 1951.

Slow to catch on. Other scientists respected her as an expert on chromosomes, but for decades few of them took up her idea of moving genes. In the 1960s and 1970s, molecular biologists, who study the molecules inside cells, reached the same finding.

BY 1950

If you remember one thing: Between 1900 and 1950 American scientists learned to measure the universe and to split atoms, and doctors working on the bomb injected 18 hospital patients with plutonium to see where it went in their bodies.

- In 1900: Volunteers counted birds on Christmas Day, and nobody had yet measured the distance to another galaxy.
- In 1950: Astronomers had measured the distance to Andromeda and found the galaxies moving apart, and the government ran big national laboratories that began with the atomic bomb.

Next: After 1950, a doctor cut cells from a woman's tumor without asking her, and a reporter and the families brought the hidden radiation experiments into the open.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 19 MINUTES

A doctor cut cells from Henrietta Lacks's tumor in 1951 without asking her, and for the rest of the century Americans kept learning what scientists had done to people who never agreed. The reporter Eileen Welsome made the plutonium injections public in 1993. Members of a federal committee then found nearly 4,000 radiation experiments on people, and in 1995 President Bill Clinton apologized. Under laws passed in 1989 and 1990, museum staff had to begin returning the Native American dead that scientists had collected.

In the same fifty years, James Watson and Francis Crick worked out the shape of DNA from Rosalind Franklin's X-ray pictures. By about 1970 most geologists, the scientists who study the Earth's rocks, agreed that the continents move. Charles David Keeling's measurements on Mauna Loa showed the carbon dioxide in the air rising every year.

Henrietta Lacks and the HeLa cells

A doctor at Johns Hopkins Hospital cut cells from the tumor of Henrietta Lacks in 1951 without her knowledge or consent. Nobody told her, and nobody asked her permission. Her cells became the first human cells that kept living and dividing in a lab with no end.

Henrietta Lacks was a Black woman, born on August 1, 1920. She and her husband moved to Baltimore, Maryland, in 1941, and they had five young children. In 1951 she went to Johns Hopkins Hospital because she was bleeding from her vagina.

Dr. Howard Jones was a gynecologist, a doctor who treats the parts of a woman's body that carry and deliver babies. He found a malignant, or cancerous, tumor on her cervix, the narrow lower end of the womb. Doctors treated her cancer with radium, a radioactive metal, which was the usual treatment at the time.

The cells. During the treatment she was asleep under anesthesia, a medicine that puts a patient into a deep sleep so they feel no pain. While she was asleep, Dr. Lawrence Wharton Jr. cut samples from her tumor and from healthy tissue of her cervix. They went to the laboratory of George Gey, a cell biologist at Johns Hopkins.

Most human cells died in a lab dish. Hers kept dividing, about once every 20 to 24 hours. Scientists named the cells HeLa, from the first two letters of her first and last names. Henrietta Lacks died at Johns Hopkins on October 4, 1951. She was 31.

Scientists used HeLa cells to study the polio vaccine, the shot that protects people from polio, and leukemia, a cancer of the blood. They also used them to study the AIDS virus, cancer, and the effects of zero gravity in space. Her family did not learn that her cells were being used in research until the 1970s.

The shape of DNA, and who got the credit

James Watson and Francis Crick worked out the shape of DNA in 1953, using Rosalind Franklin's X-ray pictures without her knowledge. DNA is the molecule inside cells that carries genes, and a molecule is a group of atoms joined together. Watson was a 24-year-old American, and Crick was British. They worked at Cambridge University in England. At Caltech in California, Linus Pauling and his team were racing for the same answer.

Watson and Crick published the structure in the journal *Nature* on April 25, 1953. DNA is a double helix: two long strands wound around each other in a spiral.

Franklin's picture. They depended on the work of Rosalind Franklin at King's College London. Franklin took pictures of DNA with X-rays, a kind of invisible light that passes through many things. In early 1953 Maurice Wilkins, who worked at King's College, showed Watson her picture called "Photo 51." He did it without her knowledge. Accounts differ on whether this was in late January or in February.

What the picture showed. Photo 51 showed a pattern shaped like an X. To Franklin, the X meant that the strands of DNA wind in a helix, a spiral. When Watson saw the picture, he concluded the same thing, and he also took from it measurements of the molecule. He and Crick relied on Photo 51 to work out their model of DNA's shape.

Her data reached Watson and Crick a second way, in a report for the Medical Research Council, a British government group that paid for research. Max Perutz passed it to them. Franklin's own paper came out in the same issue of *Nature*. She died in 1958, at 37. In 1962 the Nobel Prize went to Watson, Crick and Wilkins. Nobel rules do not allow a prize to go to a person who has died.

What Watson said. Watson later became the chancellor, one of the top leaders, of Cold Spring Harbor Laboratory in New York, the place where the Eugenics Record Office had run from 1910 to 1939. While he held that post, he made racist statements about the intelligence of people in Africa.

The *Sunday Times Magazine* of London quoted him in 2007. He said he was "inherently gloomy about the prospect of Africa" because "all our social policies are based on the fact that their intelligence is the same as ours." In the same sentence he went on: "where all the testing says not really."

The laboratory's trustees, the people who govern it, acted at once in 2007. They removed him from all his management jobs there and ended his post as chancellor.

In a PBS film shown on January 2, 2019, *American Masters: Decoding Watson*, he was asked whether his views had changed. He said, "No, not at all." On January 11, 2019, the laboratory's leaders called his views "unsubstantiated (not backed by proof) and reckless" and "reprehensible (deserving strong blame), unsupported by science." They took away his honorary titles.

How did geologists learn that the continents move?

Maps of the ocean floor recorded the evidence, and by about 1970 most geologists agreed that the continents move. The idea is called plate tectonics. The Earth's outer shell is broken into huge pieces, called plates, that slowly shift.

Marie Tharp and Bruce Heezen published a map of the floor of the Atlantic Ocean, the *Physiographic Diagram of the Atlantic Ocean*, in 1957. Harry Hess published a paper called "History of Ocean Basins" in 1962. In it he proposed seafloor spreading, the idea that new ocean floor forms along the undersea mountain ranges and spreads outward. Tharp and Heezen published a painted map of the ocean floor of the whole world in 1977.

Marie Tharp

Who: A geologist and mapmaker who mapped the ocean floor and found the rift valley along the Mid-Atlantic Ridge. Women were kept off the research ships, so she drew her maps on land.

When and where: Lamont Geological Observatory, Columbia University, from 1948.

Her work partner first called her discovery "girl talk."

Marie Tharp found a valley running down the middle of the Mid-Atlantic Ridge, a long chain of mountains under the Atlantic Ocean, in 1952 and 1953. It was a rift valley, a valley that forms where the Earth's crust, its rocky outer layer, is pulling apart. Her work partner, Bruce Heezen, at first dismissed her finding as "girl talk."

Drawn on land. Tharp began work at Columbia University's Lamont Geological Observatory in 1948. According to Smithsonian Magazine, Navy rules kept her off the research ships that Maurice Ewing and her other colleagues hired. She first sailed on one in 1968.

She made her maps from soundings, measurements of how deep the water is, taken on the ships. Tharp turned the depth numbers into drawings of the shape of the sea floor. The rift valley she found became part of the evidence that the sea floor spreads apart. Staff at the Library of Congress later named her one of the great mapmakers of the 20th century.

Measuring the air on Mauna Loa

Charles David Keeling of the Scripps Institution of Oceanography began measuring the carbon dioxide in the air on Mauna Loa, a volcano in Hawaii, in March 1958. Carbon dioxide is one of the gases in the air. It is a greenhouse gas, a gas that takes in heat and gives it off again. The amount in the air is rising mostly because people burn coal, oil and other fossil fuels for energy.

The Keeling Curve. His first reading was 313 parts per million, meaning 313 molecules of carbon dioxide in every million molecules of air. The average in the early part of that year was about 315. The measurements have run without a break since 1958, and the line they make on a graph is called the Keeling Curve. It rises in a saw-tooth pattern, with small ups and downs inside a steady climb.

The curve had passed 430 parts per million by 2026, more than a third above Keeling's first reading. Climate scientists use the Keeling Curve as the base measurement for their work.

What was the hiss in the Bell Labs antenna?

The hiss was the leftover glow of the Big Bang, the hot beginning of the universe. Arno Penzias and Robert Wilson picked it up in 1964 and 1965 at Bell Labs, the research laboratory of the telephone company AT&T, in Holmdel, New Jersey, with a large antenna shaped like a horn. An antenna is a device that picks up radio waves.

The hiss was made of microwaves, a kind of radio wave, and they could not get rid of it. They even cleared out pigeons that had nested in the antenna, along with their droppings.

Physicists at Princeton identified the hiss as the cosmic microwave background, the cooled light left over from the early universe. Penzias and Wilson won the Nobel Prize in 1978.

Darleane Hoffman

Who: A nuclear chemist who found plutonium in nature and whose group did chemistry on single atoms of the heaviest elements.

When and where: Los Alamos, New Mexico, and from 1984 Berkeley, California. She reported the plutonium find in 1971.

She found plutonium in rock from a California mine.

Darleane Hoffman showed in 1971 that plutonium-244, one form of plutonium, occurs in nature. Scientists had believed that all plutonium was made by people. Hoffman was a leader of a chemistry division at Los Alamos National Laboratory, and she found tiny traces of plutonium-244 in rock from the Mountain Pass mine in California.

One atom at a time. In 1984 she moved to Lawrence Berkeley National Laboratory and the University of California, Berkeley. Her group did chemistry on single atoms of the heaviest elements. The periodic table arranges the elements in patterns, and elements in the same column behave alike. Her group tested those patterns one atom at a time, to find where the heaviest elements stop following them. She died in 2025, at 98.

BY 1970: Scientists knew the shape of DNA, most geologists agreed that the continents move, and the Keeling Curve had been climbing on Mauna Loa for twelve years. The first Apollo crew had landed on the Moon in 1969.

What the Moon rocks and the space probes taught

Six Apollo crews landed on the Moon between 1969 and 1972. They brought back 382 kilograms, or 842 pounds, of Moon rock and soil, in 2,200 samples. Scientists at NASA's Johnson Space Center, part of the government's space agency, keep the samples and are still opening and studying them. Scientists used the rocks to work out the history of the Moon and the ages of surfaces across the solar system.

The Viking tests. Viking 1 and Viking 2 became the first spacecraft to land on Mars and work there, in 1976. Each carried tests for life in the Martian soil, and the results did not agree. One test, called Labeled Release, gave a result that looked like life. Another found no organic matter, the carbon-based material that living things are made of.

DISPUTED: Most scientists now think chemicals in the soil called perchlorates caused the Labeled Release result. Gilbert Levin, who led that test, argued to the end of his life that it had found life. Nobody has settled the question.

The Voyagers. The two Voyager probes were launched in 1977. Their pictures showed volcanoes on Io, a moon of Jupiter, and a cracked shell of ice on Europa, another moon of Jupiter. Other pictures showed the thick air around Titan, a moon of Saturn. The Voyager flights reached Uranus in 1986 and Neptune in 1989. Both probes are now in interstellar space, the space between the stars.

Cosmos. Carl Sagan's television series *Cosmos* began on PBS, the public television network, in the fall of 1980. In 2020 Charles Apple of *The Spokesman-Review*, a newspaper in Washington state, wrote that it was the

most-watched PBS series until Ken Burns's *The Civil War* in 1990. The news site Space Daily reported that about 500 million people around the world have seen it.

Linda Morabito

Who: A navigation engineer at NASA's Jet Propulsion Laboratory who found the first active volcano ever seen beyond Earth.

When and where: Jet Propulsion Laboratory, Pasadena, California, on March 9, 1979.

Movie: *The Farthest* (2017), a documentary about the Voyager missions, in which Morabito tells the story of her discovery.

A faint cloud at the edge of Io was an erupting volcano.

Linda Morabito found the first active volcano ever seen beyond Earth on March 9, 1979. It was on Io, a moon of Jupiter. An active volcano is one that is erupting, throwing out gas and melted rock.

Morabito was a navigation engineer for the Voyager 1 probe, a person who works out where a spacecraft is and where it is heading. She was processing a routine navigation picture of Io when she noticed a faint plume, a cloud shooting up from the surface, at the edge of the moon. It was 270 kilometers high, about 170 miles. The plume came from an erupting volcano. Morabito later wrote her own history of the discovery.

Richard Feynman

Who: A physicist who rebuilt the theory of light and matter, drew the diagrams that physicists still use, and explained hard ideas simply.

When and where: Los Alamos during World War II. Later Caltech, in Pasadena, California. He died in 1988.

Movie: *The Fantastic Mr Feynman* (2013), a BBC documentary with interviews with Feynman, his family and his colleagues.

He dropped a piece of rubber into ice water on television.

Richard Feynman sat on the commission, a group of experts, that looked into why the space shuttle Challenger broke apart in 1986. On February 11, 1986, at a hearing shown on television, he dropped a piece of O-ring rubber into ice water. An O-ring is a rubber ring that seals a joint. The cold rubber lost its spring. In about one minute he showed how launching in cold weather had caused the failure.

Challenger. The shuttle broke apart soon after launch, and all seven people aboard died. Hot gas had leaked through a joint in one of its booster rockets. The air at launch was 36 degrees Fahrenheit, 15 degrees colder than at any earlier shuttle launch. The seven who died were Francis R. Scobee, Michael J. Smith, Ellison S. Onizuka, Judith A. Resnik, Ronald E. McNair, Christa McAuliffe and Gregory B. Jarvis.

The physicist. Feynman shared the Nobel Prize in Physics in 1965 for his work on how light and electrically charged matter act on each other. Physicists everywhere still use the simple drawings he invented to show how particles act on each other, called Feynman diagrams. During World War II he worked at Los Alamos. Later he became known for explaining hard ideas plainly, in his lectures at Caltech and in his 1985 book *Surely You're Joking*. He died in 1988.

The national labs, a late Nobel and the genome

During the Cold War, the long rivalry between the United States and the Soviet Union after World War II, government money paid for big machines and big teams at the national laboratories. The main labs were Lawrence Berkeley, Lawrence Livermore, Argonne, Los Alamos and Oak Ridge. Scientists at these labs and in the Soviet Union raced each other to make new elements.

Inside the proton. Murray Gell-Mann proposed in 1964 that protons and neutrons, the particles in the center of every atom, are built from smaller particles, which he named quarks. For years nobody could find a quark.

A team from MIT and SLAC, a laboratory in California with a machine two miles long that speeds up electrons, found the first signs of quarks in 1968. They fired electrons at protons and found hard little pieces inside them. Gell-Mann won the Nobel Prize in 1969, and three leaders of the team shared one in 1990.

A late Nobel. Barbara McClintock, who had found genes that move in corn, won the Nobel Prize in Physiology or Medicine in October 1983. The prize came 39 years after she began the experiments, and she was the first woman to win that prize without sharing it.

The genome. Officials of the National Institutes of Health and the Department of Energy launched the Human Genome Project on October 1, 1990. A genome is the complete set of DNA in a living thing. The project's goal was to read all the DNA in a human genome, in order. Its planners gave it 15 years and about $3 billion.

Two laws to return the dead

Under two laws passed in 1989 and 1990, museum staff had to begin returning the Native American dead they held. Scientists had collected many of those remains, among them the skulls Army doctors sent to Washington from 1868 and the remains of about 1,000 people that Aleš Hrdlička's team dug out of burial grounds in Alaska in the 1930s. Native nations campaigned for both laws.

The National Museum of the American Indian Act became law on November 28, 1989. It requires Smithsonian staff to list the Native human remains the Smithsonian holds and to return them when asked.

The Native American Graves Protection and Repatriation Act became law on November 16, 1990. People call it NAGPRA, and repatriation means sending something back to where it came from. Under NAGPRA, staff at museums and government agencies that take federal money must list the Native American human remains and sacred objects they hold. They must return them to descendants and to Native nations.

The radiation experiments made public

The reporter Eileen Welsome made the plutonium injections public in November 1993. Her three-part series in the *Albuquerque Tribune*, called "The Plutonium Experiment," began on November 15, 1993, and it named the patients who had been injected. She won the Pulitzer Prize for National Reporting, a top award for American journalism, in 1994.

Energy Secretary Hazel O'Leary opened her department's records in 1993. President Bill Clinton set up the Advisory Committee on Human Radiation Experiments on January 15, 1994, to investigate.

What the committee found. The committee's members reported in 1995. They found "nearly 4,000 human radiation experiments sponsored by the federal government between 1944 and 1974." They also found "several hundred intentional releases of radiation into the environment for research purposes," meaning radiation let out into the air, land or water on purpose.

They found "little evidence of rules or practices of consent except in research with healthy subjects." In the 1940s and 1950s it was routine for doctors to use patients in research without the patients knowing. About the plutonium injections, the committee's members wrote: "In no case was there any expectation that these patient-subjects would benefit medically from the injections."

The Fernald School. Some of these experiments were done on children. The Fernald School was a state school in Massachusetts for children with disabilities, and researchers from MIT worked there with the school's senior staff. In 1946 they gave radioactive iron to 17 boys who lived at the school. From 1950 to 1953 they gave radioactive calcium to 57 boys, in a special breakfast.

The boys belonged to the school's "science club," whose members got extra milk and trips. One MIT researcher, Robert S. Harris, wrote that three boys who objected could be "induced to change their minds." A 1949 letter from the school's head to parents described a special diet and blood tests and did not mention radiation.

Doctors at Massachusetts General Hospital in Boston injected 11 patients with uranium from 1953 to 1957.

The prisons. Two doctors aimed X-rays at the testicles of 131 prisoners in Oregon and Washington from 1963 to 1973. The testicles are the organs that make sperm. The doctors wanted to learn how radiation affects the making of sperm, and the men could get no health benefit from it. Carl Heller did this to 67 men at the Oregon State Prison, and his former student C. Alvin Paulsen ran the study in Washington.

The men had to agree to a vasectomy at the end, an operation that cuts the tubes that carry sperm so a man can no longer father children. In Heller's study most men also had small pieces cut out of their testicles for testing five or more times, and were paid $25 each time.

Vanderbilt. Researchers at Vanderbilt University and the Tennessee state health department studied nutrition in pregnancy from 1946 to 1949. The women were poor patients at a clinic for pregnant women. Paul Hahn led the part of the study in which researchers gave about 819 of them a drink with a dose of radioactive iron at their second visit to the clinic.

Emma Craft and other women from the study sued Vanderbilt in federal court in 1994. They said the researchers called the drink a "cocktail" or a "vitamin drink" and never told them it was radioactive, and that no one gave them a chance to say no. The women had been pregnant when they drank it, and the children they had been carrying joined them in the lawsuit.

The women also said that Vanderbilt researchers ran a follow-up study in the 1960s and found "a disproportionately high incidence of cancer" in the children, meaning more cancer than expected. They said nobody told them they had been exposed or what the study found. Vanderbilt officials denied doing wrong. University officials settled the case in 1998 by paying the women $10 million.

The apology. At the White House on October 3, 1995, Clinton said that the United States "offers a sincere apology to those of our citizens who were subjected to these experiments, to their families, and to their communities."

O'Leary announced in November 1996 that the families of 12 people injected in the 1940s would get $4.8 million in all. Eleven had been injected with plutonium and one with uranium, and each family was to receive $400,000. Eleven of the 12 had died. One woman was still alive, living in upstate New York.

BY 2000

If you remember one thing: Between 1950 and 2000 Americans learned how DNA is built and that the continents move, and a reporter, the families and Native nations brought the hidden experiments and the collected dead into the open.

One number: Members of the federal committee counted nearly 4,000 radiation experiments on people paid for by the government from 1944 to 1974. That is about one new experiment every three days for thirty years.

Next: After 2000, scientists finished reading the human genome, and the Lacks family, Native nations and the Trinity downwinders won agreements, apologies and payments.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 11 MINUTES

The biggest experiments after 2000 had thousands of scientists on them. About 3,000 people worked on ATLAS, one of the two experiments that found the Higgs boson in 2012. Scientists finished reading nearly all of the human genome in 2003 and read all of it in 2022, and they detected gravitational waves for the first time in 2015.

Some of the people who were used for science, and their families, have won apologies, rules and payments. The Lacks family reached an agreement in 2013 on how scientists may use the genome of Henrietta Lacks's cells. The head of the Smithsonian apologized in 2023 for how people collecting for it had taken human remains, many of them dug from graves and most taken without consent. People who lived downwind of the Trinity test became able to claim federal payments in July 2025.

The genome, finished twice

Scientists announced a working draft of the human genome in June 2000. The International Human Genome Sequencing Consortium, the teams of scientists doing the work, announced in April 2003 that the genome was essentially complete. They had read about 92 percent of it, with fewer than 400 gaps left. They timed the announcement to the 50th anniversary of the 1953 paper on the shape of DNA.

Another group of scientists, the Telomere-to-Telomere consortium, published the first complete human genome with no gaps on March 31, 2022.

The cost. The National Human Genome Research Institute, the government's genome research agency, has published what the work cost. Reading one person's genome to a high-quality draft cost about $14 million in 2006. By late 2015 it cost less than $1,500.

James Watson, who with Francis Crick had worked out the shape of DNA in 1953, died in November 2025, at 97.

The Higgs boson, and the collider that members of Congress cancelled

Scientists at CERN, the European physics laboratory in Geneva, Switzerland, announced on July 4, 2012, that they had found the Higgs boson. The Higgs boson is a particle tied to how other particles get their mass, the amount of matter in an object. Two experiments found it, called ATLAS and CMS. Both used the Large Hadron Collider, a machine that smashes tiny particles together at very high speed.

According to the US Department of Energy, about 1,700 American scientists worked on these experiments through two American labs, Fermilab and Brookhaven.

The American collider. American physicists had begun building a collider of their own, the Superconducting Super Collider, near Waxahachie, Texas. It was planned as a ring 54 miles around. Members of Congress cancelled it in October 1993, after $2 billion had been spent and more than 14 miles of tunnel had been dug. The Large Hadron Collider, the machine the Higgs experiments used, was built in Europe instead.

Monica Dunford

Who: An American physicist who worked on the ATLAS experiment at CERN. She was one of six physicists a film crew followed through the search for the Higgs boson.

When and where: CERN, in Geneva, Switzerland, up to the Higgs announcement on July 4, 2012.

Movie: *Particle Fever* (2013), a documentary directed by Mark Levinson and produced by the physicist David Kaplan. It follows six physicists, Dunford among them, from the start-up of the Large Hadron Collider to the announcement of the Higgs boson on July 4, 2012.

She was one of about 3,000 people on a single experiment.

Monica Dunford is an American experimental physicist, a scientist who runs experiments and measurements. At the time of the Higgs search she was a postdoc on the ATLAS experiment at CERN, doing research for a few years after her PhD before taking a permanent job. About 3,000 people worked on ATLAS.

First beam. Dunford tested electronics for the ATLAS detector and crawled under the floor to lay cable, as she later told the story. She was in the ATLAS control room on the day the collider first sent a beam of particles into the detector. "When beam arrived at the detector there were no lights," she said. Physicists hunched over their computers, looking for the beam's data, until someone found it and put it up on a monitor at the front of the room.

Jennifer Doudna

Who: A biochemist at the University of California, Berkeley, who with Emmanuelle Charpentier made CRISPR-Cas9 into a tool for cutting DNA at a chosen spot.

When and where: UC Berkeley. The key paper came out on June 28, 2012.

Movie: *Human Nature* (2019), a documentary about CRISPR, in which Doudna is one of the main people interviewed.

She and Charpentier made a tool that cuts DNA where scientists choose.

Jennifer Doudna and Emmanuelle Charpentier published a paper about CRISPR-Cas9 in the journal *Science* on June 28, 2012. CRISPR-Cas9 is a tool that scientists can program to cut DNA at a spot they choose. Cutting DNA at a chosen spot lets scientists change genes.

Doudna is a biochemist, a scientist who studies the chemistry inside living things, at the University of California, Berkeley. She and Charpentier won the Nobel Prize in Chemistry in 2020. It was the first science Nobel Prize shared by two women with nobody else.

Rainer Weiss

Who: An MIT physicist, who came to America as a child refugee from Nazi Germany, and who worked out the idea for the detectors that first picked up gravitational waves.

When and where: MIT, and the LIGO detectors at Hanford, Washington, and Livingston, Louisiana. The detection came on September 14, 2015.

His idea from 1972 caught the ripples from two black holes crashing.

The two LIGO detectors picked up gravitational waves for the first time on September 14, 2015. Gravitational waves are ripples in space and time. These came from two black holes that crashed into each other 1.3 billion light-years away. A black hole is a place in space where gravity is so strong that not even light can get out. Rainer Weiss had worked out the idea for the detectors in 1972.

A child refugee. Weiss was born in Berlin in 1932. His family fled the Nazis through Prague and reached New York in January 1939. He became a professor at MIT, the Massachusetts Institute of Technology.

His kind of detector is called a laser interferometer. It uses laser beams to measure very small changes in distance. The LIGO detectors were paid for by the National Science Foundation, the government agency that pays for science research. LIGO scientists announced the discovery on February 11, 2016, a century after Einstein predicted the waves. Weiss shared the Nobel Prize in Physics with Barry Barish and Kip Thorne in 2017.

The Webb telescope

The James Webb Space Telescope was launched on December 25, 2021. NASA staff released the telescope's first science images on July 11 and 12, 2022. Scientists using the telescope have found galaxies from the first few hundred million years of the universe, earlier than any galaxies found before.

Scientists using the telescope made the first clear detection, in 2022, of carbon dioxide in the air of an exoplanet, a planet that circles a star other than our Sun. The planet is called WASP-39b.

Computers that predict the shapes of proteins

Scientists at DeepMind, a British lab, showed in 2020 that their program AlphaFold2 could predict the shape of a protein well enough for practical use. A protein is a molecule that does work inside living cells, and its shape sets what it can do. AlphaFold2 is an example of artificial intelligence, or AI, computer software that learns patterns from huge amounts of data.

According to the European Molecular Biology Laboratory, free public databases held more than 200 million predicted protein shapes by 2026. Staff at the science journal *Nature* surveyed more than 1,600 researchers around the world in 2023. Reporting the results, Richard Van Noorden and Jeffrey Perkel wrote that AI tools were becoming more common in science. Many of the researchers expected AI tools to become a central part of their work soon.

The 2024 Nobel Prize in Chemistry was split in two. Half went to David Baker, an American at the University of Washington, for using computers to design new proteins. The other half went to Demis Hassabis and John Jumper of DeepMind in Britain.

Heavy elements, made by many countries

Scientists from several countries now work together to make the heaviest elements. Teams from Dubna in Russia and from Lawrence Livermore and Oak Ridge in the United States have worked on the same experiments. Scientists on joint panels of two international science groups, IUPAC and IUPAP, judge who made each new element.

The seventh row. IUPAC officials announced on December 30, 2015, that they recognized four new elements, numbers 113, 115, 117 and 118. With those four, the seventh row of the periodic table was full. A team from Dubna and Livermore got the credit for three of them. One of those, tennessine, was named for Tennessee, the home of the Oak Ridge lab, whose scientists shared the credit for it.

Scientists at Berkeley made livermorium, element 116, in 2024 by firing a beam of titanium at a target. With that result, the Berkeley team prepared to try for element 120. The physicists are looking for what they call the "island of stability," a group of superheavy elements that they predict would last longer before breaking apart.

The Lacks family and the HeLa genome

European researchers published the genome of the HeLa cells in March 2013 without the consent of Henrietta Lacks's family. Francis Collins, the director of the National Institutes of Health, met with members of the Lacks family three times between April and July 2013.

The agreement. NIH officials announced the NIH-Lacks Family Agreement on August 7, 2013. Under it, scientists must apply to NIH to use the full genome data of HeLa cells. A working group that includes members of the Lacks family reviews the requests.

The lawsuit. The Lacks estate, the property Henrietta Lacks left behind, managed for her heirs, sued Thermo Fisher Scientific in 2021. The company sold about a dozen products made with HeLa cells. The lawyers Ben Crump and Chris Seeger represented the estate. The lawsuit stated that the company "made staggering profits by using the HeLa cell line." It added that this happened "all while Ms. Lacks' Estate and family haven't seen a dime."

According to news reports in STAT and Smithsonian Magazine, the two sides announced a settlement on August 1, 2023. That day would have been Henrietta Lacks's 103rd birthday. They kept the terms of the settlement secret.

Apologies, and the dead still held

Lonnie G. Bunch III, the Secretary, or head, of the Smithsonian, apologized in August 2023 for how people collecting for the Smithsonian had taken many of its human remains. He spoke after the Washington Post published its investigation of Aleš Hrdlička's collecting. The Penn Museum's director had apologized for the Morton skulls two years earlier.

Still held. Reporters at ProPublica, a news organization, counted the Native American remains still held, using federal NAGPRA reports. As of January 6, 2025, staff at about 650 museums, universities and agencies had reported holding more than 210,000 Native American remains. They had not yet made 90,831 of them, or 42 percent, available for return. That is more than two of every five.

The Ohio History Connection had the most remains not yet made available for return, about 8,000. The Illinois State Museum had about 5,800 and Harvard University about 5,400. The Smithsonian is not on that list, because it reports under the 1989 law instead of NAGPRA.

A second count, made in September 2024 and reported by Retrospect Journal, agrees closely. It found that 126,299 of 216,804 remains had been returned, which leaves about 90,500 not returned.

The 2024 rule. A revised NAGPRA rule took effect on January 12, 2024, after Interior Department officials announced it on December 6, 2023. Under the rule, staff at museums and federal agencies must ask direct descendants, Native nations or Native Hawaiian organizations for their free, prior and informed consent. That means a yes given freely and beforehand, by people who have been told everything about the request. Staff need it before they display human remains or sacred and cultural objects, let others see them, or do research on them.

To follow the new rule, staff at the Field Museum in Chicago covered display cases in two of its halls in January 2024. A statement from the museum said that the cases held cultural items that "could be subject to" the new rules,

and that they would stay covered while staff reviewed what was known about the items.

Payment for the Trinity downwinders, 2025

Downwinders are people who lived where the wind carried fallout from nuclear bomb tests. Members of Congress passed the Radiation Exposure Compensation Act, a law to pay people for harm, in 1990. The law included people who lived downwind of the Nevada Test Site, where nuclear bombs were tested from 1951 to 1957. It did not include the Trinity downwinders in New Mexico.

The campaign. Tina Cordova of the Tularosa Basin Downwinders Consortium led the campaign to add them. In July 2025, 80 years after the Trinity test, President Donald Trump signed a budget bill that added New Mexico's downwinders to the law. The bill also added uranium workers who entered the industry after 1971.

Each person who qualifies can receive $100,000 in one payment. According to KUNM, a New Mexico public radio station, New Mexicans can apply until December 31, 2027.

THE THREE QUESTIONS, ANSWERED

1. **How did American scientists learn how far away the stars are?** Henrietta Leavitt showed in 1912 that the blink of a Cepheid star tells how bright it truly is, and so how far away it is. Edwin Hubble used her rule in 1923 to place Andromeda far outside our own galaxy.
2. **Why did scientists collect human skulls and brains, and where are those remains now?** Samuel Morton, the Army's museum scientists and Aleš Hrdlička measured them to rank the races, an idea that is false. Morton's skulls are at the Penn Museum, whose staff buried 19 of them in 2024, and the Smithsonian still held at least 255 of the brains in 2023. Many Native American remains

have been returned since the laws of 1989 and 1990, but in January 2025 museums still had 90,831 not yet made available for return.

3. **Who did the work but was left out of the credit?** Lise Meitner explained fission, and Rosalind Franklin's X-ray pictures showed the shape of DNA. The Nobel Prizes went to Otto Hahn alone in 1944 and to Watson, Crick and Wilkins in 1962.

What changed: American science grew from a few colonists watching comets to experiments with thousands of workers, and the people scientists had used without asking, and their families, began to win apologies and payments.

FIVE DATES TO KEEP

June 3, 1769: four men at Norriton time Venus crossing the sun.

1839: Samuel Morton's *Crania Americana* ranks the races by skull size.

1912: Henrietta Leavitt publishes her rule for measuring space.

April 25, 1953: Watson and Crick publish the shape of DNA.

November 16, 1990: NAGPRA becomes law.

> **NOT KNOWN:** how many people the fallout from the 1945 Trinity test made sick or killed, because no government official ever counted them.

Where to go: The International African American Museum in Charleston, South Carolina, where the 1850 photographs of Renty, Delia and five others went on public view on March 11, 2026.

Next: Chapter 10, Energy. It asks what powered American life, from muscle and wood to the atom and the sun.

Chapter 10: Energy

CHAPTER 10 OF 37 · ENERGY · 10 ERAS · ABOUT 75 MINUTES

Americans moved from burning wood to burning coal, oil and natural gas, and getting that energy cost many people their freedom, their land or their lives.

A tavern keeper named Jesse Fell burned hard coal on an iron grate in his fireplace in Wilkes-Barre, Pennsylvania, on February 11, 1808. Most people thought that coal was too difficult to burn at home, but Fell showed that it could warm a house. From the 1820s to the 1840s, people put stoves and furnaces made for that coal into their homes. Miners dug that coal in northeastern Pennsylvania, and on September 6, 1869, a fire in one of their mines, the Avondale mine near Wilkes-Barre, killed 110 people.

This chapter describes the fuels in order, from the fires Native people set on purpose before 1500 to the wind turbines and solar panels of 2025. Watch for two things. One is the main fuel. Wood came first, then coal, which passed wood around 1885, and then oil and natural gas. In 2016 natural gas passed coal as the fuel that made the most American electricity. The other is who did the work and who paid for it: the enslaved people who made charcoal for the iron furnaces, the coal miners killed underground, and the Native nations whose rivers were dammed and whose land held oil and uranium.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Did kerosene really save the whales?
2. How did electricity reach almost every American home?

3. Who paid for America's energy with their freedom, their land or their lives?

Five minutes? Read "The current war" in 1850 to 1900.

Can skip: "A stove to save wood", "Oil for a world war", "Panels on the White House roof", "New and restarted reactors". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

People here did their work with the strength of their own bodies and with fire, and wood was the fuel they burned. They burned it to heat their homes, to cook and to see after dark.

North of Mexico there were no horses, oxen or mules. People carried and dragged loads with their own muscle, and they moved heavy goods by canoe. Dogs were the only animals that hauled loads. On the Plains, dogs dragged a travois, two long poles tied together at one end to form a narrow V. The load rode on the poles, and their far ends dragged along the ground.

Why did Native people set fires on purpose?

Native people lit small fires and kept them under control to help the plants and animals they used for food, clothing and ceremonies. They also burned land to clear space for crops and travel, and they used fire to hunt game. They burned on regular cycles, and the practice is now called cultural burning.

In the eastern part of the continent, oak and chestnut trees fill many forests. According to the National Park Service, those forests grew that way because people burned them on purpose to get certain nut crops. In what is now northern California, Karuk and Yurok people burned their hazel shrubs so that the shrubs would grow new stems for weaving baskets.

After 1500. Native people went on burning land long after 1500. For most of the 1900s, though, federal officials in charge of forests tried to put out wildfires, to protect water supplies, towns and timber for sale. Under the rules those officials made, Native people could do far fewer burns.

Yurok people worked with California's state fire department on a small burn on Yurok land in 2013. In May 2014, organizers with the Cultural Fire Management Council held the first Yurok training event for this kind of burning. Writers for The Nature Conservancy reported in 2020 that Native people who burn in the old way still face punishment. Their report does not say who punishes them.

Basket stems today. Karuk and Yurok people still burn their hazel shrubs. Four researchers studied those burns and published their findings in 2021, and the study appears among the US Forest Service's research papers. Burning every three to five years gave the best stems. In the first season after a fire, the shrubs grew 13 times as many basket stems.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

Spanish explorers and soldiers brought horses here in the 1500s, and at the very end of the century Spanish colonists built water mills. A horse could drag a travois farther and faster than a dog could, and it could carry more weight. Still, most people living here did their work with muscle, fire and wood for the whole century.

The mills stood in New Mexico. A history of the state's mills, printed in a Santa Fe newspaper, calls them the first mills powered by water in what is now the United States.

Horses come ashore

Hernando de Soto landed near what is now Tampa Bay, Florida, in May 1539, with 11 ships. He brought about 250 horses, 1,000 soldiers on foot, many dogs and a herd of pigs.

Hymahi. De Soto's army reached Hymahi, a small Native village where two rivers meet, in April 1540. Writers for the National Park Service say the rivers must have been the Congaree and the Wateree, in what is now South Carolina. De Soto took all of the village's food. He burned at least one of the people who lived there to death while questioning that person about a town called Cofitachequi.

Francisco Vázquez de Coronado led a large party north from Mexico into the Southwest in 1540, and his men brought horses too. He had more than 300 armed Europeans and at least 1,200 Native people who marched on the Spanish side. Many dozens of servants and enslaved people went with them. Coronado's party went as far as what is now Kansas and returned in 1542.

The first water mills, 1598

Juan de Oñate led Spanish colonists north into what is now New Mexico in 1598. That year they founded a town called San Juan de los Caballeros on the Rio Grande, on land that belonged to the Tewa, one of the Pueblo nations. Pueblo is the Spanish word for town or village. The Spanish used it for the Native peoples of the Southwest who lived in towns built of stone and of adobe, brick made of mud and dried in the sun.

Early in 1599 the colonists moved to a new capital, San Gabriel, which they built at a pueblo town near Ohkay Owingeh, a Tewa town. Writers for the National Park Service call that site abandoned. They do not say whether Tewa people had been made to leave it.

Tub mills. Oñate's colonists built their first water mills in 1598. These were small tub mills, with the water wheel lying flat in the stream. The moving water spins the wheel, and the wheel turns the millstone directly, so the stone grinds grain into flour. The colonists hauled their millstones north on the Camino Real, the Royal Road, which ran about 1,600 miles north from Mexico City.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

Wind and falling water began turning mills in the English colonies in the 1600s. The mills ground grain and sawed logs. All other work still took muscle, and colonists burned wood in open fireplaces to heat their homes and cook.

Two other kinds of energy came into use in these years. Native people rode horses and fed them corn, and along the coast colonists began to hunt whales for oil to burn in their lamps.

The first wind and water mills

George Yeardley, the governor of the Virginia colony, had a windmill built at Flowerdew Hundred, on the James River, in 1621. It is the first windmill recorded in English America. Members of the colony's council, its group of leaders, wrote to the company in London that was in charge of the colony. Their letter records Yeardley's "good example" of building a windmill.

What the diggers found. Archaeologists, scientists who dig up the past, later dug at the spot. They found a round pit five feet across with iron hoops and brackets still in place, and they took it to be the remains of Yeardley's windmill.

Whose land, and whose work. Flowerdew Hundred was land of the Weyanock, a Native nation whose language belonged to the Algonquian family of languages. Yeardley brought 15 men from England in 1619 to grow tobacco there.

That same year, the crews of two armed ships, the *White Lion* and the *Treasurer*, attacked a Portuguese ship carrying 350 enslaved Africans and seized 50 to 60 of the captives. The *White Lion* brought its share to Point Comfort, Virginia, in late August 1619. Yeardley and a merchant named Abraham Peirsey bought them in exchange for food.

At least 11 of these Africans were taken to Flowerdew Hundred, Yeardley's land. The archaeologists' account of Flowerdew does not say who moved them there. A count of the colony's people taken in 1624 and 1625 records seven Africans at Flowerdew as laborers. It gives no names for them. The records do not say what happened to the other four.

Records from 1621 also list a gristmill, a mill that grinds grain, near Jamestown. It is the first gristmill recorded in the English colonies. Farther north, three English carpenters built a sawmill and a gristmill run by water at Newichawannock, in what is now South Berwick, Maine, in 1634. They were among the first water mills in New England.

William Chadbourne

Who: An English carpenter who helped build one of the first sawmills run by water in New England.
When and where: What is now South Berwick, Maine, from July 1634.

The mill's model arrived three years before the men who built it.

William Chadbourne, James Wall and John Goddard arrived from England in July 1634 on a ship called the *Pied Cow*. They worked under a contract with the Laconia Company of Captain John Mason. Under it, the three carpenters were to build a sawmill, to cut logs into boards, and a gristmill on the Little Newichawannock River.

The model. Thomas Eyre wrote in a letter of May 1631 that a model of a sawmill had been sent to Newichawannock on the *Pied Cow*, the same ship the carpenters took three years later. Chadbourne and his partners built the sawmill in a rocky gorge. The spot is now below the Great Works bridge on Brattle Street in South Berwick. In 1652, in a lawsuit, James Wall made a sworn statement, a promise under the law to tell the truth, about where the 1634 mills had stood.

The wheel. Writers for the Old Berwick Historical Society say the sawmill is "thought to be the first" mill in America with an overshot wheel. On an overshot wheel, water pours onto the top of the wheel, and the weight of the water turns it. People in other towns of the region say that their town had the first sawmill.

Whose river. Newichawannock is an Abenaki word, and Abenaki people lived there. Between 1616 and 1618, before the carpenters came, diseases brought by Europeans, such as measles or smallpox, killed seven out of every ten of them. The society's histories of the mills do not say that Mason's men asked the Abenaki for permission to build. A leader named Rowls survived the diseases. In 1650 he sold his village land, Quamphegan, to a man named Thomas Spencer for five pounds.

Mason died in 1638, and after that the mills fell apart. People stole their materials, and the society's timeline of the mills does not name the thieves. Later one of the mills burned.

NOT KNOWN: what became of William Chadbourne after he built the mills. The society's histories of the mills do not say.

How much wood did a family burn?

Wood was the main fuel in colonial homes, and one household burned about 15 to 40 cords of it a year. A cord is a stack of wood 4 feet high, 4 feet wide and 8 feet long. Forty cords stacked in one row 4 feet high would run 320 feet, longer than a football field from goal line to goal line.

The low figure, 15 cords, comes from one New England estimate of the 1600s. The high figures, 30 to 40 cords, are for a home that heated and cooked with open fireplaces. An open fireplace sent most of its heat up the chimney, so a family had to burn a great deal of wood to stay warm.

Horses in Native hands

Native people were riding horses, putting bridles on them and feeding them corn by the early 1600s. A team of scientists showed this in a study published in the journal *Science* in 2023. The team, which included Lakota, Comanche and Pawnee scholars, studied the bones of horses found in what are now Wyoming, Kansas and New Mexico.

The old account. For a long time, the usual account said that Native people got their horses only after the Pueblo Revolt, decades later. In August 1680, Pueblo people led by Po'pay, a Tewa religious leader, rose against the Spanish colonists in New Mexico and drove them out. Perhaps 1,500 or more horses came into Native hands at one time.

Oil from whales

English colonists on Long Island and in New England began killing whales close to shore for their oil in the 1600s. From about 1690, whale oil was one of the main fuels that Americans burned in their lamps, and it stayed one for about 150 years. By the 1840s it cost too much for most families, and they burned cheaper fuels instead.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 3 MINUTES

Iron furnaces in the colonies, tall ovens where fire melts iron out of rock, ran on charcoal, a fuel made from wood. Many of the workers who fed the fire at the Baltimore Iron Works, in Maryland, were enslaved people and convicts shipped from Britain. They hauled charcoal to the furnace around the clock.

Lamps burned whale oil, and families who could pay the most bought candles made from a waxy oil in the head of the sperm whale. Benjamin Franklin designed an iron stove in 1741 to heat a room with less wood.

Charcoal for iron

Iron furnaces burned charcoal, wood that has been heated with too little air for it to burn away. The heat drives off the water and gases in the wood. What is left is nearly pure carbon, and it burns hotter than wood. The men who made charcoal were called colliers.

The owners. Five planters started the Baltimore Iron Works on the Patapsco River in Maryland in 1731. Dr. Charles Carroll, a surgeon, gave 2,200 acres of land and ran the works at first. Two of his cousins, along with Daniel Dulany and Benjamin Tasker, put in money and enslaved workers. In the 1600s, the land around the Patapsco lay within the hunting grounds of the Susquehannock nation, whose villages stood farther north, along the Susquehanna River.

The workers. The Baltimore Iron Works opened with 89 workers, and 42 of them were enslaved. Many of its workers were enslaved people or transported convicts, people found guilty of crimes in Britain and sent to the colonies to be sold into 7 to 14 years of forced work. Judges in English courts gave that sentence. Merchants shipped the convicts across the ocean, and merchants and ship captains sold them in the colonies, some of them to iron makers.

The workers hauled cartloads of charcoal, oyster shells and iron ore, the rock that iron comes from, to the top of the furnace in 12-hour shifts. The work went on around the clock, six or seven days a week. The owners did not give the workers enough food. Some workers ran away, and others worked slowly on purpose.

The profits. In a good year the partners made back more than half of what they had put in, a profit of 55 percent. By 1785 an advertisement for the Baltimore Iron Works listed "more than 200 Negroes," the word then used for Black people. The people it listed were enslaved.

The surviving records of these early furnaces list the owners. They do not list the men who made the charcoal.

What gave the brightest light?

The brightest light in the colonies came from candles of spermaceti, a waxy oil found in the head of the sperm whale. Candle makers turned it into candles that burned brighter and cleaner than any others, and they cost the most. Writers at the New Bedford Whaling Museum call spermaceti "the most valuable product of the Yankee whaling industry," Yankee meaning someone from New England.

A stove to save wood

Benjamin Franklin designed what he called the Pennsylvania fireplace in 1741. It was a stove of cast iron, iron poured into a mold while it is melted. Franklin meant it to give more heat and less smoke from less wood than an open fireplace. Few people bought it at first. David Rittenhouse later improved the design, and after that it sold better.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 7 MINUTES

The first steam engine in America pumped water out of a copper mine in New Jersey from 1755 on. A fire under a boiler, a closed tank of water, made the steam that ran it.

The iron furnaces still burned charcoal, and they burned it by the acre. Hopewell, in Pennsylvania, used the charcoal from about an acre of forest every day it ran. At Catoctin Furnace in Maryland, enslaved Black workers and some free Black workers cut the wood, made the charcoal and hauled it to the furnace. After dark, spermaceti candles still gave the brightest light.

The first steam engine in America

Water flooded John Schuyler's copper mine at Second River, now North Arlington, New Jersey, in 1748, and the mine had to shut down. Schuyler paid an English engine maker, Jonathan Hornblower, 1,000 pounds to send him a "fire engine" and mechanics to set it up. Fire engine was the name people then used for this kind of steam engine.

The crossing. The parts arrived in New York in September 1753 on a ship called the *Irene*, after twelve weeks at sea, and Jonathan's son Josiah came with them. The parts were taken to Newark, New Jersey, and put together there. By early 1755 the engine was pumping water out of the mine.

How it worked. The engine was a kind invented in England by Thomas Newcomen. The fire under the boiler turned water into steam, and the steam flowed into a cylinder, a tall round tube. Inside the cylinder, the steam filled the space under a piston, a heavy disk that could slide up and down. Then a jet of cold water sprayed into the cylinder. The cold turned the steam back into water, which left almost nothing under the piston, so the weight of the air above pushed the piston down.

The piston was joined to one end of a beam that rocked up and down like a seesaw. The other end of the beam lifted long pump rods that hung down the mine shaft, and the pumps raised the water. Then the weight of the pump rods pulled the piston back up, and the engine started again. Engines of this kind stood about two stories high. Their power was about ten horsepower, a measure based on the work one horse can do.

Josiah Hornblower

Who: The young English engine builder who came over with the first steam engine in America and later ran it.

When and where: The Schuyler copper mine at Second River, now North Arlington, New Jersey, 1753 to 1773.

The engine house burned the same night he shut the mine.

For twenty years after it started, the engine worked only part of the time. Josiah Hornblower, who had been about 24 when he came over with it, later ran it himself. In 1761 he and a partner, John Stearndall, leased the mine from the Schuyler family. They paid one seventh of the ore they dug as rent.

The first fire. The building around the engine caught fire in March 1762 and burned to the ground. A report in the *New York Mercury* of March 22 states that the engine works had cost nearly ten thousand pounds. People at the time guessed that a careless workman had left a candle burning. The engine was working again by 1767. Richard McCormick, the historian who wrote the engine's history, does not say who repaired it or when.

Out of fuel. Hornblower told what happened next in a letter of July 1768, in which he called the engine "the Fire engine." Late in 1767, he had to stop it because he had run out of fuel. He got more, put the old pumps back in, made the repairs and started it again in April 1768.

Soon the vein, the band of ore running through the rock, dipped deep. He tried to follow it with hand pumps, but they could not keep the water out, and his partners had not sent money they owed him.

The second fire. On a Monday in July 1768, he stopped the mine and let all the workers go. At about eight o'clock that evening, the engine house caught fire. It burned to ruins in a few minutes while a crowd of

people tried to save it. Hornblower wrote that a man had gone into the engine house two hours before to light his pipe, and the man said he could not find any fire there to light it with.

A report in the *Pennsylvania Chronicle* states that the fire was "supposed to be by Design," because no one knew of any fire being used there lately. People thought someone had set it on purpose. Mining at Schuyler's stopped in 1773, and Hornblower stayed in New Jersey for the rest of his life.

KNOWN:	Half of the engine's cylinder is now in the Smithsonian Institution.
NOT KNOWN:	what became of the rest. One account says the engine was broken up around 1800, and another says it was repaired in 1793 and pumped water into the 1800s.

Charcoal by the acre

Hopewell Furnace burned the charcoal from about an acre of forest every day it ran. Mark Bird built it on French Creek, in Berks County, Pennsylvania, in 1771. When the furnace was in blast, lit and making iron, it burned up to 800 bushels of charcoal a day, a bushel being a measure for dry goods such as grain.

In a year the furnace used 5,000 to 7,000 cords of wood, from more than 200 acres of woodland. A family heating its home with open fireplaces burned 30 to 40 cords. The owners held between 4,000 and 8,000 acres of forest to keep the furnace supplied. Woodcutters, using only axes, cut an average of two cords a day each.

Whose land. The land around Hopewell had belonged to the Lenni Lenape. After the colony's founder, William Penn, left Pennsylvania in 1701, his agent James Logan handled Penn's land deals. Under Logan, the colony's land deals with the Lenni Lenape were often dishonest, and some were frauds, deals built on lies.

By about 1750, nearly all Native people had been driven out of the lower Delaware and Susquehanna river valleys, and most moved west to the Allegheny, Monongahela and Ohio river valleys. The history of Hopewell written for the National Park Service does not name the people who drove them out.

How a collier made charcoal

A collier made charcoal in a pile called a pit, built on flat, cleared ground. He drove a green pole, freshly cut and 18 feet long, into the middle of that ground and built a chimney with three corners around it. Then he stacked about 30 cords of wood around the chimney in three layers and covered the whole pile with leaves and dust.

To light the pit, he shoveled red-hot coals from his cooking fire down the chimney. The wood inside smoldered, burning slowly with very little air. The collier watched it day and night, walking on top of the pit to find soft spots where air was getting in and filling them. After 10 days to two weeks, the wood had turned into charcoal. One pit made about 1,100 bushels, enough to run the furnace for a day and a half.

Who made the charcoal?

At Catoctin Furnace, in Maryland, enslaved Black workers and free Black workers made it. Four brothers, James, Baker, Roger and Thomas Johnson, built the furnace, and it was making iron by 1776. The Johnson family enslaved more than 80 people there. One of them was a skilled man recorded only as Collier Sam, and the Catoctin Furnace Historical Society's history gives only his name and his trade.

Over the life of the furnace, at least 271 enslaved African Americans worked at Catoctin, along with an unknown number of free African Americans. They mined ore, cut wood, made charcoal, drove wagons and worked the forge, the shop where iron was heated and hammered into shape. Woodcutters cut, hauled and stacked the wood for the colliers, and other workers carried the finished charcoal to the furnace.

At Hopewell. Mark Bird enslaved 18 people in 1780: 10 men, 4 women, 3 boys and 1 girl. No one else in Berks County enslaved as many people that year. That same year Pennsylvania lawmakers passed a law to end slavery in stages, but under it mainly children born after the law passed could become free. The last record of slavery at Hopewell is from 1821, when Matthew Brooke freed one person he enslaved.

Hopewell's owners hired free Black workers only for jobs that took little training, as woodcutters, laborers and teamsters, who drove wagons. According to the National Park Service, no record from Hopewell's 112 years shows a Black worker in a skilled job or as a manager.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 5 MINUTES

Hard coal from northeastern Pennsylvania went into American stoves and furnaces in these years, and gas made from coal lit city streets. A tavern keeper showed in 1808 that the coal could heat a home, and boats, first on the rivers and then on canals, carried it to the cities. The country's first public gas street lamp was lit in Baltimore in 1817, with gas made from coal and sent through pipes.

The American whaling fleet reached its largest size in 1846, with 735 ships. Whale oil cost too much for most families, and most homes burned cheaper fuels.

Stone coal

Northeastern Pennsylvania has a hard kind of coal called anthracite, which people then called stone coal. Two brothers named Gore, who were blacksmiths, had burned it in their forges, the fires where blacksmiths heat metal, since 1769. For use at home, though, most people thought anthracite was too difficult to burn.

Fell's grate. Jesse Fell ran a tavern in Wilkes-Barre, Pennsylvania. He had believed for some time that a big enough pile of anthracite would keep burning once it was lit. He built a grate shaped like the letter L out of "Small Iron rods," to hold the coal up off the floor of the fireplace so air could flow in underneath.

Fell set his grate in the fireplace of the tavern's main room on February 11, 1808, and lit the coal. He later wrote that "on first lighting" he "found it to burn excellently well."

After Fell showed that anthracite could heat a home, the anthracite business grew. A company called Lehigh Navigation was formed in 1818, and anthracite floated down the Lehigh River to Philadelphia in boats called arks. Later,

boats on canals carried the coal into the cities. From the 1820s to the 1840s, people put stoves and furnaces made to burn anthracite into homes and other buildings.

Gaslight

Heating coal makes a gas that burns, a mix of gases that includes hydrogen and a gas called carbon monoxide. Rembrandt Peale, who ran a museum on Holliday Street in Baltimore, lit a room of his museum with gas made from coal in 1816.

The first gas company. The Gas Light Company of Baltimore received its charter, a legal paper that allowed the company to form, on June 17, 1816. It was the first gas company in the United States. Gas makers stored the gas in large tanks called gasometers and sent it through pipes. The company's first public gas street lamp, the first in the country, was lit at Market and Lemon Streets in Baltimore on February 7, 1817.

About 50 American cities and towns had gas works, plants that made gas, by 1850. Gaslight was expensive, and most Americans could not pay for it. It lit streets, shops and the homes of richer families in the larger cities.

Whale oil, and who could pay for it

The American whaling fleet counted 735 ships in 1846, the most in any year, out of about 900 whaling ships in the whole world. Other counts put the peak of the whaling business as late as 1852. New Bedford, Massachusetts, was the leading whaling port, and at its peak more than 400 whaling ships sailed from there.

Who could pay. Whale oil cost $1.30 to $2.50 a gallon, so mainly richer families burned it. Oil from sperm whales lit their homes, along with lighthouses and public halls. Most families burned cheaper fuels: tallow candles made of animal fat, lard oil made from pig fat at about 90 cents a gallon, and camphene at about 50 cents.

Camphene was one part turpentine, a liquid made from pine trees, mixed with four parts alcohol and a little camphor, added for its smell. Its fumes caught fire easily, and camphene lamps could start sudden fires.

Nelson Cole Haley

Who: A New Bedford harpooner whose book tells how a whaling crew turned a whale into lamp oil.

When and where: At sea on the whaling ship *Charles W. Morgan*, 1849 to 1853.

The crew boiled the whale's fat over a fire of whale scraps.

Nelson Cole Haley hunted whales for the oil that Americans burned in their lamps. He grew up in New Bedford, Massachusetts, and his father died when he was a boy. In 1844, when he was twelve, he ran off to sea to become a whaleman, even though his mother did not want him to go.

The chase. Haley became a harpooner on the *Charles W. Morgan* in 1849, when he was seventeen. A harpooner threw the harpoon, a heavy iron spear, into the whale from a boat that the crew rowed out from the ship. Haley called the harpoon an iron.

He later wrote about driving it into the whale's blubber, the thick layer of fat under its skin. "I raised the iron, and with all the force I was capable of, I sent it to the socket into the vast mass of blubber and meat that was now only a foot or two clear of the boat."

He drove a second harpoon in beside the first. Then the second mate, one of the ship's officers, killed the whale with a lance, a long spear with a sharp blade, and the crew rowed the dead whale back to the ship.

Whale into oil. The next morning, men stood on the dead whale and peeled off strips of blubber. The crew hoisted the strips on board and cut them into chunks they called bibles, then boiled the chunks in two big metal pots on the try-works, a brick furnace built on the deck.

The heat melted the fat into oil, which the crew poured into barrels below deck. For fuel under the pots, they burned the crisp bits of blubber left over from the boiling.

> Haley's voyage lasted four years, from 1849 to 1853. Whaling ships of that time stayed at sea three to five years on a voyage. Haley wrote a book about it, *Whale Hunt*, which the Mystic Seaport Museum first published in 1948, almost fifty years after he died.
>
> The *Charles W. Morgan* was built in New Bedford in 1841 and made 37 voyages between 1841 and 1921, with sailors from fifty countries. It is the last wooden whaling ship left in the world, and it is kept at the Mystic Seaport Museum, in Mystic, Connecticut.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 13 MINUTES

Americans began to buy two new kinds of energy in these years: kerosene for their lamps, made from oil, and electricity sent through wires. Edwin Drake's crew drilled a well in Pennsylvania that reached oil in 1859, and refiners made the oil into kerosene. Thomas Edison's workers began sending electric current to paying customers from a station in New York City in 1882.

Coal became the country's main fuel in these years. By the count of the US Energy Information Administration, coal supplied 9 percent of the energy Americans used in 1850 and 27 percent by 1870. Around 1885, Americans began to burn more energy from coal than from wood for the first time. Miners died digging it. A fire at the Avondale coal mine in Pennsylvania killed 110 people in 1869.

Drake's well, 1859

Edwin Drake's crew struck oil 69.5 feet down near Titusville, Pennsylvania, on August 27, 1859. It was the first well in the United States drilled on purpose to find oil and sell it. Writers at the American Oil & Gas Historical Society date the start of the American oil business to that day.

Drake worked for the Seneca Oil Company of New Haven, Connecticut, whose owners wanted oil to make kerosene, a cheap fuel for lamps. The driller, William Smith, known as Uncle Billy, cut through rock and shale, a soft rock made of hardened mud, at about three feet a day. A steam engine of six horsepower drove the drill.

Edwin Drake

Who: The man whose 1859 well started the American oil business, though he lost his money afterward.

When and where: Titusville, Pennsylvania, 1859.

Movie: *Born in Freedom: The Story of Colonel Drake* (1954). A 30-minute drama paid for by the oil industry's American Petroleum Institute, with Vincent Price as Drake. It first played in Titusville on March 29, 1954.

The title "Colonel" was made up to impress the town.

People called him Colonel Drake, but he never held that rank. An investor named James Townsend made up the title and addressed letters to "Colonel E. L. Drake" to impress the people of Titusville.

The drive pipe. Water from Oil Creek kept seeping into the hole, and the sides kept caving in. Drake had a pipe driven down to the rock, and then the drill worked inside the pipe, which kept the water and loose ground out.

After the well. Drake never patented the drive pipe, which means he never got a government paper giving him the only right to make and sell it. The Seneca Oil Company fired him, and he lost his money on Wall

Street, a street in New York City where people buy and sell shares in companies. When he came back to Titusville years later, he had little money, and his health was failing.

His friends raised about $4,000 for him in the late 1860s. In 1873 people of Titusville won him a pension from the state of Pennsylvania, $1,500 paid to him every year. Drake died in November 1880 in Bethlehem, Pennsylvania.

Did kerosene save the whales?

A common saying holds that kerosene saved the whales, but writers at the University of Houston's engineering college and at the website environmentalhistory.org call that claim a myth. Whaling was already shrinking before kerosene came, and in most homes kerosene replaced camphene, not whale oil.

What families burned. American families switched to kerosene for their lamps in the 1860s. Refiners made it by heating oil until parts of it boiled off as vapor, then cooling the vapor back into separate liquids. Kerosene sold for about 50 cents a gallon.

The whaling fleet had been largest in 1846, and whalers caught fewer whales through the 1850s. Whale oil cost $1.30 to $2.50 a gallon, so mainly richer families burned it. Most families burned camphene and lard oil.

The tax. During the Civil War, members of Congress passed the Internal Revenue Act to pay for the Union Army, the army of the Northern states. Under that law, alcohol was taxed at up to $2.08 a gallon from 1862 to 1864. The lawmakers meant to tax alcohol that people drank, but they did not leave camphene out of the law, and camphene was about three quarters alcohol.

Before the tax, camphene and kerosene each sold for about 50 cents a gallon. At the top rate, the tax on the alcohol in one gallon of camphene came to more than a dollar, while kerosene was taxed at 10 cents a gallon. People stopped buying camphene, and families switched to kerosene.

Pearl Street, 1882

Thomas Edison's workers started the first permanent central power station in the United States on September 4, 1882. It stood at 257 Pearl Street in Manhattan, in New York City, and it made electricity in one place for many buildings, sending it out through wires.

Coal into current. The station ran on coal. Four boilers burned coal to make steam, the steam ran engines, and the engines turned six dynamos, machines that turn motion into electric current. Wires carried the current to a district of about a quarter of a square mile around the station.

The station served 85 customers on its first day, with about 400 lamps among them. Within a year it served 513 customers with about 10,000 lamps. It ran until January 2, 1890, and in those years it went dark only once, for three hours.

Thomas Edison

Who: The inventor who built his electric system on direct current, a kind that could not travel far.

When and where: Pearl Street, Manhattan, New York City, from September 4, 1882.

When his station started, Edison stood in a banker's office.

Thomas Edison was in the office of the banker J. Pierpont Morgan, at the bank of Drexel, Morgan and Company, when the Pearl Street station began sending out current. He had built the system to run on direct current, called DC, which flows in one direction only, like the current from a battery.

The station sent DC out at a low voltage, the force that pushes electric current through a wire. Low-voltage direct current loses a lot of its energy in the wires as it travels. Because of that loss, Pearl Street could serve only the small district around the station.

The current war

Alternating current, called AC, flows back and forth, changing direction many times each second. In the United States today it changes direction 60 times a second. A machine called a transformer can easily raise or lower the voltage of AC, which could not easily be done with direct current.

George Westinghouse sold electric systems that ran on AC. Nikola Tesla received patents for motors that ran on alternating current in May 1888, and two months later Westinghouse paid for the right to use them. Chapter 8 tells how Tesla's motor worked and what Westinghouse paid for it.

The dogs. Edison and his supporters attacked AC as deadly. Harold Brown, an electricity salesman, ran tests at Edison's laboratory in West Orange, New Jersey, in 1888, killing dogs with alternating current to show that it was dangerous. The dogs were strays, bought from boys in the neighborhood for 25 cents each. Edison's supporters used the word "Westinghoused" to mean killed by electricity.

The chair. New York lawmakers replaced hanging with death by electricity in 1888, a change Governor David B. Hill had proposed. New York State officials hired Harold Brown to build the first electric chair, which kills a person by sending a strong electric current through the body. Edison secretly paid Brown to use alternating current in it. A chair that killed with AC fit Edison's campaign to convince Americans that alternating current was too dangerous to have in their homes.

The first man put to death in the electric chair was William Kemmler, of Buffalo, New York. Kemmler killed Matilda Ziegler, who lived with him as his wife, in their apartment in Buffalo, striking her more than 25 times on the head, neck and shoulders with a hatchet. At his trial in a Buffalo court in May 1889, he was found guilty of murder and sentenced to die by electricity in Auburn State prison.

His lawyer argued that death by electricity was a cruel and unusual punishment, which the New York State Constitution forbids, but judges all the way up to the US Supreme Court let the sentence stand.

The execution. Prison officials at Auburn put Kemmler in Brown's chair on August 6, 1890, and sent a current through him for 17 seconds. A doctor said he was dead, but then Kemmler groaned and began to breathe again. The officials turned the current back on, and this time it took between one and four minutes to kill him.

During the execution his fist clenched so hard that blood ran from his palm, and the back of his coat briefly caught fire. The room filled with the smell of burning flesh, and several witnesses fainted. Newspaper writers called the execution "a disgrace to civilization."

Chicago and Niagara. General Electric offered to light the World's Columbian Exposition, the world's fair in Chicago, with Edison's direct current for $554,000. Westinghouse offered to light it with alternating current for $399,000, and he got the job. In May 1893 his company's AC system lit about 100,000 electric lamps at the fair, 250 times the 400 lamps Pearl Street lit on its first day.

Westinghouse also won the job of building the three generators, machines that turn motion into current as Edison's dynamos did, for the Adams power plant at Niagara Falls. Each was rated at 5,000 horsepower. The Adams plant sent out its first alternating current, to factories in the town of Niagara Falls, on August 26, 1895. In November 1896 current from Niagara Falls lit Buffalo, New York.

George Westinghouse and Nikola Tesla

Who: The businessman who sold alternating current, and the inventor whose AC motors he bought the right to use.

When and where: New York State, 1888 to 1890.

Movie: *The Current War* (2017). A Hollywood drama, not a documentary. Michael Shannon plays Westinghouse and Nicholas Hoult plays Tesla.

Westinghouse refused to sell New York three dynamos for its electric chair.

George Westinghouse had owned the right to use Nikola Tesla's AC motors since 1888. Tesla was a Serbian immigrant who had come to the United States in 1884. Westinghouse stood to lose millions of dollars if Americans came to believe that alternating current would kill them in their homes.

New York State officials asked to buy three Westinghouse AC dynamos for the new electric chair, and Westinghouse refused to sell them. Harold Brown got AC dynamos anyway. Westinghouse then gave $100,000 toward the lawyers' fees for Kemmler's appeal to the US Supreme Court, and the appeal failed.

After Kemmler's execution in August 1890, Westinghouse said, "It has been a brutal affair. They could have done better with an ax."

Avondale, 1869: one way out

Power stations such as Pearl Street burned coal, and miners died digging it. Thirteen years before Pearl Street opened, a fire at the Avondale mine, near Wilkes-Barre, Pennsylvania, killed 110 people on September 6, 1869. The Steuben Coal Company owned the mine.

Mine operators then kept small fires burning at the bottom of their shafts, the deep holes that lead down into a mine. A fire like this, called a ventilating furnace, made a draft that moved fresh air through the mine.

One way out. Sparks from the ventilating furnace set fire to the wooden timbers in the shaft, and the flames spread up to the breaker, the wooden building where coal was broken and sorted. The breaker stood right over the shaft, and the shaft was the only way into or out of the mine. The men who ran the Steuben Coal Company had the mine and its breaker built that way.

The fire filled the mine with smoke and gas, and 108 men and boys underground died because they could not breathe. Five of the dead were boys between 12 and 17 years old. Two men who went down to rescue the miners also died.

Pennsylvania lawmakers passed a mine law in 1870. It required every mine to have more than one way out, and it forbade using a single passage both to bring fresh air in and to let bad air out.

From charcoal to coal

Hopewell Furnace in Pennsylvania burned charcoal from about 1771 until it closed in 1883. By then iron makers had built new ironworks that burned anthracite, the hard coal, and charcoal furnaces had fallen out of use. For more than a hundred years, workers at Hopewell had cut the forest around it for charcoal. Mark Bird, who built the furnace, enslaved some of those workers in its early decades, and the last record of slavery at Hopewell is from 1821.

Lafayette Houck

Who: One of the last colliers at Hopewell Furnace, who later taught the National Park Service how charcoal was made.

When and where: Hopewell Furnace, Berks County, Pennsylvania, in the later 1800s, and again in 1936.

Fifty-three years after the furnace closed, he showed how charcoal was made.

Lafayette Houck came from a family of colliers. Their work at Hopewell began in 1818, when Henry Houck worked there as a master collier, in charge of the pits and of the helpers who worked them. In winter Henry also repaired wooden wagon wheels or chopped wood to sell. In the 1830s the furnace's owners paid about 20 colliers, and each one tended eight or nine pits.

The watch. Lafayette made charcoal the way Hopewell's colliers had since the 1700s, in smoldering piles of stacked wood. A Hopewell collier lived in a rough hut near his pits from May to October, with one or two helpers, and together they tended up to eight or nine pits at once. They watched the pits day and night, from the moment a pit was lit until a teamster, a man who drove a wagon, hauled away the last load of charcoal.

Teaching the trade. Hopewell closed in 1883, and federal officials bought the land in the 1930s. In 1936 Houck and his son, William, showed workers of the Civilian Conservation Corps, a government jobs

program, how a collier lived and worked. Houck taught the National Park Service how charcoal was made, and he told them what he remembered about life at the furnace.

NOT KNOWN: his exact age, his pay, and the years he began and stopped work as a collier. One National Park Service page gives his life as 1846 to 1939, and another says he was 82 in 1936, which would put his birth around 1854.

BY 1900

If you remember one thing: Alternating current, which a transformer could raise or lower, won the current war against Edison's direct current.

- 1859: Edwin Drake's crew strikes oil near Titusville, Pennsylvania.
- 1869: A fire at the Avondale coal mine kills 110 people. The mine has only one way out.
- Around 1885: Coal passes wood as the country's main fuel.

Next: In the next fifty years, electric wires reached almost every American home, and oil shot out of a hill in Texas.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 15 MINUTES

Electric wires reached almost every American home in these fifty years. About 8 households in 100 had electricity in 1890, and 94 in 100 did by 1950. Emanuela Cardia worked out those figures in a 2008 study from the census, the government's count of the people and their homes, taken every ten years. Most farms got their wires only after 1935.

Coal still heated most homes. The 1940 census found that more than half of American homes were heated mainly with coal, and about a quarter with wood.

A single well in Texas began to pour out an estimated 100,000 barrels of oil a day in 1901. In World War II, most of the oil burned by the Allies, the countries fighting Germany, Italy and Japan, came from the United States.

Spindletop, 1901

A well on Spindletop hill, about 3 miles south of Beaumont, Texas, struck oil 1,139 feet down on January 10, 1901. Oil shot more than 100 feet into the air. The well poured out an estimated 100,000 barrels a day until workers capped it nine days later, on January 19.

Nine days. All of Texas had produced 836,000 barrels of oil in the whole year of 1900. At the estimated rate, the Spindletop well poured out about 900,000 barrels in its nine days, more than that whole year's total.

The salt dome. Anthony F. Lucas led the drilling. According to the Texas State Historical Association, he was the leading American expert on salt domes, large masses of salt buried deep underground, and Spindletop hill stood on one. Other geologists of the time doubted that oil lay in the salt domes along the coast of the Gulf of Mexico. Lucas was sure it did, and the well proved him right.

Several oil companies started at Spindletop or grew large there, among them the Texas Company, later called Texaco, and Gulf Oil.

What coal cost the miners

Coal miners died at work by the thousands in the early 1900s. Officials of the federal Mine Safety and Health Administration, part of the national government, keep a count for every year. In 1900, 1,489 coal miners died in accidents at work. The worst year was 1907, when 3,242 died. The count was still 2,063 in 1930, and it fell to 643 in 1950.

The yearly counts from 1900 through 2025 add up to about 105,000 coal miners who died in accidents. The counts do not include miners who died of disease from their work.

Monongah. Explosions in mines No. 6 and No. 8 at Monongah, West Virginia, killed 362 men by the official count on December 6, 1907. It is the worst mine disaster in American history. Later estimates run above 500, because the explosion destroyed the system that kept track of which miners were underground, so no one could make a full count.

Some of the dead were boys as young as eight. Mine companies of the time hired more workers than they listed, and their lists left out many of the children who worked underground. The dead included immigrants from Italy, Poland and Hungary, and Black workers. About 1,000 children lost a father.

What went wrong. Experts at the time did not agree on what set off the explosions. According to Clio, a history website run from Marshall University, a loaded coal car broke loose near the top of a trestle, a raised track, and ran back into mine No. 6. Some experts blamed torn electrical wires. Others blamed miners' lamps.

C. W. Watson was the president of the Fairmont Coal Company, which Clio names as the owner of the mines. He said the explosion "could only have been caused by the careless use of a mining lamp." The West Virginia Mine Wars Museum names a different owner, the Consolidation Coal Company. Neither history names anyone charged with a crime. After Monongah, members of Congress created the federal Bureau of Mines.

Ludlow. Colorado National Guard soldiers, the state's own force of part-time soldiers, killed striking coal miners and their families at Ludlow, Colorado, in 1914. The coal miners of southern Colorado had gone on strike in 1913, stopping work to demand changes. The coal they mined supplied Colorado's steel mill and its railroads. Most of them worked for the Colorado Fuel and Iron Company, whose main owner was John D. Rockefeller Jr.

The miners wanted the company's owners to obey Colorado's mining laws and to accept their union, the United Mine Workers, a group workers form so they can bargain with owners together. The strikers and their families lived in tent camps. Governor Elias M. Ammons sent the Colorado National Guard, and the mine owners agreed to pay for it.

Fighting broke out at the tent camp at Ludlow on April 20, 1914. No one knows who fired the first shot. Guardsmen burned the tents. At least 19 people were killed: one guardsman, five miners, and thirteen women and children. The women and children had hidden in a pit under a tent, and fumes from the burning filled the pit, so they died because they could not breathe.

Guardsmen killed three strike leaders who were under a flag of truce, a white flag that asks for a pause in fighting. They shot the strike leader Louis Tikas, a Greek American, three times in the back.

In the days after, miners attacked mines across the region and killed mine bosses and guards. No one knows how many people died in those days, but more died than at Ludlow. President Woodrow Wilson sent the US Army on April 28. The strike ended in December 1914, and the miners won none of the union's goals.

Samuel Insull

Who: Edison's former secretary, who tied more than 85 electric companies into one chain that collapsed in 1932.

When and where: Chicago, 1892 to 1932.

Tried three times after his companies failed, he was never found guilty.

Samuel Insull built a chain of electric companies that served millions of people, and the chain collapsed in 1932. He had worked for Thomas Edison as his private secretary. In 1892 Insull took over the Chicago Edison company, and he built it into Commonwealth Edison.

The chain. Insull tied together more than 85 companies through holding companies, companies that own shares, or pieces of ownership, of other companies. Insull's companies owned shares in one another, and they had borrowed much of the money behind them. Many small investors bought shares in his companies.

The fall. Insull's companies failed in 1932, during the Great Depression, and investors lost millions of dollars. Insull fled to Europe. In October 1932 a grand jury in Chicago, a group of citizens who decide whether there is enough proof for a trial, charged him with crimes.

He moved to Greece, and officials there refused to send him back. In 1934, after US officials pressed them, Greek officials told him to leave. Officials of Turkey arrested him, and US State Department officers brought him back to the United States to stand trial.

He was tried three times. One trial was for fraud, cheating people by lying. Another was for embezzlement, stealing money that others had trusted him to handle. The third was for breaking federal bankruptcy law, the rules for what happens when a person or a company cannot pay its debts. He was found not guilty all three times.

> Franklin Roosevelt, running for president, named Insull in a campaign speech in 1932. In 1935 members of Congress passed the Public Utility Holding Company Act, which they wrote to stop anyone from building another chain of electric companies like Insull's.

Rivers into power, and who lost their homes

Federal officials had large dams built to make electricity from 1933 to 1945. In the Tennessee Valley alone, they made an estimated 82,000 people leave their homes to do it. A hydroelectric dam holds back a river, and water rushing down through the dam turns machines that make electricity.

The TVA. President Franklin Roosevelt signed the law that created the Tennessee Valley Authority, or TVA, on May 18, 1933. The TVA was a federal corporation, a company owned by the national government. Its board and staff ran it, and TVA officials had dams built in the Tennessee Valley. Before the TVA, about 3 in 100 families in the valley had electricity. Work on the first TVA dam, Norris Dam, began in October 1933.

Who had to leave. TVA officials bought or took about 1.3 million acres from their owners from 1933 to 1945, and they made those 82,000 people leave to make room for 16 hydroelectric dams. For Norris Dam alone, TVA officials made more than 3,000 families leave.

The price. TVA officials set the price of each piece of land, and an owner who would not sell at that price lost the land anyway. TVA lawyer John Snyder put it this way: "a price is set and we buy at that price or we condemn." To condemn land is to take it by law without the owner's agreement, at a price the government sets. TVA's own economists estimated that condemning land got it for about 60 percent of what a private buyer would pay.

The TVA's board and staff made these choices together. Wayne Moore's 1995 history of the TVA land-taking does not name one official who made them.

Hoover Dam. Hoover Dam stands on the Colorado River, between Arizona and Nevada, and it was one of the big federal dams that made electricity in these years. Its first generator began sending electricity over 266 miles of wire

to Los Angeles on October 9, 1936. Some records date the start to October 26, 1936, the day that generator reached full operation. Chapter 12, Landmarks, tells how many men died building the dam.

Grand Coulee. Officials of the federal Bureau of Reclamation had Grand Coulee Dam built on the Columbia River, and it was finished in 1941. The dam stands 550 feet high, and its builders gave it no fish ladders, the rising pools that let salmon swim upstream past a dam. Salmon and steelhead, a trout that swims to the sea and back, could no longer reach the whole upper Columbia Basin, and their runs there ended.

The lake behind the dam flooded Kettle Falls, where Native people had fished for salmon for about 9,000 years. The catch there had averaged about 644,500 fish a year. Native people also lost thousands of acres of low, flat land beside the river where they grew food, and they lost their way to the places where they gathered roots and berries.

As the dam neared completion in June 1940, the Colville Confederated Tribes held a three-day Ceremony of Tears to mourn the loss of the fishery at Kettle Falls. Between 8,000 and 10,000 people came, from the Spokane, Yakima, Nez Perce, Coeur d'Alene and other nations.

Osage oil

Some of the oil Americans burned in the 1920s came from under the Osage Nation's land in Oklahoma. Under the Osage Allotment Act of 1906, the Osage kept the rights to the oil and minerals under their land, owned in common. Each Osage person with a share, called a headright, received part of the oil money. Under a law passed in 1921, local judges put many Osage adults' money under the control of white guardians, people the judges chose to handle it.

The murders. From about 1920 to 1925, husbands, guardians and others killed Osage headright holders to inherit their shares of the oil money. A cattleman named William Hale planned to have members of one Osage family killed so that his nephew, Ernest Burkhart, would inherit their headrights. It was the family of Ernest's wife, Mollie. Federal agents later proved that Hale ordered the murders.

Mollie's family. Mollie Burkhart's mother was Lizzie Q. Kyle. Her sisters were Anna Brown and Rita Smith, and Rita's husband was Bill Smith. Henry Roan was Mollie's cousin.

The killings. Kelsie Morrison shot Anna Brown in May 1921. He later admitted that he killed her at Hale's request. Henry Roan was shot and killed in January 1923. A cowboy named John Ramsey admitted that Hale had hired him to kill Roan, though Ramsey later took back his confession.

A bomb blew up Rita Smith's home on March 10, 1923. It killed Rita, Bill Smith and Nettie Brookshire, who worked for them. Ramsey confessed that he took part in those murders too, and he named Hale as the leader, along with two other men.

The sentences. Ernest Burkhart admitted his guilt in June 1926 and got life in prison for the murder of Bill Smith. Morrison got life that November for killing Anna Brown. Burkhart testified against his uncle and Ramsey. Hale got life in January 1929, and Ramsey got life that November, both for the murder of Henry Roan. Chapter 2 tells how Osage leaders brought in the federal agents who solved the case.

NOT KNOWN: whether Mollie's mother, Lizzie Q. Kyle, was poisoned when she died in July 1921, or by whom. Poison was suspected, but the Oklahoma Historical Society's and the FBI's accounts do not say.

DISPUTED: the number of dead. Writers for the Oklahoma Historical Society count about 24 violent or suspicious deaths, and the FBI's history of the case says at least two dozen. The Osage Nation counts more than 60 murders and suspicious deaths.

The night the lights came on

Fewer than 11 farms in 100 had electricity from a central power station in 1935. A Tennessee farmer, whose name was not recorded, had said in 1930 that "the greatest thing on earth is to have the love of God in your heart." The next greatest thing, he said, "is to have electricity in your house." David Nye records the words in his book *Electrifying America*. In 1984 the national association of electric cooperatives named its history of the program *The Next Greatest Thing*.

The REA. President Roosevelt created the Rural Electrification Administration, or REA, on May 11, 1935, with Executive Order 7037, a rule a president issues on his own authority, without a vote of Congress. He signed the Rural Electrification Act on May 20, 1936. Under that law, REA officials made long-term, low-cost loans to cooperatives, businesses owned by the people who use them. Farmers' cooperatives used the loans to build power lines.

Louisan Mamer, who worked for the REA teaching farm families to use electricity in their homes, toured farm towns in the 1930s and 1940s with a traveling show called the electric circus. She showed families electric appliances and how to cook with electricity.

Pedernales. In the Texas Hill Country, power first ran through the lines of the Pedernales Electric Cooperative on October 27, 1939. The cooperative had 1,800 miles of line and 422 first customers. Families coming home that night

saw their farmhouses lit for the first time. About half of American farms had electricity by 1945, about 9 in 10 by 1950, and about 97 in 100 by 1960.

Pearl Yates

Who: A country schoolteacher in western North Carolina who remembered when the lights first came on in her home.
When and where: Haywood County, North Carolina, 1939.

She and her children walked room to room, looking at the lights.

Pearl Yates taught high school English in the countryside of western North Carolina. When the electric lights came on in her home, she walked from room to room with her small children. "We'd stop and look and they were so pretty and we'd go look at another room and another room," she said. The power reached her part of Haywood County in July 1939.

Before the lines. She cooked on a wood stove, and washing clothes took a whole day, in a large pot. Officials of the power company, Carolina Power and Light, would not run lines into the countryside where the Yates family lived, so people there formed a cooperative. Many neighbors did not trust it at first, because outsiders ran it and members had to pay money up front. Organizers went from door to door and signed many of them up.

Bonnie Bishop interviewed Pearl Yates and her husband, Oral Yates, a former North Carolina state lawmaker, on May 29, 1984. The interview was part of a set recorded for the 50th anniversary of the REA, and it is kept in the Southern Oral History Program at the University of North Carolina.

Oil for a world war

Six of every seven barrels of oil the Allies used in World War II came from the United States. Writers at the American Oil & Gas Historical Society count about 6 billion of the 7 billion barrels.

Pipelines. Tanker ships carried oil from Texas along the coast, and German submarines were sinking them, so workers built two pipelines on land. The Big Inch, a pipe 24 inches wide, ran from East Texas to Illinois and on to the East, and it was finished in August 1943. Together with a second line, the Little Big Inch, it carried more than 350 million barrels of oil east before the war in Europe ended.

BY 1950

If you remember one thing: Electric wires reached almost every American home in these fifty years.

In 1890: About 8 American households in 100 had electricity.

In 1950: About 94 households in 100 had it, and about 9 farms in 10, most of them wired by farmers' own cooperatives after 1935.

Next: After 1950 Americans began splitting atoms to make electricity, and in 1973 a cutoff of foreign oil left drivers waiting in long lines for gasoline.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 12 MINUTES

Splitting atoms became a new way to make American electricity after 1951, when a test reactor in Idaho lit four light bulbs. The first full-scale American plant built only for civilian power began sending electricity into a power company's lines in Pennsylvania in 1957. A reactor at Three Mile Island, also in Pennsylvania, partly melted in 1979, and after that American power companies stopped ordering new reactors.

Americans kept burning more oil and natural gas after World War II, according to the US Energy Information Administration. Officials of the Arab members of OPEC, a group of countries that sell oil, cut off oil sales to the United States in October 1973, and drivers waited in long lines for gasoline. Members of Congress then passed new energy laws and set up a federal Department of Energy, which opened in 1977.

How does a nuclear power plant make electricity?

A nuclear power plant makes electricity from the heat of splitting atoms. Inside the reactor, the machine where the atoms are split, atoms of uranium split in two, and each split gives off a large amount of energy as heat. This splitting is called fission.

The fuel is uranium, a heavy metal dug out of the ground as ore, rock that holds a metal, and it sits in the core, the center of the reactor. The heat boils water into steam. The steam spins the blades of a turbine, a wheel with many blades, and the turbine turns a generator, which turns that motion into electric current.

Four light bulbs. A test reactor in Idaho called EBR-1 made the first usable electricity ever produced from nuclear energy on December 20, 1951. It lit four 200-watt light bulbs. The town of Arco, Idaho, about 1,200 people, ran on electricity from a nearby reactor called BORAX III for about an hour on July 17, 1955. Arco was the first town lit only by nuclear power.

Shippingport. President Eisenhower gave a speech called "Atoms for Peace" to the General Assembly of the United Nations on December 8, 1953. Work on a nuclear power plant at Shippingport, Pennsylvania, began in 1954. The plant sent its first electricity into the lines of Duquesne Light, a power company, on December 18, 1957. Five days later it reached its full power of 60,000 kilowatts, or 60 million watts. That was enough to light 300,000 bulbs like the ones EBR-1 lit.

Shippingport was the first full-scale nuclear power plant in the United States built only to make electricity for civilian use, meaning not for the military. It was not the first to make nuclear electricity. EBR-1 and smaller American reactors came before it, and so did reactors built for more than one purpose. A British plant, Calder Hall, began sending power in 1956.

Garrison Dam and the Three Affiliated Tribes

Members of Congress paid for Garrison Dam on the Missouri River in North Dakota in 1947. The dam was part of the Pick-Sloan Plan of the Army Corps of Engineers, the part of the Army that builds dams and waterways. Under that plan, the dams were to stop floods and make electricity. The Army Corps was in charge of Garrison Dam, and it was finished in 1953.

Under the lake. The dam's lake, Lake Sakakawea, flooded the farmland along the river on the Fort Berthold Reservation, the home of the Mandan, Hidatsa and Arikara, called the Three Affiliated Tribes. It covered the river bottomlands, the low, flat lands beside the river where the tribes farmed. Counts of the flooded land run from 153,000 to about 155,000 acres.

Farms, homes, schools, a hospital, businesses, churches, cemeteries, roads and whole towns went under the water, among them Elbowoods, Sanish and Van Hook. By 1954 the Elbowoods school building stood under 50 feet of water.

Who had to leave. Under the federal act for taking the tribes' land, about 300 families had to leave their homes before the lake covered them. By one count, that was more than 90 percent of the tribes' people.

How the land was taken. Federal planners had chosen the dam's plan without asking the tribes. In May 1948 tribal leaders signed a contract giving up the tribes' land for $5,105,625. Tribal chairman George Gillette was in tears as he signed. He said the contract broke the Treaty of Fort Laramie, a signed agreement the tribes had made with the United States: "The truth is, as everyone knows, our Treaty of Fort Laramie ... and our constitution are being torn to shreds by this contract."

Members of Congress passed a law in 1949 that set out how the tribes would be paid for their land, and the president signed it. In 1950 the tribes' adults voted on whether to accept the terms of that law. Of the 991 adults, 525 voted yes. Tribal members feared that if they refused, they would be paid even less later.

NOT KNOWN: whether a vote against the terms could have stopped the dam.

Black lung and the 1969 law

An explosion at the Consol No. 9 coal mine in Farmington, West Virginia, killed 78 miners on November 20, 1968. Members of Congress then passed the Federal Coal Mine Health and Safety Act of 1969, which became law on March 30, 1970. Under it, federal inspectors had to check every underground coal mine four times a year and every surface mine twice a year, and they could close a mine where they found a danger to life. Miners with black lung disease could also get federal payments.

What black lung does. Black lung is a group of lung diseases caused by breathing coal mine dust. The body's defending cells try to break down the grains of dust and cannot, so the cells burst and release chemicals that damage the lung. Over the years, scar tissue and hard lumps form in the lungs.

Miners cough up dark, inky phlegm, the thick slime that comes up from the lungs. In the worst form, large masses of scar tissue fill the lungs, and the miner gasps for every breath. According to US Department of Labor figures reported in *Smithsonian* magazine in 2017, more than 76,000 miners had died of black lung since 1968.

Officials of the Mine Safety and Health Administration count the coal miners who died in accidents at work each year. They counted 311 in 1968, the year of Farmington, and 260 in 1970, the year the law took effect. By 2000 the count had fallen to 38, and in 2014 it was 16, the lowest ever recorded.

1973: the gasoline runs short

Officials of the Arab members of OPEC announced an embargo, an order that stops trade, on oil sales to the United States in October 1973. They acted because US officials were sending military supplies to Israel in the Yom Kippur War, which began on October 6, 1973, when Egypt and Syria attacked Israel's forces. The embargo lasted until March 1974. In about six months, the price of a barrel of oil rose from about $2.90 to $11.65, about four times as much.

Long lines. Gas stations ran out of gasoline, and drivers waited in long lines. Officials in many states let drivers buy gas only on certain days, by license plate number: cars with odd numbers on odd-numbered days, and cars with even numbers on even-numbered days. Members of Congress set a national speed limit of 55 miles an hour, which became law in January 1974. A US Department of Energy report gives the average price of gasoline as 39 cents a gallon in 1973 and 53 cents in 1974.

More energy laws followed. The Energy Policy and Conservation Act became law on December 22, 1975. Under it, federal officials set up the Strategic Petroleum Reserve, a store of crude oil, the oil that comes straight out of the ground, kept for emergencies.

The law also contained the first fuel-economy standards for cars, rules for how far a car must go on a gallon of gas. New cars had to average 27.5 miles per gallon by 1985, about twice what they got then. The federal Department of Energy opened on October 1, 1977.

David Falconer

Who: A government photographer who recorded Oregon's gasoline shortage in pictures and in his own captions.

When and where: Oregon, October 1973 to May 1974.

In Portland he photographed a man in line with a gas can.

David Falconer photographed the gasoline shortage in Oregon and wrote down what he saw. He worked for Project DOCUMERICA, which officials of the Environmental Protection Agency started in 1972 to photograph environmental problems around the country. About 120 photographers took part, and the National Archives keeps Falconer's pictures and captions.

Closed pumps. At Sutherlin, on Interstate 5, he photographed closed pumps in October 1973. His caption states, "By midday gasoline was becoming unavailable along interstate highways." That month in Lincoln City, gas stations closed early and stayed closed on weekends, and "No Gas Today" signs went up.

Portland. In December 1973 he photographed a man who had run out of gas and was standing in line with a gas can. The man's name was not recorded. By February 1974, drivers there with even-numbered license plates lined up for gas on even-numbered days, Monday through Friday. Anyone could try on Saturday if gas was left, and all Portland stations closed on Sundays.

Falconer wrote that Oregon was the first state to use this odd-even plan. In May 1974, after the embargo had ended, he photographed a sign at a downtown Portland station saying its gas for the day was sold out.

What went wrong at Three Mile Island?

A stuck valve let cooling water escape from the Unit 2 reactor at the Three Mile Island power plant in Pennsylvania on March 28, 1979, and the reactor's core overheated and partly melted down. It was the worst accident in American history at a nuclear power plant that sold its electricity. In a meltdown, the reactor's fuel gets so hot that it melts.

The valve. General Public Utilities ran the reactor. A small fault in the cooling system came first. Then a relief valve, a valve that opens to let out pressure, stuck open. The operators had no gauge that showed the valve was open, and they believed the system held too much water, so they cut back the water flowing into it. The core lost its water and overheated, and at least 45 percent of it melted.

Governor Dick Thornburgh advised pregnant women and preschool children living within 5 miles to leave on March 30, and he told people within 10 miles to stay indoors. Officials gave out messages that conflicted with each other. About 140,000 people left on their own.

A small amount of radiation escaped. Radiation is energy that substances such as a reactor's fuel give off, and it can damage the cells of the body. The average dose to people within 10 miles was 0.08 millisieverts, about the same as one chest X-ray. A millisievert is a unit that measures how much radiation a body takes in. No one got more than 1 millisievert, about a third of the radiation an average American gets from nature in a year.

Scientists at the Nuclear Regulatory Commission, the federal agency that oversees nuclear plants, and more than 12 health studies since 1981, found no health effects they could detect. No deaths are linked to the accident.

Where the uranium came from

Miners dug uranium on Navajo land for the federal government and later for power plants. Federal officials did not warn them about radon, a gas from the uranium that caused lung cancer. Until 1966 the federal Atomic Energy Commission was the only buyer, and after that uranium was also sold to fuel power plants.

Miners dug nearly 30 million tons of uranium ore from Navajo land from 1944 to 1986, according to the Environmental Protection Agency. About 10,000 people worked in uranium, and about a quarter of them were Navajo.

No warning. Uranium gives off radon, a radioactive gas, which means it gives off energy that can damage the cells of the body. Navajo miners say that no one taught them about the dangers of uranium mining, and that no one gave them protective gear or fresh air in the mines.

A federal committee, the Advisory Committee on Human Radiation Experiments, reported in 1995 that "at least several hundred" uranium miners had died of lung cancer from breathing radon. Its members found that federal officials did not require the mine owners to pump fresh air into the mines. They also did not warn the miners.

Church Rock. A dam holding radioactive waste, owned by the United Nuclear Corporation, broke near Church Rock, New Mexico, on July 16, 1979, four months after Three Mile Island. About 94 million gallons of radioactive liquid and 1,100 tons of solid waste poured down the Rio Puerco, past about 1,700 Navajo people.

A 2013 study estimated that the spill released 46 curies of radioactivity, against 13 curies for Three Mile Island. Curies measure how much radioactive material was let loose. The millisieverts given for Three Mile Island measure something else: how much radiation a person's body took in. The US Geological Survey called the spill "the largest accidental radioactive release in the United States."

No official declared an emergency or ordered anyone to leave. A New Mexico state agency called the effects on people and the environment "quite limited," but its report also warned that water pumped out of the mines into the river might be a greater danger over time. Governor Bruce King turned down the Navajo Nation's request for a federal disaster declaration. Chapter 13, The Elements, tells the spill in full.

NOT KNOWN: how many of the people living along the river were harmed by the spill.

Panels on the White House roof

President Carter held a ceremony for 32 new solar panels on the roof of the West Wing of the White House on June 20, 1979. The panels used sunlight to heat water. They were in use for about seven years. In 1986, while President Reagan was in office, workers took the panels down to repair the roof, and no one put them back.

Some of the panels went to Unity College in Maine in 1991, where workers put 16 of them back up to heat water for the cafeteria. One panel went to the Smithsonian's National Museum of American History in 2009. Others are at the Carter Library and at a solar museum in Dezhou, China.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 13 MINUTES

Natural gas took coal's place as the fuel that makes the most American electricity. Drillers got more and more of that gas by fracking, which cracks rock deep underground to free the gas inside. Natural gas made more electricity than coal over a full year for the first time in 2016, according to the US Energy Information Administration, or EIA. Wind and solar power made a record share of the country's electricity in 2025, about 17 to 18 percent, by EIA figures.

Americans produced more energy than they used in 2019, for the first time since 1957. A winter storm shut down power plants across Texas in February 2021, and more than 4.5 million households lost power. A new nuclear reactor began running in Georgia in 2023, the first new American reactor to start since 2016.

What is fracking?

Fracking, short for hydraulic fracturing, is a way of getting gas and oil out of rock deep underground. Drillers pump water, sand and chemicals down a well at high pressure. The pressure cracks the rock, and the sand holds the cracks open so that gas or oil can flow out. Many of these wells turn and run sideways through the rock for thousands of feet, which is called horizontal drilling.

From Texas shale. George Mitchell's company, Mitchell Energy, began working the Barnett Shale, a layer of rock made of hardened mud, in Texas in the early 1980s. Mitchell and his company spent about twenty years trying to get gas out of it. In the late 1990s an engineer, Nick Steinsberger, used a cheaper way of fracking called slickwater fracturing, which cut the cost enough that selling the shale gas made money. In the 2000s drillers joined fracking with horizontal drilling.

American wells produced 16 times as much shale gas in 2023 as in 2007, according to the EIA. By 2018 the United States was the world's largest producer of both natural gas and crude oil.

The argument. People disagree about fracking. Supporters say it brought cheaper energy and jobs. They add that natural gas burns cleaner than coal, and that power companies have replaced coal-burning plants with gas-burning ones.

Critics worry that fracking fluid can pollute groundwater and that methane, the main gas in natural gas, leaks from wells and pipes. Earthquakes are a third worry.

Drillers pump wastewater from oil and gas wells deep underground. Scientists at the US Geological Survey wrote in 2017 that the sharp rise in Oklahoma's earthquakes is widely seen as the result of that deep pumping of waste fluids. An earthquake near Pawnee, Oklahoma, measured 5.8 in magnitude, the number that states an earthquake's size, on September 3, 2016. It was the largest ever recorded in the state.

Mine deaths, black lung and a pipeline

An explosion of gas and coal dust killed 29 miners at the Upper Big Branch mine in Montcoal, West Virginia, on April 5, 2010. It was the worst mine disaster in the United States in 40 years. Performance Coal Company, part of Massey Energy, ran the mine.

The federal Mine Safety and Health Administration's report on the explosion identifies Massey's "corporate culture," its habits and ways of working, as the root cause. Officials of the agency issued 369 citations and orders, written notices of broken safety rules, with fines of $10.8 million.

The trial. Massey's former chief executive, Don Blankenship, was convicted in December 2015 of conspiring, or planning with others, to break federal mine safety laws. It was a misdemeanor, a less serious kind of crime. Judge Irene Berger gave him the longest sentence the law allowed on April 6, 2016: one year in prison and a $250,000 fine. A year of supervised release followed, when a court officer checks on him. He was not convicted of causing the miners' deaths.

Black lung came back among coal miners in the 2000s. Researchers at NIOSH, the federal agency that studies workers' health, found 60 cases of the worst form of the disease in 20 months at one small clinic in Kentucky in 2016. Reporters at National Public Radio found 962 cases of advanced black lung in the 2010s, more than double the 441 cases NIOSH had recorded in the 40 years before. *Smithsonian Magazine* reported both counts in 2017.

Standing Rock. Pumping more oil also meant moving it. A company called Energy Transfer Partners built the Dakota Access pipeline to carry crude oil from the Bakken oil field in North Dakota to Illinois. Members of the Standing Rock Sioux Tribe opposed it in 2016 where it crosses under Lake Oahe, upstream of their reservation. The lake is the tribe's water supply, and they feared that a spill would pollute it.

Protest camps began in April 2016. Army Corps of Engineers officials denied the easement for the crossing, the permission to cross federal land under the lake, on December 4, 2016. President Trump ordered the Army Corps to

review and approve the easement quickly on January 24, 2017. Army Corps officials approved it on February 8, 2017, and oil moved through the pipeline later that year. The tribe's lawsuits continued.

Natural gas, wind and solar, 2016 to 2025

Natural gas passed coal for a full year for the first time in 2016, when it made 34 percent of American electricity, according to the EIA. By 2025 it made about 41 percent, more than twice coal's share of about 17 percent. Nuclear power made about 18 percent.

Renewables. Wind, solar, flowing water and other sources that do not run out are called renewable energy. In 2025 they made about 24 percent of American electricity: wind about 11 percent, solar about 7 and hydropower, from flowing water, about 6.

Wind and solar together made a record share. The EIA's yearly report puts it at about 17 percent, but its rounded shares for wind and solar add up to 18, so the share was about 17 to 18 percent.

Analysts at the federal Bureau of Labor Statistics expect wind turbine service technicians to be the fastest-growing job in the country from 2024 to 2034, up 49.9 percent. Solar panel installers come second, up 42.1 percent. The two jobs together are projected to add fewer than 20,000 jobs.

Electric cars. Americans also began buying cars that run partly or fully on electricity: hybrids, which have both a gasoline engine and an electric motor, and battery electric cars, which run on electricity alone. According to the EIA, about 20 percent of the new cars, SUVs and pickups sold in 2024 were hybrids or electric, and in 2025 the share rose to about 22 percent.

But 2025 was also the first year that sales of battery electric cars fell. Federal tax credits for buyers of these cars, money taken off the buyer's tax bill, ended on September 30, 2025. In each of the months left in 2025, battery electric cars made up less than 6 percent of sales.

Why did the Texas lights go out in 2021?

Texas power plants of every kind broke down in the cold during a winter storm named Uri in February 2021. To keep the state's whole power grid from failing, the people who run it cut off power to millions of customers. More than 4.5 million households, about 10 million people, lost power, some of them for days. Reports on the failure by federal energy regulators and by researchers at the University of Texas give these figures, and so do news reports.

The grid. The Electric Reliability Council of Texas, called ERCOT, runs the Texas grid, the network of power plants and wires that serves the state. Some of its gas, coal, nuclear and wind plants stopped working. ERCOT's operators cut 20,000 megawatts, a megawatt being a million watts. That was more than 300 times the 60 megawatts the Shippingport nuclear plant made in 1957, and the largest cutoff of its kind in American history.

ERCOT officials later said the grid came within 4 minutes and 37 seconds of a total collapse. Texas state health officials counted 246 deaths from the storm in 2022, but others have argued that the official count is much too low. Reporters at BuzzFeed News compared the number of Texans who died in the week of the worst blackouts with the number who would normally die. They estimated that about 700 people were killed by the storm in that week alone. Damage estimates run above $195 billion.

Cristian Pavón Pineda

Who: An 11-year-old sixth grader who died in his family's mobile home during the Texas blackout.

When and where: Conroe, Texas, February 16, 2021.

He had seen snow for the first time the day before.

Cristian Pavón Pineda was 11 years old when he died in his family's mobile home in Conroe, Texas, on February 16, 2021. The home had been without power since the Sunday before, and the temperature there fell to about 10 degrees. Al Día News reported that he had seen snow for the first time the day before he died.

The family of five slept in one room to keep warm. Cristian shared a bed with his younger brother. His aunt, Jaliza Yera, told a TV station that he went to bed in "a shirt, a sweater, two pairs of pants, socks on." His stepfather put another blanket over him. In the morning his family could not wake him.

The cause. Early reports, and his family's lawsuit, said he died of hypothermia, which means the body's temperature has fallen too low to keep a person alive. But an autopsy, an examination of a body to find the cause of death, found on February 18, 2021, that he died of carbon monoxide poisoning, Conroe police said in May 2021.

Carbon monoxide is a gas with no color or smell that comes from burning fuel. When a person breathes it in, it stops the blood from carrying oxygen. Across Texas, more than 30 people had died in the storm by February 21, Al Día News reported. Many of them died of carbon monoxide poisoning after using cars or generators to keep warm.

The lawsuit. His mother, Maria Elisa Pineda Guzman, sued ERCOT and Entergy Texas, the power company, for more than $100 million on February 22, 2021. Her lawyer was Tony Buzbee. Officials had called the

power cuts temporary rolling outages, planned cuts that move from area to area. The suit states that ERCOT and Entergy Texas did not give his family good enough information about how long the outages would last.

"Accurate information might have saved Cristian Pineda's young life," the suit states. In a statement, ERCOT officials called his death a "tragedy" and said they were "confident that our grid operators made the right choice to avoid a state-wide blackout."

NOT KNOWN: where the carbon monoxide in the home came from, and how the lawsuit ended. Published reports do not say.

New and restarted reactors

Two new nuclear reactors at the Vogtle plant in Georgia began selling power in 2023 and 2024: Unit 3 on July 31, 2023, and Unit 4 on April 29, 2024, according to the EIA. Unit 3 was the first new reactor to start in the United States since Watts Bar Unit 2 in Tennessee, owned by the TVA, began running in 2016.

Work on Watts Bar 2 had begun in 1973. Workers stopped building it in 1985 and started again in 2007, so the two Vogtle reactors were the first American reactors begun after the 1970s to start running.

Palisades. The owners of two closed plants plan to run them again. Holtec International owns the Palisades plant in Michigan, which shut down in May 2022, and it got a $1.52 billion federal loan to restart it. Its targets of 2025 and early 2026 passed without a restart.

Workers began loading fuel into the reactor in late August 2026. On August 30 a fuel assembly, a tall bundle of fuel rods, tilted while it was being loaded, and the loading was paused. Officials of the Nuclear Regulatory Commission, the federal agency that oversees nuclear plants, began a review, and their first

results showed no radiation had escaped and no workers were harmed. Holtec's officials had given no date for the restart as of late September 2026, a Michigan TV station reported.

Three Mile Island again. Three Mile Island Unit 1 is the reactor that did not melt down in 1979, and it closed in 2019. It now carries the name Christopher M. Crane Clean Energy Center. Leaders of its owner, Constellation Energy, signed a 20-year agreement to sell its power to Microsoft. Members of the Nuclear Regulatory Commission are expected to decide in May 2027 whether to give Constellation an operating license, permission to run the reactor, the news outlet WITF reported in July 2026.

What energy independence means

Americans produced more energy than they used in 2019, for the first time since 1957, according to the EIA. They produced less than 1 percent more than they used.

People call this energy independence: Americans produce more energy in total than they use. It does not mean Americans stopped buying fuel from other countries. In November 2019 Americans still bought nearly twice as much crude oil from other countries as they sold to them, by EIA figures.

Americans sold a record amount of energy to other countries in 2025, about one and a half times as much as they bought from them, the EIA reported in May 2026. Oil and products made from it were 63 percent of the energy sold abroad, and natural gas was 29 percent.

THE THREE QUESTIONS, ANSWERED

1. **Did kerosene really save the whales?** No. Whaling was shrinking before kerosene came, and in most homes kerosene replaced camphene, after a Civil War tax on alcohol raised camphene's price.
2. **How did electricity reach almost every American home?** Edison's Pearl Street station began selling current in 1882, and

alternating current, which a transformer could raise or lower, carried power from Niagara Falls to Buffalo by 1896. After 1935 federal loans paid for farmers' own power lines, and by 1950, 94 households in 100 had electricity.

3. **Who paid for America's energy with their freedom, their land or their lives?** Enslaved people fed the iron furnaces, at least 271 at Catoctin alone, and about 105,000 coal miners died in accidents from 1900 through 2025. Federal officials made 82,000 people in the Tennessee Valley leave their homes for dams, other dams flooded Kettle Falls and the Fort Berthold farmlands, and husbands, guardians and others murdered Osage people for their oil money.

What changed: Americans went from fires of wood to coal, oil, natural gas, the atom, the wind and the sun.

FIVE DATES TO KEEP

February 11, 1808: Jesse Fell burns hard coal in his tavern fireplace.

August 27, 1859: Drake's crew strikes oil in Pennsylvania.

September 4, 1882: Edison's Pearl Street station starts selling electricity.

December 6, 1907: The Monongah explosions kill at least 362 miners.

2016: Natural gas passes coal in making American electricity.

> **NOT KNOWN:** The surviving records of the early colonial iron furnaces list the owners, not the men who made the charcoal.

Where to go: The *Charles W. Morgan*, the last wooden whaling ship left in the world, is kept at the Mystic Seaport Museum in Mystic, Connecticut.

Next: Chapter 11, Transportation. It asks how Americans moved people and goods, from trails and canals to railroads, cars and planes.

Chapter 11: Transportation

CHAPTER 11 OF 37 · TRANSPORTATION · 10 ERAS · ABOUT 75 MINUTES

Each new way of moving people and goods made trips faster or cheaper, and enslaved people and immigrant workers did much of the building, on land taken from Native nations.

Eight Chinese workers laid the last stretch of track at Promontory Summit, in Utah, on May 10, 1869. It joined two railroad lines into the first one across the country, and a golden spike marked the spot. With it, a trip from coast to coast took about a week instead of about four months. Chinese workers had built the line's western part for less pay than white workers got.

Era by era, this chapter describes how people and goods moved, from foot trails and canoes before 1500 to jets, container ships and ride apps after 2000. Watch two numbers fall as the eras go by: how long a trip took and what it cost. Look for old routes under new ones, too. Many colonial roads began as Native paths, and so did part of the first federal highway. And keep an eye on who did the digging and the track-laying, whose land and homes the routes went through, and who was told where to sit.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How much faster and cheaper did travel get?
2. Who built the new routes, and whose land and homes did they take?
3. How did Black travelers fight the laws that made them sit apart?

Five minutes? Read "The Chinese workers" in 1850 to 1900.

Can skip: "Trains and Jeeps in World War II", "The minivan", "Ports, trains and bridges". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

Nobody in North America hauled loads on wheels before 1500, and nobody rode a horse. People moved themselves and their goods on foot and by water, over trails and rivers that crossed the whole continent. The horses of the Americas had died out after the ice age. North of Mexico, no large animal was left that could pull a cart.

With no animal to pull a cart, people here had no use for one. In Mesoamerica, the region that is now Mexico and Central America, people made toys with wheels, but they did not use wheels to haul loads.

Trails that became highways

Native people built and kept up long trails across the continent, and many of those trails later became colonial roads. Some of those roads became highways. Many trails had names. The Great Trail, also called the Great Path, was a network of footpaths that linked New England, the middle of the Atlantic coast and the Great Lakes. People who spoke Algonquian and Iroquoian languages, two families of related languages, used it.

The Natchez Trace. This route began as paths worn by bison walking to salt licks, places where animals lick salt from the ground, near present-day Nashville. Natchez, Choctaw and Chickasaw people followed the paths, widened them and kept them clear. They used them for trade, travel, war and talks with other nations. People have used the route for about 8,000 years.

People traded over these trails and rivers for thousands of years. As early as 6000 BC, they carried seashells and native copper, copper found pure in the ground, between the Great Lakes and the coast of the Gulf of Mexico.

Canoes, portages and the travois

On the rivers and lakes, people traveled in two kinds of canoe. A dugout was one log that builders hollowed out with fire and tools. For thousands of years dugouts were the main boats of the Southeast and of the Eastern Woodlands, the forests that covered the eastern part of the continent. Some dugouts found in Wisconsin lakes are more than 4,000 years old.

Birchbark. In the Northeast and around the Great Lakes, people built canoes from the bark of birch trees. One or two people could carry one. It floated in shallow water, and its owners repaired it with materials from the forest. Builders made them in sizes from one-person boats to big canoes that carried freight, goods being shipped.

Where one river or lake ended, travelers lifted their canoes and carried them over land to the next, a crossing called a portage. Portages and trails linked the waterways into one network across the continent.

On the Great Plains, dogs dragged loads on a travois, which Chapter 10 describes. The travois was the usual way to move goods on the Plains before horses came.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

Spanish soldiers and colonists brought horses and wagons into what is now the United States in the 1500s, and they built a port in Florida, all on land where Native nations already lived. The first horses in the Southwest came north with Coronado's soldiers in 1540. The port, St. Augustine, began inside a Timucua town, where Spanish colonists took over the chief's council house in 1565. Juan de Oñate's colonists followed in 1598 with 83 wagons and carts, bound for Pueblo land in New Mexico.

Horses, a port and 83 wagons

Horses. Christopher Columbus carried horses to the Caribbean islands on his second voyage, in 1493. In 1539 Hernando de Soto landed about 250 horses in Florida, on a march that Chapter 10 tells. The next year a Spanish commander, Francisco Vázquez de Coronado, led a long march north from the west coast of Mexico, from 1540 to 1542. His soldiers brought more than a thousand horses, the first in what is now Arizona. The march went on into New Mexico and the Great Plains.

A port. Spanish colonists built St. Augustine, in what is now Florida, in 1565, and it became a port. Spanish ships sailing between Spain and the Caribbean stopped there for supplies and for protection. People have lived there without a break ever since. It is the oldest European town and port on the mainland of the United States.

The colonists built it inside a Timucua town. Their leader, Pedro Menéndez de Avilés, landed at Seloy on September 8, 1565. Seloy was also the name of the town's chief, who answered to a greater chief. One count gives Menéndez about 1,500 soldiers and colonists, and another gives 800 colonists, including 24 women and an unknown number of enslaved Africans.

The priest with the Spanish ships wrote that the Timucua received the Spanish well and gave them their chief's large house on the riverbank. It was the chief's council house, the building where the town's leaders met. The Spanish took it over. Two of their captains had a ditch, a moat and a wall of earth built around it, and it became their first fort there. Chapter 1 tells what happened between the colonists and the Timucua after that.

Wagons. Juan de Oñate led a Spanish colony north from Santa Bárbara, in northern New Spain, the Spanish colony that included Mexico, in January 1598. About 400 men came, about 130 of them with families. They brought 83 wagons and carts and more than 7,000 farm animals. In late April the long line of wagons, people and animals reached the Rio Grande near El Paso del Norte.

The land the colony moved into was the homeland of the Pueblo peoples. Oñate claimed New Mexico for Spain on April 30, 1598, in a ceremony the Spanish called La Toma, "the taking." In July he set up the colony's headquarters, which the Spanish called San Juan de los Caballeros, at the Tewa town of Ohkay Owingeh on the upper Rio Grande. Chapter 10 tells about the colony's water mills.

The route the wagons followed became El Camino Real de Tierra Adentro, Spanish for "the royal road of the interior." It ran about 1,600 miles from Mexico City to northern New Mexico.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 3 MINUTES

Boats carried most of the goods in the English colonies of the 1600s, from canoes and small open boats called shallops to ships that sailed along the coast from one colony to another. The leaders of the Massachusetts colony licensed a ferry across Boston's harbor in 1631. On land, colonists followed paths that Native people had made long before, and a rider carrying mail began using them between New York and Boston in 1673.

The Boston Post Road, on Native paths

The first post rider, a man on horseback who carried letters, left New York for Boston in January 1673. The governor of New York, Francis Lovelace, had pushed for the route along with John Winthrop Jr. of Connecticut. The rider went by way of New Haven, Hartford, Springfield and Worcester. The trip was about 250 miles and took about two weeks. The path that he and later riders used grew into the Boston Post Road.

In time the road had two main routes between New York and Boston, an upper road inland and a lower road near the shore, and both followed Native paths.

The upper road. The first rider's route, through Hartford, Springfield and Worcester, became the upper road. Between Boston and the Connecticut River it followed the Old Connecticut Path and the Bay Path, Native trails from Massachusetts Bay to the river. Nipmuc people carried corn along them to Massachusetts Bay in the early 1630s and traded it there for copper, iron goods and wool cloth. Thomas Hooker led the members of his church along the same path in 1636 to found the town of Hartford.

The lower road. It ran near the shore, through New London and Providence. That stretch followed the Pequot Path, which Narragansett and Pequot people had traveled for hundreds of years. The path ran about 69 miles, from Providence to New London, Connecticut, and English settlers kept using it until it became part of the lower road.

What Roger Williams saw. The English colonist Roger Williams walked the Pequot Path in 1636. Along 20 miles of it he passed about a dozen Narragansett villages. He wrote: "It is admirable to see what paths their naked hardened feet have made in the wilderness in the most stony and rockie places" (by admirable he meant worth wondering at).

Edward Converse

Who: A Puritan settler and church deacon who ran the first ferry between Charlestown and Boston.
When and where: Boston harbor, licensed June 14, 1631. Lived 1589 to 1663.

The colony's rulers let him charge two pence a passenger.

Edward Converse ran a ferry across the harbor between Charlestown and Boston, and the record that licensed it still exists. The members of the Massachusetts Court of Assistants, the colony's ruling council, wrote it on June 14, 1631: "Edw: Converse hath vndertaken to sett vpp a fferry betwixte Charlton & Boston." That is how people spelled English then. In modern spelling, Converse had taken on the job of setting up a ferry between Charlestown and Boston.

The fares. The same men set his prices. A passenger crossing alone paid two pence, or two of the small English coins called pennies. When two or more crossed together, each paid one penny. Their license was a charter, a written permission from a government.

Two firsts. A history page from the West End Museum in Boston states that Converse started his ferry in 1630, the first on that crossing, and ran it for about ten years. At the time it was the only way across the river there. The history page of Boston's transit agency, the MBTA, names a different first. It states that Thomas Williams opened the first chartered transit service in the United States in 1631, with his own ferry to Charlestown.

> Converse was a Puritan, one of the English Christians who started the Massachusetts colony on land where Native people already lived. He was also a deacon, a church officer who helps the minister. The Charlestown ferry earned 50 pounds in English money in 1639. The next year the colony's leaders gave the ferry's earnings to Harvard College.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 5 MINUTES

Stage lines for passengers and a big freight wagon called the Conestoga came into use in the English colonies between 1700 and 1750. Pennsylvania wagon builders made the Conestoga to haul freight to Philadelphia, and New Jersey officials licensed one of the first stage lines in 1706. The roads were still rough, as Sarah Kemble Knight wrote in her journal after she rode from Boston to New York in 1704.

The wagon and the people it was named for

The Conestoga wagon was a big freight wagon from Lancaster County, Pennsylvania. Its name first shows up in writing on December 31, 1717. That day James Logan, who had been William Penn's secretary, wrote in his account book that he had bought a "Conestogoe Waggon."

German and Swiss wagon builders along the Conestoga River worked out the design. The wagon's bed curved down toward the middle, so the load settled toward the center, and a white cloth cover stretched over hoops above it. Drivers hitched teams of four to six horses to it and hauled loads more than 60 miles to Philadelphia. People in the East used it as their main freight wagon well into the age of railroads.

The name. The wagon took its name from the Conestoga River and from the Conestoga people who lived in Lancaster County. In December 1763 a mob of men from Paxton township, known as the Paxton Boys, killed the last of the Conestoga people. First they killed the six people at home at Conestoga Manor, a settlement under the colony's protection: three men, two women and a boy.

Lancaster officials then put the survivors in the county workhouse, a locked building where people who broke small laws were held and made to work, to protect them. On December 27 the mob broke in and killed them, 14 or 16 men, women and children by different counts. The mob killed about 20 Conestoga people in the two attacks, and no one was ever put on trial for it. Chapter 2 tells the killings in full.

Stage lines, log roads and the Great Wagon Road

A stage line carried passengers in a wagon or coach along a fixed route between towns. New Jersey officials gave Hugh Huddy a patent, a legal right, to run one between Burlington and Perth Amboy in 1706. Coaches ran between New York and Philadelphia from 1732, though not on a fixed schedule.

New lines opened from Trenton to New Brunswick in 1738 and from Bordentown to New York in 1740. By 1756 several regular coach services ran between New York and Philadelphia, and the trip took about three days.

Where a road crossed swampy ground, builders laid logs side by side across it. People called it a corduroy road, after a cloth with raised ribs.

The Great Wagon Road. It ran from Philadelphia down the Shenandoah Valley of Virginia toward Augusta, Georgia, and colonists used it heavily from the 1720s on. Accounts give its length as about 730 miles or almost 800, depending on where the count ends.

South of Lancaster and York, in Pennsylvania, the road roughly followed a route that Europeans called the Great Warriors' Path. Native people had made that path to travel through the Shenandoah Valley, and they still valued it.

The Treaty of Lancaster. Leaders of the Six Nations of the Iroquois, six Native nations joined in one league, met officials of Pennsylvania, Virginia and Maryland in the town of Lancaster in June 1744. There the two sides made a treaty, a written agreement between nations. In it the Iroquois leaders gave up their use of the path and their claims to land in the Shenandoah Valley.

The two sides later disagreed about how much land the treaty covered. Virginia's leaders claimed land as far as the Ohio River and beyond it. The Iroquois said they had given up much less.

Who built the roads. In Virginia, colonists built and repaired the roads themselves, under road laws that the colony's lawmakers passed in 1632 and 1657 and added to in 1661. Each year the members of each county court chose an overseer of the highways, a man put in charge of the roads. He was usually given all the "Labouring Male Titheables" who lived on or near the road.

Titheables, or tithables, were the people counted for a tax on each person: all free men 16 and older, and all enslaved people 16 and older, women as well as men. The road orders required the working men among them to bring their own tools, wagons and teams of animals and to work six days a year on the roads. The surviving road orders do not say how many of these men were enslaved.

Sarah Kemble Knight

Who: A Boston businesswoman who rode from Boston to New York and wrote down what the road was like.

When and where: October 1704, by road from Boston to New Haven and on to New York. Her journal was published in 1825.

She wrote down which bridges she was afraid to cross.

Sarah Kemble Knight traveled with post riders, the men who carried the mail, and hired guides from one town to the next. She crossed some rivers by canoe in the dark and others at fords, shallow places where people and horses can wade across.

Her journal is an eyewitness record of the road itself. It was published in 1825, more than a hundred years after her ride.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 4 MINUTES

Around Philadelphia, between 1750 and 1800, investors paid for a road and charged travelers a fee to use it, and an inventor ran a boat pushed by a steam engine. The investors, people in and around Philadelphia and Lancaster, put their money into the road company in 1792. Their Philadelphia and Lancaster Turnpike, finished in the mid-1790s, was the first long-distance road of its kind in the country.

John Fitch's steamboat carried paying passengers on the Delaware River on a schedule in 1790, seventeen years before Robert Fulton's steamboat ran on the Hudson.

The first turnpike

The Philadelphia and Lancaster Turnpike Company got its charter in 1792 to build a turnpike, a road whose owners charge travelers a fee, called a toll, at gates along the way. Work on the road began that year. People in and around Lancaster and Philadelphia bought 1,000 shares of the company's stock, pieces of ownership in the company, at $300 each. A Philadelphia merchant, William Bingham, led the company.

The road ran 62 miles between Philadelphia and Lancaster, mostly along the older Philadelphia-Lancaster Road, the first stretch of the Great Wagon Road. Its surface was broken stone and gravel. Some accounts say it was in use in 1794, and most say 1795.

KNOWN:	The records name the people who bought shares and the company's president.
NOT KNOWN:	who broke the stone, or how many men did the work.

The Lancaster Turnpike was the country's first long-distance engineered toll road, planned and built to a design, with a prepared surface. After it succeeded, people built many more toll roads, the historian Charlene Mires

writes. By the 1830s the country had almost 12,000 miles of turnpikes, nearly 200 times the length of the first one.

A steamboat before Fulton's

John Fitch tested a steamboat on the Delaware River on August 22, 1787, while delegates to the Constitutional Convention watched. They were the men meeting in Philadelphia that summer to write the Constitution of the United States. A steam engine on Fitch's boat worked rows of oars that pushed the boat through the water, and it moved upriver, against the current, at about three miles an hour.

Fitch's boat, the *Experiment*, carried passengers on a schedule in the summer of 1790. It was the first steamboat service anywhere in the world to carry paying passengers on a schedule. The boat carried up to about 30 passengers at a time on the Delaware, between Philadelphia and New Jersey towns such as Trenton, Burlington and Bordentown, and also to Wilmington.

John Fitch

Who: The builder of a working steamboat in 1787 and of the first steamboat service anywhere to carry paying passengers on a schedule.
When and where: The Delaware River, 1787 to 1790. Died 1798.

George Washington backed a rival's steamboat, not his.

John Fitch had little money when he decided, at about 41, that a boat driven by steam could travel upriver against the current. The country had no national patent law yet. So in 1786 he went from state to state asking lawmakers for a patent, the legal right to be the only one to build and run such boats.

Benjamin Franklin, who had his own ideas about powering boats, showed little interest. Virginia's lawmakers turned Fitch down in favor of the boat of a Virginian, James Rumsey, which George Washington backed. New Jersey's lawmakers gave Fitch the only right to run steamboats on that state's waters for 14 years.

Losing out. His 1790 passenger service failed when too few people bought tickets, the machinery broke down and the people who had put money into his boats stopped paying. In 1791 the members of the federal patent board, led by Thomas Jefferson, gave steamboat patents to both Fitch and Rumsey and would not say that Fitch had been first. Fitch sailed to France and England in 1793 to look for backers and found none.

In 1796 he went to Kentucky, where he had claimed land, and found squatters, people living on it without his permission. He killed himself in Bardstown, Kentucky, in 1798, nine years before Robert Fulton's steamboat began running on the Hudson.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 13 MINUTES

Moving people and goods got much faster and cheaper in the first half of the 1800s, on steamboats, canals and the first railroads. Robert Fulton's steamboat went from New York City to Albany in 32 hours in 1807, a trip that took a sailing boat about four days. After the Erie Canal opened in 1825, hauling a ton of goods from Buffalo to New York City cost under $10, against about $100 by wagon.

Who did the work. American-born laborers and Irish immigrants dug the Erie Canal. In the South, enslaved Black men dug most of the Dismal Swamp Canal, and enslaved people built most of the railroads. Owners rented the men out to the builders and kept their pay, and the men running Southern railroad companies also bought enslaved people outright.

Steamboats on the rivers

Robert Fulton's North River Steamboat left New York City on August 17, 1807, and reached Albany, 150 miles up the Hudson River, 32 hours later. Sailing boats called sloops took about four days to make the same trip. Fulton's boat began carrying passengers on a regular schedule right away. People later called it the *Clermont*.

Many later accounts say that people who doubted the boat called it "Fulton's Folly" (a folly is a foolish project). Few records from 1807 show anyone using that name. It comes from stories told afterward.

The western rivers. Within a few years, steamboats were running on the Ohio and Mississippi Rivers. Twenty-one steamboats arrived at New Orleans in 1814, and 2,770 arrived in 1846, more than 130 times as many. A steamboat covered about 50 miles a day in the 1810s and about 100 by the 1820s.

Much of what the boats carried was cotton, grown and picked by enslaved people whom their enslavers forced to work. Farms in the state of Mississippi grew 20 million pounds of cotton in 1820 and 535 million pounds in 1860. Before the Civil War, more than half of all the cotton grown in the United States passed through New Orleans.

Boilers. Steamboat boilers, the tanks where water was heated into steam under pressure, exploded again and again on the Mississippi and the rivers that flow into it in these years. The explosions killed thousands of people.

Robert Fulton

Who: The man who made the steamboat a business that lasted.
When and where: The Hudson River in New York, from August 17, 1807.

His second boat steamed 1,800 miles from Pittsburgh to New Orleans.

Robert Fulton's partner, Robert Livingston, paid for the building of his boats. Livingston held a monopoly on steamboats in New York, which meant that by law no one else could run them there.

Fulton and Livingston paid for a second boat, the *New Orleans*, built at Pittsburgh. It left Pittsburgh on October 20, 1811, traveled more than 1,800 miles down the Ohio and Mississippi Rivers, and reached New Orleans on January 10, 1812. It was the first steamboat on the western rivers.

The National Road

The National Road was the first highway in the United States built entirely with money from the federal government, the national government in Washington. Members of Congress approved it in 1806, while Thomas Jefferson was president. Work began at Cumberland, Maryland, in 1811. The road reached Wheeling, on the Ohio River, in 1818, and by the 1830s it went on to Vandalia, Illinois, where the federal money stopped.

An older path. West of Cumberland, the road followed a path that a Delaware chief named Nemacolin and a colonist named Thomas Cresap marked and cleared in 1749 or 1750. It ran between the Potomac and Monongahela Rivers, from the site of Cumberland to the mouth of Redstone Creek, where Brownsville, Pennsylvania, now stands.

George Washington used the path on his first trip to the west, and General Edward Braddock's army used it in the French and Indian War. People called it Braddock's Road until the National Road was built on the same route.

Who built it. Irish laborers built sections of the National Road for six dollars a month.

How much did the Erie Canal save?

Hauling a ton of goods from Buffalo to New York City cost about $100 by wagon. On the Erie Canal it cost under $10, and some accounts put it at about $6 a ton.

The Erie Canal was a waterway that people dug so boats could travel where no river ran. Workers dug it from 1817 to 1825, and it stretched 363 miles, from Albany on the Hudson River to Buffalo on Lake Erie. While it was being dug, people who mocked it called it "Clinton's Ditch," after DeWitt Clinton, who pushed for it.

The canal opened on October 26, 1825, and cost about $7.1 million. The tolls that boats paid to use it covered the cost of building it in about nine years.

The hoggees. Boys drove the mules that pulled the canal boats, and people called them hoggees. Many were about 10 years old. A hoggee walked 18 to 20 miles a day, six hours on and six hours off, for about $8 to $10 a month. Many hoggees were cheated out of their pay. Columns on the canal boys in the Lockport *Union-Sun & Journal*, a newspaper in a canal town, tell of the cheating but do not name the men who did it.

Who dug the canals, and whose land they crossed

American-born workers and Irish immigrants dug the Erie Canal. Between 2,000 and 3,000 laborers were working on it in 1818, with a horse for every second man. Ads in Ireland that called for workers promised wages of 8, 10 or 12 dollars a month, and meals came on top of that pay: meat three times a day, and liquor.

The pay. Many men were paid by the day instead, 75 cents to $1.50 a day, and less as more workers arrived. They got no pay on rainy days, but they still had to pay for their lodging. Some contractors, the men who ran sections of the work, started fights among the workers to get out of paying them.

At Rochester, a contractor named William Brittin brought about 30 convicts, people serving prison sentences, from Auburn State Prison to work. Many escaped, and Irish workers took their places.

Malaria. The canal crews reached the Montezuma Marshes, wet ground full of mosquitoes, in 1819. The mosquitoes spread malaria, a disease that brings high fevers and chills again and again. The canal commissioners, the state officials in charge of the canal, reported that about 1,000 workers fell sick between the middle of July and October 1, 1819. Many died, and no one kept a count of the dead.

Whose land. The Erie Canal ran through the homelands of the Oneida, Onondaga, Cayuga and Seneca nations. The Oneida Indian Nation's history of the canal states that the Oneida lost the land for it through a series of 27 treaties with the State of New York, and it describes all 27 as illegal. New York State officials took parts of the Seneca Oil Spring Reservation, land set aside for the Seneca, from 1858 to 1871 for a canal reservoir, a lake made to store water.

In the South. Owners rented out enslaved men to dig canals and kept the men's pay. Enslaved men dug most of the Dismal Swamp Canal, which runs 22 miles from Deep Creek, Virginia, to South Mills, North Carolina, from 1793 to 1805.

Before the canal, George Washington and his brother John Augustine Washington ran a business called the Dismal Swamp Company. Through it they bought 54 enslaved men, women and children to dig ditches and cut timber in the swamp.

DeWitt Clinton

Who: The New York governor who pushed the Erie Canal through while people mocked it.
When and where: New York State, 1811 to 1825.

He predicted the Iroquois would be gone from New York.

DeWitt Clinton pushed for the Erie Canal while critics called it "Clinton's Ditch" and "Clinton's Folly." In 1811 he was the mayor of New York City and a new canal commissioner, one of the state officials planning the canal. Its planned route ran through the land of the Iroquois, six Native nations joined in one league and also called the Six Nations.

The speech. That year Clinton spoke to the New-York Historical Society. He predicted that "before the passing away of the present generation, not a single Iroquois will be seen in this state." He was wrong. More people of the Six Nations live in New York now than lived there at the end of the American Revolution.

The wedding of the waters. As governor, Clinton rode on the *Seneca Chief*, the first boat to travel the whole length of the canal, in 1825. At the opening he poured water from Lake Erie into New York harbor, and people called it the "wedding of the waters."

James Garfield, canal boy

Who: A 16-year-old who worked on an Ohio canal boat. He later became president of the United States.

When and where: The Ohio and Erie Canal, 1848, on the boat *Evening Star*.

At 16 he ran away to drive a canal boat's mules.

James Garfield was 16 when he ran away in 1848 to work on a canal boat called the *Evening Star*. The only job open was driving the mules that pulled the boat. The boat carried freight, goods being shipped, on the Ohio and Erie Canal, and for about six weeks he helped haul coal, copper ore and wood.

Later he caught malaria and went home. His six weeks on the canal made a strong picture for his campaign for president in 1880. Writers of biographies for that campaign told stories of him falling into the canal, fourteen times by their count. That number comes from those later stories, not from the record of his time on the boat.

Moses Grandy

Who: An enslaved man who ran boats through the Dismal Swamp canals, bought his own freedom three times, and described the men who dug the canals.

When and where: Camden County, North Carolina, and the canals to Norfolk, Virginia, from the early 1800s. His book about his life was published in London in 1843.

He paid for his own freedom three times.

Moses Grandy was born into slavery in Camden County, North Carolina, around 1786. His owners hired him out each year to other men. He worked canal boats that carried shingles, boards and other freight through the Dismal Swamp canals to Norfolk.

Three prices. The first time, Grandy paid $600 to his owner, who kept the money and sold him to a man named Trewitt.

The second time, Grandy paid Trewitt $600, money he earned over two and a half years. But Trewitt had pledged Grandy as security for a loan, which meant the lender could take Grandy if the loan was not paid back. When Trewitt's business failed, the lender took Grandy and sold him to Enoch Sawyer, who put him to work in the fields.

The third time, a captain from Deep Creek, Edward Minner, lent Grandy $650, and Sawyer set him free for that price. Grandy paid Minner back over three years.

His wife. While Grandy worked on the canal, his wife's owner sold her. A group of enslaved people passed along the road beside the canal, and she called out to him. The man who had bought her, Mr. Rogerson, pulled out a pistol and said he would shoot Grandy if he came near the wagon. Grandy wrote: "I have never seen or heard of her from that day to this."

The diggers. Grandy also described the enslaved men who dug the canals. They worked "up to the middle or much deeper in mud and water, cutting away roots and baling out mud" (baling out means scooping out).

They slept in open huts, still covered in mud, with no bedding. Once a month their owners came to collect the men's pay.

An overseer named Wiley M'Pherson, the man in charge of the workers, gave every man the same amount of digging each day. When men had not finished the day before, M'Pherson tied them up and flogged them. Flogging means whipping a person's bare back until the skin splits.

Then he had "pork or beef brine," the salt water used to keep meat, put "on their bleeding backs, to increase the pain." He left men tied all day with their feet barely touching the ground, while flies and mosquitoes settled on the cuts.

Grandy wrote: "I have seen him flog slaves with his own hands, till their entrails were visible" (entrails are the organs inside the body). He went on: "I have seen the sufferers dead when they were taken down. He never was called to account in any way for it."

After freedom. Grandy later married again. He lived in Boston, sawed wood, worked in coal yards, loaded and unloaded ships, and went on more voyages. He saved enough to buy his second wife out of slavery in Virginia, and she joined him in Boston.

He raised $450 to buy his son's freedom. His daughters in New Orleans paid for their own freedom, $1,200 for each of them. His book was sold to raise money for his relatives who were still enslaved.

The first railroads

The Baltimore and Ohio Railroad was the first railroad in the United States to carry both passengers and freight on a schedule for anyone who paid. Its builders laid the first stone on July 4, 1828. Its first 13 miles of track, from Baltimore to Ellicott's Mills, opened in 1830.

A legend. In a well-known story, Peter Cooper's steam engine, the *Tom Thumb*, raced a horse pulling a railroad car on August 28, 1830, and lost when a belt on the engine slipped. The story comes from a talk that John H. B. Latrobe gave in 1868, 38 years later. No record from 1830 shows that the race took place, and the Baltimore and Ohio Railroad Museum's page on the *Tom Thumb* describes the race as a legend.

New York State's first steam passenger train ran on August 9, 1831, behind a locomotive, or train engine, named the *DeWitt Clinton*. It went 16 miles from Albany to Schenectady in about an hour, on the Mohawk and Hudson line.

In the city. Abraham Brower ran a horse-drawn coach called an omnibus on the streets of New York City from 1827. The *John Mason*, a horse-drawn car that rolled on rails, began carrying passengers in lower Manhattan for the New York and Harlem Railroad on November 14, 1832. It was the first street railway in the country.

Who built the Southern railroads. In the South, enslaved people built most of the railroads. The men running Southern railroad companies bought hundreds of enslaved men between the ages of 16 and 35 as early as 1841, and in the 1850s they bought or rented enslaved workers in groups of hundreds.

The historian Theodore Kornweibel Jr. found enslaved workers on 85 of the 113 railroads in the Confederate states, the Southern states that later fought the United States in the Civil War. Southern railroad companies owned about 15,000 enslaved people in 1860, and women and children were among them.

The president of the Mississippi Central Railroad told the people who owned shares in the company in 1855 that "the slave is preferable to free labor, and far better adapted to the construction of railways in the south." By free labor he meant workers who were not enslaved.

BY 1850

If you remember one thing: Steamboats, canals and the first railroads made moving people and goods far faster and cheaper, and in the South enslaved people did much of the digging and track-laying.

- 1807: Fulton's steamboat reaches Albany in 32 hours. Sloops took about four days.
- 1825: The Erie Canal opens. Hauling a ton from Buffalo to New York City drops from about $100 by wagon to under $10.
- 1841: The men running Southern railroad companies are buying enslaved men by the hundreds.

Next: After 1850 railroad builders pushed track across the whole country, through the homelands of many Native nations.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 14 MINUTES

Railroad builders laid track across the whole country in the second half of the 1800s. The country had about 9,000 miles of railroad track in 1850 and more than 190,000 by 1900, more than twenty times as much. Counts for 1900 run from about 193,000 to 215,000 miles, depending on whether side tracks are counted.

Coast to coast. The first railroad across the country was finished in 1869. Central Pacific managers hired about 10,000 to 12,000 Chinese workers to build its western part. The tracks crossed the lands of the Cheyenne, Lakota, Arapaho, Shoshone and Paiute nations.

In the cities, streetcars ran on rails laid in the streets, and by the end of the century the companies that ran them were switching from horse-drawn cars to electric ones. Many Americans, women among them, were riding bicycles.

The railroad across the continent

Two companies built the first railroad across the country. Union Pacific crews built west from Omaha, Nebraska, while Central Pacific crews built east from Sacramento, California. The two lines met at Promontory Summit, Utah, on May 10, 1869.

Land and loans. Members of Congress voted to give the two companies land and loans, and President Abraham Lincoln signed their Pacific Railroad Act on July 1, 1862. Under it, each company got 6,400 acres of public land, ten square miles, for every mile of track it built. Each also got up to $48,000 in government bonds, a kind of loan, for every mile. The top rate was for miles built through mountains.

The act also stated: "The United States shall extinguish as rapidly as may be the Indian titles to all lands falling under the operation of this act" (to extinguish a title means to end someone's ownership of land). With those words, the lawmakers directed federal officials to end Native nations' ownership of the land along the railroad as fast as they could.

Members of Congress voted to give railroads about 130 million acres of federal land from 1850 to 1871, and some counts run as high as 175 million acres. State lawmakers gave railroads about 51 million acres more.

Whose land the railroad crossed

The companies' builders and US officials took land from many Native nations while the two lines were built, and they drove people from their homes. Among those nations were the Cheyenne, Lakota (also called Sioux), Arapaho, Shoshone and Paiute. Historians at the Utah Division of State History count 15 Native homelands that the track crossed.

The bison. The Lakota, Arapaho and Cheyenne hunted bison, also called buffalo, for food, shelter and trade. As the railroad crews pushed west, soldiers, railroad workers and travelers hunted the bison too. National Park Service writers state that the number of bison fell from tens of millions in the early 1800s until they had almost died out.

Sand Creek. The railroad crews worked in the middle of a war between the US Army and the Cheyenne, Arapaho and Lakota nations. US soldiers on horseback led by Colonel John Chivington attacked a camp of Cheyenne and Arapaho people at Sand Creek, in Colorado, on November 29, 1864. The camp flew a US flag and a white flag.

The soldiers killed about 230 people, most of them women and children, and the people they killed were not armed. Britannica and the National Park Service give that count, and PBS writers give 150. Chapter 2 tells Sand Creek in full.

Striking back. Cheyenne, Arapaho and Lakota fighters struck back for Sand Creek. They burned the town of Julesburg, Colorado, on January 7, 1865, and cut the telegraph line, the wire that carried messages by electric signals.

Guards for the crews. Six days later, on January 13, 1865, four army units of Pawnee soldiers, called companies, joined the US Army under Major Frank J. North. Union Pacific managers and US officials hired hundreds of Pawnee, who guarded the work crews alongside the Army. Some Paiute people worked for the Central Pacific.

The fighting reached the tracks. At Plum Creek, Nebraska, on August 27, 1867, Cheyenne men pulled up railroad track, wrecked a work train and killed all but one of its crew.

The Chinese workers

Central Pacific managers hired about 10,000 to 12,000 Chinese workers from 1865 to 1869. Most came from Guangdong, a province in southern China. The Chinese workers were paid about $35 a month, and they had to buy their own food and housing. White workers got about $42 a month, plus housing.

The dead. The Central Pacific's managers kept no record of the Chinese workers who died, so no one knows how many there were. Avalanches, masses of snow sliding down the mountains, killed workers in the winter of 1866 to 1867, when 44 storms hit. In one, snow carried away the camp at Strong's Canyon.

Blasts of black powder and nitroglycerin, explosives used to cut through rock, killed others. Smallpox, a disease that spreads from person to person, killed more in 1868 and 1869.

Guesses of the number run from about 50 into the thousands. On June 30, 1870, a writer at the *Sacramento Union* reported "about fifty." The same day, a writer at the *Sacramento Reporter* told of "the accumulated bones of perhaps 1,200," about 20,000 pounds of bones being shipped home to China. Researchers on the online forum of the Central Pacific Railroad Photographic History Museum estimate 100 to 150 dead, and other estimates run to hundreds or thousands.

The strike. Chinese workers in the Sierra Nevada mountains went on strike on June 25, 1867, which means they stopped work to demand better terms. Estimates of how many struck run from 2,000 to 5,000. They asked for $40 a month instead of $35, for workdays of no more than ten hours, and for shorter shifts in the cramped tunnels. It was the largest strike by workers in the country up to that time.

The construction boss, Charles Crocker, and his foreman, James Harvey Strobridge, who ran the work crews, cut off food and supplies to the Chinese camps. After a week with little food, Crocker told the strikers that men who went back at once would only be fined. Men who stayed out would lose all their pay for June.

Most men, weak from lack of food, went back. The men who refused faced a group of armed white men, and work started again. Crocker gave the strikers no raise, though pay for experienced men later rose a little, according to the Library of Congress.

Ten miles in a day. Crews laid 10 miles and 56 feet of track in one day on April 28, 1869. Eight Irish workers carried the rails, and several thousand Chinese workers did the rest of the work.

The last track. Twelve days later, on May 10, 1869, a different crew of eight, all of them Chinese, laid the last track at Promontory Summit, joining the two lines, and a golden spike marked the place. Three of those eight, Ging Cui, Wong Fook and Lee Shao, rode on a float at the celebration of the railroad's 50th anniversary on May 10, 1919.

Hung Wah

Who: The leading Chinese headman on the Central Pacific.
When and where: The Central Pacific Railroad, from January 1864.

The payroll names him, and not most of his workers.

Hung Wah is one of the few Chinese railroad workers whose names appear in the records. The company's payroll, its list of the people it paid, usually named only headmen, the men who led the Chinese work gangs. The names of most of the thousands of Chinese laborers are not in the records.

Hung Wah first appears on the Central Pacific's payroll in January 1864. With another headman, Ah Toy, he supervised the railroad's first Chinese crew, about 23 men. He became the leading Chinese headman on the line, over hundreds of Chinese workers and at times thousands. He handled the workers' pay and their living arrangements, and he dealt with the company for them.

Cornelius Vanderbilt

Who: A ferryman who moved his money from steamboats into railroads and left the largest American fortune of his time.

When and where: New York, 1810 to 1877.

The ferryman of 1810 died in 1877 with about $100 million.

Cornelius Vanderbilt took control of the New York Central Railroad, in the East, in 1867, the same year Chinese crews were building the Central Pacific through the Sierra Nevada. He had owned steamboats, and early in the 1860s he moved his money into railroads. He joined the New York Central with his Hudson River Railroad on November 1, 1869, and in 1871 he opened Grand Central Depot, a train station in Manhattan.

The ferryman. Vanderbilt had started at 16, in 1810, carrying freight and passengers between Staten Island and Manhattan in a periauger, a shallow sailboat with two masts. Other boat captains called him "the Commodore," the title of a navy officer who commands a group of ships, at first as a joke.

Two stories. Accounts of how he got the boat differ. One says he borrowed $100 from his mother and named the boat *Swiftsure*. The first account of his life, printed in 1853, says the boat was his father's and he kept half the profit. The website Biography.com describes the story of the young ferryman as a legend.

When he died in 1877, he left the largest American fortune of his time.

Mark Twain, steamboat pilot

Who: Samuel Clemens, who steered steamboats on the Mississippi River before he wrote books as Mark Twain.

When and where: The Mississippi River. He got his pilot's license on April 9, 1859.

Movie: *Mark Twain* (2001), a documentary by Ken Burns about his whole life. PBS showed it in January 2002.

"Mark twain" was a river call meaning twelve feet of water.

Steamboats still ran on the Mississippi River while the railroads spread. Samuel Clemens was a licensed steamboat pilot, the person who steers the boat, on the Mississippi. He got his license on April 9, 1859, when he was 23. He piloted boats until 1861, when the Civil War began and traffic on the river stopped.

He took his pen name from a call used on the river. A leadsman, the crew member who measured the depth of the water, called the depth out to the pilot. "Mark twain" meant two fathoms, and a fathom is six feet, so the call meant twelve feet of water. In 1883 he published *Life on the Mississippi*, a book about his years as a pilot.

Clocks, sleeping cars and danger on the railroads

Time zones. Railroad managers in the United States and Canada began using standard time zones, regions where all clocks show the same time, on November 18, 1883. Before then, each railroad company ran its trains by its own clocks. William F. Allen, the editor of the *Traveler's Official Railway Guide*, a book of train schedules, drew up the plan.

On the day of the switch, railroad workers reset every railroad clock to the new time, even clocks that had already passed noon. In those places noon came twice, so people called it "the day of two noons." Members of Congress did not vote time zones into law until the Standard Time Act of March 19, 1918.

Sleeping cars. George Pullman built the *Pioneer*, his first sleeping car built for luxury, in 1865. It had upper beds that folded away and seats that pulled out. His company, the Pullman Palace Car Company, began in 1867.

Danger. About 8.5 of every 1,000 American trainmen, the workers who ran the trains, were killed on the job in 1889, twice the rate in Britain.

In the same year, 1.73 of every 1,000 trainmen died while coupling, the job of joining railroad cars together.

With the old link-and-pin coupler, a brakeman, the crew member who set the brakes and joined the cars, had to stand between two moving cars to join them. Mangled hands were known as "the badge of the experienced worker."

Safer equipment. Safer couplers and brakes existed for years before lawmakers required railroad owners to use them. Eli Janney got a patent, the legal right to be the only one to make and sell an invention, for an automatic coupler in 1873. It joined cars without a worker standing between them. George Westinghouse's air brake existed from 1869. A pump on the locomotive pushed air through hoses to every car, and when the engineer opened a valve, the air set the brakes on all the cars at once.

Members of Congress passed the Safety Appliance Act in 1893. Under it, railroad owners had to put automatic couplers and air brakes on trains that crossed state lines, starting in 1900. Accidents while coupling cars fell from

about 11,000 in 1892 to about 2,000 in 1902, while the number of railroad workers grew.

Who decided where Black passengers sat?

Train crews and lawmakers decided where Black passengers could sit. Ida B. Wells had a first-class ticket on a train in Tennessee in 1884, but the train crew ordered her into the car for Black passengers. She refused, and they forced her off the train. She sued the railroad and won $500 in a Tennessee court. The judges of the Tennessee Supreme Court threw out that decision in 1887.

Plessy. Louisiana lawmakers passed the Separate Car Act on June 10, 1890. Under it, railroads had to provide "equal but separate" cars for Black and white passengers. A passenger who broke the law could be fined $25 or jailed for 20 days.

Homer Plessy, a shoemaker in New Orleans, offered to test the law. To test it, he would break it on purpose so that judges would have to decide whether the law was allowed. He bought a ticket on the East Louisiana Railroad on June 7, 1892, and sat in the car for white passengers. The railroad's officials agreed to the test, because separate cars cost the company money. A private detective hired by the group planning the test, the Citizens' Committee, arrested him.

Judge John H. Ferguson ruled against Plessy. On May 18, 1896, the justices of the US Supreme Court ruled against him too, 7 to 1, in *Plessy v. Ferguson*. With that ruling, the justices allowed states to keep separating Black and white passengers by law. Nearly sixty years later, in 1954, the justices of the Supreme Court threw out that ruling's reasoning in *Brown v. Board of Education*.

Electric streetcars and bicycles

Electric streetcars replaced horse-drawn ones in American cities between 1888 and 1902. Electric streetcars had run earlier in East Cleveland in 1884, in Baltimore in 1885 and in Montgomery, Alabama, in 1886. The Dictionary of American History describes the system that Frank Sprague built in Richmond, Virginia, in 1888 as the first successful one.

The owners of about 200 streetcar systems had switched to electricity or planned to by 1891. Street railway track grew from about 8,000 miles in 1890 to 22,500 miles in 1902. In those same years, the share of streetcar service pulled by animals fell from 75 percent to 1 percent. The last horse-drawn streetcar in paid service in New York City ran on July 26, 1917.

Bicycles. Cycling became a craze in the 1890s, something that very many people took up at the same time. Riders used the safety bicycle, which had two wheels of the same size, a chain drive and air-filled tires. Women rode as well as men.

Susan B. Anthony told the reporter Nellie Bly in the *New York World* on February 2, 1896, that bicycling "has done more to emancipate women than anything else in the world" (to emancipate is to set free). She said: "I stand and rejoice every time I see a woman ride by on a wheel."

Frank Sprague

Who: The engineer whose streetcar system in Richmond showed that electric streetcars could work in a city.

When and where: Richmond, Virginia. Regular service began February 2, 1888.

Ten electric cars began running in Richmond on February 2, 1888.

Frank Sprague built the Richmond Union Passenger Railway, which began regular electric streetcar service that day with 10 cars. By May 1888 it had about 12 miles of track and 23 cars.

Within about two years, about 110 electric railways had been built or ordered using Sprague's equipment. Members of the Institute of Electrical and Electronics Engineers, a society of engineers, have named his Richmond railway a milestone in the history of engineering. Chapter 6 tells how builders put up new neighborhoods along the electric lines.

BY 1900

If you remember one thing: Railroad builders laid track from coast to coast, across the homelands of many Native nations, and Chinese workers built the western part of the first line.

In 1850: the country had about 9,000 miles of railroad track, and a trip from one coast to the other took about four months.

In 1900: it had more than 190,000 miles of track, and since 1869 the trip had taken about a week.

Next: After 1900 Ford's workers built cars by the millions, and airplanes began carrying mail and passengers.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 10 MINUTES

Orville and Wilbur Wright flew a powered airplane in 1903, and Ford's Model T car went on sale five years later, for $825. Workers at Ford built 15 million Model Ts by 1927. The first airline to fly on a schedule began in 1914, across Tampa Bay in Florida, and by 1927 airplanes were carrying mail and paying passengers on schedules.

Trains carried about 43.7 million members of the armed forces in World War II, from 1941 to 1945. In Virginia, bus drivers had the power of police officers to make Black passengers sit apart from white passengers and to arrest riders who refused.

The Model T and the new roads

The Ford Model T went on sale on October 1, 1908, at $825, and its price fell to $260 by 1925. From 1913 Ford's workers built it on a moving assembly line, and the time it took to build a car's frame fell from more than 12 hours to about 93 minutes. Chapter 8 tells how the line worked. The 15 millionth Model T left the factory on May 26, 1927, the last day Ford's workers made the car.

The Lincoln Highway. A group of private backers, among them Carl Fisher and Henry Joy, laid out the Lincoln Highway in 1913. It was the first named road for cars across the whole country, from Times Square in New York City to San Francisco. After 1926 highway officials made parts of it into sections of numbered routes.

Route 66. State and federal highway officials gave the main highways of the United States numbers on November 11, 1926, and Route 66 got its number that day. It ran 2,448 miles, from Chicago to Santa Monica, California, and people called it the "Main Street of America." It was fully paved only by the late 1930s.

Crashes. Car crashes killed about 4,100 to 4,200 people in the United States in 1913. In 1937 they killed about 37,800 to 39,600, about nine times as many, which was about 30 of every 100,000 Americans. The counts differ because

the National Safety Council, a private safety group, and the federal officials who kept the national tables counted deaths in different ways.

The Wright brothers

Who: Orville and Wilbur Wright, the brothers who flew their powered airplane four times in one day.
When and where: Near Kill Devil Hills, North Carolina, December 17, 1903.

The first flight lasted 12 seconds and covered 120 feet.

Orville and Wilbur Wright made four flights in a powered airplane near Kill Devil Hills, North Carolina, on December 17, 1903. Orville flew first. Wilbur made the fourth and last flight of the day, 852 feet in 59 seconds. Five people watched, and one of them, John T. Daniels, took the photograph. He belonged to a lifesaving station, a crew that rescued people from wrecked ships.

About ten years after those flights, an airplane in Florida was carrying paying passengers on a schedule. Chapter 8 tells how the brothers built their airplane.

How the airlines began

The St. Petersburg-Tampa Airboat Line in Florida was the first airline in the world to fly on a schedule. Its first flight left on January 1, 1914. The pilot, Tony Jannus, flew a Benoist flying boat, a plane that takes off from and lands on water. The trip across Tampa Bay took about 23 minutes, low over the water.

Abram C. Pheil, a former mayor of St. Petersburg, paid $400 at an auction for the first round-trip ticket. The airline ran for about four months.

Airmail. Army pilots began flying mail on a regular route on May 15, 1918, 218 miles from Washington to Philadelphia to New York. Post Office pilots took over in August 1918. Members of Congress passed the Kelly Act in 1925, and under it private companies flew the airmail on contract. The airline companies began with those mail contracts.

After Lindbergh. Charles Lindbergh, an airmail pilot, flew the *Spirit of St. Louis* alone and without stopping from New York to Paris on May 20 and 21, 1927, about 3,600 miles in 33 hours and 30 minutes. Chapter 1 tells the flight in full. Airline passengers in the United States rose from 5,782 in 1926 to 173,405 in 1928, about 30 times as many. Applications for pilot licenses tripled in 1927.

The DC-3. The Douglas DC-3 airliner first flew passengers in 1936. It carried 21 or more passengers at up to 207 miles an hour. In the words of van der Linden, a curator, or collection keeper, at the Smithsonian's National Air and Space Museum, the DC-3 is "widely considered to be the first airliner capable of making money just by carrying passengers." By 1939 DC-3s carried about 90 percent of the world's airline travel.

Jack Knight

Who: An airmail pilot who flew through the night and a snowstorm to finish a test that kept the airmail going.

When and where: North Platte, Nebraska, to Chicago, the night of February 22 to 23, 1921.

The next pilot would not fly in the storm, so Knight did.

Post Office officials ran a test in February 1921 to show that airplanes could carry mail across the country faster than trains. Pilots flew the mail in a relay, day and night, each pilot handing it to the next. Jack Knight flew his part, from North Platte, Nebraska, to Omaha.

At Omaha the next pilot refused to take off in the storm. Knight flew the mail on to Chicago himself, at night, through snow and fog, over ground he had never flown before. The mail crossed the country, 2,629 miles, in 33 hours and 20 minutes. After the test, members of Congress voted money to keep the airmail flying.

The sleeping-car porters

Pullman Company managers hired Black men as the porters who served passengers in the company's sleeping cars. After the Civil War, George Pullman looked for men who had been enslaved to hire as his porters. By the early 1900s the Pullman Company was the largest single employer of Black men in the United States.

400 hours. Porters often had to work at least 400 hours a month to earn a full month's pay. A porter who worked every day of a 30-day month would still need more than 13 hours a day to reach 400. Their pay was among the lowest of all the workers on the train. Company managers built tips from passengers into the porters' pay, which saved the company money. To earn those tips, porters had to do whatever passengers asked.

"George." Passengers called porters "George," whatever their real names were, after George Pullman. Calling an enslaved person by the owner's name was a practice from slavery. Some passengers called the porters "boy."

The porters formed a union, a group of workers who bargain together with their employer. The union's leaders won a contract in 1937 that limited the porters' work to 240 hours a month.

The porters of Miles of Smiles

Who: C. L. Dellums, E. D. Nixon and six other retired Pullman porters, with Rosina Tucker, a porter's wife, who described the porters' work in their own words.

When and where: Pullman sleeping cars across the country, from the 1910s to the 1940s. Filmed in 1982.

Movie: *Miles of Smiles, Years of Struggle* (1982), a documentary by Jack Santino and Paul Wagner, made from the porters' own accounts.

On the job, the porters had to smile for the passengers.

Eight retired Pullman porters told two filmmakers in 1982 what their job had been like. Rosina Tucker, a porter's wife who worked to build the porters' union, tells the story in the film. The porters describe the smile Pullman managers required them to wear and the nights they worked without sleep.

Two of the men in the film are C. L. Dellums and E. D. Nixon. Pullman managers fired Dellums in October 1927 for organizing porters into a union. Nixon later called the meeting that organized the Montgomery bus boycott. From December 1955 to December 1956, most of the 40,000 Black people of Montgomery, Alabama, stayed off the city's buses, until federal judges ended bus segregation there. Chapter 25 tells the boycott in full.

Trains and Jeeps in World War II

Trains carried about 43.7 million members of the armed forces from December 1941 to August 1945, more than 97 percent of all the troops moved in organized groups. About 100,000 of them rode troop trains on an average day, and half of all Pullman sleeping cars were in use carrying troops.

The Jeep. About 640,000 Jeeps, small army cars, were built in the war. About 363,000 of them were the Willys MB, and about 280,000 were the Ford GPW.

Drivers with the power to arrest

Under Virginia law, buses had to seat Black and white passengers apart, and bus drivers were "special policemen." A driver could decide a passenger's race, order the passenger to another seat, throw the passenger off the bus and make an arrest. Refusing a driver was a crime with a fine of $5 to $25. Greyhound's own rules stated that the company had "full control and discretion as to the seating of passengers" (discretion means the power to decide).

Riders thrown off. Bessie Nelson and Mamie Kinchlow were thrown off a Greyhound bus in Alexandria, Virginia, in August 1932 and jailed for more than a week. Mildred Turpin and Caroline Johnson, clerks for the Navy Department, were jailed at Clarendon, Virginia, on January 16, 1943. Tonito Holmes was beaten, removed from a Greyhound bus and fined $14.25 in Johnson City, Tennessee, on February 19, 1945. The Encyclopedia Virginia account of these cases does not name the drivers and officers who threw the riders off, jailed them or beat them.

Irene Morgan

Who: A Baltimore war worker who refused to give up her bus seat in Virginia and won her case in the US Supreme Court.

When and where: A Greyhound bus near Saluda, Virginia, July 16, 1944. The Supreme Court decided her case on June 3, 1946.

She tore up the sheriff's warrant and threw it out the window.

Irene Morgan, of Baltimore, was 27 and built B-26 bombers in a wartime factory. She had been visiting her mother in Gloucester County, Virginia, and on July 16, 1944, she took a Greyhound bus home to her husband and to see a doctor. Near Saluda, two white passengers got on the crowded bus. The driver told Morgan and the woman next to her, a Black woman holding a baby, to move to the back seat.

"I refused to move," Morgan said years later. The driver drove the bus to the jail in Saluda, where the sheriff showed her a warrant, a paper that allows an arrest. She "just took it and tore it up and just threw it out the window." "So then he put his hands on me," she said, and she kicked him. The sheriff and a deputy forced her off the bus.

The courts. Her mother paid $500 to get her out of jail. Morgan paid a $100 fine for resisting arrest on October 18, 1944. She would not admit breaking the seating law. A judge found her guilty of it anyway, and she refused to pay the $10 fine. The Encyclopedia Virginia account of her case does not name the judge.

Her lawyer was Spottswood W. Robinson III, and the lawyers Thurgood Marshall and William H. Hastie of the NAACP, a civil rights group, joined him. The judges of the Virginia Supreme Court of Appeals ruled against her on June 6, 1945.

The justices of the US Supreme Court ruled for her on June 3, 1946. Justice Stanley Reed wrote that a passenger crossing several states could meet a different seating rule in each one, and under Virginia's law might

have to change seats again and again inside Virginia. Seating on trips across state lines, he wrote, needed "a single, uniform rule," so Virginia's law could not apply to those buses.

The ruling covered only trips between states. Reporters at the *Afro-American* newspaper wrote that bus companies' seating rules did not change right away.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 11 MINUTES

Three new ways of moving people and goods over long distances began between 1956 and 1958: Interstate highways, shipping containers and American jet airliners across the Atlantic. President Dwight Eisenhower signed the law for the Interstates, the big highways that join the states, in 1956, the same year a ship called the *Ideal X* carried 58 shipping containers from New Jersey to Texas.

Pan Am's jets crossed the Atlantic about twice as fast as the older planes. Private railroads were losing money on passenger trains, and in 1971 a new company, Amtrak, took over most of them.

Homes taken. Highway officials forced the people of more than 475,000 households, more than a million people, out of their homes to make room for roads paid for by the national government. That number is the US Department of Transportation's estimate, a figure worked out rather than an exact count.

The Interstate highways

President Eisenhower signed the Federal-Aid Highway Act on June 29, 1956. The law allowed for 41,000 miles of new highways, called the Interstate Highway System. It was the largest public works program, a set of projects that the government pays for and the public uses, in the history of the United States up to then. The system is about 48,900 miles long today, and in 1990 members of Congress added Eisenhower's name to it.

The new Interstates went around Route 66. Officials of AASHTO, the association of state highway officials, took Route 66 off the list of numbered US highways on June 27, 1985.

Dwight Eisenhower

Who: The president who signed the Interstate highway law, 37 years after he crossed the country in an Army motor convoy.

When and where: The 1919 convoy from Washington, D.C., to San Francisco. The highway law, June 29, 1956.

In 1919 an Army convoy needed 62 days to cross the country.

The Army's first convoy of motor vehicles, a group of 81 vehicles traveling together, crossed the country in 1919. It went 3,251 miles, from Washington, D.C., to San Francisco. Its vehicles sank in mud and broke down, and bridges failed under them.

Dwight Eisenhower was a young Army officer, a lieutenant colonel, and he volunteered to go. He wrote a report on the trip. At the end of World War II, in 1945, he saw the autobahns, Germany's highways. After those two experiences, he argued for a system of highways across the United States, and as president he signed the law for it on June 29, 1956.

The homes the highways took

The people who planned the Interstates ran many of them through city neighborhoods, and they took the homes that stood in the way. By the US Department of Transportation's estimate, highway officials took the homes of more than 475,000 households, more than a million people, for federal roads.

The planning scholar Alan Altshuler estimated in those years that the new system would push out up to a million people, "a disproportionate number of them Black," meaning more than their share. The law professor Deborah N. Archer says the neighborhoods chosen "were largely Black and poor."

Montgomery. Interstate 85 ran south of Montgomery, Alabama, in the plans drawn up in 1955. Sam Engelhardt became head of the Alabama State Highway Department in 1959. His business cards read "I Stand for White Supremacy and Segregation," a stand for white rule and for keeping Black and white people apart by law.

Under Engelhardt, state highway officials chose a final route through Montgomery's only middle-class Black neighborhood. Ralph Abernathy, a minister and civil rights leader, lived there, and Alabama State University stood next to it. An engineering firm had suggested a route through Oak Park, which city officials had closed rather than let Black people use it.

Highway officials took about 356 homes in the Centennial Hill, Bel Air and Bottoms neighborhoods and paid owners an average of $3,300 a house. Abernathy sent a telegram, a short message sent over electric wires, to President John F. Kennedy in 1961. He wrote that the route "will destroy one of the best negro neighborhoods in the south" ("negro" was the common word for Black people in his time). Rebecca Retzlaff, a researcher at Auburn University, told this history in a 2019 study.

Rondo. Highway officials built Interstate 94 through Rondo, a Black neighborhood in St. Paul, Minnesota, from 1956 to 1968. Counts of what was lost differ: about 600 families by one count, about 700 homes and 300 businesses by another. Chapter 6 tells Rondo's story in full.

Jet airliners, a crash and cheaper fares

The Grand Canyon crash. Two airliners, TWA Flight 2 and United Air Lines Flight 718, left Los Angeles three minutes apart on June 30, 1956, and flew into each other over the Grand Canyon in Arizona. The crash killed all 128 people on the two planes, the deadliest airplane crash in the world up to that time. It was a major reason the Federal Aviation Agency was set up in 1958.

The jet. A Pan Am Boeing 707 jet flew from New York to Paris with 111 passengers and 12 crew members on October 26, 1958, in about 8 hours. It was the first jet service across the Atlantic by an American airline. The 707 flew about twice as fast as the older propeller airliners and carried about twice as many people.

Fares. Until 1978 the members of a federal board, the Civil Aeronautics Board, or CAB, decided which airlines could start or stop flying and what they could charge. President Jimmy Carter signed the Airline Deregulation Act on October 24, 1978, and under that law the board lost its control of fares and routes. Under the CAB Sunset Act, a part of that law, lawmakers set dates for the board to lose its powers one by one, and the board shut down on December 31, 1984.

Average fares fell about 40 to 45 percent in the decades after 1978, counted in dollars adjusted for rising prices, by government and industry figures. Two economists, experts on money, prices and trade, studied the change for a research group, the Brookings Institution, and found that fares ended up lower than they would have been under the old rules.

Barbara "Dusty" Roads

Who: An American Airlines stewardess who fought the airline's rule that fired women at age 32 or when they married.

When and where: American Airlines, from 1950. She lived from 1928 to 2023.

Movie: *Fly With Me* (2024), a PBS *American Experience* documentary about flight attendants, directed by Sarah Colt and Helen Dobrowski. Roads appears in it.

American's managers fired stewardesses at 32 or when they married.

Barbara Roads, called Dusty, joined American Airlines in 1950 as a stewardess, a woman who served passengers on an airplane. The job is now called flight attendant. In a 1953 contract, American's managers put in a rule that any stewardess hired after November 1953 would be fired at age 32. A stewardess who married was fired too.

In a radio interview, Roads gave her view of the reason: "It was cheaper to have someone that'll never get married, never have babies, never get pensions, never get the highest rate of pay."

Fighting the rule. Roads lobbied members of Congress, trying to talk them into acting, on her own flights to Washington, D.C. In 1963 she held a news conference that made the papers. At news conferences she also asked reporters to pick the 32-year-old stewardesses out of a lineup. Representative Martha Griffiths helped her.

The stewardesses came close to a strike, a refusal to work until their demands were met, in August 1968. By Roads's account, American's managers dropped the age rule the day after someone asked Griffiths to press the Equal Employment Opportunity Commission, the federal office that handles complaints of unfair treatment at work.

Roads helped start the Association of Professional Flight Attendants, a union, in 1977. She worked for American Airlines for 44 years.

The Freedom Rides

Black and white riders traveled together by bus into the South in May 1961, and people called them Freedom Riders. They were testing a court order that banned separating Black and white travelers in bus stations used for trips between states. Two groups left Washington, D.C., on May 4 on a Greyhound bus and a Trailways bus, headed for New Orleans. Among the Black riders was John Lewis, who later led the Student Nonviolent Coordinating Committee, a civil rights group.

Anniston. A white mob with clubs and bats attacked the Greyhound at Anniston, Alabama, on May 14. They broke its windows and slashed its tires, then chased the bus until the flat tires stopped it several miles out of town. One of the attackers threw a firebomb, a bomb that starts a fire, through a window. The riders and other passengers barely got out of the flames.

A state officer riding the bus in plain clothes held the attackers back with his gun. The mob beat the riders while the bus burned, until police arrived. Later that day white men got on the Trailways bus at Anniston and beat the riders on it. Their beating left one rider, Walter Bergman, a white man, with permanent brain damage.

Birmingham. The same day, a crowd met the Trailways bus in Birmingham with pipes, chains and baseball bats. Many in the crowd belonged to the Ku Klux Klan, a group that used violence against Black people and their supporters. Eugene "Bull" Connor, the city official in charge of the police, had told Klan leaders that the police would hold back from the bus station for 15 minutes, and he encouraged the Klan to attack the riders.

With no police there, Klansmen beat the riders in the waiting room and in a dark hallway. They beat James Peck, a white rider, until he was unconscious, and he needed more than 50 stitches. Walter Bergman was among the riders they beat, for the second time that day.

Montgomery. A white crowd in Montgomery attacked a new group of riders arriving by Greyhound on May 20. They beat John Seigenthaler, a Justice Department official, until he was unconscious. Alabama's public safety director

had arranged protection for the buses up to Montgomery, but Montgomery police did not take it over, and the director went into the fighting himself. Governor John Patterson blamed the riders for the violence.

The ban. The rides went on, and over the summer of 1961 the number of Freedom Riders grew to more than 400. Justice Department officials asked the members of the Interstate Commerce Commission, the federal officials in charge of trade and travel between states, to act. The commissioners banned keeping Black and white passengers apart in bus and train stations. They issued the ban on September 22, 1961, and it took effect on November 1, 1961. People in many Southern towns kept ignoring it.

Amtrak takes over the passenger trains

Private railroad companies were losing money on their passenger trains. Members of Congress passed the Rail Passenger Service Act in 1970 and created a new company called Amtrak. Amtrak began running most of the passenger trains between American cities on May 1, 1971, after the private railroads gave them up.

How much did a box save?

Loading a ton of cargo onto a ship by hand cost about $5.86 in 1956. Loading it in containers cost about 16 cents, less than a thirtieth as much, by the count of the writer Marc Levinson in his book *The Box*.

Before containers, dockworkers loaded cargo onto ships by hand. A ship called the *Ideal X* left Port Newark, New Jersey, on April 26, 1956, carrying 58 metal boxes, each 35 feet long, the size of a truck trailer. These boxes are called shipping containers. The ship reached Houston, Texas, five days later.

Members of an international standards group set standard sizes for containers in the late 1960s, and the same boxes came into use around the world.

Malcom McLean

Who: A North Carolina trucking owner who sold his trucking company to start shipping truck-sized boxes by sea.
When and where: Port Newark, New Jersey, April 26, 1956.

His trucking company began with one used truck in 1934.

Malcom McLean built that one truck into a trucking company in North Carolina. Then he sold the trucking company and put the money into carrying containers by sea, and in 1956 he sent the *Ideal X* to sea with them.

The deadliest year on the roads

Car crashes killed 54,589 people in the United States in 1972, the most in any single year before or since. By 1975 the yearly count had fallen to 44,525.

Federal safety officials have given part of the credit to a lower speed limit. During the oil shortage of 1973 and 1974, which Chapter 10 tells, members of Congress set a national speed limit of 55 miles an hour to save fuel, and by March 1974 every state had lowered its limit to match. A federal task force later estimated that the 55-mile limit saved 20,000 to 30,000 lives from 1974 to 1978.

The minivan

Workers in Windsor, Ontario, in Canada, built the first Dodge Caravan and Plymouth Voyager minivans on November 2, 1983. The minivans went on sale as 1984 models.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 12 MINUTES

With a phone in hand, Americans after 2000 could find their way and hire a ride, and some of them bought electric cars. About 8 of every 100 new cars sold in 2024 ran on batteries alone, according to Kelley Blue Book. About 7 of every 100 bridges in the country were rated in poor condition in federal records in 2025, by the count of a road builders' group.

Deaths. Federal safety officials counted 43,230 deaths in car crashes in 2021, and their early estimate for 2025, published in April 2026, is about 36,640. A container ship that had lost power hit a bridge in Baltimore in 2024, and the bridge's fall killed six road workers. An Army helicopter and a passenger jet collided near Washington, D.C., in 2025, and the crash killed all 67 people aboard.

Maps and rides on a phone

GPS, the Global Positioning System, uses signals from satellites to show a GPS device where it is. Until 2000 a setting called Selective Availability made GPS less exact for ordinary users. Federal officials switched the setting off a few minutes after midnight at the end of May 1, 2000, and the error of an ordinary GPS device shrank from about 100 meters to about 20, according to the government's GPS website.

Ride apps. People also began hiring rides through apps on their phones. Uber began in March 2009 as a company called UberCab and started its app service in San Francisco on July 5, 2010. In October 2010, officials of San Francisco's city transit agency and of California's Public Utilities Commission ordered UberCab to stop operating. Its owners changed the company's name to Uber that month, so that it would not look like a taxi business. Lyft started its service in June 2012.

In a ride-hailing app, a rider asks for a ride, and a driver using a personal car takes the job. The companies' managers called their drivers independent contractors, people in business for themselves rather than employees. One driver, Barbara Ann Berwick, asked the state of California to decide whether she was Uber's employee.

Barbara Ann Berwick

Who: A San Francisco Uber driver who asked the state of California to decide whether she was Uber's employee, and won.

When and where: San Francisco, July to September 2014. The decision came on June 3, 2015.

A hearing officer ruled that Uber owed her 56 cents a mile.

Barbara Ann Berwick drove for Uber in San Francisco, in her own car, for about eight weeks in the summer of 2014, and she quit on September 18. Uber's managers called her an independent contractor, and the company did not pay her back for the costs of her car. She took a claim to the California Labor Commissioner, the state office that handles pay disputes.

The hearing. Berwick argued her case herself on March 10, 2015, at a hearing, a meeting where each side tells its story to an official who decides. Uber sent two lawyers and a product manager, Brian Tolkin.

The hearing officer, Stephanie Barrett, listed the rules Uber's managers set for its drivers. The car could be no more than 10 years old, counted by its model year, and the company had to approve it. Drivers needed $1,000,000 in insurance. They had to keep a rating from riders of 4.6 stars or higher, or the company turned off their app. The agreement said riders did not tip. Barrett wrote that Uber was "involved in every aspect of the operation."

The ruling. Barrett ruled on June 3, 2015, that Berwick was Uber's employee, and she ordered Uber to pay Berwick $4,152.20. That was 56 cents a mile for 6,468 miles, plus $256 in bridge tolls and $274.12 in

> interest, extra money owed for the time she had waited to be paid. Barrett turned down Berwick's claim for unpaid wages, because Berwick agreed that Uber had paid her.
>
> Uber's lawyers asked a court in San Francisco to undo the decision. In a statement, Uber's spokespeople said the ruling applied to Berwick alone, and Uber's managers kept treating the company's other drivers as contractors.

The fight over drivers' pay

What was at stake. If app drivers were employees, the companies would have to pay back the costs of their cars, as the hearing officer ordered Uber to do for Berwick. As contractors, drivers paid those costs themselves.

California voters decided the question for app drivers in their state in November 2020. They passed Proposition 22, a law put to the voters directly, 58.6 percent to 41.4 percent. Under it, app drivers stayed contractors, but the companies had to pay them at least 120 percent of the minimum wage for the time they spent working on a ride request, plus 30 cents a mile.

The money. Uber, Lyft, DoorDash, Instacart and Postmates paid for the campaign for the law. It raised $205.7 million, the most for any California ballot question up to then, by the count of Ballotpedia, which tracks state ballot questions.

In court. Four drivers and a union, the Service Employees International Union, went to court on January 12, 2021, to overturn the law. The justices of the California Supreme Court ruled on July 25, 2024, that the law could stand.

Massachusetts. In June 2024 Uber and Lyft settled a lawsuit brought by Massachusetts, agreeing to pay $175 million and to pay drivers there at least $32.50 an hour for time spent driving to a rider or carrying one, while the drivers stayed contractors.

Bigger vehicles and electric ones

Americans bought more light trucks, meaning pickups, sport utility vehicles (SUVs) and minivans, than cars for the first time in 2001. Light trucks made up 50.8 percent of new vehicle sales that year, against 49.2 percent for cars, according to trade magazines that follow the car business. The gap grew wider in the years after.

Tesla. The company Tesla delivered its first Model S electric cars to buyers in Fremont, California, on June 22, 2012. It is named after the inventor Nikola Tesla, who died in 1943 and had no connection to it.

Americans bought about 1.3 million battery electric cars, which run on electricity alone, in 2024 and almost as many in 2025, by the counts of Kelley Blue Book and Cox Automotive, car-market research companies, published in January 2026. They made up 8.1 percent of new car sales in 2024 and 7.8 percent in 2025. Chapter 10 gives larger shares that also count hybrids, which have both a gasoline engine and an electric motor. Tesla sold nearly half of all the battery electric cars bought in 2025.

The tax credit. Members of Congress passed a budget law in July 2025, and President Donald Trump signed it on July 4. Under it, the federal tax credits for buying electric cars, money taken off what a buyer owes in taxes, ended for cars bought after September 30, 2025. In the last three months of 2025, Americans bought 234,000 electric cars, 46 percent fewer than in the three months before.

Scooters. A company called Bird put electric scooters for rent on the streets of Santa Monica, California, in September 2017. Another company, Lime, followed in 2018, and city officials began trial programs for scooters.

Ports, trains and bridges

Ports. Ships carrying containers backed up outside American ports in 2021. Staff at the Marine Exchange of Southern California counted a record 109 container ships waiting off the ports of Los Angeles and Long Beach on January 9, 2022. By October 2022 the line was down to about 4 ships.

A fast train. California voters approved $9.95 billion in bonds, a kind of loan, for high-speed trains from San Francisco to Anaheim in November 2008. The state's high-speed rail officials then put the cost of the whole system at $33.6 billion. Workers broke ground in Fresno on January 6, 2015, and the first section planned is 171 miles, from Merced to Bakersfield.

US Transportation Secretary Sean Duffy canceled about $4 billion in federal grants, money the national government had promised, for the California line in July 2025. He said the state's rail agency had "no viable plan," meaning no plan that could work. California officials sued, then dropped the case in December 2025.

The project now gets $1 billion a year through 2045 from cap-and-trade, a state program that makes polluters pay for permits to pollute. Associated Press reporters wrote in December 2025 that cost estimates are now above $100 billion, about three times the $33.6 billion estimate. No passenger had ridden a California high-speed train as of 2026.

Bridges. Researchers at ARTBA, a group for companies that build roads, counted the federal bridge records for 2025. The United States had 624,167 bridges, and 41,677 of them were rated in poor condition, about 7 of every 100. Drivers crossed those poor bridges 163 million times a day.

Deaths on the roads and in the air

Car crashes killed 43,230 people in the United States in 2021, the most in recent years, and the count then fell four years in a row. In April 2026 officials at the National Highway Traffic Safety Administration published an early estimate of 36,640 deaths in 2025. That is 1.10 deaths for every 100 million miles driven, and the only lower rate on record was 1.08, in 2014.

The Key Bridge. The container ship *Dali* was leaving Baltimore for Sri Lanka at about 1:30 in the morning on March 26, 2024, when it lost power and steering and hit a support of the Francis Scott Key Bridge. The bridge fell into the Patapsco River. The fall killed six men who were filling potholes on the bridge on an overnight shift.

Maryland Governor Wes Moore named them in a statement: Dorlian Ronial Castillo Cabrera, Carlos Daniel Hernandez Estrella, Alejandro Hernandez Fuentes, Miguel Angel Luna Gonzalez, Jose Mynor Lopez and Maynor Yassir Suazo Sandoval. They were immigrants from Mexico and Central America.

The cause. Members of the National Transportation Safety Board, the federal board that investigates crashes, reported the cause in November 2025. A label band had been put on a wire the wrong way. The band kept the wire from going all the way into its connector, so the connection came loose and cut the ship's power.

The board's press release does not say who put the band on or when. The board's members sent safety advice to several groups, among them the ship's builder, HD Hyundai Heavy Industries of South Korea.

The charges. Federal prosecutors, the government lawyers who bring criminal cases, charged the two Synergy Marine companies that ran the ship with crimes on May 12, 2026. They also charged the *Dali*'s technical superintendent, Radhakrishnan Karthik Nair, the manager in charge of the ship's machinery and upkeep. The charges include causing the deaths of the six workers.

A charge is an accusation, not proof. Under the law, the companies and Nair are innocent unless a judge or jury finds them guilty. The same day, Attorney General Anthony Brown, Maryland's top lawyer, announced a $2.25 billion settlement, a deal that ends a legal claim, with the ship's owner, Grace Ocean, and with Synergy.

Near Washington. An Army Black Hawk helicopter collided with an American Eagle passenger jet that was landing at Reagan National Airport, near Washington, D.C., on January 29, 2025. The crash killed all 67 people on the two aircraft, 64 on the jet and three soldiers on the helicopter. It was the deadliest crash of an American passenger airline in more than 20 years.

The head of the National Transportation Safety Board, Jennifer Homendy, said on January 27, 2026: "This was preventable. This was 100% preventable." CNN reported that the board's members blamed Federal Aviation Administration officials for helicopter routes that ran close to the path planes took down to the runway, and for failing to act on years of reports of near misses.

THE THREE QUESTIONS, ANSWERED

1. **How much faster and cheaper did travel get?** On the Erie Canal a ton of goods went from Buffalo to New York City for under $10 instead of about $100 by wagon, and on the first railroad across the country a coast-to-coast trip took a week instead of four months. By 1956, loading a ton of cargo onto a ship cost about 16 cents in containers, against about $5.86 by hand.
2. **Who built the new routes, and whose land and homes did they take?** Irish and American-born laborers dug the Erie Canal, enslaved people dug the Dismal Swamp Canal and built most of the Southern railroads, and Chinese workers built the western part of the first railroad across the country. Builders and US officials took Native nations' land, and highway officials building federal

roads took the homes of more than 475,000 households, many in Black neighborhoods.

3. **How did Black travelers fight the laws that made them sit apart?** They refused to move, went to court and stayed off the buses: Ida B. Wells sued a railroad in 1884, Homer Plessy tested a Louisiana law and lost in 1896, Irene Morgan won in the Supreme Court in 1946, and Black riders in Montgomery, Alabama, stayed off the city buses for more than a year in 1955 and 1956. After white mobs and Klansmen beat the Freedom Riders in Alabama in 1961, federal officials banned separating passengers in bus and train stations.

What changed: People here went from moving on foot, by canoe and with dogs before 1500 to railroads, highways, jets and container ships today, each faster or cheaper than what came before.

FIVE DATES TO KEEP

January 1673: the first post rider leaves New York for Boston.

October 26, 1825: the Erie Canal opens.

May 10, 1869: Chinese workers lay the last track of the first railroad across the country.

May 18, 1896: the Supreme Court rules against Homer Plessy.

June 29, 1956: Eisenhower signs the Interstate highway law.

NOT KNOWN: Nobody knows how many Chinese workers died building the Central Pacific, because its managers kept no record of their deaths.

Where to go: Golden Spike National Historical Park, at Promontory Summit in Utah, marks where the last track was laid, and from May to October you can see working copies of the engines Jupiter and No. 119 there.

Next: Chapter 12, Landmarks. It asks who built the country's best-known structures and monuments, and what people have argued about them.

Chapter 12: Landmarks

CHAPTER 12 OF 37 · LANDMARKS · 10 ERAS · ABOUT 75 MINUTES

Many of the people who built America's landmarks were enslaved, forced to work or killed on the job. Americans still argue about whose land the landmarks stand on and which people they honor.

In Emancipation Hall, in the Capitol Visitor Center in Washington, there is a block of sandstone from Aquia Creek, Virginia. It was part of the Capitol's East Front, built from 1824 to 1826. Members of Congress unveiled it as a marker on February 28, 2012. Its plaque states that the stone "was quarried," or cut from the ground, "by laborers, including enslaved African Americans." In the 1790s the officials in charge of building the Capitol rented enslaved men from their owners by the year, and the owners collected the pay.

This chapter describes landmarks from earthworks more than 3,000 years old to memorials opened in 2024. Watch for two things as you read. One is who did the building: Native men drafted to cut stone for a Spanish fort, enslaved men rented out by their owners, immigrants killed on the Brooklyn Bridge. The other is what people argued about afterward. A golf club used an ancient earthwork in Ohio as a golf course from 1910 to 2024. Workers carved Mount Rushmore on land that members of Congress had taken from the Sioux. Since 2015, officials and work crews have taken down, moved or renamed hundreds of Confederate memorials, and in 2025 federal officials began putting some back.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Who built the White House and the Capitol, and who was paid for their work?
2. How many workers died building Hoover Dam?
3. What has happened to the Confederate monuments since 2015?

Five minutes? Read "Enslaved men who built the capital" in 1750 to 1800.

Can skip: "The Woolworth Building", "The largest private house", "The Space Needle". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 6 MINUTES

Native people built the oldest landmarks in the United States, hundreds and even thousands of years before any European arrived. They piled up mounds of earth, and one of them covers more ground than the Great Pyramid in Egypt. In the Southwest they built stone houses with hundreds of rooms and set whole villages under cliffs.

No one wrote down the names of the people who built these places. In the Southwest, the builders' descendants, among them the Pueblo peoples, still live in the same region.

Monks Mound and the mound builders

Monks Mound, at Cahokia in what is now Illinois, is the largest structure made of earth in North and South America. People piled up its earth in stages, mostly between about the years 1050 and 1200. It stands about 100 feet tall. Its base covers about 14 acres, and the base of the Great Pyramid of Giza, in Egypt, covers about 13. The pyramid is far taller, so the mound is bigger only in the ground it covers.

Poverty Point, in Louisiana, is much older. People built it between about 1700 BC and 1100 BC, which is about 3,700 to 3,100 years ago. The builders lived by hunting, fishing and gathering wild food. They heaped up earth into five mounds and six curved ridges, set one inside another around a wide open space in the middle. It is the largest earthwork of its age north of Mexico.

A world list. Poverty Point is on the World Heritage List, which includes places chosen because they matter to all people. The World Heritage Committee of UNESCO, a part of the United Nations, keeps the list. Its members added Poverty Point on June 22, 2014, at a meeting in Doha, Qatar, as the 1,001st place on the list and the 22nd in the United States.

Serpent Mound, in Ohio, is a snake shaped out of earth, about a quarter of a mile long. It is the largest snake-shaped mound in the world. Nothing found inside it shows who built it.

Two dates. Archaeologists, scientists who study the past from the things people left behind, have tested the mound with radiocarbon dating, a way to measure the age of anything that was once alive. Tests done in 1991 gave about the year 1070, the time of a people archaeologists call the Fort Ancient culture. Tests done in 2014 gave about 300 BC, the time of a people they call the Adena culture. Later work has found evidence for both dates.

NOT KNOWN: which people built Serpent Mound. Archaeologists now think it possible that people built it in one period and rebuilt it in another.

Stone buildings of the Southwest

In Chaco Canyon, in what is now New Mexico, people built large stone buildings called great houses between about 850 and 1150. The largest, Pueblo Bonito, rose four stories high. It held about 600 to 650 rooms, or more. The counts differ because some of them include a guess at how many rooms the upper floors held, and some do not.

At Mesa Verde, in what is now Colorado, people built Cliff Palace between about 1190 and 1280. They set it under an overhang, a place where the rock of the cliff sticks out above like a roof. Cliff Palace has about 150 rooms and 23 kivas, rooms used for religious ceremonies. It is the largest cliff dwelling in North America.

The National Park Service lists 26 tribes with a special tie to Mesa Verde. Twenty-one of them are Pueblo nations, among them the Hopi Tribe and the Pueblos of Zuni, Taos and Acoma in New Mexico. The other five, the Navajo Nation, three Ute tribes and the Jicarilla Apache Nation, also have a tie to the place.

Earthworks under a golf course

Native people in southern Ohio built long walls of earth in the shapes of circles and eight-sided figures about 2,000 years ago. Archaeologists call these people the Hopewell culture. Hopewell is a name archaeologists gave them, not the name of any nation.

Accounts differ on how long the building went on, from about 400 years to about 700, in the centuries between about 200 BC and the year 500.

The Octagon Earthworks, in Newark, Ohio, is a large circle of earth joined to an eight-sided wall. Together the two walls surround nearly 70 acres. The walls line up with the points where the moon rises, in a pattern that repeats every 18.6 years.

The golf course. The Moundbuilders Country Club began leasing, or renting, the Octagon in 1910 and used it as a golf course. Since 1933 the land has belonged to the Ohio Historical Society, now called the Ohio History Connection, a group set up under state law and not run to make money. For decades its leaders kept leasing the site to the club.

Members of UNESCO's World Heritage Committee voted on September 19, 2023, to add eight Hopewell earthwork sites to the World Heritage List. The Octagon was one of them.

Glenna Wallace

Who: The first woman to lead the Eastern Shawnee Tribe of Oklahoma, chief from 2006 to 2026, who fought for years to get a golf course off the Octagon Earthworks.

When and where: The Octagon Earthworks, Newark, Ohio, from the late 2000s to 2025.

A golfer shouted at her, "Out of the way! You don't belong here!"

The golfer. Wallace first visited the Octagon Earthworks in the late 2000s, in 2007 by the account in the Smithsonian's *American Indian* magazine and in 2009 by other accounts. That was the visit when the golfer shouted at her. She decided to get the golf course off the earthworks and to win World Heritage status for them.

Forced out of Ohio. Wallace's own people had once lived in western Ohio, near Lewistown. Their band of Shawnee and Seneca, joined as one, gave up that land in a treaty, a written agreement between nations, signed on July 20, 1831. James B. Gardiner, a special official, signed it for the United States.

Under the treaty, US officials forced the people out of Ohio in 1832. They walked about 800 miles to a reservation, land set aside for a Native nation, in what is now Ottawa County, Oklahoma. More than 15 percent of them died on the way, according to the Ohio History Connection. No record of the march names the officials who led it. Wallace was born in that county in about 1939.

Her own words. At Ohio Statehood Day in 2019, Wallace asked, "Why had I never read anything about Newark Earthwork Mounds?" Then she answered her own question: "Because you here in Ohio didn't even realize the treasures that you had."

The court case. Leaders of the Ohio History Connection went to court to end the club's lease. They used eminent domain, a legal power to take property for public use as long as the owner is paid. On December 7, 2022, the judges of the Ohio Supreme Court ruled 5 to 1 that they could do it.

Wallace gave the main speech at the 2023 meeting in Riyadh, Saudi Arabia, where members of UNESCO's World Heritage Committee voted to list the earthworks. In August 2024 leaders of the club and of the Ohio History Connection agreed to end the court case, and they did not make the terms public. "At last," Wallace said. "So many people have worked so long for this to become reality."

The club ran the golf course until the end of 2024. The Octagon opened to the public on January 1, 2025.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 1 MINUTE

Nothing that Europeans built here in the 1500s still stands. The Spanish built their first forts in Florida of wood and earth. Those forts burned many times, and the Spanish rebuilt them again and again.

Spanish priests ran missions, settlements where Native people lived and were taught the Catholic religion. The mission buildings of this century, in Florida and in the Southwest, survive only as remains in the ground that archaeologists dig up. Native mounds and stone buildings of earlier centuries, such as Monks Mound and Cliff Palace, were standing then, and they still stand today.

Where did St. Augustine begin?

St. Augustine, Florida, began in a Native town. Pedro Menéndez de Avilés landed at Seloy, a town of the Timucua people, on September 8, 1565. The Spanish made their first settlement in Seloy's village. People have lived in St. Augustine without a break ever since. Of all the cities that Europeans founded on the mainland of the United States, it is the oldest that people never left.

Francis Drake and his men burned the town in 1586. The only landmark left from this century is the place where the Spanish settled. Nothing they built there in the 1500s survives above ground. The stone fort that still stands in St. Augustine, about a mile south of Seloy, was begun in 1672.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 9 MINUTES

Spanish officials forced Native men from their towns to cut the stone for a fort at St. Augustine, in Florida. The fort still stands, and it is among the oldest buildings that Europeans put up in the United States. So are two churches of this century: a chapel in Santa Fe, New Mexico, made of adobe, bricks of mud and straw dried in the sun, and a wooden church building in Massachusetts called a meetinghouse.

A fort built of shell stone

Spanish officials ordered a stone fort, the Castillo de San Marcos, built at St. Augustine after pirates attacked the town. About a hundred English pirates came ashore at midnight on May 28, 1668, and looted St. Augustine. They killed more than 50 Spaniards, and they said they would come back and take the town's fort.

The order. Queen Mariana of Spain then named Manuel de Cendoya governor of Florida. She sent him to the viceroy of New Spain, the king's highest official in Mexico, to collect 12,000 pesos, which were Spanish coins, to begin a fort of stone.

Workers broke ground on October 2, 1672, and Cendoya laid the first foundation stone that November. The last stones were set in 1695 or 1696, by different accounts. By 1696 the fort had cost close to 100,000 pesos. It is the oldest masonry fort, a fort built of stone or brick, in the continental United States.

Stone made of shells. The fort is made of coquina, a soft stone made of packed seashells. Workers cut the coquina from quarries, pits where stone is cut out of the ground, on Anastasia Island, across the bay from the town. They cut grooves in the rock with picks and axes, then broke the blocks loose with bars and wedges.

The largest blocks were 2 feet thick and 4 feet long. Albert Manucy, who wrote a history of the fort for the National Park Service in 1942, says six strong men "could hardly lift" one of them. Oxen dragged the blocks to a dock, and rafts carried them across the bay.

The stones are held together with mortar, a paste that hardens. Workers made lime, a white powder, for the mortar by burning oyster shells in kilns, or very hot ovens. By the spring of 1672 they had stored about 7,000 bushels of lime, measures of about 8 gallons each. The walls they built are 14 feet thick at the base and about 9 feet thick at the top.

Two sieges. English soldiers attacked the fort twice and failed both times. Governor James Moore of Carolina came with an army in November 1702, with Colonel Robert Daniel at his side. Almost 1,500 people crowded into the fort for safety. The siege, an attack in which an army surrounds a place and tries to force the people inside to give up, lasted about two months.

The English cannonballs did not shatter the walls. The shell stone crushed inward where each ball hit, so the balls sank into the wall or bounced off. When a Spanish force arrived to help, the English set fire to their own ships and retreated. As they left, Daniel's troops and their Native allies burned the rest of St. Augustine to the ground.

The fort and the people inside it survived. General James Oglethorpe of Georgia besieged the fort for 27 days in 1740, and he failed too. The fort is now the Castillo de San Marcos National Monument.

Who cut the stone?

Spanish officials forced Native men to work on the Castillo and in the king's corn fields near the town. At times up to 300 Native people were working for the Spanish king in St. Augustine, counting the men in the fields as well as the men on the fort. The men came from three nations: the Guale of what is now Georgia, the Timucua of eastern Florida and the Apalache of western Florida.

Officials drafted the men in their home towns, which means they ordered them to come and work. Some of the men had to walk about 200 miles to reach St. Augustine. Manucy wrote that "many of them served unwillingly." A drafted man had two choices. He could bring his family with him, or he could leave his wife and children in the village to feed themselves.

Past their terms. Each group of drafted men was supposed to work for a set time and then go home, but officials often held the men long past it. They drafted even some chiefs, and one chief was forced to work on the fort for more than three years without once going home. Some governors used Native men as their own servants. Years before the work on the Castillo began, Spanish officials had sentenced the Apalache to forced labor on the forts as a punishment for rebelling.

The pay. The Native laborers were paid 1 real, a Spanish silver coin, a day, plus a daily share of corn. Manucy counted the real as worth 12 and a half cents, and a park handbook written in 1993 puts it at about 20 cents. Spanish master masons on the same job earned 20 reales a day.

The fort alone needed about 150 laborers: 50 to quarry and haul the stone, 50 to gather oyster shells and help at the lime kilns, and 50 to dig trenches, carry sand and mix mortar. Officials found it hard to get even 100. In the first winter a sickness the Spanish called El Contagio, "the contagion," spread among the Native laborers, and the crew shrank to almost no one. Manucy's history does not count how many men died.

No names. The payrolls, the lists of workers and their pay, counted the Guale, Timucua and Apalache men who cut the stone. Manucy's history and the 1993 park handbook were both written from those payrolls. They give the men's nations and numbers, but not their names.

Convicts and enslaved men. Spanish officials also put convicts on the fort, men sentenced to forced labor there for a set number of years. One Spaniard caught smuggling English goods got 6 years of labor on the fort, and his term would double if he ran away. Enslaved Black people owned by the Spanish king worked there too, and in 1687 officials added eighteen of them to the crew.

That same year, eleven people escaped slavery in Carolina and reached St. Augustine. They were eight men, two women and a nursing baby. Governor Diego de Quiroga y Losada gave them shelter and had them baptized in the Catholic Church, a ceremony with water that makes a person a member of the church.

The governor hired the men as paid workers, and six of them worked on the Castillo. In 1693 King Charles II of Spain ordered that enslaved people who escaped from the English colonies and became Catholic would be free.

John Collins

Who: An English mason the Spanish held prisoner, who made the lime and ran the quarry for the Castillo de San Marcos.

When and where: St. Augustine, Florida, from 1670 for 19 years or more.

He made more lime in a week than Spanish workmen in two.

John Collins was an English mason, a builder in stone. In 1670 a ship sailing for the new English colony at Charleston, in Carolina, landed by accident at the Spanish mission of Santa Catalina, near the Savannah River. The Spanish there captured two Englishmen from the ship.

A small boat came from Charleston to get them back, and Collins and another man carried a message ashore. The Spanish held them too and sent all four men to St. Augustine as prisoners.

Juan Calens. Governor Manuel de Cendoya put the prisoners to work on the fort, and the Spanish payroll lists Collins as Juan Calens. According to Manucy's history, Collins could burn more oyster shells into lime in a week than Spanish workmen could in two. The lime went into the mortar that held the coquina blocks together. As a prisoner he was paid 8 reales a day, when a master workman was owed 20.

Collins rose from master of the lime kilns to master of the quarry. Later he ran the dugout boats, the food stores and the convict workers. At last he held the job of pilot, guiding ships between St. Augustine and Charleston. Officials of the Spanish king recognized his work after he had spent 19 years or more in the town.

NOT KNOWN: Manucy's history and the 1993 park handbook do not say when he was born or died, or whether he ever went home.

The oldest churches

San Miguel Chapel in Santa Fe, New Mexico, is often called the oldest church in the country. Its site and its foundations are that old, but most of the adobe walls standing today date from a rebuilding in 1710. The chapel was built around 1620 as a church for the soldiers, servants and laborers of the town's Spanish officials, and it was in use before 1626.

The Pueblo Revolt. The Pueblo people of northern New Mexico rose up against Spanish rule in 1680. Spanish officials had been collecting tribute, payments of goods, from the Pueblos, and they had used their power to keep the Pueblo people from practicing their own religion. A religious leader named Popé planned the uprising from Taos. The Pueblo people drove the Spanish out of the region, and the Spanish stayed out until 1692, when Diego de Vargas led them back.

The chapel was partly destroyed in the revolt. The histories of the chapel written for the National Park Service and the Historic Santa Fe Foundation do not say who damaged it. In 1710 Governor José Chacón had it rebuilt on the old foundations.

The Old Ship Meetinghouse in Hingham, Massachusetts, was built in 1681. The Puritans, a group of English Protestants who settled in New England, met in buildings like this one for church. It is the only Puritan meetinghouse from the 1600s still standing in the country, and the oldest church building in the United States that has been in use without a break.

The name. Its roof rests on a frame of heavy timbers, left open to view from inside. To the people who worshiped there, the frame looked like the hull, or body, of a ship turned upside down. That is how the building got its name.

The two claims. San Miguel's foundations are about 60 years older than the Old Ship Meetinghouse, but San Miguel's standing walls are about 30 years younger.

1700 to 1750

Colonists in Boston and Philadelphia put up public buildings that are still landmarks today. The first lighthouse in what became the United States was lit at the mouth of Boston Harbor in 1716, and Boston's Old North Church went up in 1723. In Philadelphia, builders began a statehouse for Pennsylvania's lawmakers in 1732. It is now called Independence Hall.

In Texas, Spanish priests ran a mission at the place later known as the Alamo. The first stone of its stone church was laid in 1744.

The first lighthouse

Boston Light stands on Little Brewster Island, at the entrance to Boston Harbor. It was first lit on September 16, 1716, the first lighthouse in what became the United States. British forces blew up the tower in 1776. It was rebuilt in 1783, and the 1783 tower is the one that stands today.

George Worthylake

Who: The first keeper of Boston Light, who drowned with his family two years into the job.

When and where: Little Brewster Island, Boston Harbor, 1716 to 1718.

The keeper, his wife and their daughter drowned coming home from church.

George Worthylake became the first keeper of Boston Light in 1716. He was paid £50 a year, 50 British pounds, to keep the light burning from sundown to sunrise. Worthylake lived on the island with his wife Ann and his daughter Ruth. He earned extra money guiding ships in and out of the harbor, and he kept a flock of sheep on Great Brewster Island, next door.

The canoe. The family had gone into Boston for a church sermon on November 3, 1718. Just after noon, on the way back to the island, their canoe tipped over. Worthylake, Ann and Ruth all drowned. Shadwell, a man Worthylake enslaved, drowned with them, and so did George Cutler, a servant, and John Edge, a friend of the family. Within weeks, in a second accident, two of the men hired to keep the light until a new keeper was chosen drowned near the island too.

Franklin's song. Benjamin Franklin was 12 years old and working for his older brother, a printer in Boston. His brother had him write a ballad about the drowning, a song that tells the story, called "The Lighthouse Tragedy." Once it was printed, Franklin's brother sent him around the town to sell copies. Franklin later called his own verses "wretched stuff," and no copy survives.

A steeple and a statehouse

Old North Church in Boston, also called Christ Church, was built in 1723. It is the oldest church building still standing in Boston. Its steeple, the tall pointed tower on top, was finished in 1740 and is 191 feet high.

Two lanterns. On April 18, 1775, the church's sexton, or caretaker, Robert Newman, and Captain John Pulling Jr. hung two lanterns in the steeple. The lanterns were a signal, worked out by Paul Revere, that British troops were moving by water.

Work on the Pennsylvania State House in Philadelphia began in 1732 and ended in 1753, 21 years later. Andrew Hamilton designed it with Edmund Woolley, a master carpenter. Workers added its tower from 1750 to 1753, and in 1753 they raised a bell into it. Words on the bell read "Proclaim liberty throughout all the land." The bell later became known as the Liberty Bell.

The State House is now called Independence Hall. Leaders of the colonies debated and signed the Declaration of Independence inside it in 1776.

The mission church later called the Alamo

A Spanish priest, Father Antonio de San Buenaventura y Olivares, founded Mission San Antonio de Valero in San Antonio, Texas, on May 1, 1718. Soldiers sent by Governor Martín de Alarcón came with him.

The people who lived at the mission came from more than a hundred Native groups, among them the Payaya, the Pamaya, the Xarame, the Apache and the Karankawa. Diseases brought by Europeans had already killed many Native people in the region. Many came to the San Antonio missions for protection from their enemies and for a steadier supply of food.

Kept by force. As a rule, the Spanish forced no one to come in. Once people had joined a Texas mission, though, priests and soldiers used force to keep them. Soldiers went out to bring back people, and whole groups, who left. Smallpox and measles spread through the mission in 1739. In 1745, 311 people lived there.

The cornerstone of a stone church, the first stone set at a corner of the new building, was laid on May 8, 1744. That church fell down in the 1750s. Work on the church that stands today began in 1758. The missionaries never finished it, and the bell towers and the dome they planned were never built. The records do not say who laid the church's stones.

Spanish officials closed the mission in 1793 and divided its lands among the Native people and others who still lived there.

The Alamo Company. From 1803 a company of Spanish soldiers lived in the old mission. They had been stationed before at Alamo de Parras, a town in what is now Mexico, so people called them the Alamo Company, and the mission took its name from them.

Texans were fighting to break away from Mexico in 1836, in a war called the Texas Revolution. That year Mexican soldiers attacked the old mission and killed the Texan soldiers defending it, 187 men by the National Park Service's count.

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 6 MINUTES

Enslaved people worked at every stage of putting up the first buildings of the new national capital. Leaders of the United States began building the capital beside the Potomac River in the 1790s, and its two main buildings were the President's House and the Capitol. The officials in charge rented enslaved men from their owners, and the owners collected the pay. Enslaved workers also built two houses of the time that are landmarks today, Mount Vernon and Monticello.

Raising the capital's buildings

The land chosen for the capital had been home to the Nacotchtank people. The English captain John Smith traveled up the Potomac River in 1608 and found their villages there. European settlers brought diseases that killed many of the Nacotchtank. In colonial times most of their groups joined other Native peoples, and some moved away.

James Hoban, an architect born in Ireland, designed the President's House, later called the White House. Its cornerstone was laid on October 13, 1792. George Washington laid the cornerstone of the Capitol, the building where Congress meets, on September 18, 1793. Neither building was done by 1800. When John Adams moved into the President's House in November 1800, it was still unfinished, and the Capitol had only one wing.

Enslaved men who built the capital

Enslaved men quarried sandstone for the President's House and the Capitol. They also cut timber, made bricks, sawed boards, did carpentry and hauled loads. The three commissioners, the officials in charge of the new District of Columbia, bought a sandstone quarry on Government Island, in Aquia Creek, in Stafford County, Virginia, for $6,000 on December 2, 1791. In the fall of 1792 they allowed the man running the quarry to rent forty enslaved men to work there, beside a number of free workers.

Rented by the year. William C. Allen, a historian in the office of the Architect of the Capitol, studied the Capitol's payrolls for Congress in 2005. His report states that the commissioners rented enslaved men from their owners by the year. They called this "Negro hire," using a word of that time for Black people. The Capitol's accounts list 385 payments for it between February 11, 1795, and May 17, 1801.

Who got the money. The money went to the owners. At first an owner got $60 a year for each man, when a white laborer with no special skills earned $70 a year. The commissioners raised the owners' rate to $70 in 1797. When a man missed work, the commissioners cut his owner's pay.

Two of the commissioners, Gustavus Scott and William Thornton, rented out men they held in slavery to the project, and Thornton also designed the Capitol. James Hoban was paid for enslaved men too. So were the commissioners' treasurer, the man who oversaw the Capitol's laborers and a land developer. Many Maryland slaveholders rented out men as well, and several of them were women, such as Ann Digges and five women of the Brent family.

The commissioners told the overseers to keep the rented men at work "from sunrise to sunset," six days a week. They housed the men in huts and gave them rations, a set share of food and drink, of salt meat and whiskey. Allen found that the overseers probably kept the enslaved sawyers, men who sawed logs into boards, at work seven days a week. For work at night, on Sundays and on holidays, the men themselves got small extra wages.

First names only. Only a few of the men's names were written down, and only their first names. The payment records list Dick and Tom, rented from Ann Digges in 1795, and Nace, Gerrard, David, Charles, Harry, Gabe and Sil, rented from the Brent women in April 1795. Allen wrote that "virtually nothing is known of their lives." A man named Jacob ran away from the work in 1793, and his owner offered a $6 reward for him.

KNOWN:	The historian Bob Arnebeck counts at least 200 known enslaved laborers on the Capitol and the President's House together.
NOT KNOWN:	the full number. Richard Baker, the Senate Historian, and Kenneth Kato of the House history office, who introduced Allen's report, wrote that no one will ever know how many enslaved people helped to build the Capitol.

Tom, Peter, Ben, Harry, and Daniel

Who: Five enslaved carpenters who helped build the White House, known only by the first names on one month's payroll.
When and where: The President's House building site, Washington, May 1795.

Peter and Ben each worked 28 days and got none of the pay.

Tom, Peter, Ben, Harry and Daniel were enslaved carpenters who worked on the President's House in May 1795. The carpenters' payroll for that month lists them by their first names only. James Hoban, the architect of the building, held four of them in slavery, and his assistant, Pierce Purcell, held the fifth.

The payroll records how many days the men worked that month. Peter and Ben each worked 28 days, Daniel worked 25 and Harry worked 9. Hoban signed for their wages. The pay went to the men's owners and not to the men.

NOT KNOWN: which of the five men Purcell held. The White House Historical Association's own accounts differ.

Who built Mount Vernon and Monticello?

Enslaved workers built and enlarged Mount Vernon, George Washington's home in Virginia, and Monticello, Thomas Jefferson's home in Virginia.

Washington had the roof of his one-story house at Mount Vernon raised in the late 1750s to make a full second floor. The people he enslaved did most of the work, while he was away at war. He began enlarging the house again in 1774, and its last new room was finished in about 1787.

Jefferson began building Monticello in 1769 and left it unfinished in 1784. From 1796 to about 1809 he redesigned it and had it rebuilt, and enslaved workers did much of the building and made much of its fine woodwork. One of them was John Hemmings, a joiner, or maker of fine woodwork.

Thomas Jefferson

Who: The owner of Monticello, who designed his own house and worked on a design for Virginia's capitol that copied a Roman temple.

When and where: Monticello, Virginia, 1769 to about 1809. The design for the Virginia State Capitol in Richmond, 1785.

Virginia's capitol was modeled on an ancient Roman temple in France.

Thomas Jefferson designed his own house at Monticello, and with a French draftsman, a man who drew building plans, he made the design for the Virginia State Capitol.

The temple. Virginia's Directors of Public Buildings asked Jefferson for a design for a new state capitol in Richmond in 1785. He was then the United States minister to France, the man who represented the country to the French government. The French draftsman, Charles-Louis Clérisseau, persuaded him to model the outside of the building on the Maison Carrée, an ancient Roman temple in the city of Nîmes, in France.

Clérisseau drew the final plans. A plaster model reached Richmond late in 1786 to guide the workmen, and Samuel Dobie built the capitol. A history of the building by the Virginia General Assembly, the state's lawmakers, states that the capitol "introduced the Classical Revival temple style to the modern world," a style that copies the temples of ancient Greece and Rome. The same history states that the capitol "has inspired countless public buildings for over 200 years."

NOT KNOWN: who Dobie's workmen were, or whether any of them were enslaved. The General Assembly's history names only Dobie.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 4 MINUTES

Work on two tall stone monuments, one to the Battle of Bunker Hill and one to George Washington, stopped when the people raising them ran out of money. They were among the first monuments Americans built to the Revolution and to Washington. Workers finished the Bunker Hill Monument near Boston in 1842. The Washington Monument in the capital stood at about 150 feet when work stopped in 1854, and the stump stayed unfinished for 25 years.

Enslaved craftsmen at Monticello, in Virginia, went on rebuilding Thomas Jefferson's house until about 1809. One of them, the joiner John Hemmings, made much of its fine woodwork.

Two obelisks that ran out of money

Both monuments are obelisks, tall stone pillars with four sides that narrow toward a pointed top. The Bunker Hill Monument marks the Battle of Bunker Hill, fought on June 17, 1775, and it stands on Breed's Hill in Charlestown, Massachusetts. A group of leading citizens of the Boston area formed the Bunker Hill Monument Association in 1823 to build it.

The cornerstone. Daniel Webster and the Marquis de Lafayette, a French general, led the ceremony that laid its cornerstone on June 17, 1825, 50 years to the day after the battle. About 40 men who had fought in the battle came, along with about 190 other men who had fought in the Revolutionary War.

The association bought a granite quarry in Quincy, Massachusetts. Horses pulled the granite blocks three miles to the Neponset River on a railway. A National Park Service article describes it as the first horse-drawn railway built to carry goods as a business. Ships then carried the blocks to Charlestown.

Out of money. The association's money ran out in December 1828, after 19 months of work, and the work stopped. To pay off its debts, its leaders sold 10 acres of the old battlefield in 1839. Sarah Josepha Hale organized a Ladies' Fair at Quincy Market in Boston in 1840, and the money taken in at the fair came to more than $30,000, about a quarter of the monument's cost.

Workers finished the 221-foot granite obelisk in July 1842. It was dedicated, or opened with a public ceremony, on June 17, 1843, with President John Tyler there.

The Washington Monument. Work on a monument to Washington began in the capital on July 4, 1848. About 20,000 people watched members of the Washington National Monument Society lay the cornerstone. By 1854 the society's money was gone, and work stopped at about 150 feet.

The Pope's stone. In March 1854, members of the Know-Nothing movement, a political movement against Catholics, stole a block of marble meant for the monument. Pope Pius IX, the head of the Catholic Church, had given it. By the usual account, the thieves threw the stone into the Potomac River, and it was never found. Know-Nothings took control of the monument society from 1855 to 1858. The stump of the monument stood unfinished until 1879.

The Castle. One building in the capital in these years was paid for out of one man's gift. James Smithson, an English chemist who never set foot in the United States, left his fortune to the country in his will, to found the Smithsonian Institution.

Workers put up the Smithsonian Institution Building, of red sandstone, from 1847 to 1855, and the money for the work came from the interest that Smithson's gift had earned. The architect James Renwick Jr. designed it, and its cornerstone was laid on May 1, 1847. People call it the Castle.

John Hemmings

Who: An enslaved joiner who made the fine woodwork of Monticello's rebuilt rooms, and one of only five people Jefferson freed in his will.

When and where: Monticello and Poplar Forest, Virginia. Born 1776, died 1833.

Of more than 600 people Jefferson enslaved, his will freed five.

Thomas Jefferson held John Hemmings in slavery at Monticello. From the age of 17, Hemmings learned the joiner's trade from white joiners whom Jefferson hired.

When Jefferson rebuilt Monticello, Hemmings made the fine woodwork of the remodeled rooms and much of the furniture. He also led the woodwork at Poplar Forest, Jefferson's other house in Virginia.

Freed by the will. Jefferson enslaved more than 600 people during his life, and in his will he freed five of them. Hemmings was one of the five, and he became free in 1826. Jefferson also left him the tools of the joiner's shop.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 10 MINUTES

The Washington Monument, finished in 1884, was the tallest structure in the world at 555 feet. In New York, workers hung the Brooklyn Bridge from cables, and at least 21 of them died. Other workers raised a bronze statue onto the new dome of the Capitol and set up the Statue of Liberty in New York Harbor. As St. Louis grew, between 1850 and 1904, people dug away almost all of the Native mounds that had stood there for centuries.

The Statue of Freedom

Workers set the last section of a bronze statue called Freedom on top of the new dome of the Capitol on December 2, 1863. Clark Mills, a sculptor who had taught himself, cast the statue from 1860 to 1862 in his foundry, a workshop where metal is melted and poured into molds. One of the men who cast it was Philip Reid, whom Mills held in slavery.

Philip Reid

Who: An enslaved foundry worker who helped cast the Statue of Freedom for the dome of the Capitol, and who was free by the day it was raised.

When and where: Clark Mills' foundry, Washington, 1860 to 1863.

Reid kept Sunday's pay, and his owner took the other six days.

Philip Reid worked out how to take apart the plaster model of the Statue of Freedom so it could be cast in bronze. He was born in slavery in Charleston, South Carolina, in about 1820, and Clark Mills bought him there. Mills said he paid $1,200 for Reid "because of his evident talent for the business."

The puzzle. An Italian sculptor on the job refused to show how to take the model apart unless he got a raise in pay. Reid worked out how to separate the sections himself, using a pulley and tackle, a set of ropes and wheels for lifting heavy loads.

The pay. Reid earned $1.25 a day, but he kept only Sunday's pay. Mills collected the pay for the other six days of each week.

Free. President Abraham Lincoln signed the District of Columbia Compensated Emancipation Act on April 16, 1862. It was a law for setting free, or emancipating, the enslaved people of the capital, and Reid became free that day.

Under the law, owners who had stayed loyal to the Union, the side of the United States government in the Civil War, could be paid, or compensated, up to $300 for each person. The government of the District of Columbia counts 3,100 people freed under it, and the US Senate's history office counts 2,989.

When the last section of Freedom was set on the dome in December 1863, Reid had been free for more than a year and a half. He later signed his name Philip Reed.

The Brooklyn Bridge and the bends

The Brooklyn Bridge, in New York, opened on May 24, 1883. It is a suspension bridge, which means its roadway hangs from cables strung between tall towers. At least 21 workers died building it, and most of the dead were immigrants.

How many died. The counts differ. The historian David McCullough counted 21 deaths. C. C. Martin, an assistant engineer on the bridge, told the *Brooklyn Eagle* newspaper that 27 men died in accidents. E. F. Farrington, the head mechanic on the job, said the number could be as high as 40.

The towers stand on caissons, huge boxes, open underneath, that were sunk to the bottom of the river. Men worked inside them, digging out the riverbed in air pumped in under pressure to keep the water out.

The bends. When men came up out of that air too quickly, bubbles of gas formed in their blood. The bubbles caused great pain in the joints, and they could leave a man paralyzed, unable to move parts of his body, or kill him. This illness is called caisson disease, or the bends.

Dr. Andrew Smith, the bridge company's doctor, gave it the name caisson disease. Between January 25 and May 31, 1872, he treated 110 cases among the roughly 600 men who worked in the air under pressure. Three of them died of it.

Caisson disease killed John Myers on April 22, 1872, Patrick McKay eight days later, and Daniel Reardon within the month. After those deaths, Washington Roebling, the chief engineer, stopped digging the New York caisson any deeper.

Other workers died too. John French and Thomas Douglas died before the caisson deaths, and Neil Mullen died in 1877. In 1878 a strand of cable snapped at the Manhattan end and threw Thomas Blake and Harry Supple, two men from Newfoundland, to their deaths. Caisson disease also crippled many workers who lived.

John, Washington, and Emily Roebling

Who: The man who designed the Brooklyn Bridge, the son who took charge of building it, and the son's wife, who carried his instructions to the engineers for 11 years.

When and where: New York, 1869 to 1883.

Movie: *Brooklyn Bridge* (1981), Ken Burns' first documentary, narrated by David McCullough. It was nominated for the Academy Award for Best Documentary Feature. It is about the bridge and the Roeblings.

Emily Roebling rode across first, holding a live rooster.

John A. Roebling designed the Brooklyn Bridge, but he died before building began. In June 1869 he was measuring the site for a tower when a ferry crushed his foot against the posts that held up the dock.

Doctors told him the foot should be cut off. He refused and allowed only a water treatment, with cold water dripped steadily onto the wound. His crushed toes were cut off, and tetanus, an infection from a wound that makes the muscles tighten and lock, set in. He died on July 22, 1869.

The son. His son, Washington Roebling, took over as chief engineer. He went down into the caissons with the workers and got caisson disease. He collapsed in 1872 and was left partly paralyzed. For the next 11 years, until the bridge opened in 1883, he directed the work from a room in Brooklyn Heights, watching the bridge through a telescope.

The son's wife. Emily Warren Roebling carried her husband's instructions to the engineers for 11 years. She studied cable construction, the forces on a bridge and the mathematics of bridge building, so she could pass on his orders correctly and answer the engineers' questions. When the bridge's trustees, the people chosen to look after the project, tried to remove her husband, she defended him before them.

Some writers today call her the bridge's "effective chief engineer," meaning she did much of that job in practice. Washington kept the title and made the engineering decisions from his sickroom. Emily was the person the engineers dealt with every day.

> When the bridge opened in 1883, Emily Roebling was the first person to cross it by carriage. She carried a live rooster as a sign of victory.

The Washington Monument, finished

Members of Congress voted in 1876 to have the federal government take over the unfinished Washington Monument. Army engineers led by Lieutenant Colonel Thomas Lincoln Casey started work again in 1879, and the workers finished the monument on December 6, 1884.

An aluminum tip. On its point the workers placed a cast aluminum tip that weighed 100 ounces. Aluminum then cost about a dollar an ounce, roughly a day's wage for a laborer, and the whole tip cost $225.

The monument was dedicated on February 21, 1885. At 555 feet, it was the tallest structure in the world until the Eiffel Tower was built in Paris in 1889.

A line in the stone. About 150 feet up, the color of the marble changes. The stone laid after 1879 came from different beds of rock in the quarries than the stone laid from 1848 to 1854. The line shows where the work stopped for 25 years.

Coins for Liberty's pedestal

People in France gave the money for the Statue of Liberty, and Americans had to raise the money for its pedestal, the tall stone base it stands on. Édouard de Laboulaye proposed the statue in 1865. The sculptor Frédéric Auguste Bartholdi designed it.

The statue's finished arm and torch were shown at the Centennial Exhibition, a big fair in Philadelphia in 1876 that marked 100 years since 1776. From 1877 to 1882 the arm stood in Madison Square Park in New York to draw gifts of money for the pedestal.

Two pennies thick. The engineer Gustave Eiffel joined the work in 1879 and designed the iron frame inside the statue. The statue's copper skin hangs on that frame, and it is 3/32 of an inch thick. In the words of the National Park Service, that is "about the thickness of two pennies placed together."

The newspaper campaign. The architect Richard Morris Hunt designed the pedestal, which was built from 1884 to 1886. Money for it came in slowly until 1885. That year Joseph Pulitzer, who published the *New York World* newspaper, ran a campaign in its pages. More than $100,000 came from about 120,000 donors. Most gave less than a dollar, and many of the gifts were coins from schoolchildren. Every donor's name was printed in the paper.

President Grover Cleveland led the dedication ceremony on October 28, 1886. The statue is 151 feet tall, and with its pedestal it stands about 305 feet high.

Frédéric Auguste Bartholdi

Who: The French sculptor who designed the Statue of Liberty and spent more than 15 years on it.

When and where: Paris, 1870 to 1885. New York Harbor, dedicated October 28, 1886.

The statue crossed the ocean in 350 pieces, packed in 214 crates.

Frédéric Auguste Bartholdi worked on the Statue of Liberty from 1870 to 1886. He traveled to the United States in 1871, and in a little under three months he chose Bedloe's Island in New York Harbor as the site and met many of the leading people in America. He and Laboulaye set up committees in both countries to raise money.

Hammered copper. The statue's skin was made of thin copper sheets shaped by hammering, a method called repoussé. The arm and torch were finished in 1876, and the head and shoulders in 1878. That year the head and shoulders were shown at the Paris Universal Exposition, a world's fair. The whole statue was put together in Paris between 1881 and 1884.

Then it was taken apart again. The French ship Isère carried it across the Atlantic Ocean in 350 pieces packed in 214 crates, and it arrived on June 17, 1885. Bartholdi came back to New York with a group sent from France for the dedication in 1886.

Mounds dug away for fill

St. Louis, Missouri, was once called the Mound City. It was built among about 40 mounds, hills of earth that Native people built between about the years 600 and 1300. As the city grew, people dug away most of them. One group of 25 mounds stood along the north riverfront, and by the 1850s all of them were gone except part of the largest, Big Mound.

Sold for fill. Big Mound stood about 30 to 34 feet high. Workers dug it away completely in 1869, and its earth was sold to the North Missouri Railroad to build up the beds for its tracks. The workers who removed it found 32 burials, the graves of people, in two chambers inside it.

No surviving record says what became of the bones, and no archaeologist is known to have recorded the digging. The history of the mounds written for the Landmarks Association of St. Louis does not name the men who dug the mound out or the person who sold its earth.

Before the World's Fair of 1904 in Forest Park, two more groups of mounds along the River des Peres were destroyed, 16 mounds in all. That same history does not name who destroyed them.

One mound is left in St. Louis, Sugarloaf Mound, on the south side of the city. In 1928 someone built a house on top of it. The story of how the Osage Nation got it back is in 2000 to Today.

The largest private house

George W. Vanderbilt had Biltmore House built in Asheville, North Carolina, between 1889 and 1895. It has 250 rooms and covers about 179,000 square feet, and it is still the largest privately owned house in the United States. Vanderbilt opened it to his family on Christmas Eve, 1895.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 14 MINUTES

Workers died building three of the giant landmarks that went up between 1913 and 1941. Five died on the Empire State Building and 11 on the Golden Gate Bridge. At Hoover Dam the official count is 96, and it leaves out 42 more deaths that were listed as pneumonia.

The Lincoln Memorial and Mount Rushmore went up in the same years. Mount Rushmore was carved into a mountain in the Black Hills of South Dakota, on land that members of Congress took from the Sioux in 1877, breaking a treaty, a written agreement between nations.

The Woolworth Building

Frank W. Woolworth paid the whole $13.5 million cost of the Woolworth Building in New York himself, in cash. Workers finished it in 1913. At 792 feet, it was then the tallest building in the world. Woolworth had made his fortune from stores that sold goods for five and ten cents.

A roped-off section at the Lincoln Memorial

At the opening of the Lincoln Memorial in Washington in 1922, a white Marine ordered Black guests into a roped-off section, apart from white guests. William Howard Taft, who led the group in charge of the memorial, told the only Black speaker to cut his speech.

The building. Work on the memorial to Abraham Lincoln began on February 12, 1914, Lincoln's 105th birthday. Joseph Blackburn, a member of the Lincoln Memorial Commission, the group in charge of the building, broke the ground. He had been an officer in the Confederate army, the army of the Southern states that fought to keep slavery in the Civil War. The architect Henry Bacon designed the building, and the sculptor Daniel Chester French made the seated statue of Lincoln inside.

About 50,000 people came to the dedication on May 30, 1922. The crowd was segregated, which means Black people and white people were kept apart. According to an account in Smithsonian magazine, the Marine was rough and rude as he sent the Black guests to their section. Twenty-one of them left in protest.

The telegram. Robert Russa Moton was the only Black speaker. A week before, on May 23, Taft sent him a telegram, a message sent by wire. Taft was the Chief Justice, the head of the US Supreme Court, and also the president of the Lincoln Memorial Commission. He wrote, "Shall have to ask you to cut five hundred words."

Taft added, "I am sure you wish to avoid any insinuation (hint) of attempt to make the occasion one for propaganda (messages meant to push people to one side)." Moton made the cuts. One passage he removed said that the work Lincoln died for was "still unfinished."

A concert on the steps. Marian Anderson, a famous African American singer, sang from the memorial's steps in 1939, after the Daughters of the American Revolution refused to let her sing in Constitution Hall. The group owned the hall, in Washington, and its rule allowed only white performers there. Eleanor Roosevelt, the president's wife, quit the group in protest.

Harold Ickes, the Secretary of the Interior, got President Franklin D. Roosevelt's approval for a concert at the memorial. On Easter Sunday, April 9, 1939, Anderson sang from its steps to about 75,000 people of all races.

Whose land is Mount Rushmore on?

Mount Rushmore is carved on land that US officials promised to the Sioux in a treaty and that members of Congress later took. The Lakota, one of the Sioux peoples, call the mountain Tunkasila Sakpe, the Six Grandfathers. It stands in the Black Hills of South Dakota.

The treaty. In the Fort Laramie Treaty of 1868, US officials set aside a large reservation for the Sioux, and the Black Hills were part of it. The treaty states that the land was "for the absolute and undisturbed use and occupation" of the Sioux, theirs alone to live on and use. It also states that no part of it could be given up unless three-fourths of the adult Sioux men signed.

Lieutenant Colonel George Armstrong Custer led close to 1,000 soldiers and teamsters, men who drove wagons, into the Black Hills on July 2, 1874. Lieutenant General Philip Sheridan had sent them, and by the middle of August they had found gold.

The gold rush. Hundreds of miners rushed into the hills once the news spread. At first soldiers tried to keep them out of the land the treaty had set apart for the Sioux. In late 1875 President Ulysses S. Grant ordered the Army to leave the miners alone.

The food law. Members of Congress then set out to get the hills for the United States. In August 1876 they passed a law saying no more money would be spent on food for the Sioux until they gave up the Black Hills. Under it, officials would give the Sioux no more food rations, and the Sioux then depended on those rations to eat.

A group of officials led by George Manypenny brought the Sioux a paper in September 1876. It was already written, and it stated that the Sioux gave up the Black Hills. Only about one in ten of the adult Sioux men signed it, far fewer than the three-fourths the treaty required. Members of Congress made that paper a law anyway on February 28, 1877, and with it they took the Black Hills.

The judges of the US Supreme Court, who are called justices, decided the case *United States v. Sioux Nation* in 1980. Justice Harry Blackmun wrote for the court that the taking had broken the treaty. The justices agreed with an earlier award of $17.1 million for the land, plus interest, extra money of 5 percent for every year since 1877. The total came to about $106 million.

The Sioux nations have never taken the money. They say the Black Hills were never for sale. The money sits in a federal account held by the US Interior Department, and officials keep its balance secret. South Dakota Public Broadcasting put it at about $2 billion in 2022. Frank Star Comes Out, president of the Oglala Sioux Tribe, has said, "We will never sell out our holy lands, the Black Hills, to the United States for monetary compensation (payment in money)."

The carving. Workers carved the mountain from October 4, 1927, to October 31, 1941. According to the National Park Service, nearly 400 men and women worked there, among them drillers and blacksmiths. They did about 90 percent of the carving with dynamite and removed about 450,000 tons of rock in all.

Then drillers made rows of holes close together, a method called honeycombing, and smoothed the faces with hand tools. Workers were lowered down the 500-foot face on steel cables, sitting in bosun chairs, seats hung from a cable. No worker died in the 14 years of carving. Today the memorial's staff consult with 21 Native nations connected to the site.

Gutzon Borglum

Who: The sculptor who designed Mount Rushmore, after starting a Confederate carving in Georgia that the Ku Klux Klan helped pay for.

When and where: Stone Mountain, Georgia, from 1923. The Black Hills of South Dakota, 1927 to 1941.

Klan money helped pay for Borglum's carving at Stone Mountain.

Before he carved Mount Rushmore, Gutzon Borglum went to meetings of the Ku Klux Klan and took a deep part in Klan politics, according to reports in the Washington Post and Smithsonian magazine. No record proves he was a member.

The Klan. Confederate veterans had started the first Klan in Pulaski, Tennessee, in December 1865. Its members whipped, burned the homes of and murdered freed Black people and the people who helped them. Federal officials put that Klan down in the early 1870s.

William J. Simmons and 16 other men climbed Stone Mountain in Georgia on Thanksgiving night in 1915. They burned a cross there and announced that the Klan was born again. Members of the new Klan preached white supremacy, the belief that white people should rule over everyone else. They were also against Catholics and Jews, and they wanted fewer immigrants let into the country.

At Stone Mountain, Borglum designed a carving of three Confederate leaders on horseback, Robert E. Lee, Stonewall Jackson and Jefferson Davis. Klan money helped pay for it. Work began in 1923, and Borglum unveiled the head of Lee in 1924.

Borglum quarreled with the businessmen who ran the Stone Mountain project, and they fired him. He then destroyed his models to protect his design, which made the directors angry. A warrant, a court paper ordering his arrest, was issued, and he fled Georgia.

Borglum began Mount Rushmore in 1927 and directed the carving until he died on March 6, 1941. His son, Lincoln Borglum, finished the work that year.

Nick Clifford

Who: The youngest worker on Mount Rushmore, and the last of its carvers to die.

When and where: Mount Rushmore, South Dakota, 1938 to 1940. Died in 2019, at 98.

The Borglums hired the 17-year-old partly to pitch for their baseball team.

Donald "Nick" Clifford was 17 when he was hired at Mount Rushmore in 1938, the youngest worker on the job. The Borglums wanted him for the crew's baseball team, where he pitched.

Clifford earned 55 cents an hour. He ran the winch, a machine that winds a cable, and the cable carried men up the face of the mountain. He also drilled holes for the dynamite. He worked there until 1940.

When Clifford died on November 23, 2019, at the age of 98, he was the last of the carvers.

The Empire State Building and the Mohawk ironworkers

Five workers died building the Empire State Building in New York, by the official count. A story that hundreds died is false.

Builders took about 410 days to put up the building, from the first steel to the opening on May 1, 1931. Up to 3,400 workers were on the job each day, and during the fastest stretch the steel frame rose about four and a half floors a week. The photographer Lewis Hine took pictures of the men working on the steel for his book *Men at Work*.

The building has 102 stories and stands 1,250 feet tall, or 1,454 feet to the tip of today's antenna. It was the tallest building in the world until 1970, when the steel frame of the World Trade Center's North Tower rose higher.

High steel. Some of the riveting crews were ironworkers from Kahnawake, a community of the Mohawk Nation in Canada. Ironworkers put up the steel frames of buildings and bridges, and riveters joined the steel beams with rivets, hot metal pins that lock the beams together. Kahnawake men had done this work since the 1880s.

The Quebec Bridge. Kahnawake ironworkers had died on an earlier job. On August 29, 1907, the south half of the Quebec Bridge fell while it was being built across the St. Lawrence River in Canada. James H. Marsh, writing in the Canadian Encyclopedia, gives 75 workers killed, and Eve Cable, writing in *The Eastern Door*, the Kahnawake newspaper, gives 76. Thirty-three of the dead were Kahnawake men.

A Royal Commission, a group set up to find the cause, blamed two engineers. Theodore Cooper, an expert brought in to oversee the design, had made mistakes in it and had lengthened the bridge to save money. John Deans, the chief engineer, kept the crews working after Cooper warned of danger.

The women's rule. The women of Kahnawake made sure after 1907 that the men of one family did not all work on the same job at the same time. *The Eastern Door* gives the rule this way: "If a lady had seven sons, they're not all

going to the same job." Crosses made from the bridge's steel stand in the village cemetery. In 2007 a monument went up with a picture of each man who was killed and a 40-foot steel model of the bridge.

The Golden Gate Bridge

Eleven workers died building the Golden Gate Bridge in San Francisco. One died in October 1936, and ten died on February 17, 1937, when a falling work platform tore through the safety net under the bridge. The bridge opened in May 1937, and on May 27, the first day, about 200,000 people walked across it.

Who designed it. Joseph Strauss was the chief engineer. Charles Ellis, the engineer who worked out how the bridge's structure would hold its weight, did the detailed design and thousands of calculations from 1929 to 1931. Strauss fired Ellis before building began, and Ellis got no public credit for decades. In a 2007 report, officials of the Golden Gate Bridge District gave Ellis the main credit for the design.

Joseph Strauss

Who: The chief engineer of the Golden Gate Bridge, who hung a safety net under the bridge while it was built.

When and where: The Golden Gate Bridge, which opened in May 1937.

A $130,000 net under the bridge caught 19 falling men.

Joseph Strauss required hard hats on the Golden Gate Bridge job. He also spent about $130,000 on a safety net that hung under the bridge while it was built. It was the first large safety net used on an American bridge job.

The net caught 19 men who fell. They called themselves the Halfway to Hell Club.

Al Zampa

Who: An ironworker who fell from the Golden Gate Bridge and lived, and who later had a bridge named for him.

When and where: The Golden Gate Bridge, October 19, 1936. From Crockett, California.

Zampa fell into the net where it sagged down onto the rocks.

Alfred Zampa was an ironworker from Crockett, California. On October 19, 1936, he slipped on wet steel and fell into the safety net. He was near the shore, where the net sagged down onto the rocks, and he broke four bones in his back.

Zampa spent twelve weeks in the hospital and two years in a back brace. Then he went back to ironwork. He was one of the first members of the Halfway to Hell Club and later its unofficial spokesman, the man who spoke for the club without holding any title.

California lawmakers named the new bridge over the Carquinez Strait the Alfred Zampa Memorial Bridge in 2003.

How many men died building Hoover Dam?

By the official count, 96 men died building Hoover Dam. The count comes from the Bureau of Reclamation, the federal office that runs the dam. It includes deaths from falls, rock slides, machinery and drowning, and it leaves out deaths from heat, heart trouble and pneumonia, a sickness of the lungs. The exact number of deaths is not known.

The 42. The main builder was a company called Six Companies Inc. The records list 42 more workers who died of pneumonia. Workers said these men really died of carbon monoxide poisoning. They said officials of Six Companies listed the deaths as pneumonia so the company would not have to pay compensation claims, the payments owed when a worker is hurt or killed on the job.

Carbon monoxide is a gas with no color or smell that comes from burning fuel. When a person breathes it in, it stops the blood from carrying oxygen. The workers blamed the gasoline-powered vehicles running inside the diversion tunnels, which were dug to carry the river around the building site. The tunnels often reached 140 degrees Fahrenheit and filled with thick exhaust. In nearby Boulder City, no one who did not work on the dam was recorded as dying of pneumonia in those years.

Father and son. The first deaths on the official list came in 1922, during the surveys for the dam. J. G. Tierney drowned on December 20 of that year, and Harold Connelly also died that year. The last death on the list came 13 years to the day after Tierney's. On December 20, 1935, his son, Patrick Tierney, an electrician's helper, fell from one of the dam's intake towers, the towers that take in water.

People tell a story that men are buried inside the dam's concrete. It is false. Workers poured the dam as many separate blocks, in shallow layers, with crews standing over each pour, so a body could not have been left inside. President Franklin D. Roosevelt dedicated the dam on September 30, 1935, and its generators began making electricity in 1936.

BY 1950

If you remember one thing: Workers died building three of the giant landmarks of these years, and Mount Rushmore was carved on land that members of Congress took from the Sioux.

96 and 42: Hoover Dam's official count of the dead is 96. The records list 42 more workers as dying of pneumonia, deaths that workers blamed on carbon monoxide in the tunnels.

Next: After 1950, two men climbed the unfinished Gateway Arch in St. Louis to protest who was kept off the job.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 8 MINUTES

Americans in these years fought over who was allowed to build a landmark and over what a memorial to the dead should look like. In St. Louis, Justice Department lawyers later charged in court that leaders and members of the building trades unions kept Black workers out of the unions, and so off the job building the Gateway Arch. Two men climbed the unfinished arch in protest.

In Washington, critics attacked the design of the Vietnam Veterans Memorial, a black stone wall set into the ground. The names of more than 58,000 Americans who died in the Vietnam War are cut into it, and it was dedicated in 1982. Builders also put up two towers in New York, one of them for a few years the tallest building in the world, and workers restored older landmarks, including the Statue of Liberty and Ellis Island.

The Space Needle

Builders put up the Space Needle in Seattle in about 400 days for a world's fair called the Century 21 Exposition. It opened on April 21, 1962, the first day of the fair. The tower is 605 feet tall, with a restaurant on top that turns around.

The Gateway Arch and the men kept off the job

The Gateway Arch in St. Louis is 630 feet tall and 630 feet wide, and its outside is stainless steel. The architect Eero Saarinen won the contest to design it, and the winner was announced in February 1948. Saarinen died in 1961, before building began. Workers built the arch from February 12, 1963, to October 28, 1965. Insurers had predicted 13 deaths, and no worker died.

Black workers were kept out of the building jobs on the arch, a federal monument. In St. Louis, the building trades unions, groups that carpenters, plumbers, ironworkers and other builders join to bargain together for jobs and pay, had almost all white members. Justice Department lawyers later charged in court that the leaders and members of these unions kept Black men out of the unions and so out of the jobs.

The climb. Percy Green and Richard Daly climbed a 125-foot construction ladder on the unfinished north leg of the arch on July 14, 1964. The two men were activists, people who campaign for a cause, and they climbed to protest. An article by the Gateway Arch Park Foundation states that they stayed up for 6 hours, and a St. Louis Public Radio report states that Green was up there for more than four hours. Police arrested both men.

Green later helped start ACTION, a St. Louis group that worked for fair hiring. ACTION stood for the Action Committee to Improve Opportunities for Negroes, a word of that time for Black people.

Two Black plumbers, Elijah Smith and Oliver Parker, were hired to work on bathrooms in the arch's visitor center. White union workers walked off the job on January 7, 1966, to protest the hiring of the two men.

The lawsuit. Lawyers in the US Justice Department sued the St. Louis Building and Construction Trades Council and five of its unions about a month later, on February 4, 1966. They charged the unions under the Civil Rights Act of 1964, which made it against the law for unions and employers to treat workers unfairly because of their race.

Officials of several of the unions settled the case. They signed an agreement to end "all practices that were discriminatory," meaning every rule and habit that kept Black workers out, and to judge everyone who applied by the same written standards. Two unions, the sheet metal workers and the electricians, fought the case in court. A judge ruled for them in 1968. In 1969 appeals judges overturned that ruling, found that the two unions' rules still kept Black workers out, and ordered the rules changed.

Harold McComber

Who: A Mohawk ironworker from Kahnawake, in Canada, who left home to work on the steel frames of Manhattan skyscrapers.

When and where: Manhattan and Kahnawake, filmed in 1965.

Movie: *High Steel* (1965), a documentary by the National Film Board of Canada, directed by Don Owen. It is about McComber's working life.

McComber's sons grew up without him while he built New York skyscrapers.

Harold McComber was a Mohawk ironworker from Kahnawake, in Quebec. Like many Kahnawake men, he left home to work on the steel frames of skyscrapers in Manhattan.

The director Don Owen built his 13-minute documentary *High Steel* around McComber's working life, and the National Film Board of Canada produced it in 1965. The film shows McComber and the men he worked with on the steel high above New York City. It also shows the quieter life of their community at home. To film the men at work, the camera crew reached the site by crossing on a ladder from the building next door.

In the film, McComber is sorry that his sons have had to grow up without their father. The film also tells how Kahnawake men first earned their name for steelwork, on a railway bridge built in the late 1800s.

The World Trade Center

The architect Minoru Yamasaki designed the two towers of the World Trade Center in New York, each 110 stories tall. The ribbon-cutting was on April 4, 1973. The North Tower stood 1,368 feet. Its steel frame had passed the height of the Empire State Building in 1970, which made it the tallest building in the world. It kept that title until May 1973, about a month after the ribbon-cutting, when the steel frame of the Sears Tower in Chicago rose higher.

Philippe Petit

Who: A French high-wire walker who walked on a cable between the two towers of the World Trade Center.

When and where: New York, August 7, 1974.

Movie: *Man on Wire* (2008), directed by James Marsh. It won the Academy Award for Best Documentary Feature and is about the walk.

Petit crossed between the towers eight times in 45 minutes.

Philippe Petit walked on a wire strung between the tops of the Twin Towers, about 1,350 feet above the ground, on August 7, 1974. He and his friends had smuggled a cable up to the roofs and strung it from one tower to the other. Petit crossed eight times in 45 minutes.

Afterward police arrested him. The charges against him were dropped. In return, he put on a show for children in Central Park.

The Vietnam Veterans Memorial and its critics

Two long walls of polished black granite, set into the ground of the National Mall in Washington, form the Vietnam Veterans Memorial. The names of more than 58,000 Americans who died in the Vietnam War are cut into the stone, in the order they died. It was dedicated on November 13, 1982, and it became the most visited memorial in Washington.

The attacks. Critics attacked the design before it was built. One veteran called it "a black gash (a deep cut) of shame." Another critic said that burying the dead "in a black stone sarcophagus," a stone coffin, "is like spitting on their graves." Opponents of the design included the radio host Patrick Buchanan and Congressman Henry Hyde. They campaigned to make the wall white and to add an eight-foot statue of soldiers.

The members of the US Commission of Fine Arts, a federal board that reviews designs in Washington, kept the wall. They also added a statue of three soldiers by Frederick Hart nearby, in 1984. Hart's design had won third place in the contest for the memorial.

Maya Lin

Who: The 21-year-old college student whose design won the contest for the Vietnam Veterans Memorial.

When and where: Yale University and Washington, 1981 to 1982.

Movie: *Maya Lin: A Strong Clear Vision* (1994). It won the Academy Award for Best Documentary Feature and is about Lin.

Entry number 1026 beat 1,420 others.

Maya Lin was a 21-year-old architecture student at Yale University when she won the contest to design the Vietnam Veterans Memorial. She had first drawn the design for a class. She was born in Ohio, where her parents were professors. They had escaped from mainland China as young adults.

The contest. It was the biggest design competition held in the United States up to then. The judges looked at the entries without knowing who had made them, and they chose entry number 1026 over 1,420 others. In May 1981 officials came to Lin's college room to tell her she had won the $20,000 first prize.

The critics. Lin argued against the campaign to make her wall white and add a statue, and she said Congressman Henry Hyde was "drawing mustaches on other people's portraits." Some of the wall's critics also used her age and her Chinese family background as reasons to change the design or drop it. The speakers at the dedication in 1982 did not mention her.

Restoring the old landmarks

Workers restored the Statue of Liberty for its 100th birthday from 1984 to 1986. They took down its original 1886 torch in 1984, and it is now in the statue's museum. In its place they put a copy made of copper and covered in gold leaf, thin sheets of gold. The statue was dedicated again on July 4, 1986.

Ellis Island, in New York Harbor, was where federal officials checked arriving immigrants. On May 11, 1965, President Lyndon B. Johnson signed Proclamation 3656, a formal order from the president, under which Ellis Island became part of the Statue of Liberty National Monument. Ellis Island's main building had opened in 1900. Workers restored it, and in 1990 it opened as a museum of immigration.

On the West Coast, from 1910, US officials held immigrants in barracks on Angel Island, in San Francisco Bay. Chinese immigrants held there had carved more than 200 poems into the barracks walls, and in 1970 the poems were found again. After that, people campaigned to save the barracks. In 1997 Angel Island Immigration Station became a National Historic Landmark.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 12 MINUTES

Memorials to people who were killed or enslaved went up after 2000: to the victims of the September 11 attacks, to the Black Americans murdered by mobs without a trial, and to the people held in slavery. In the same years, officials and work crews took down, moved or renamed hundreds of memorials to the Confederacy, the Southern states that fought to keep slavery in the Civil War.

These memorials include statues and place names. Researchers at the Southern Poverty Law Center, a group that campaigns for civil rights, counted 415 of them removed, moved or renamed between 2015 and April 2025, and 2,086 still standing. In 2025 federal officials began putting some of the removed monuments back.

Ground Zero rebuilt

The National September 11 Memorial in New York stands where the Twin Towers stood. On September 11, 2001, hijackers took over four airliners. They crashed two of them into the North Tower and the South Tower, and fires from the crashes made both towers collapse. They crashed a third into the Pentagon, the headquarters of the US military, near Washington, and the fourth, Flight 93, also crashed.

The dead. The hijackers killed 2,977 people, not counting the 19 hijackers themselves, according to the 9/11 Memorial and Museum. Of those, 2,753 were killed in New York, 184 at the Pentagon and 40 on Flight 93.

The memorial opened on September 11, 2011, ten years after the attacks. It has two pools set into the footprints of the two towers. Each pool covers nearly an acre. Water falls 30 feet into each pool and then drops another 20 feet. Around the edges, bronze panels carry the names of 2,983 people. They are the people killed on September 11, 2001, and the six people killed in an earlier bombing of the towers in 1993.

The design, called *Reflecting Absence*, won a contest in 2004 that drew 5,201 entries from 63 countries. The museum under the memorial opened on May 21, 2014. On November 3, 2014, One World Trade Center opened nearby. It stands 1,776 feet to the tip of its spire. The height was chosen to match 1776, the year of the Declaration of Independence.

Michael Arad

Who: The architect, then 34 and working for New York City, whose design for the National September 11 Memorial was chosen from 5,201 entries.

When and where: New York. He won the design contest in 2004, and the memorial opened in 2011.

His first sketches showed two empty spaces in the Hudson River.

Michael Arad was 34 years old and working as an architect for a New York City government office when he entered the contest for the memorial. In his first sketches, he pictured two empty spaces cut into the surface of the Hudson River. His finished design put two pools where the towers had stood.

Arad worked with the landscape architect Peter Walker, who plans outdoor spaces such as parks. The contest judges chose their entry from 5,201 in 2004.

New memorials in Washington

New memorials to Black Americans went up in Washington after 2000. The Martin Luther King, Jr. Memorial was dedicated on October 16, 2011, the first memorial to an African American in the area of the National Mall. At its center is a 30-foot carving called the Stone of Hope.

The Capitol's builders. Members of Congress unveiled a marker to the enslaved workers who helped build the Capitol on February 28, 2012, in Emancipation Hall, the great hall of the Capitol Visitor Center. The marker is a block of Aquia Creek sandstone taken from the Capitol's East Front, which was built from 1824 to 1826. Its plaque states that the stone "was quarried by laborers, including enslaved African Americans, and commemorates (honors) their important role in building the Capitol."

The National Museum of African American History and Culture opened on September 24, 2016, beside the Washington Monument. It is part of the Smithsonian. The architect David Adjaye led its design. He based the building's outside, a bronze-colored shape in three levels called the corona, on the art of the Yoruba, an African people. The pattern of its metal screen is copied from ironwork made by enslaved and free Black craftsmen in the South.

Memorials to lynching and slavery

The National Memorial for Peace and Justice, in Montgomery, Alabama, is a memorial to Black people who were lynched, killed by a mob without a trial. The lawyer Bryan Stevenson founded the Equal Justice Initiative (EJI), a legal group that does not make a profit. EJI built the memorial and opened it on April 26, 2018, with a museum called the Legacy Museum.

805 blocks. The memorial holds 805 steel blocks, each six feet tall, hanging from above. Each one stands for a county in the United States where EJI researchers found a record of a lynching. In their study *Lynching in America*, EJI researchers counted almost 4,400 lynchings of Black people from 1877 to 1950.

A copy of each county's block stands at the site, and EJI offers each copy to groups in that county to set up at home. A team called MASS Design Group designed the memorial, and it cost about $20 million, paid by private foundations.

122,000 names. EJI opened the Freedom Monument Sculpture Park nearby in March 2024, on 17 acres with nearly 50 sculptures. Its National Monument to Freedom lists more than 122,000 last names taken from the 1870 census, the government's count of everyone in the country that year. That census was the first time people who had been enslaved could claim a last name that the government would recognize. In it, nearly five million Black people took these names as their own.

The monument stands 43 feet tall and 155 feet long, and EJI dedicated it on Juneteenth, June 19, 2024. Juneteenth marks June 19, 1865, the day Major General Gordon Granger of the US Army reached Galveston, Texas, with the news that enslaved African Americans were free.

Confederate monuments coming down and going back up

Who put them up. Members of the United Daughters of the Confederacy had put up hundreds of Confederate statues at courthouses and other public places since the Civil War, researchers at the Southern Poverty Law Center (SPLC) reported in 2018. The researchers found two main periods of building.

The first began around 1900, while lawmakers in Southern states were passing Jim Crow laws, which they wrote to force Black and white people apart and to take away Black people's rights. The second ran from the early 1950s through the 1960s, when segregationists, people who wanted to keep the races apart, fought the civil rights movement.

Hundreds of these memorials came down or were renamed after people were killed in three places: Charleston, Charlottesville and Minneapolis.

Charleston. A 21-year-old white man named Dylann Roof sat in on a Bible study at the Emanuel African Methodist Episcopal Church in Charleston, South Carolina, on June 17, 2015. After about an hour he opened fire and killed nine Black worshippers. Roof had posted pictures of himself with Confederate flags on his website, and he had written racist views there. A federal jury found Roof guilty of all 33 federal charges against him on December 15, 2016, and the federal court sentenced him to death on January 10, 2017.

The Confederate battle flag had flown at the South Carolina State House, in Columbia, since 1961. After the murders, state lawmakers voted to take it down, and Governor Nikki Haley signed the law on July 9, 2015. The next day an honor guard of the state Highway Patrol lowered the flag, and it went to the Confederate Relic Room at the state museum.

Charlottesville. Paul Goodloe McIntire paid for a statue of the Confederate general Robert E. Lee in Charlottesville, Virginia, and it was dedicated in 1924. The members of the city council voted 3 to 2 on February 6, 2017, to remove it. City workers took the statue down on July 10, 2021, and city officials gave it to

the Jefferson School African American Heritage Center. In October 2023 the staff of the center's Swords into Plowshares project had the statue melted down at a foundry.

The rally. White supremacists organized a rally called Unite the Right around the statue for August 2017, six months after the council's vote. On August 12 James Alex Fields Jr. drove his car into a crowd of people protesting against the rally. He killed Heather Heyer, a 32-year-old paralegal, a worker who helps lawyers, and injured many others. Counts of the injured run from 19 to 29.

A Virginia jury found Fields guilty in December 2018 of first-degree murder, the most serious kind of murder, done on purpose. In 2019 he pleaded guilty to 29 federal hate crimes, crimes against people chosen because of their race, religion or a similar trait, and a federal judge sentenced him to life in prison.

Minneapolis. Minneapolis police officer Derek Chauvin murdered George Floyd on May 25, 2020, by kneeling on his neck, back and shoulder for about ten minutes. A jury convicted Chauvin of murder in 2021. Protests followed Floyd's murder, and SPLC researchers counted at least 168 Confederate symbols removed in 2020 alone.

Virginia Governor Ralph Northam ordered the removal of Richmond's Lee statue, a 12-ton monument put up in 1890, in June 2020. The judges of the Supreme Court of Virginia then refused to block the removal in two lawsuits. A crew led by Devon Henry, who owned the construction company doing the work, took the statue down on September 8, 2021, ABC News reporters wrote.

SPLC researchers counted 2,086 Confederate memorials still standing in public places in April 2025. In their count, memorials include place names and other symbols as well as monuments such as statues, and 685 of the 2,086 were monuments. Rivka Maizlish of the SPLC called the memorials "the results of a mass propaganda campaign," meaning a huge effort to push one side of the story.

Going back up. Federal officials began putting some monuments back in 2025. Protesters had pulled down a statue of the Confederate general Albert Pike in Washington in June 2020 and set it on fire. National Park Service

workers put it back up in October 2025. They cited a historic preservation law and an executive order, a written command from the president, that President Donald Trump had signed on restoring removed monuments.

Members of the United Daughters of the Confederacy put up the Confederate Memorial at Arlington National Cemetery in 1914. The sculptor, Moses Ezekiel, had fought for the Confederacy. The memorial shows "an enslaved man following his owner to war." It also shows an enslaved woman as a "mammy," holding a white officer's child.

The "mammy" was a made-up picture of an enslaved Black woman who cared for a white family's children and seemed happy in slavery. The picture hid the truth that enslavers separated these women from their own children. A commission set up by Congress found that the memorial showed "highly sanitized depictions of slavery," pictures of slavery with the cruelty cleaned out.

On that commission's advice, the memorial was taken down in December 2023. *Stars and Stripes*, the newspaper that reported it, does not say who did the work. In August 2025 Defense Secretary Pete Hegseth announced that it would return in 2027, and *Stars and Stripes* reported that the repairs would cost about $10 million.

Who took down the slavery exhibit in Philadelphia?

National Park Service workers took down an exhibit about slavery in Philadelphia in 2026. A federal judge ordered it put back, but appeals judges later let officials of the Trump administration replace it with panels of their own. The President's House site marks where George Washington lived while he was president. Its exhibit panels described the lives of nine people Washington held in slavery there.

The court case. The workers removed the panels in January 2026, following President Trump's executive order called "Restoring Truth and Sanity to American History." Lawyers for the City of Philadelphia sued. On February 16, 2026, US District Judge Cynthia Rufe ordered the panels restored while the case went on, and workers began putting them back three days later.

Lawyers for the federal government appealed, which means they asked a higher court to change the ruling. On June 18, 2026, judges of the Third Circuit Court of Appeals ruled that the city had no right to decide what the exhibit showed. On July 15 officials of the Trump administration replaced the old panels with their own.

The new panels still describe the nine enslaved people, but they leave out some of the old panels' detail, such as a map of the routes of the slave trade and a timeline of slavery. As of September 2026, the administration's panels were in place, and the city's case was still going on in the lower court.

Old landmarks, new names and owners

Sugarloaf Mound, on the south side of St. Louis, is the only one left of the roughly 40 mounds that Native people built in the city. People dug away all the others as the city grew, Big Mound and its 32 burials among them, as 1850 to 1900 describes. Someone built a house on top of Sugarloaf Mound in 1928.

Back to the Osage. The Osage Nation bought that house and about a third of the mound in 2009, and had the house torn down in 2017. In 2025, working with an arts group called Counterpublic, the Osage Nation got the last two pieces of the property transferred to it. The Osage Nation's announcement describes Sugarloaf Mound as a sacred Osage site.

Afterward Andrea Hunter, the Osage Nation's Historic Preservation Officer, said, "It has been a long 17-year journey, and I am thrilled to finally see the entire mound come under Osage Nation control." She said her office must now "remove all the structures from the properties and stabilize (make firm) the mound." Osage leaders plan to build a center there to teach visitors about the mound.

New names. Workers finished restoring the barracks of the Angel Island Immigration Station in California in 2009. On February 22, 2018, President Donald Trump signed a law under which the Jefferson National Expansion Memorial in St. Louis, the grounds of the Gateway Arch, became Gateway Arch National Park. It is the smallest national park in the country.

THE THREE QUESTIONS, ANSWERED

1. **Who built the White House and the Capitol, and who was paid for their work?** Enslaved men did much of the work, from quarrying the stone to sawing boards and hauling loads. The officials in charge rented them from their owners by the year, and the owners collected the pay.
2. **How many workers died building Hoover Dam?** By the official count, 96. The records list 42 more as dying of pneumonia,

deaths that workers blamed on carbon monoxide in the tunnels, so the exact number is not known.

3. **What has happened to the Confederate monuments since 2015?** By April 2025 officials and work crews had taken down, moved or renamed 415 Confederate memorials, from statues to place names. Hundreds of them came down or were renamed after Dylann Roof killed nine Black worshippers in Charleston in 2015, James Alex Fields Jr. killed Heather Heyer in Charlottesville in 2017 and the police officer Derek Chauvin murdered George Floyd in Minneapolis in 2020. In 2025 federal officials began putting some back.

What changed: No one wrote down who built the oldest landmarks here, and since 2000 Americans have built memorials to the enslaved and the murdered and fought over monuments to the Confederacy.

FIVE DATES TO KEEP

October 2, 1672: Workers break ground for the Castillo de San Marcos.

September 18, 1793: George Washington lays the cornerstone of the Capitol.

February 28, 1877: Members of Congress take the Black Hills from the Sioux.

May 24, 1883: The Brooklyn Bridge opens, after at least 21 workers died building it.

June 17, 2015: Dylann Roof kills nine Black worshippers in Charleston.

NOT KNOWN: Nobody knows how many enslaved people helped to build the Capitol, and two congressional historians wrote that no one ever will.

Where to go: The Octagon Earthworks in Newark, Ohio, a golf course from 1910 to 2024, opened to the public on January 1, 2025.

Next: Chapter 13, The Elements. It describes the copper, iron, gold and other elements that people here dug up, used and discovered.

Chapter 13: The Elements

CHAPTER 13 OF 37 · THE ELEMENTS · 10 ERAS · ABOUT 85 MINUTES

From the first ironworks to the uranium mines, the people whose land held the metal often lost that land. Many of the people who dug and handled it paid with their freedom or their health.

A lump of pure copper that weighs 3,708 pounds has been at the Smithsonian, in Washington, since 1860. It once lay in the Ontonagon River country near Lake Superior. The Ojibwe had known it for a long time, held it sacred and made offerings at it. In 1843 a Detroit merchant hauled it away, and a federal agent made him hand it over to the government. The Keweenaw Bay Indian Community asked for it back in 1991, and Smithsonian officials refused in 2000.

This chapter follows the elements people here dug up, shaped, named and made, from copper hammered 9,500 years ago to the hunt for element 120. The gold, copper and uranium in this chapter lay under Cherokee, Ojibwe, Sioux and Navajo land, so watch what happened to the people who lived there. Watch, too, who did the work with the metal: Scottish prisoners, enslaved ironworkers, hatters, dial painters, men making a lead additive for gasoline, and uranium miners. Nobody in the United States discovered a new element until 1940. Between 1940 and 1974, teams in American labs made or found at least twelve.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Who lost their land when Americans found gold and copper on it?
2. What did the people in charge say about the radium, lead and uranium that poisoned workers?

3. When did someone in the United States first discover a new element?

Five minutes? Read "Lead in gasoline and paint" in 1900 to 1950.

Can skip: "Meanwhile in Europe", "Lead at Galena", "Elements at home". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 4 MINUTES

Native miners near Lake Superior were digging and shaping copper at least 9,500 years ago. A 2021 study places them among the world's first coppersmiths, people who make things out of copper. All the land that later became the United States was Native land before 1500. No miner or metalworker from these thousands of years is known by name.

Copper is one of the chemical elements. Everything is made of atoms, tiny pieces far too small to see, and an element is a substance made of only one kind of atom. Copper, iron, gold and silver are all elements.

Numbers and rows. Each element has a number. It counts the protons, tiny particles in the center of each atom, so copper is element 29 because every copper atom has 29 protons. Chemists arrange the elements in order of their numbers in a chart called the periodic table.

The numbers rise from left to right along each row, and the elements in each column often act alike. The seventh row ends with element 118. Heavier elements, such as element 120, which scientists are trying to make, would go in an eighth row.

Nobody anywhere on Earth knew what an element was before 1500. People here mined copper, gathered salt and colored earth, and chose hard stone for tools. In some regions they also worked iron that had fallen from space. They turned these materials into tools, beads, ornaments and paint.

Copper from Lake Superior

In the Lake Superior country, in what are now Michigan, Wisconsin and Minnesota, veins of pure copper metal, called native copper, run through the rock. Native miners dug it out and hammered it into spear points, knives, fishhooks and ornaments. They also made awls, thin pointed tools for punching holes.

How old the work is. David Pompeani, a scientist who studies rocks and the Earth, led a team that dated the copper work. They used 53 radiocarbon dates, ages measured from things that were once alive, such as wood or bone. The team published its results in 2021 in *Radiocarbon*, a magazine for scientists' studies. The copper work began at least 9,500 years ago, about 3,500 years earlier than scientists had thought. It was busiest between about 7,000 and 5,000 years ago.

The oldest known copper work in the Middle East is a pendant, an ornament that hangs from a cord, about 8,700 years old. So the Lake Superior work is as old as the earliest copper work known in the Middle East, or older. Writers at the journal *Science* reported the study under the headline "Ancient Native Americans were among the world's first coppersmiths."

Traders carried Lake Superior copper hundreds of miles along Native trade routes. Along the same routes they carried shells, blue-green turquoise stone, and obsidian, a natural glass that forms from volcanic lava.

Iron from space

The only iron metal people here could work before 1500 came from meteorites, pieces of rock or metal from space that have fallen to Earth. Nobody here yet got iron out of rock by smelting, which means heating rock until the metal inside it melts out.

The beads from Havana. Archaeologists, the scientists who dig up and study what people left behind long ago, found 22 iron beads in 1945 in burial mounds near Havana, Illinois. Native people of the Hopewell way of life, which lasted in the eastern woodlands from about 2,000 to 1,600 years ago, had built the mounds over the graves of their dead. They made the beads about 2,000 years ago.

Timothy McCoy of the Smithsonian and four other scientists studied the beads and published their findings in 2017. The iron came from the Anoka meteorite, an iron meteorite from Minnesota. So people had carried or traded the metal several hundred miles before anyone made it into beads. The beadmakers shaped the iron by hammering it, the same way people worked copper.

Gold, silver, ochre, salt and stone

In some regions, metalworkers made ornaments of gold and silver. People also gathered salt and traded it, and they made tools of flint and chert, two hard stones.

A compound. Red and yellow ochre, a colored earth, went into paint. Ochre gets its color from iron oxide, a compound. A compound is two or more elements joined together, and iron oxide is iron joined with oxygen.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 1 MINUTE

Spanish explorers crossed the Southeast and the Southwest in the 1500s on long journeys called expeditions, looking for gold and silver. They found no cities of gold in the lands that later became the United States. The land was still Native land from coast to coast, and people here worked the same copper, gold and meteorite iron as before. The Spaniards brought some metal of their own into their few outposts, the small forts and settlements they built.

Spanish gold hunters, 1539 to 1543

Hernando de Soto led a Spanish expedition across the Southeast from 1539 to 1543. Francisco Vázquez de Coronado led another across the Southwest from 1540 to 1542. Both men were following stories of cities full of gold, and neither found one. In the same century Spaniards did find large amounts of silver, but in Mexico and South America, not in the future United States.

No science of elements yet. Nobody here or anywhere else had a science of elements. In Europe, the modern idea of an element had not been written down. People there who studied what things are made of still worked by alchemy, the older practice that came before chemistry. Alchemists tried to turn ordinary metals, such as lead, into gold by heating them and trying to make them purer. They kept most of their methods secret.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

The first ironworks English colonists built here stood on the land of the Powhatan, a union of Native towns in eastern Virginia, and Powhatan fighters destroyed it in 1622. At the second, at Saugus in Massachusetts, workers melted iron out of ore, rock that contains metal, from 1647 until about 1670. The company's men forced Scottish prisoners of war to work there. People in Europe, Asia and Africa had been smelting iron for thousands of years already.

Falling Creek, 1619 to 1622

English colonists began building an ironworks on Falling Creek, near present-day Richmond, in 1619. They built it for the Virginia Company, the English company that King James I had allowed to start a colony in Virginia in 1606. By March 1622 the furnace was ready to make iron, or close to it.

Opechancanough was the head chief of the Powhatan. The English colony stood on Powhatan land, and English colonists had been moving farther up the James River and settling more of it. From 1618, Virginia Company officials gave land to new colonists, who planted it in tobacco. By 1620 colonists were taking the land they wanted from the Powhatan without asking or paying, according to the historian Betty Wood.

Company officials, George Thorpe most of all, also pressed the Powhatan to send their children to live among the English. The English wanted to school the children and make them Christian. Opechancanough planned attacks on many parts of the colony to drive the English out for good.

The attack. Powhatan fighters destroyed the ironworks at Falling Creek on March 22, 1622, and killed 27 people there. The colonists never managed to rebuild the works.

Hammersmith at Saugus

Richard Leader began building an ironworks on the Saugus River near Boston in 1646. He worked for the Company of Undertakers of the Iron Works in New England, and in the 1600s an undertaker meant a person who took on a business project. People called the works Hammersmith. Its furnace was running by the next year.

From ore to iron. Hammersmith was the first ironworks in North America where every stage of the work happened on one site. The ore was bog iron, which workers collected from swamps and ponds. A blast furnace, a tall furnace with air blown into its fire, got hot enough to melt the iron out of the ore. The iron that came out of it was called pig iron.

At the forge, a workshop where workers heat iron and hammer it, they turned pig iron into wrought iron, a tougher iron that bends instead of breaking. In the rolling and slitting mill, rollers pressed the iron flat and blades cut it into strips. The strips were the raw material for nails, tools and horseshoes. Seven waterwheels powered the machines.

The works ran until about 1668 to 1670. The site is now Saugus Iron Works National Historic Site. Chapter 8 tells more about both ironworks and the people who built and ran them.

Scottish prisoners at Saugus

Scottish prisoners of war did forced labor at Saugus. English soldiers under Oliver Cromwell took these Scottish soldiers prisoner at the Battle of Dunbar in 1650 and the Battle of Worcester in 1651. About 400 prisoners from the two battles reached New England in all, according to the National Park Service. The prisoners had no choice about going or about the work.

The march to Durham. Cromwell's soldiers won the Battle of Dunbar in September 1650. They marched about 3,900 of the fittest prisoners south to the English city of Durham. Their English captors gave them no food and no shelter on the march, and killed some of them for refusing to keep walking. At Durham the English locked the prisoners in the city's cathedral, a large church that was not in use at the time.

A group of English leaders called the Council of State decided to send most of the prisoners to the colonies. In November 1650 they ordered 150 of the Dunbar prisoners handed over to agents of John Becx and Joshua Foote, two of the main investors in the Company of Undertakers. The prisoners sailed from England on a ship called the *Unity* and reached Boston in December 1650. The records do not show how many died on the voyage.

The men running the company sent 36 of these prisoners to work at Saugus, according to the historian Marsha Hamilton. They put others to work at a company warehouse in Boston and sold the rest to farmers, merchants and other mills.

Bound to work. The company's men forced many of the Scots to work five to seven years at Saugus under indentures, written agreements that bound a person to work for a master for a set number of years. These men had no say in theirs. They had to work to pay back the cost of their voyage, food, shelter, care and clothing. National Park Service staff give the term at Saugus as seven years.

Most of the Scots at Saugus cut wood, worked as colliers, the men who made charcoal, or did heavy work that needed no special skill. Other prisoners did hard and dangerous forced labor elsewhere in Massachusetts and in New

Hampshire and Maine, for the farmers, merchants and mill owners who bought them.

Meanwhile in Europe

Chemists in Europe, people who study what substances are made of and how they change, began to separate their work from alchemy in the 1600s. Robert Boyle's book *The Sceptical Chymist* ("chymist" is an old spelling of chemist), published in 1661, is one sign of that split. Every element discovered in this century was found in Europe. Phosphorus, for one, was found in the city of Hamburg in 1669.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 3 MINUTES

At many of the iron furnaces colonists built between 1700 and 1750, the owners forced enslaved people to do much of the work. Colonists had built ironworks in New England, Pennsylvania, Maryland, Virginia and New Jersey. By about 1750 they were shipping raw iron, iron not yet made into finished goods, from their own furnaces to Britain. Nobody discovered an element anywhere in the Americas in these years, and element science still happened only in Europe.

Enslaved and indentured ironworkers

British investors set up the Principio Company in Maryland in 1719. Its furnace began with workers who were mostly indentured servants from Britain. By the middle of the 1700s, more of the workers there were enslaved African Americans, many of them in skilled jobs.

The owners fed their enslaved and indentured workers mostly corn and salt pork. Some of these workers tried to escape. Historians at the University of Maryland and the Maryland Historical Trust, who surveyed the state's old industries, wrote that escape attempts were "not uncommon."

The Baltimore Iron Works. Five rich Maryland planters, owners of large farms called plantations, founded the Baltimore Iron Works in 1731. They were Dr. Charles Carroll, his cousins Charles and Daniel Carroll, Daniel Dulany and Benjamin Tasker. The partners put up money and supplied enslaved people, whom they held as property and forced to work without pay. The works opened with 89 workers, and 42 of them were enslaved, according to the staff of the Mount Clare Museum House in Baltimore.

Workers hauled cartloads of charcoal, oyster shells and iron ore to the top of the furnace in 12-hour shifts. The furnace ran day and night, six or seven days a week. Many of the workers were enslaved people. Others were convicts, people found guilty of crimes in Britain and shipped across the ocean as punishment. The owners did not give the workers enough food, according to the museum. Some enslaved and convict workers ran away, and others worked slowly or carelessly on purpose.

The Iron Act of 1750

Members of Parliament, Great Britain's lawmakers, passed the Iron Act in 1750. They wrote it to keep colonists making pig iron and bar iron, iron hammered into bars, and sending it to Britain. The act also stated that colonists could not build new mills to make finished ironware, iron goods ready for use. The members of Parliament wanted that business kept in Britain.

Colonists ignored the ban. After 1750 they built more than sixty new ironworks, about twenty of them in Pennsylvania. By the American Revolution, colonists made more iron than people in England and Wales did. By a common ranking, the colonies were third in the world for iron.

At home. Colonists used other elements every day. Lead went into gunshot and into pewter, a gray metal made mostly of tin and used for plates, bowls, mugs and spoons. Kettles and buttons were made of copper or of brass, a metal made partly of copper. Silver and gold arrived in the colonies as Spanish coins.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 5 MINUTES

Chemists in Europe turned chemistry into a modern science in the second half of the 1700s. Among them were Carl Wilhelm Scheele in Sweden and Antoine Lavoisier in France, who worked out what an element is and found new ones. Nobody in the United States discovered an element in these years. Americans put elements into their coins and dug ores out of the ground.

Joseph Priestley, one of those chemists, collected oxygen in England in 1774 and moved to Pennsylvania twenty years later. Meanwhile owners of iron furnaces in Maryland held hundreds of Black people in slavery. And in North Carolina in 1799, a 12-year-old boy found a gold nugget in a creek on his father's farm.

Three elements in the new coins

Lawmakers in Congress passed the Coinage Act, and it became law on April 2, 1792. Under it, government officials set up the United States Mint, where workers make the country's coins. The act also stated that the coins would be made of three elements: gold for coins called eagles, silver for dollars and smaller coins, and copper for cents.

Enslaved ironworkers in Maryland

After the Revolution, Maryland officials took a one-fifth share of the Baltimore Iron Works from Daniel Dulany, who had sided with Britain in the war as a Loyalist. They offered the share for sale in 1785 in an advertisement in the *Maryland Gazette*, a newspaper. The advertisement listed more than 200 enslaved Black people at the works, according to the Mount Clare Museum House. Their owners made them work without pay.

Catoctin Furnace. Four brothers, Thomas, James, Baker and Roger Johnson, built Catoctin Furnace in Maryland, and it was making iron by 1776. Thomas Johnson later became the first governor of the state of Maryland. In 1803 Baker Johnson became the only owner.

One Johnson owner by himself enslaved more than 80 people at the furnace, according to the Catoctin Furnace Historical Society, which names him only as "Johnson." The society names some of the enslaved men, among them Collier Sam, Waggoner's Henry and Harvey. A collier made charcoal, and a waggoner drove wagons.

Counting all the years the furnace ran on enslaved labor, at least 271 enslaved people and an unknown number of free African Americans worked at Catoctin, according to a 2023 study in the journal *Science*. They mined ore, made charcoal, worked the forge, filled the furnace, drove wagons and cut wood. Others worked in the owners' houses and fields. The furnace had a cemetery for its African American workers, with burials from 1774. Between about 1825 and 1850, the owners switched to paid workers, most of them white.

The cemetery. The same study traced the DNA, the material in the body's cells that parents pass down to their children, of 27 people buried in the Catoctin cemetery. Scientists from Harvard Medical School, the Smithsonian and the company 23andMe planned and led the work, and they published it on August 4, 2023. They linked the 27 people to nearly 42,000 living relatives.

Joseph Priestley

Who: The English chemist credited with discovering oxygen, who spent his last ten years as an immigrant in Pennsylvania.

When and where: Isolated oxygen on August 1, 1774, in England. Moved to America in 1794. Lived in Northumberland, Pennsylvania, until his death on February 6, 1804.

Priestley pointed sunlight through a lens and caught a new gas.

He did it in England on August 1, 1774. With a burning lens, a glass lens that bends sunlight to one hot point, he heated mercuric oxide, a compound of the element mercury and oxygen. He isolated a gas from it, which means he collected the gas apart from everything else. The gas was later named oxygen.

Carl Wilhelm Scheele, in Sweden, had found the same gas earlier but published his work later. The French chemist Antoine Lavoisier gave oxygen its name. Priestley had already invented carbonated water, water with bubbles of gas in it, in Leeds in 1767. In 1770 he gave rubber its English name, because he found it was good for rubbing out pencil marks.

A mob, then Pennsylvania. Priestley was also a minister, a leader of a church, and he preached outside the official Church of England. Many people in Birmingham, England, turned against him for his views on religion, and in 1791 a mob there burned his home and his laboratory. In 1794 he left England for Pennsylvania and settled in Northumberland, where his house was finished in 1798.

There he built what was then the best chemistry laboratory in the United States and identified the gas carbon monoxide. He turned down a job as a professor at the University of Pennsylvania. Priestley died in Northumberland in 1804. American chemists met at his house in 1874, one hundred years after he isolated oxygen, and that meeting was a step toward the founding of the American Chemical Society in 1876. The house is now a National Historic Landmark.

Conrad Reed

Who: A 12-year-old farm boy who found the first gold in the United States that an expert confirmed was real.

When and where: 1799, Little Meadow Creek, Cabarrus County, North Carolina.

The Reeds used a 17-pound gold nugget to hold a door open.

Conrad Reed pulled a heavy yellow rock out of Little Meadow Creek in 1799. The creek ran through the farm of his father, John Reed, in Cabarrus County, North Carolina. The rock was a gold nugget, a lump of metal found in the ground, and it weighed 17 pounds.

Nobody in the family knew the rock was gold. They used it as a doorstop for about three years. In 1802 a jeweler identified it as gold and bought it from John Reed for $3.50, about a week's wages. It was worth about $3,600 at the time.

Conrad's find was the first gold found in the United States that an expert checked and showed was real. After it, people in North Carolina began the first gold mining in the United States.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 5 MINUTES

Thousands of miners rushed onto Native land to dig gold in Georgia from 1829 and copper in Michigan from 1843. The Georgia gold lay under Cherokee land, and the Michigan copper lay under Ojibwe land. Georgia lawmakers gave the Cherokee gold country away by lottery, a drawing of names by chance. In 1842 a United States official signed a treaty, a written agreement between nations, under which Ojibwe bands, groups within the Ojibwe nation, gave up the copper country.

Nobody in the United States discovered a new element in these years. In Europe, chemists such as Humphry Davy and Jöns Jacob Berzelius found one element after another.

Gold on Cherokee land

North Carolina came first. After Conrad Reed's find in 1799, more people dug for gold on the Reed farm and along the creeks near it, and that mining grew from 1803. Miners in North Carolina dug more gold than miners in any other state until the California gold rush of 1849.

The first printed report of gold in Georgia appeared in the *Georgia Journal*, a newspaper, on August 1, 1829. The gold was in the Cherokee Nation, the homeland of the Cherokee people. By the spring of 1830, about 4,000 miners had crowded onto Cherokee land to dig. The gold town of Dahlonega takes its name from the Cherokee word for "golden."

The Gold Lottery. Members of the Georgia General Assembly, the state's lawmakers, passed a law on December 24, 1831. Under it they divided "the original Cherokee Indian territory" into lots and gave it away by lottery. In the Gold Lottery, winners received lots of 40 acres in the gold country for a fee of $10 a lot. The drawings ran from October 22, 1832, to May 1, 1833.

The Cherokee who lived on the land could not enter, because the lawmakers barred anyone who lived in the Cherokee territory. The lots went to white Georgians. Men who were United States citizens, widows and the families of orphans could enter if they had lived in Georgia for three years and had not mined gold in the Cherokee territory since June 1, 1830.

Forced out. President Martin Van Buren sent General Winfield Scott in 1838 to force the remaining Cherokee off their land and west of the Mississippi River. Scott commanded about 7,000 soldiers and members of state militias, part-time armies run by the states. His troops forced the Cherokee into stockades, pens fenced with tall wooden posts.

A missionary wrote in June 1838 that the Cherokee "have been dragged from their houses." In Georgia, he wrote, "multitudes were allowed no time to take any thing with them except the clothes they had on."

Scott's soldiers forced more than 16,000 Cherokee to leave for the west in 1838 and 1839, on the journey called the Trail of Tears. Over 4,000 died of cold, hunger and disease along the way, by the usual count. Russell Thornton, a scientist who studies the size of populations, puts the Cherokee losses at about 8,000 or more. Chapter 2, Native Nations, tells the Trail of Tears in full.

Copper on Ojibwe land

Douglass Houghton was Michigan's state geologist, a scientist the state paid to study its rocks. In 1840 he published a report on the copper of the state's Upper Peninsula. The Keweenaw Peninsula there has veins, long thin bands running through the rock, of pure native copper. Native miners had worked those same veins for thousands of years.

The land belonged to Ojibwe bands. Robert Stuart, an official the United States sent to make an agreement, signed the Treaty of La Pointe with Ojibwe bands on October 4, 1842. Under the treaty, the bands gave up land along the south shore of Lake Superior, including the Keweenaw copper country.

The treaty states that the Ojibwe would receive $12,500 a year in coins and $10,500 a year in goods for 25 years. It also states that $75,000 would go toward debts the Ojibwe owed to traders. The Ojibwe kept the right to hunt on the land "until required to remove by the President of the United States." That meant they could hunt there only until the President ordered them to leave.

The treaty never uses the word copper, but people came to call it the Copper Treaty. The Bad River Band of Ojibwe and the Lac Courte Oreilles Ojibwa College both say that United States officials wanted the copper.

The copper rush. United States officials opened an office at Copper Harbor in 1843 to handle land with metal in it. From that year on, thousands of prospectors, people who search the ground for metal, poured into the Upper Peninsula in the nation's first great copper rush. The Keweenaw stayed the country's biggest source of copper into the 1880s.

The Ontonagon Boulder

Julius Eldred, a merchant from Detroit, made a deal in the summer of 1841 for the sacred Ontonagon Boulder, the 3,708-pound lump of pure copper. He made it with Okandikan, a leader of the Ontonagon band of Ojibwe. Eldred agreed to pay $45 right away and $105 more if he managed to move the boulder. He hauled it away in 1843.

Walter Cunningham was the United States government's agent in charge of the lands with metal in them. Before Eldred could leave Copper Harbor, Cunningham made him hand the boulder over to the government in Washington. Later, members of Congress paid Eldred money to make up for his loss.

The boulder sat in a yard of the War Department, the part of the government that ran the army, until 1860. Then it was moved to the Smithsonian, the national museum in Washington, D.C., and put on display.

The Keweenaw Bay Indian Community, made up of the L'Anse and Ontonagon bands of Lake Superior Ojibwe, formally asked the Smithsonian to return the boulder in 1991. Smithsonian officials refused in 2000. They said the boulder did not fit the meaning of a sacred object under the law on returning Native objects, and it stayed at the Smithsonian.

Lead at Galena

Miners also dug lead in these years, in Missouri and in the Galena district of Illinois and Wisconsin. The town of Galena, Illinois, is named for galena, a lead ore.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 7 MINUTES

Mercury from the gold mines got into California's rivers and fish, and mercury in the hat shops of Danbury, Connecticut, poisoned the hatters who breathed it. California's gold miners released about 13 million pounds of it at their mines and into rivers. Miners also took gold from the Black Hills, land that belonged to the Sioux, and in 1877 members of Congress voted to take the hills from them.

Aluminum, rare at the start of these years, was cheap by the end of them. In 1886 Charles Martin Hall, a 22-year-old in Oberlin, Ohio, found a cheap way to make it. By the middle of the 1890s its price had fallen from about $12 a pound to less than $1. Scientists abroad already knew aluminum as an element. What Hall found was a process, a series of steps for making the metal.

Mercury in the rivers and the hat shops

Mercury is an element, a metal that stays liquid at room temperature, also called quicksilver. Gold miners used it to catch the fine bits of gold in the gravel they dug, and they lost mercury into the rivers.

How much mercury. California's gold miners used about 26 million pounds of mercury, and about half of it, some 13 million pounds, escaped into the ground and the rivers. Scientists at the United States Geological Survey, the government office for studying the country's rocks and water, made the count.

Placer miners, who wash gold out of sand and gravel in streams, lost about 10 million pounds of mercury, 80 to 90 percent of it in the Sierra Nevada mountains. Miners at hardrock mines, which are dug into solid rock, lost about 3 million pounds more.

Still in the fish. The Geological Survey's scientists list three ways this mercury reaches people: in fish they eat, in mud they handle and in the air they breathe. In the air it is a vapor, a gas rising off a liquid or a solid. The form that builds up most easily in living bodies, fish included, is called methylmercury. It is also the form most poisonous to people.

California officials had warned people about eating fish from about 20 lakes, rivers and other waters by 2005, because of mercury. Fish in the Bear and Yuba river areas carry enough mercury to put people's health at risk, the scientists found. They give no count of people poisoned by the gold miners' mercury.

The Danbury shakes. People in Danbury, Connecticut, had made hats since 1780. To make felt, a thick cloth of pressed fur, they soaked fur in a liquid that contained mercury nitrate, a compound of mercury, and the fur matted together into felt. This step was called carroting. As they worked, the hatters breathed in the mercury as vapor and as dust.

Doctors first described the hatters' mercury poisoning in medical writing in 1860, and people called it the Danbury shakes. The poisoned hatters had tremors, shaking they could not stop. Their skin itched, burned or peeled. Some lost their hair and teeth. They sweated, swelled up, felt dizzy and got

confused. The mercury slurred their speech and made them stumble, and people mistook the shaking hatters for drunks. In bad cases, hatters had hallucinations: they saw or heard things that were not there.

The members of Connecticut's State Board of Health watched the mercury's effects in Danbury's hat factories in the 1880s and 1890s. They did not act, because the carroting was not harming people outside the factories. The historian Shirley Wajda, who wrote the history of the Danbury shakes for Connecticut Humanities, names no factory owner and gives no count of hatters poisoned before 1900.

Silver, copper and a table from Russia

Miners found the Comstock Lode, a long, rich band of ore inside the rock, at Virginia City, Nevada, in 1859. It was the richest find of silver ore ever made in North America. Its ore held gold as well as silver, and miners rushed there too.

Dmitri Mendeleev, in Russia, published his periodic table of the elements in 1869: a chart that arranges the elements in order, with elements that act alike grouped together. Mendeleev used his table to predict elements that nobody had found yet. Every element that Americans discovered later went into it.

Americans strung copper wire through their cities in these years for electric lights and the telephone. The copper came from Michigan, and later from Butte, Montana.

Gold from the Black Hills

The Black Hills, in what is now South Dakota, belonged to the Sioux under the Fort Laramie Treaty of 1868. Lieutenant Colonel George A. Custer led an Army expedition into the hills in 1874, with miners along, and the men confirmed that there was gold. Miners poured in, and in late 1875 President Ulysses S. Grant ordered the Army to stop keeping them out.

Members of Congress then voted to cut off the Sioux's food until they gave up the hills. In 1877 they took the hills by law, though only about one in ten adult Sioux men had signed the paper giving them up. Chapter 12, Landmarks, tells that story in full. It also tells about the money the justices of the Supreme Court awarded the Sioux in 1980, about $106 million, which the Sioux have refused.

An aluminum tip for the Washington Monument

Chapter 12, Landmarks, tells how workers finished the Washington Monument in 1884. Its tip was a pyramid of aluminum, a metal that was rare then. Aluminum cost about $1 an ounce, the same as silver, though some price records from those years give a little less.

Colonel Thomas Lincoln Casey of the Army Corps of Engineers was the engineer in charge of finishing the monument. He talked over the metal for the tip with William Frishmuth, the owner of a Philadelphia foundry, a factory where workers melt metal and pour it into molds. Frishmuth chose aluminum, and Casey agreed. Aluminum matched the color of the monument's granite and would not stain. It also polished well and could be engraved.

Frishmuth cast a pyramid that weighed 100 ounces, the largest piece of aluminum anyone had yet cast. After some bargaining over his bill, he was paid $225.

Before the tip went up, Frishmuth showed it at the Tiffany's store in New York without permission. The tip sat on the floor, so visitors could step over the top of the Washington Monument. Workers set it in place on December 6, 1884.

Charles Martin Hall and Julia Brainerd Hall

Who: A 22-year-old Ohio college graduate who invented the cheap way to make aluminum, and his older sister, a chemist whose notes helped win the fight over his patent.

When and where: February 23, 1886, in the family woodshed in Oberlin, Ohio.

Charles Hall made aluminum in a woodshed, with batteries he built himself.

Hall was 22 and had just finished at Oberlin College. In the family woodshed he melted a substance called cryolite and dissolved aluminum oxide, a compound of aluminum and oxygen, in it. On February 23, 1886, he ran electricity from batteries he had built himself through the melted mix, and beads of aluminum metal came out.

His older sister, Julia Brainerd Hall, had studied chemistry at Oberlin College. She helped with the experiments, watched them and wrote them down. Later Hall had to fight for his patent, the government paper that gave him alone the right to make and sell his invention for a set number of years. Julia's notes helped him win.

In France, Paul Héroult found the same process in the same year, working on his own. Both men were born in 1863, and both died in 1914. The method is called the Hall-Héroult process, and aluminum makers around the world still use it.

Cheap aluminum. Aluminum cost about $12 a pound in the early 1880s. In 1888 the investors who backed Hall formed the Pittsburgh Reduction Company to make aluminum his way. After aluminum makers began to use his process, the price fell to about $2 a pound, and by 1893 to about 78 cents. The company's owners renamed it the Aluminum Company of America, or Alcoa, in 1907. Aluminum became cheap enough for kitchen foil and pots and pans.

Helium, almost found in America

William Hillebrand, a chemist at the United States Geological Survey, got a gas out of uranium ore around 1890. The gas did not join with other substances. Hillebrand recorded it as nitrogen and missed the chance to find helium.

William Ramsay in London followed up on Hillebrand's paper in 1895. He got a gas out of cleveite, a uranium mineral, and examined it with a spectroscope, an instrument that splits light into its colors. He saw a yellow line that belongs to helium. Scientists had seen helium's line in the light of the sun since 1868, but nobody had found helium on Earth before. The credit for finding it on Earth goes to Ramsay.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 25 MINUTES

Radium, lead, mercury, arsenic and uranium poisoned many of the Americans who worked with them in the first half of the 1900s. Young women who painted watch dials swallowed radium because their supervisors told them to shape their brushes with their lips, and many of them died of radium poisoning. At least 15 workers died of lead poisoning in the 1920s at the plants that made a lead additive for gasoline.

Arsenic from a copper smelter in Montana killed farm animals. From 1941 Navajo and other Native miners dug uranium, and Navajo miners later reported that no one had told them of its dangers.

At the same time, scientists began making new elements, substances of only one kind of atom, with a machine at Berkeley, California. The first, in 1937, was identified in Italy, in material that had come out of that machine. By the end of 1949, teams working in the United States had made or found seven more: astatine, neptunium, plutonium, curium, americium, promethium and berkelium.

The gas well that put out the fire

Helium is an element, a gas that does not burn. A drilling company struck a roaring gas well on William Greenwell's farm near Dexter, Kansas, in May 1903. The people of Dexter planned a celebration. They pushed a burning bale of hay toward the gas to light a giant flame, and the gas put the fire out. Local people made fun of it as "wind gas."

Erasmus Haworth was a Kansas geologist, a scientist who studies rocks. He carried samples of the gas to the University of Kansas. There the chemists Hamilton P. Cady and David F. McFarland tested it. On December 7, 1905, they showed that the gas was 1.84 percent helium. Scientists had thought helium was rare on Earth, and Cady and McFarland found large amounts of it in the natural gas under the Great Plains.

Helium for airships. Airships flew in World War I, and helium became valuable to armies because it does not burn. Members of Congress passed the Helium Act in 1925. Under it, federal workers, people who worked for the national government, began producing helium and storing it underground in the Bush Dome of the Cliffside gas field, near Amarillo, Texas. That store became the Federal Helium Reserve, and for decades it held nearly all of the world's supply of helium.

Under a 1927 law, no one could sell American helium to other countries. For that reason, the German airship *Hindenburg* flew on hydrogen, a gas that burns. On May 6, 1937, the *Hindenburg* caught fire as it came in to land at Lakehurst, New Jersey. Of the 97 people on board, 35 died, and so did a man working on the ground.

After the fire, President Franklin D. Roosevelt considered selling helium to Germany. Then in 1938 Hitler took over Austria and made it part of Germany, and Harold Ickes, the Secretary of the Interior, refused to sell. Ickes headed the federal department in charge of public lands.

Radium on the watch dials

Marie and Pierre Curie found the element radium in France in 1898. Radium is radioactive: its atoms break apart on their own and give off radiation, energy that shoots out of an atom as it breaks apart. Some radiation travels as tiny, fast particles that can damage the living cells of a body. The kind radium gives off is called alpha radiation.

Workers at American companies mixed radium into paint in the early 1900s so that watch numbers glowed in the dark. Other sellers put radium into tonics, drinks they claimed would make people healthy.

The companies. Two doctors, Sabin Albin von Sochocky and George S. Willis, founded the Radium Luminous Materials Corporation in New Jersey in 1914. After World War I the company was reorganized and renamed the U.S. Radium Corporation, with a plant in Orange, New Jersey. At its biggest, the company employed as many as 250 young women, some only 15 years old.

Arthur Roeder, who had been the company's treasurer, in charge of its money, replaced von Sochocky as president in January 1921. Howard Barker was the vice president and chief physicist. In Ottawa, Illinois, the Radium Dial Company ran another dial-painting plant. It belonged to the Standard Chemical Company of Pittsburgh, and Joseph Kelly was its president.

KNOWN:	More than 3,000 girls and young women painted radium dials across the country in the 1910s and 1920s, by the count of the National Institute of Standards and Technology, a federal science laboratory.
NOT KNOWN:	The full count, since Northern Public Radio gives about 4,000 and neither count comes with a list of the painters.

The Radium Girls

Who: Young women, some of them teenagers, who painted glowing radium numbers on watch and instrument dials and were poisoned by the paint.

When and where: The U.S. Radium Corporation in Orange, New Jersey, from 1917, and the Radium Dial Company in Ottawa, Illinois, into the 1930s.

The method had a name: "lip, dip, paint."

Young women at the U.S. Radium Corporation plant in Orange, New Jersey, painted watch numbers with radium paint from 1917. To shape each brush to a fine tip, a painter drew it between her lips, then dipped it in the paint and painted: lip, dip, paint. Drawing the brush through the lips was called lip-pointing. Each time a painter lip-pointed, she swallowed a little radium. The women went home glowing, and some people called them ghost girls.

Who told them to. Their supervisors told them to lip-point and said the paint was safe. Von Sochocky, one of the company's founders, grew worried about lip-pointing and told the painters to stop, but the supervisors contradicted him, according to Northern Public Radio. Arthur Roeder was the company's president from January 1921, and he still signed papers for the company in 1926. Lip-pointing there went on until after 1926. No surviving record names the New Jersey supervisors.

What the radium did. Radium belongs to the same chemical family as calcium, the mineral in bones and teeth. So the painters' bodies took the swallowed radium into their bones and teeth, the way they take in calcium, and there it kept giving off radiation from inside the body. The radiation damaged the bone marrow, the soft center of the bones that makes blood cells, until the marrow stopped making them. Doctors call this aplastic anemia.

The jawbone died and broke down, which doctors call necrosis of the jaw, and some women got bone cancer. A history published by the National Institute of Standards and Technology states that the radiation "had

eaten away their bones from the inside out." Some women's spines collapsed, and they had to wear braces. Their jawbones shattered under light pressure. When doctors examined dial painters' bodies after death, they found 99 percent of the radioactivity in the skeleton.

The first deaths. Grace Fryer began painting dials at the Orange plant on April 10, 1917, and worked there until 1920. Another painter there, Amelia Maggia, called Mollie, painted dials at the company until she died in 1922. In 1924 a dentist found damage to Grace Fryer's jawbone of a kind he had never seen.

In June 1925 a chemist at the company died of aplastic anemia, and a dial painter died 13 days later. The medical examiner of Essex County, New Jersey, the doctor who looks into sudden and suspicious deaths there, examined the chemist's body. He gave the jaw disease the name "radium jaw."

The lawsuit. Grace Fryer and four other dial painters sued the company in May 1927. Their lawyer was Raymond Berry. Mollie Maggia's body was dug up on October 25, 1927. It held 48.4 micrograms of radium, millionths of a gram, which is 500 times the amount later set as the limit for a human body.

Company officials first offered each woman $10,000, with her medical and legal costs taken out of it. The women refused. In June 1928 they accepted $10,000 each, their medical bills and a pension of $600 a year, money paid every year for the rest of their lives. A committee of three doctors had to approve the bills. Some accounts give the amount each woman got as $15,000.

A federal judge arranged the deal on June 4, and the agreement was signed on June 8. The company's officials admitted no blame, and Berry took 10 percent. Von Sochocky, one of the two doctors who founded the company, died of radium poisoning on November 14, 1928. Grace Fryer died in 1933.

Ottawa, Illinois. The Radium Dial Company advertised for painters in Ottawa in September 1922. The advertisement named a Miss Murray as the person young women should apply to. Catherine Wolfe, who later married and took the name Donohue, described how Miss Murray taught them to point the brushes between their teeth. Supervisors at Radium Dial told the women the paint was safe, and even healthy, and kept them lip-pointing.

Radium Dial's managers hired doctors to examine the painters from 1925. The doctors told one painter that she was very healthy. Nobody told her that she had tested positive for radiation, her niece said later.

Catherine Wolfe Donohue painted dials there and began to feel sick in 1925. Radium Dial's managers fired her in 1931. In her own words, "my limping was causing much talk." She lost half her body weight, and parts of her jaw fell out.

Joseph Kelly lost his post as Radium Dial's president in 1934. He opened a new dial company, Luminous Processes, a few blocks away and hired many of the same workers. That plant ran until 1976, when officials of the Nuclear Regulatory Commission, a federal agency, found radiation there 1,666 times the allowed level.

The hearing. A lawyer took Catherine Donohue's case for no pay, before the Illinois Industrial Commission, a state board that decided claims by workers hurt on the job. At a hearing on February 10, 1938, she brought a box of pieces of bone that she said had come from her jaw. When the judge asked her doctor about her chances of living, she collapsed, and several men carried her from the room. She weighed 71 pounds.

The hearing moved to her home. On April 5, 1938, the hearing officer ruled that her work at Radium Dial had made her sick and awarded her $5,661, which included a pension of $277 a year for life. On July 6 the members of the commission threw out the company's appeal and added $730.

> Catherine Donohue died on July 27, 1938, at the age of 35. According to NPR Illinois, she weighed less than 60 pounds. Her lawyer said hers was the eleventh death among women who had done that work at the plant, and Northern Public Radio later counted fifteen Ottawa workers dead of radium. Radium Dial's lawyers appealed all the way to the United States Supreme Court and lost, and the case ended in October 1938. Because Radium Dial had left Illinois, the Ottawa women together collected only $10,000.

Radium sold as medicine

William J. A. Bailey owned Bailey Radium Laboratories in East Orange, New Jersey. He sold Radithor, which was radium dissolved in water. Bailey had falsely claimed degrees from Harvard and from Vienna, and in 1927 he had pleaded guilty to practicing medicine without the right to do it. His company sold more than 400,000 bottles of Radithor at $1 each.

Eben Byers was a rich Pittsburgh businessman. He hurt his arm in 1927 at a party on a train after the Harvard-Yale football game, and he began drinking Radithor to heal it. He stopped in 1930, when his teeth began falling out. Accounts of how much he drank differ. The Museum of Radiation and Radioactivity at Oak Ridge Associated Universities says he averaged three bottles a day for about two years from December 1927. Other accounts give about 1,400 bottles in all.

The radium destroyed his bones. A government investigator reported that his whole upper jaw except two front teeth, and most of his lower jaw, had been removed. The rest of his bones were slowly breaking down, and holes were forming in his skull.

Byers gave testimony to the Federal Trade Commission, the federal office whose officials act against companies that cheat or mislead buyers. On December 19, 1931, the commission's officials ordered Bailey to stop claiming that Radithor was harmless or that it healed people. Byers died months later, in 1932, at the age of 51.

BY 1938: Doctors had named radium jaw, a federal judge had arranged the New Jersey painters' settlement, and Illinois officials had ruled that Catherine Donohue's work at Radium Dial made her sick.

Lead in gasoline and paint

Lead is a soft, heavy metal and an element, and it poisons people who swallow it or breathe it in. Scientists at the National Institute for Occupational Safety and Health (NIOSH), the federal office that studies dangers at work, list what large doses of lead do. Their list includes paralysis (being unable to move part of the body), madness, gout (painful, swollen joints), colic (sharp pains in the belly) and death.

The additive. Thomas Midgley Jr., a researcher at General Motors (GM), found that tetraethyl lead, a liquid made of lead joined with other chemicals, stopped engine "knock," a pinging sound in gasoline engines. In August 1924 GM and Standard Oil of New Jersey set up the Ethyl Gasoline Corporation to sell it, and the DuPont company made it.

The dead. Workers who made tetraethyl lead died of lead poisoning at three plants. Standard Oil ran one, the Bayway refinery in Elizabeth, New Jersey, a plant that turned oil into gasoline and other products. Seven men died there in October 1924, and 33 went to the hospital, according to Bill Kovarik, who counted the dead in a 2005 article in a journal about workers' health.

Ten more workers died at a DuPont plant in Deepwater, New Jersey, between September 1923 and the fall of 1924. At GM's laboratory in Dayton, Ohio, at least two died, and 40 went to the hospital.

KNOWN:	At least 15 workers died from making tetraethyl lead in the 1920s, the count NIOSH scientists gave in 2021.
DISPUTED:	Kovarik's plant-by-plant numbers add up to at least 19, while other accounts give five dead at Bayway, not seven, and 35 in the hospital.

How the work poisoned them. The tanks that held the chemicals were not closed off from the workers, who had to open them between steps, Kovarik writes. Workers squeezed half-melted lead through metal grates with shovels and with their boots.

At Bayway, poisoned men had to be held down and tied into straitjackets, coats that pin a person's arms to the body. Kovarik's account does not say who restrained them. Their bodies were black and blue from muscle spasms they could not stop. They saw things that were not there, such as flying insects, and some could suddenly turn violent or want to kill themselves. Workers called tetraethyl lead "loony gas."

What the bosses said. Frank Mann, the Bayway plant supervisor in 1924, said, "These men probably went insane because they worked too hard." A month before the deaths, in September 1924, engineers from DuPont had visited Bayway and called its safety measures "grossly inadequate."

Joseph G. Leslie, a Bayway worker poisoned there, was kept in a mental hospital for 40 years. Only his wife, Gertrude, and later his son knew he was alive, and everyone else believed he had died. Kovarik does not say who sent Leslie to the hospital or who spread the story that he was dead. He names no manager of the Deepwater plant or the Dayton laboratory apart from Midgley and Charles Kettering, who ran GM's research.

Midgley held a press conference on October 30, 1924. He poured tetraethyl lead on his hands and breathed its vapor for about 60 seconds, to show it was safe. A few months earlier, lead had made him seriously ill. At the same event he acknowledged the two deaths in Dayton and said more than 50 workers were "under observation" for lead poisoning.

The meeting in Washington. Hugh Cumming, the Surgeon General, ran the Public Health Service, the federal office in charge of the nation's health. On May 20, 1925, he brought more than 100 people from industry and from public health to a meeting in Washington.

Frank Howard of Standard Oil said the industry could not give up "what has come to the industry like a gift from heaven." Yandell Henderson, who studied how the body works at Yale, called tetraethyl lead "one of the most dangerous

things in the country today." Alice Hamilton of Harvard told Kettering there were "thousands of things better than lead."

Members of a Surgeon General's committee reported in 1926 that they found "no good grounds" for a ban, and asked for more study. The Ethyl company paid Robert Kehoe of the University of Cincinnati to study lead. Kehoe set out the industry's "safe level" theory, the claim that lead below a certain amount did no harm, and the companies held to that claim for decades.

Lead paint. Painters also used paint that contained lead. Between 1925 and 1927, more painters died of lead poisoning than workers in all other jobs combined, NIOSH states.

Delegates of the International Labour Organization, a world body that sets rules for workplaces, met in Geneva in November 1921. They agreed on a treaty to ban lead paint for the insides of buildings. The ban took effect in 1923 in the countries that accepted it. The United States did not belong to the organization until 1934, and it was still outside the ban in 2017.

Mercury in Danbury's hat shops

Danbury's hatters kept breathing mercury at work after 1900, because they still used it to turn fur into felt. Connecticut lawmakers added mercury poisoning to the state's workmen's compensation law in 1913. Under a law of that kind, employers pay workers who are hurt or made sick by their jobs.

Alice Hamilton of Harvard examined 100 Danbury hatters in 1922 and found 43 with mercury poisoning. Some shook so hard from tremors that they could not feed themselves.

Who pushed for a fix. The hatters in the union, a group of workers who join together to bargain with their employers, kept demanding investigations. Grace Mailhouse Burnham, who had set up the Workers' Health Bureau, found a way to make felt without mercury in the Soviet Union. She could not get the hat manufacturers to agree to use it.

Government researchers made a full study only in 1937. They found many hatters poisoned by mercury. They also found that drinking and smoking had not caused the hatters' symptoms, as some manufacturers and insurance

companies had claimed in court. The historian Shirley Wajda's account of the Danbury shakes names no factory owner.

The end of mercury felt. Officials of the Public Health Service then worked out an agreement with the hatters' unions and the hat manufacturers in the 26 states that made hats. Under it, hat makers stopped using mercury and used hydrogen peroxide in its place.

Connecticut Governor Robert A. Hurley announced his state's ban on December 1, 1941. He said "it was possible to manufacture good fur felt hats without making physical wrecks out of hundreds of workers." Mercury is still in Danbury's soil and in the mud of the Still River.

Arsenic smoke in Montana

Arsenic is an element and a strong poison. The Anaconda Copper Mining Company started its Washoe smelter, a plant where workers melt ore, rock that holds metal, to get the metal out, at Anaconda, Montana, in 1902. It stood about 25 miles from the copper mines of Butte. When workers melted copper ore there, arsenic went up the smokestack with the smoke, and farmers nearby reported livestock dying in the smelter's first year.

Farmers in the Deer Lodge Valley formed an association in 1904 to sue the company. Fred J. Bliss, whose 320-acre farm lay about five miles from the smelter, filed the case, *Bliss v. Anaconda Copper Mining Co.*, in 1905. In January 1909 a federal judge, William Hunt, agreed that arsenic from the smelter had poisoned livestock and the hay and grass they ate, but he refused to close the smelter.

The judge's reason. Closing the smelter, Hunt wrote, would throw thousands of the company's workers out of their jobs and do harm that could never be undone to the cities of Anaconda and Butte. Bliss could ask a court for money for his losses instead. The smelter's superintendent, a Mr. Mathewson, told the court that no known way of catching the arsenic would work at a smelter that size, and in April 1909 Hunt dismissed the case.

Buying the smoke rights. The company's officers then bought out many of the farmers. From the rest they bought "smoke easements," legal rights to send the company's smoke over a farm. Staff of the Environmental Protection Agency (EPA), the federal office whose staff work to protect the country's air, water and land, wrote a history of the site. Neither that history nor the 1909 rulings name the officers who chose the buyouts, and neither counts the people harmed by the arsenic.

Uranium from Navajo land

Uranium is a heavy metal element whose atoms break apart slowly and give off radiation. From 1941, Native American miners, among them Navajo, Pueblo and Hopi people, worked in mines in the Southwest that dug uranium and vanadium, another metal element. The Vanadium Corporation of America began mining uranium in secret on Navajo land in 1943.

Miners working for mining companies dug nearly 30 million tons of uranium ore out of Navajo land from 1944 to 1986, EPA staff report. The companies mined under leases with the Navajo Nation, agreements to use land for a set time in return for payment.

BY 1943: Hat makers had stopped using mercury, Anaconda's owners had bought the right to send smoke over the farms that were left, and a company was secretly mining uranium on Navajo land.

A false first, and the machine at Berkeley

While those poisonings went on, physicists, scientists who study matter and energy, were hunting for new elements. Fred Allison, a physicist at Alabama Polytechnic, now Auburn University, announced two new elements in 1931. He called element 85 "alabamine" and element 87 "virginium," and said he had found them with a machine in his lab.

Scientists at other labs tried his method and could not get the same results. They showed that the signals Allison saw came from his equipment, not from any element, and scientists stopped accepting his claims. A Berkeley team made the real element 85 in 1940.

The machine at Berkeley. Ernest Lawrence built his first cyclotron, a machine that whirls tiny charged particles in a spiral up to high speed, at Berkeley, California, in 1930 and 1931. When the fast particles hit a target, they can turn atoms of one element into atoms of another. With his machines, Berkeley's Radiation Laboratory became the place most of the new elements made in the United States came from.

Ernest Lawrence

Who: The physicist who invented the cyclotron, the machine behind most of the elements discovered in the United States.

When and where: Berkeley, California, from the 1930s to the 1950s. He won the Nobel Prize in Physics in 1939 and died in 1958.

Lawrence's first cyclotron was small enough to hold in one hand.

Lawrence made his first cyclotron out of glass, sealing wax and bronze, and it was small enough to hold in one hand. He and his teams then built larger and larger ones, and the 60-inch cyclotron of 1939 had a magnet that weighed 220 tons. The Radiation Laboratory at Berkeley became an independent laboratory in 1936. Lawrence won the Nobel Prize in Physics, a world prize given each year, in 1939.

His machines made the material for several new elements. His 37-inch cyclotron supplied the metal sheet that held the first element made by people, and teams used his 60-inch cyclotron to make astatine and plutonium in 1940. Lawrence died in 1958. Element 103, lawrencium, carries his name.

Elements made by people

Mendeleev's periodic table of 1869, the chart of the elements in order, had a gap at element 43, below manganese. Early in 1937, Lawrence mailed a thin sheet of a metal called molybdenum to Emilio Segrè in Palermo, Sicily. The sheet had been part of the 37-inch cyclotron.

The first element made by people. Segrè and Carlo Perrier, a scientist who studies minerals, took a few billionths of a gram of element 43 out of the sheet. They named it technetium, from a Greek word meaning "artificial." Technetium was the first element made by people. Italian scientists did the chemistry, and the material came from an American machine.

The first elements found in America. Teams in American labs made or found seven new elements in the 1940s. Most of their names came from planets, places and people.

Segrè and two other Berkeley scientists made element 85 in 1940 by striking the element bismuth with alpha particles in the 60-inch cyclotron. It was the element Allison had called "alabamine." In 1947 its makers named it astatine, from a Greek word for "unstable."

Edwin McMillan and a colleague found element 93 the same year, in uranium that had been struck in the cyclotron. It was the first element heavier than uranium. Uranium was named for the planet Uranus, so they named element 93 neptunium, for Neptune, the next planet out.

Plutonium. Glenn Seaborg's team made element 94 in the 60-inch cyclotron on December 14, 1940. On the night of February 23 and 24, 1941, they proved by chemistry that it was a new element, in Room 307 of Gilman Hall at Berkeley. The room is now a National Historic Landmark.

They named the element plutonium, for the planet Pluto. Seaborg chose the symbol Pu instead of "Pl" as a joke, because "pee-yoo" is what people say about a bad smell, and the members of the naming committee accepted it. Government officials kept the work secret from the start. During World War II, American scientists used plutonium and uranium to build atomic bombs.

96 before 95. Seaborg's team made element 96 in the summer of 1944 and named it curium, for Marie and Pierre Curie. They identified element 95 late that year and named it americium, for the Americas.

An element's number counts the protons in its atoms, not the order in which it was found. These two were so hard to separate from each other that the team nicknamed them "pandemonium" and "delirium," words for wild uproar and madness. Much of this work took place at the Metallurgical Laboratory, a secret wartime lab in Chicago.

Told on a quiz show. Seaborg was a guest on a children's radio show called *Quiz Kids* on November 11, 1945. A boy asked him whether any new elements had turned up during the war. Seaborg said yes, elements 95 and 96. He told the boy five days before he planned to announce them to the American Chemical Society, a national group of chemists.

Charles D. Coryell and two other chemists found element 61 in 1945 at Clinton Laboratories in Oak Ridge, Tennessee, now Oak Ridge National Laboratory, in the leftovers of uranium atoms that had been split. Grace Mary Coryell, Charles Coryell's wife, suggested the name promethium, for Prometheus, who stole fire from the gods in Greek stories. The team announced the element in 1947. Promethium is still the only element ever discovered in Tennessee.

Seaborg's team made element 97 at Berkeley in December 1949 by striking americium with alpha particles in the 60-inch cyclotron. They named it berkelium, for Berkeley.

Emilio Segrè

Who: An Italian physicist who stayed in the United States after Benito Mussolini and his officials barred Jews like him from university jobs in Italy, and who helped find two elements.

When and where: Palermo, Sicily, and Berkeley, California, from 1937 into the 1940s. He lived in the United States from 1938 and died in 1989.

Mussolini's officials took Jews' university jobs while Segrè was visiting Berkeley.

Emilio Segrè was Jewish, and he was in Berkeley for the summer when he learned the news. Benito Mussolini and his officials in Italy had issued new racial laws against Jews. Under them, Italian officials took university jobs away from Jews. Segrè stayed in the United States and became an American citizen.

He had already helped identify technetium in Palermo. At Berkeley, Segrè helped make astatine in 1940, and with Glenn Seaborg he showed in 1941 that atoms of plutonium-239 could be split.

He won the Nobel Prize in Physics in 1959 for his work on the antiproton, a tiny particle with the opposite electric charge of the proton, a particle in the center of every atom.

Glenn Seaborg

Who: The chemist whose teams found plutonium and nine more elements, and the first person to see an element named for him while he was alive.

When and where: Berkeley, California, and wartime Chicago, from 1940 to 1974. He died in 1999.

A letter addressed only in element names would reach him, Seaborg joked.

The address was Seaborgium, Lawrencium, Berkelium, Californium, Americium. That stood for Seaborg, at the Lawrence laboratory, in the city of Berkeley, in California, in America. Element 106 was named seaborgium after him in 1997.

Glenn T. Seaborg led the team that made plutonium in December 1940 and proved it was a new element in February 1941. In all, he helped discover ten elements, numbers 94 through 102 and number 106. One of the ten, nobelium, was later credited to scientists at Dubna in the Soviet Union.

Seaborg shared the 1951 Nobel Prize in Chemistry with Edwin McMillan for their work on the elements heavier than uranium. From 1961 to 1971 he was chairman of the Atomic Energy Commission, the federal agency in charge of atomic energy.

BY 1950

If you remember one thing: The elements Americans used poisoned many of the people who handled them, and in 1940 American labs began finding new elements of their own.

- June 8, 1928: The New Jersey dial painters sign their settlement with the U.S. Radium Corporation.
- 1940: Teams at Berkeley make astatine and neptunium, the first elements discovered in the United States, and then plutonium.
- December 1, 1941: Connecticut's governor announces the state's ban on mercury in hat making.

Next: After 1950, Berkeley and a lab in the Soviet Union argued over who had made the heaviest elements first, and uranium mining on Navajo land reached its peak.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 17 MINUTES

Scientists at Berkeley and at Dubna, a lab in the Soviet Union, argued for decades over who had made the newest elements first. Teams at Berkeley and other American labs made or claimed elements 98 through 106 between 1950 and 1974, and Dubna's scientists claimed several of the same ones. In 1992 and 1993 the members of an international panel gave some credit to Berkeley, some to Dubna, and split the rest.

Uranium mining on Navajo land reached its peak in the same years. Miners breathed radioactive gas underground, and most small mines had no fresh air blown in until the 1960s or later. Government researchers and mine owners did not tell the miners the danger, and hundreds of miners died of lung disease and cancer. Other scientists proved that lead was harming children's brains, and between 1971 and 1996 federal officials limited and then banned lead in house paint and in gasoline for cars.

Elements from Berkeley and from a bomb test

Kenneth Street Jr., Stanley G. Thompson, Albert Ghiorso and Glenn Seaborg made element 98 at Berkeley early in 1950 by striking curium with helium particles. They announced it on March 17, 1950, and named it californium, for the state and its university.

Two elements from a bomb. Elements 99 and 100 turned up in the dust of Ivy Mike, the test of a hydrogen bomb, a bomb far more powerful than the first atomic bombs. The test took place at Enewetak Atoll, a ring of small coral islands in the Pacific Ocean, on November 1, 1952. The blast wiped out one of the atoll's islands, Elugelab, turning it to vapor.

Drone planes with no one aboard flew through the mushroom cloud, carrying filter papers to catch the dust. Workers then shipped tons of coral from the blast site to Berkeley. In the dust and coral, Ghiorso and teams from Berkeley, Argonne and Los Alamos found two new elements. In the blast, uranium atoms had soaked up huge numbers of neutrons, tiny particles in the center of an atom.

Government officials classified the discoveries, keeping them secret. The scientists published them on August 1, 1955, with the names einsteinium and fermium. By then both men they honored had died, Enrico Fermi in November 1954 and Einstein in April 1955. Neither man was told that an element would carry his name.

Seventeen atoms, one at a time

A Berkeley team made element 101 in 1955 from about a billion atoms of einsteinium, all the einsteinium that existed. The team was Ghiorso, Bernard G. Harvey, Gregory R. Choppin, Thompson and Seaborg. They struck the einsteinium with particles, and the new atoms flew off onto a gold foil, a way of catching atoms that Ghiorso had worked out. The team dissolved the foil and rushed it through the chemistry.

They made 17 atoms of element 101 in all. It was the first element identified one atom at a time. In the scientists' own telling, Ghiorso wired the detector to the building's fire alarm, so the bell rang for each new atom. He forgot to disconnect it, and the alarm later emptied the building late at night.

The team named element 101 mendelevium, for Dmitri Mendeleev, the Russian who made the periodic table. That was during the Cold War, the long contest between the United States and the Soviet Union, and Seaborg asked the United States government for approval before he used a Russian's name. A French chemist later told Ghiorso that the name did more for American and Soviet relations than most diplomacy, the work of officials who handle dealings between countries.

The fight over elements 102 to 106

Berkeley and Dubna each claimed to have made elements 102 through 106 first. Each side gave the elements its own names and argued for them in science journals for decades. In 1992 and 1993 a panel of chemists and physicists called the Transfermium Working Group, named for the elements after fermium, element 100, split the credit between the two labs, and the names were settled in 1997.

Element 102. Scientists in three countries worked on element 102. A team in Stockholm, Sweden, claimed it in 1957 and named it nobelium, for Alfred Nobel, then took back its claim. Berkeley scientists claimed the element in 1958, and scientists at Dubna did experiments on it in 1966. The panel's members credited Dubna. The International Union of Pure and Applied Chemistry (IUPAC), the world organization of chemists whose officials approve element names, kept the Swedish name nobelium anyway, because scientists had used it for more than 30 years.

The panel's members split the credit for elements 103, 104 and 105 between Berkeley and Dubna. They credited Berkeley alone with element 106. Element 103 kept the name lawrencium, for Ernest Lawrence.

Seaborgium. IUPAC's officials proposed a rule in 1994 against naming elements for living people. Under that rule, they could not have approved the Berkeley name for element 106, seaborgium. In 1997 they set the proposal aside and approved the final names: rutherfordium for element 104, after the scientist Ernest Rutherford, dubnium for element 105, after the town of Dubna, and seaborgium for element 106.

Glenn Seaborg was the first person to see an element named for him while he was alive. He kept a periodic table with seaborgium on it until he died in 1999.

Albert Ghiorso

Who: The builder of instruments who helped discover more elements than anyone else in history, without ever earning a doctorate.

When and where: Berkeley, California, from 1944 to 1974, with work into the 1990s. He died in 2010.

He helped discover 12 elements and never earned a doctorate.

Albert Ghiorso helped discover americium through seaborgium, numbers 95 to 106, without a doctorate, the highest university degree. Guinness World Records lists his 12 as the most elements discovered or co-discovered by one person.

Ghiorso built the tools the element hunters needed, among them the detectors. He worked out the method of catching new atoms on a foil, which his team used to find mendelevium in 1955. And he ran the HILAC, a machine at Berkeley that sped up particles to make new elements.

One story his colleagues told about him has him driving fresh, radioactive samples across the lab in a Volkswagen car.

Darleane Hoffman

Who: A nuclear chemist who proved that plutonium, an element people had made in labs, also occurs in nature.

When and where: Los Alamos, New Mexico, from 1953, and Berkeley, California, from 1984. She died in 2025, at the age of 98.

She found plutonium, an element made in labs, in ancient California rock.

Darleane C. Hoffman was a nuclear chemist, a chemist who studies atoms that break apart and give off radiation. She began work at Los Alamos in 1953. In 1971 she found traces of plutonium-244 in ancient rock from the Mountain Pass mine in California. Until then plutonium had been known only as an element made in labs, and her find showed that tiny amounts of it also occur naturally on Earth.

Hoffman showed that atoms of fermium-257 could split in two on their own. She was the first woman to lead a science division at Los Alamos. From 1984 she led work at Berkeley on the chemistry of the heaviest elements, studying them one atom at a time.

She won the National Medal of Science in 1997. In 2000 she won the American Chemical Society's Priestley Medal, named for Joseph Priestley, as only the second woman ever to receive it.

Elements at home

Many home smoke detectors hold a speck of americium-241, about a third of a millionth of a gram. The americium gives off alpha particles inside a small chamber. The particles let a tiny electric current run through the air in the chamber. Smoke that drifts in disturbs the current, and the alarm goes off.

Silicon is an element that was discovered in Sweden in 1824. Computer chips are made of it, and Silicon Valley takes its name from the element in the chips made there.

The federal helium program was $1.4 billion in debt by 1996. That year members of Congress passed the Helium Privatization Act and ordered the Federal Helium Reserve sold.

Uranium miners on Navajo land

While the element hunters argued over credit, uranium miners on Navajo land were breathing radioactive gas. Their ore went to one buyer. EPA staff state that the Atomic Energy Commission (AEC), the federal agency in charge of atomic energy, was the only buyer until 1966 and kept buying ore until 1970. Doug Brugge and Rob Goble, writing in the *American Journal of Public Health* in 2002, say the government was the only buyer from World War II until 1971.

About 10,000 people worked in uranium mining in all, and about a quarter of them were Navajo. The mining peaked in the middle of the 1950s, with about 750 mines working. The companies named in the records include the Vanadium Corporation of America, Kerr-McGee, the United Nuclear Corporation and Hydro Resources Inc.

What radon does. When uranium atoms break apart, they turn into radon, a radioactive gas. Radon atoms then break apart into radioactive specks called radon daughters, and miners breathed them in. Brugge and Goble explain that the daughters stay in the lungs next to delicate cells and hit those cells with strong doses of radiation. The harm named in the records is lung cancer and lung fibrosis, scarring that makes the lungs stiff, so that breathing gets harder.

Navajo miners report that no one told them about the dangers of uranium mining. They say they got no protective equipment and no ventilation, the fans and shafts that blow fresh air into a mine and push radon out. Scientists already knew about the danger from uranium mines in Europe. Brugge and Goble found that few protections were in place for American miners before 1962, and they came slowly after that.

A warning turned down. Members of a federal panel, the Advisory Committee on Human Radiation Experiments, traced who made these choices in their 1995 report. In 1948 Merril Eisenbud, a safety expert in the AEC's New York office, urged AEC officials to write safety rules into the agency's contracts to buy ore. Officials of two AEC divisions, Biology and Medicine and Raw Materials, rejected his advice. They said that under the law the AEC had no power over safety in the mines.

The study that did not warn them. Public Health Service workers led by Duncan Holaday and Victor Archer followed the miners from 1950 to measure their cancer risk. Accounts give the study group two sizes. Linda M. Richards, writing in 2013 for *Distillations*, the magazine of the Science History Institute, counts 3,415 miners, 779 of them Native American. The 1995 federal committee counted about 4,100. Brugge and Goble found that the researchers did not tell the miners about the risks they were studying.

At first the researchers left the minority miners out of the results, saying they wanted "a homogeneous population," a group of people who are all alike. Duncan Holaday later testified in court that the researchers made a spoken agreement with the mine owners not to tell the miners what they found. They made that deal so the owners would let them into the mines.

Staff of the AEC and of the Public Health Service met on January 25, 1951. The staff at that meeting believed the radon in the mines was at levels that would cause cancer. They agreed that ventilation could lower it, but they called it "unrealistic" to set a limit the mine owners had to meet.

Hueper's speech. Wilhelm Hueper, a cancer researcher at the National Cancer Institute, warned about radon. His figures showed lung cancer in 40 to 75 percent of the radioactive ore miners in Europe. In 1952 Shields Warren of

the AEC asked the institute's director to stop Hueper from giving those figures in a speech to the Colorado Medical Society. The director ordered Hueper to cut them, and Hueper did not give the speech.

Warren then asked that Hueper be fired. Hueper kept his job, but Victor Archer later said Hueper was forbidden to travel west of the Mississippi River for his research. The 1995 committee report that gives Archer's account does not say who gave that order.

Public Health Service officials urged the mining companies to ventilate. Some large mines got ventilation in the 1950s and 1960s, but most small mines got none until the 1960s or later. Secretary of Labor Willard Wirtz set the first federal radon limit for these mines in 1967. The committee's members found that the mine owners, the state governments and the federal government all had a duty to ventilate the mines after 1951.

In court. A federal judge found in 1984, in a case called *Begay v. United States*, that Public Health Service officials, working under the Surgeon General, decided not to warn the miners because they feared many would quit. The judge still ruled that the miners could not sue the United States government. The law that lets people sue the government for harm does not cover choices that officials make as a matter of policy, and the judge found that the choice not to warn the miners was one of those.

In the ruling, the judge wrote that the miners' situation "cries for redress," meaning it called out to be put right, and called it a "tragedy of the nuclear age." Appeals judges upheld the ruling in 1985.

A study from 2000, cited by Brugge and Goble, found 94 deaths from lung cancer among Navajo people from 1969 to 1993, and 63 of them had been uranium miners. Richards reported that by the early 1980s "hundreds of Indian miners had died from lung diseases and cancers."

KNOWN:	The 1995 federal committee found that 410 of the 4,100 miners in the Public Health Service study had died of lung cancer by 1990, more than five times the 75 deaths expected.
NOT KNOWN:	How many Navajo miners died in all, since none of these accounts gives a full count.

The law of 1990. Members of Congress passed the Radiation Exposure Compensation Act on October 5, 1990, and President George H. W. Bush signed it on October 15. Under it, a uranium worker made sick by radiation on the job could claim one payment of $100,000, if the worker met the law's rules.

Harris Charley was a Navajo uranium miner. His records show he breathed 1,192 "working level months" of radon, a unit that measures how much radon a miner breathed over time. He died of lung fibrosis in 1986.

His son, Perry H. Charley, became an environmental scientist and worked with Stewart Udall, a former Secretary of the Interior, to investigate the miners' illnesses. In 1996 he helped start the Uranium Education Program at Diné College, which carries the Navajo people's own name for themselves. Navajo organizers, among them Harry Tome, Perry Charley and Phil Harrison, pushed for help for the miners from the 1960s on.

The spill at Church Rock

An earthen dam owned by the United Nuclear Corporation broke near Church Rock, New Mexico, on July 16, 1979. The dam held waste from the company's uranium mill, a plant that takes uranium out of crushed rock. The waste was tailings, the ground-up rock left behind after the uranium is taken out.

The waste ran at least 80 miles down the Rio Puerco, a river that flows past the homes of about 1,700 Navajo people. Accounts give slightly different amounts. Richards gives 1,000 tons of radioactive tailings and 93 million gallons of acid, radioactive water. New Mexico's Environmental Improvement Division, the state office that checked for pollution, gives 1,100 tons and 94 million gallons.

Measured in curies, a unit of radioactivity, the spill released 46. The accident at the Three Mile Island nuclear power plant, four months earlier, released 13. The U.S. Geological Survey called Church Rock "the largest accidental radioactive release in the United States."

The authors of the Environmental Improvement Division's own report saw it differently. They concluded that the spill's effects "on people and the environment were quite limited." They wrote that the water pumped out of the mines into the Puerco River might be a greater long-term danger.

What officials did. Within a few hours, officials of the Environmental Improvement Division began testing the river. They ordered United Nuclear to stop sending waste to the broken pond, and the company stopped milling for about three months. No official declared an emergency or ordered anyone to leave.

New Mexico's governor, Bruce King, turned down the Navajo Nation's request to have the area declared a federal disaster area, according to news accounts. The state's report on the spill names no United Nuclear official as responsible for the dam.

Lead: the proof and the bans

Thousands of American children went to the hospital each year in the 1960s with lead encephalopathy, swelling and damage of the brain, and about one in four of them died. A 2007 review in the journal *Environmental Health Perspectives* states those numbers.

Where the lead came from. Before the 1960s, the poisoned children usually lived in old, poorly kept slum housing, David Rosner and Gerald Markowitz wrote in 2012. The children had swallowed flakes of lead paint and went into convulsions, fits of violent shaking they could not control. Rosner and Markowitz call lead paint in older buildings the major source of lead around children.

Lead harms a child's growing brain. It lowers intelligence and causes trouble with reading, paying attention and behavior, and the 2007 review states that no safe level of lead is known. The review names the main ones to blame: the paint and pigment industry, the oil industry and a few scientists paid by industry.

The proof. Clair Patterson, a Caltech scientist who studied the chemistry of rocks and the Earth, measured lead in the air at about 1,000 times its natural level. In a 1965 paper he called the "safe level" idea of Robert Kehoe, the scientist the Ethyl company had paid to study lead, "an ill-defined opinion unsupported by any evidence."

Herbert Needleman, a children's doctor in Pittsburgh, measured the lead in the baby teeth of about 2,500 schoolchildren in the 1970s. Children with more lead in their teeth did worse in school. Scientists paid by the lead industry challenged his work, and later reviews backed his findings, according to Bill Kovarik, who wrote the 2005 article about the tetraethyl lead deaths.

The bans. Members of Congress passed the Lead-Based Paint Poisoning Prevention Act in 1971. Under it, homes built or repaired with federal money could have only limited amounts of lead paint, and in 1972 the limit was set at 0.5 percent of the paint. Officials of the U.S. Consumer Product Safety

Commission banned lead paint in all homes in 1978, and from then on house paint could hold no more than 0.06 percent lead. Homes built before 1978 are still likely to have some lead paint.

EPA officials began work on a rule to cut the lead in gasoline in 1972 and 1973. Gas stations began selling unleaded gasoline, and car makers built cars for it, in 1975 and 1976. The Clean Air Act's ban on leaded gasoline for cars and trucks took effect on January 1, 1996. On January 29, EPA Administrator Carol M. Browner announced the last step in 25 years of cutting lead out of gasoline. She said the amount of lead in children's blood had fallen 70 percent.

Poisoned ground put on the cleanup list

EPA officials put both the Anaconda smelter site in Montana and the Church Rock mill on the National Priorities List in 1983. The list includes the country's most dangerous waste sites, chosen for cleanup under the federal Superfund program.

Smelting at Anaconda had stopped in 1980. EPA staff count nearly 100 years of smelting at the whole site, which left arsenic, cadmium, copper, lead and zinc over more than 200 square miles. EPA staff list Atlantic Richfield, the company that bought the smelter in 1977, as responsible for the cleanup.

BY 2000

If you remember one thing: Between 1950 and 2000, researchers proved what radon did to uranium miners and what lead did to children, and federal officials banned leaded gasoline and began paying sick uranium workers.

One number: 70 percent. That is how far the amount of lead in children's blood had fallen by January 1996, after 25 years of cutting lead out of gasoline, by the count Carol Browner announced.

Next: After 2000, Russian and American scientists finished the seventh row of the periodic table together, and lead from old pipes got into the tap water of Flint, Michigan.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 11 MINUTES

The heaviest elements yet came from Russian and American scientists working together. Joint teams made elements 114 through 118 between 1998 and 2010. The atoms formed at Dubna, in Russia, and scientists from American labs brought detectors and, for element 117, the only target material in the world that would work. In 2015 and 2016 IUPAC's officials recognized the last four elements of the periodic table's seventh row and gave them names.

The poisons of earlier years were still in the ground and the pipes. As of June 2026, EPA staff count 523 abandoned uranium mines on the Navajo Nation. Managers appointed by Michigan's governor switched the water supply of Flint, Michigan, in 2014, and into 2015 the water carried lead from old pipes to the city's people.

Finishing the seventh row

Scientists at the Joint Institute for Nuclear Research in Dubna, Russia, worked with scientists from Lawrence Livermore National Laboratory in California. For elements 115 and 117, scientists from Oak Ridge National Laboratory and Vanderbilt University joined them. The first atom of element 114 formed at Dubna in December 1998, and element 116 followed in 2000.

IUPAC's officials named element 114 flerovium in May 2012, for Russia's Flerov Laboratory. They named element 116 livermorium, for the Livermore laboratory and the city of Livermore, California.

The row filled. IUPAC's officials recognized elements 113, 115, 117 and 118 on December 30, 2015, which filled the seventh row of the periodic table, and they announced the names on November 28, 2016. Scientists at RIKEN, a research institute in Japan, made element 113, the first element discovered in Asia, and it became nihonium. Element 115 was named moscovium, for the region around Moscow, and element 117 tennessine, for Tennessee.

Element 118 became oganesson, for Yuri Oganessian, the Dubna physicist who led the hunt for these heavy elements. It was only the second element named for a living person, after seaborgium. His colleagues asked him to leave the

conference call before they voted on the name. IUPAC's officials credited these elements to the joint teams, made up of scientists from several countries who worked together.

Tennessine and the berkelium target

Joe Hamilton of Vanderbilt University started the partnership on element 117 when he introduced Jim Roberto of Oak Ridge to Yuri Oganessian. To make element 117, the Dubna team needed a target made of berkelium-249, and the only place that could make it was a research reactor at Oak Ridge National Laboratory. The berkelium spent 250 days in the reactor. Oak Ridge chemists then spent 90 days working on it and ended up with 22 milligrams, thousandths of a gram.

Five trips across the Atlantic. The berkelium was shipped in June 2009. Russian customs officials, who check what comes into a country at its border, twice rejected the paperwork, so the package crossed the Atlantic Ocean five times. At Dubna, scientists fired a beam of calcium-48 atoms at the target for six months and made six atoms of element 117. The team published the discovery in April 2010.

Tennessee became the second American state named on the periodic table, after California. The atoms of tennessine formed in Russia. Promethium, found at Oak Ridge in 1945, is still the only element discovered in Tennessee.

Clarice Phelps

Who: A nuclear chemist at Oak Ridge National Laboratory and a U.S. Navy veteran. Her laboratory's staff profile describes her as the first Black woman involved in the discovery of an element.

When and where: Oak Ridge National Laboratory, Tennessee, from 2009. Her berkelium work began in 2010, and the laboratory recognized her in 2019.

She helped purify berkelium for the experiments that confirmed element 117.

Clarice Phelps served in the U.S. Navy and graduated from Tennessee State University. She joined Oak Ridge National Laboratory in 2009, and her first job there was as a nuclear operations technician.

She worked in the laboratory's Nuclear Security and Isotope Technology Division from 2010. There she was part of a team that helped purify berkelium-249, removing everything else from it. Scientists used that berkelium to confirm the discovery of element 117. The berkelium for the first run at Dubna had shipped in June 2009, before she began this work.

A 2019 news release from Oak Ridge National Laboratory described her as "the first African American woman to be involved with the discovery of an element, tennessine." That first is her laboratory's claim. IUPAC's officials credited Oak Ridge as a laboratory, not its scientists one by one. The same year, she was named to the Periodic Table of Younger Chemists, a project of IUPAC and the International Younger Chemists Network.

Toward element 120, and the end of federal helium

Scientists in the Heavy Element Group at Berkeley Lab made two atoms of livermorium in a new way in 2024. They fired a beam of titanium-50 at plutonium-244 in the lab's 88-Inch Cyclotron, and Berkeley Lab's news center reported the result on July 23, 2024. The test showed that the method could work for element 120.

Element 120 would start the eighth row of the periodic table, and it would be the heaviest atom ever made. The Berkeley team began runs to make it in 2025, firing titanium-50 at californium-249. As of August 2026, no one had announced a discovery.

The end of federal helium. Federal officials sold the Federal Helium System, which included the reserve, the Cliffside gas field and a pipeline 423 miles long, to Messer, a company that sells industrial gases. The sale was completed in June 2024. Messer's accepted bids, opened in January 2024, totaled $423.35 million. Officials of the Bureau of Land Management, a federal agency, stated in 2024 that the sale in the end sent about $460 million to the U.S. Treasury, the government's money office.

Helium is still scarce. Hospitals need it for MRI machines, which take pictures of the inside of the body, and rocket makers and computer chip makers use it too.

Uranium on Navajo land today

Elsie Mae Begay, a Navajo woman, lived in Monument Valley below the abandoned Skyline uranium mine. Two of her sons who had lived with her died, one of lung cancer and the other of a tumor. Linda Richards, who reported her story in 2013, calls them rare cancers. Richards does not say whether doctors linked the sons' cancers to the mine.

Begay's family hogan, a traditional Navajo house, gave off radiation up to 100 times the acceptable level, the Associated Press reported. When her children were young, they had played in piles of uranium tailings. Richards writes that people testing Navajo homes found dangerous radioactivity where families had built with mine debris or mixed it into concrete floors. EPA officials treated the Begay hogan as nuclear waste, and in 2001 men in radiation suits took it apart and hauled it away.

The Navajo ban. Members of the Navajo Nation Council passed the Diné Natural Resources Protection Act in 2005. Under it, uranium mining is banned on Navajo land.

How many mines. EPA staff count 523 abandoned uranium mines on the Navajo Nation as of June 2026. They have money to study and clean up 230 of them, fewer than half, and they list 46 as priority mines. Richards, counting abandoned mine sites rather than mines, found at least 1,032 on Navajo land in 2013, and 38 water sources with more radioactive elements than health limits allow.

EPA officials had reached agreements and settlements over the mines worth more than $1.7 billion by June 2026. A settlement is an agreement to pay money to end a legal fight.

About 3,975 uranium workers had applied for payments under the Radiation Exposure Compensation Act by March 2001, according to Brugge and Goble. The law ran out for a time. Members of Congress renewed it as part of the One Big Beautiful Bill Act, which became law on July 4, 2025. According to the

Department of Justice in September 2026, workers must file claims by December 31, 2027, and a uranium worker who qualifies receives $100,000, paid once.

Lead in the water of Flint

Flint, Michigan, is a majority-Black city. Emergency managers switched its water supply in April 2014. Michigan Governor Rick Snyder had appointed them to run the city in place of its elected leaders. Flint had been getting Detroit's water, drawn from Lake Huron, and the new supply came from the Flint River.

Who made the switch. Governor Snyder later appointed the Flint Water Advisory Task Force to find out what went wrong. Its 2016 report states that Flint's emergency manager Ed Kurtz approved using the Flint River, and that Darnell Earley, the emergency manager in April 2014, oversaw the switch. A timeline published by the Centers for Disease Control and Prevention (CDC), the federal health agency, states that the river water had no corrosion control, a treatment that keeps water from eating into pipes.

Detroit's water carried a chemical called orthophosphate, which protects pipes from corrosion. The Flint River water had none, and it was high in chloride, a salt. The river water ate into the city's old pipes.

Flint's service lines carry water from the main line under the street into each house. Between 10 and 80 percent of them were made of lead, according to an estimate published in 2016. Lead was in the water for about 18 months, reporters for NPR, a national radio network, said in 2023.

The children's blood. Mona Hanna-Attisha, a children's doctor at Hurley Medical Center in Flint, and her colleagues compared blood tests of 1,473 children in Flint with 2,202 outside the city, in a study published in 2016. Among Flint children under 5, the share with high lead in their blood about doubled, from 2.4 percent in 2013 to 4.9 percent in 2015. In the parts of the city with the most lead in the water, it rose from 4.0 to 10.6 percent.

Children absorb 40 to 50 percent of the lead they swallow in water, and adults absorb 3 to 10 percent. Babies who drank formula mixed with tap water were at the highest risk.

The warnings. Miguel Del Toral, an EPA expert on lead in water, warned officials of Michigan's Department of Environmental Quality (MDEQ) on February 27, 2015. He wrote that MDEQ's instructions for collecting water samples made the lead readings come out low, and that a federal rule, the Lead and Copper Rule, required Flint to have corrosion control. The same day, Stephen Busch of MDEQ wrote back that Flint had working corrosion control. The task force found that this was wrong.

Del Toral asked another MDEQ official on April 25, 2015, how Flint could meet the rules with no corrosion control. That official traded e-mails about his question with Busch and Mike Prysby of MDEQ. In July 2015 MDEQ's spokesman, Brad Wurfel, wrote that Flint's residents "do not need to worry about lead in the water supply."

Hanna-Attisha and her colleagues at Hurley Medical Center told pregnant women and children to stop drinking the water in September 2015. Flint was connected again to a regional water system in 2015. Snyder asked for federal help on January 14, 2016, President Barack Obama declared a federal emergency in Flint two days later, and EPA officials issued their own emergency order on January 21.

Legionnaires' disease. Legionnaires' disease, a lung infection and a kind of pneumonia, is caused by bacteria that grow in poorly treated water. Genesee County, where Flint is, had 90 cases from June 2014 to October 2015. NPR reporters linked the outbreak in 2018 to low chlorine, the chemical that kills germs in drinking water, in Flint's water.

KNOWN:	State health officials counted 10 dead in one report and 12 in another.
DISPUTED:	The official count, because reporters for the PBS program *Frontline* found more deaths from pneumonia that it missed.

The charges. None of the officials charged over Flint's water was convicted of a felony, one of the most serious kinds of crime. Michigan's attorney general, the state's top lawyer, charged 15 officials in 2016 and 2017, Busch, Prysby and Earley among them. Seven of them took plea deals for lesser crimes called misdemeanors. In June 2019 the prosecutors who had taken over the cases dropped the charges against the other eight, saying the cases were only partly built.

The same prosecutors charged Governor Snyder and eight other officials in January 2021, Earley among them. Snyder faced two counts of willful neglect of duty, knowingly failing to do his job. The state's health director and its chief medical executive each faced nine counts of involuntary manslaughter, causing a person's death through carelessness without meaning to kill.

How the cases ended. A one-judge grand jury, a single judge who decides alone whether to charge someone with a crime, had brought the 2021 charges. The judges of the Michigan Supreme Court ruled in 2022 that this broke the state constitution. The 2021 cases ended on October 31, 2023, with no one found guilty.

Flint's people sued. U.S. District Judge Judith Levy approved a settlement of $626.25 million on November 10, 2021, for more than 90,000 Flint residents and businesses.

THE THREE QUESTIONS, ANSWERED

1. **Who lost their land when Americans found gold and copper on it?** The Cherokee lost theirs after gold turned up in Georgia in 1829, when Georgia lawmakers gave it away by lottery and soldiers forced them west in 1838. The Ojibwe bands of Lake Superior gave up the copper country in the Treaty of La Pointe in 1842, and members of Congress took the Black Hills from the Sioux in 1877, after Custer's men found gold there.
2. **What did the people in charge say about the radium, lead and uranium that poisoned workers?** Supervisors told the dial

painters the paint was safe, the Bayway supervisor said his poisoned men had worked too hard, and Thomas Midgley breathed the vapor of tetraethyl lead in front of reporters to show it was safe. Public Health Service researchers agreed with mine owners not to tell the uranium miners what they found.

3. **When did someone in the United States first discover a new element?** In 1940, at Berkeley, California, when teams using Ernest Lawrence's cyclotron made astatine and neptunium, and then plutonium. Every element before that had been found abroad, and Fred Allison's 1931 claims were false.

What changed: Nobody anywhere knew what an element was in 1500, and by 2010 scientists from American labs had helped make element 118, the heaviest yet.

FIVE DATES TO KEEP

1799: Conrad Reed finds a 17-pound gold nugget in North Carolina.

October 4, 1842: Ojibwe bands give up the Keweenaw copper country in the Treaty of La Pointe.

June 8, 1928: The New Jersey dial painters sign their settlement with the U.S. Radium Corporation.

December 14, 1940: Glenn Seaborg's team makes plutonium at Berkeley.

April 2014: Emergency managers switch Flint's water to the Flint River.

> **NOT KNOWN:** How many Navajo uranium miners died of their work in all, because each count that exists covers only some of them.

Where to go: Saugus Iron Works National Historic Site, on the Saugus River near Boston, is the place where Hammersmith's furnace, forge and mill worked from the 1640s until about 1670.

Next: Chapter 14, Work and Workers. It asks what the daily job felt like and how working people organized, and Grace Fryer's fight comes back there from the workers' side.

PART 4

Work, Food, and Money

Chapter 14: Work and Workers

CHAPTER 14 OF 37 · WORK AND WORKERS · 10 ERAS · ABOUT 85 MINUTES

For most of American history, employers and masters decided how long people worked, how much they earned and how safe the job was, and workers won shorter days and higher pay mainly by acting together.

In October 1836 the girls in one room of a Lowell mill, in Massachusetts, could not decide whether to turn out, their word for walking off the job together. The managers had just taken more money out of their pay for room and board. Harriet Hanson was 11 and had worked in the mill since she was 10. She later remembered telling them: "I don't care what you do, I am going to turn out, whether anyone else does or not." She walked out, and they followed her.

This chapter follows the people who did the work, era by era, from the farmers and hunters of the Eastern Woodlands before 1500 to the warehouse and delivery workers of today. Watch what happens when workers act together, the way Harriet's room did. Some won higher pay or a shorter day. Others were beaten, jailed or shot by police, hired guards and soldiers. Watch the deaths at work too. Some of the laws that made jobs safer came only after workers died, in a burning mine or behind a locked factory door.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Which workers were not free to leave their work?
2. What happened when workers went on strike?
3. What made work less deadly?

Five minutes? Read "The shirtwaist makers and the Triangle fire" in 1900 to 1950.

Can skip: "The telephone operators", "The Mohawk ironworkers", "The pandemic, 2020". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 2 MINUTES

The people of North America worked for their own households and towns before 1500, and they planned the work around the seasons. They farmed, hunted, fished and built canoes. Nobody worked for wages, pay from an employer, and no one hired another person, set their hours or fired them. Work for wages began here only after people from Europe arrived.

Who did which work?

In the Eastern Woodlands, the forests of eastern North America, women and men did different work. Women farmed corn, beans and squash and gathered wild foods, and men hunted and fished. On the biggest jobs they worked together in larger groups: at planting time and at harvest, for building canoes, and for maple sugaring, boiling down the sap of maple trees to make sugar.

Where farmers grew enough food for whole towns, some people could spend their time on one kind of work. They became traders, stoneworkers or religious leaders.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

The first work that newcomers organized in this land was forced work. Spanish settlers in Florida and the Southwest made Native people work for them, with little pay or none. Spanish officials ran that forced work under two systems, the encomienda and the repartimiento.

The encomienda and the repartimiento

Under the encomienda, a system set up by the king of Spain, Spanish settlers could force Native people to work for them and to hand over tribute, payments of goods or work that rulers force people to give. In return the settlers were supposed to give the Native people "protection and religious instruction." Settlers used the encomienda from Florida across the Southwest.

The repartimiento. Spanish officials in the colonies added a second system in the middle of the 1500s. Under it, the officials sent Native workers in groups, by turns, to work on Spanish projects, and they were supposed to pay them. In New Mexico, Spanish governors used the repartimiento to farm and to trade. They also forced enslaved people to do the work, though Spanish law forbade it.

Acoma, 1599: forced work as a sentence

Juan de Oñate, the leader of the Spanish colony in New Mexico, sentenced the survivors of Acoma Pueblo to twenty years of forced labor in February 1599. That meant work they could not refuse and could not leave. Acoma Pueblo is the Acoma people's town, with their fields around it.

What came before. Spanish soldiers led by Oñate's nephew, Juan de Zaldívar, came to Acoma in December 1598 to demand food. In the Acoma people's own account, the soldiers raped an Acoma woman: they forced her into sex. The Acoma killed Zaldívar and eleven to fourteen of his men, and accounts differ on the number.

The attack. Oñate sent about seventy soldiers back to Acoma in January 1599, led by Vicente de Zaldívar. Over two or three days they killed Acoma men, women and children and burned much of the town. Nobody counted the dead, and estimates run from about 300 to about 1,500.

The sentences. Oñate gave the men over 25 two punishments: one foot cut off, and twenty years of forced labor in Spanish households, with no right to leave. Boys and men from 12 to 25 got the twenty years of forced labor only. So did girls and women over 12.

The feet. The sentences are in the written record, but whether anyone carried out the cutting of feet is disputed. In the Acoma people's own account, Oñate had the right feet of 24 captive men cut off. Two historians who studied the Spanish records for years, Marc Simmons and John Kessell, came to doubt it, and Kessell points out that no record describes an Acoma man with one foot.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

Three of every four newcomers around Chesapeake Bay between 1630 and 1680 were servants bound to a master for years, and they could not quit. Most got no wages. Over the whole colonial period, between one-half and two-thirds of the Europeans who came to the English colonies came this way.

Masters worked them in the tobacco fields, and a sickness in their first summer killed more than half of them. Virginia judges had runaways whipped and added years to their time. In the same century, English colonists began to hold Africans in slavery for life.

Bound for years: indentured servants

An indentured servant was bound by a written contract, called an indenture, to work for a master for a set number of years. Most terms ran four to seven years, and the servant could not leave. Most servants got no wages. A skilled servant named Buckland was paid 20 English pounds a year on top of his food, drink, washing and a place to sleep, and his contract was unusual.

How many. Counts differ. Most estimates run from one-half to two-thirds of all European immigrants to the colonies, and some go as high as three-quarters. Around Chesapeake Bay, about 50,000 servants arrived between 1630 and 1680, three of every four newcomers. In the 1630s there were about six men for every woman among them.

Servants there worked tobacco "from dawn until dusk, six days a week through the growing season." Many fell sick in their first summer. People called this sickness the seasoning, and it killed more than half of the new arrivals. One writer of the time said immigrants died "like cats and dogs."

Women servants. Virginia's lawmakers punished a woman servant who had a baby without being married. She had an extra year added to her term, or she had to pay her master 1,000 pounds of tobacco.

At the end of the term, a master owed the servant "freedom dues," goods to start a free life with. In Virginia a man got ten bushels of corn (a bushel is about eight gallons), thirty shillings in English coins and a musket, a long gun. A woman got fifteen bushels of corn and forty shillings.

Masters also took children and teenagers as apprentices, who worked for them to learn a trade such as printing or shoemaking. At home, families did their own spinning, weaving, candle-making and brewing, the making of beer.

Martin's Hundred, on the land of Tsenacomoco

Why this place. Richard Frethorne, an indentured servant whose letters home survive, worked at Martin's Hundred. He arrived in December 1622, nine months after a Powhatan attack there.

Martin's Hundred was an English plantation on the James River in Virginia, and its main settlement was Wolstenholme Towne. The plantation stood inside Tsenacomoco, the land of the Powhatan chiefdom, a union of many Native nations under one high chief.

Tsenacomoco ran north from the James River to the Potomac River, and from Chesapeake Bay west to the places where the rivers drop in falls from higher ground. About 15,000 people lived there.

The attack of 1622. The Powhatan leader Opechancanough led an attack on most of the English settlements on March 22, 1622. Colony officials recorded 347 colonists killed. They got no report from some settlements, so the real number was probably higher. The Powhatan fighters killed at least 58 colonists at Martin's Hundred. Its main settlement, Wolstenholme Towne, lost more people than any other settlement.

Richard Frethorne

Who: An indentured servant in Virginia, probably a young teenager, whose letters home to his parents survive.

When and where: Martin's Hundred, Virginia, from December 1622 until his death, recorded by February 1624.

"When we are sick there is nothing to comfort us," he wrote home.

Richard Frethorne reached Martin's Hundred in December 1622 on a ship called the *Abigail*, nine months after the Powhatan attack. He had come as an indentured servant, and he was probably a young teenager.

His letters. He wrote to his parents in England in March and April 1623. He begged them to buy out his indenture, or else to send food. Since he left the ship, he wrote, he had eaten nothing but peas and loblollie, a thin porridge boiled in water.

The muster list. A muster list made by February 1624, a count of the living and the dead at each settlement, records Frethorne, spelled "Frethram," among the dead at Martin's Hundred.

Runaways, and a sentence for life

Servants who ran away and were caught faced the whip and more years of work. The governor of Virginia and his council sat together as the colony's highest court, called the General Court.

Three runaways. These judges heard the case of three runaway servants of Hugh Gwyn, a planter, or owner of a plantation, on July 9, 1640. They ordered two of them, a Dutchman called Victor and a Scotsman named James Gregory, whipped thirty times each. Both men also had to serve extra years.

The third runaway was John Punch, a Black man. For the same escape, the same judges ordered him to serve his master "for the time of his natural Life," which meant for the rest of his life.

Branding. Thirteen days later, on July 22, the same judges ordered other runaways whipped thirty times. They also ordered three of them, Christopher Miller, Peter Wilcocke and a Black man named Emanuel, "to be Burnt in the cheek with the letter R." This punishment is called branding. To brand a person was to press a red-hot iron into the skin, and the burn left the letter on the cheek as a scar for life.

The court records name the letter R and the cheek, but they do not describe the iron used, and they do not name the men who did the whipping and the branding. The judges also ordered Miller and Emanuel to work in shackles, iron rings locked around the legs, for a year or more.

The 1643 law. Virginia's lawmakers wrote two punishments for runaways into law in March 1643. A runaway had to serve double the time he had been gone. A servant who ran away a second time was to be "branded in the cheek with the letter R." The law did not state who was to do the branding.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 2 MINUTES

A boy who learned a trade between 1700 and 1750 climbed three ranks: apprentice, journeyman and master. A journeyman, the middle rank, was a skilled worker paid wages by the day. Sailors and dock workers were the other large group who worked for wages, and officers of the British navy could seize them and force them to serve at sea.

Around Chesapeake Bay and in the Lowcountry along the southern coast, colonists held more and more people in slavery. Slave traders brought about 8,600 enslaved Africans to Virginia between 1701 and 1710, about 6,200 between 1711 and 1720, and about 13,000 between 1721 and 1730. Chapter 24, Slavery and Freedom, tells the work and the lives of enslaved people in full.

The ladder of a trade

A trade such as printing, shoemaking, carpentry or blacksmithing had those three ranks. A child or teenager started as an apprentice, bound to a master to learn the work. When the apprentice's time was up, he became a journeyman and worked for wages. A journeyman who set up a shop of his own became a master.

In the towns, enslaved men also worked at skilled trades. Owners "hired out" some of these men to other employers, who paid wages for the work, and the owners kept the wages.

Benjamin Franklin

Who: A runaway apprentice, bound at 12 to work in his brother James's print shop.

When and where: Boston, New York and Philadelphia, 1718 to 1723.

Movie: *Benjamin Franklin* (2022), a two-part documentary by Ken Burns, shown on PBS in April 2022. It is about Franklin's life.

At 17, with about four years left to serve, Franklin ran away.

Benjamin Franklin was 12 in 1718 when he was bound as an apprentice to his brother James, a printer in Boston. Under his indenture he had to work in James's shop until he was 21, and only in the last year would he get a journeyman's wages.

The beatings. Franklin later wrote that his brother beat him. He also admitted that he himself may have been "too saucy and provoking," which meant rude enough to make James angry. He ran away in September 1723, first to New York and then to Philadelphia. He reached Philadelphia on October 6, 1723, with almost no money.

Sailors, press gangs and the Knowles Riot

Sailors and dock workers earned wages, and officers of Britain's Royal Navy could impress them: seize them and force them to serve on a navy ship. The groups of men sent to grab them were called press gangs.

The Knowles Riot. Press gangs working for Commodore Charles Knowles, a navy officer who commanded a group of ships, seized 46 men in Boston in November 1747. Among them were boatmen, sailors and even carpenters. Beginning on November 17, a crowd made up mostly of working people rioted in Boston for three days. They took some of Knowles's officers as hostages and forced Knowles to free the seized men in exchange.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 2 MINUTES

Hired workers in Philadelphia began to act together against their employers in the late 1700s. In 1786 journeymen printers there went on strike, stopping work together until their employers met their demands, and they won pay of at least $6 a week. In 1794 journeymen shoemakers in the same city formed a trade union, a group of workers in one trade who join together to bargain, or make a deal, with their employers over pay and hours. Their union lasted.

The printers' strike of 1786

The journeymen printers of Philadelphia struck in 1786 against a cut in their wages. A US Labor Department list of important events in labor history records the start of the strike as June 2, 1786. The printers won, and their employers agreed to pay at least $6 a week.

The printers also set up a fund of money to support one another during the strike, the first strike fund on record. The same Labor Department list calls theirs "the earliest authenticated strike of workers in the United States in a single trade" (authenticated means proven by records).

The bakers of 1741. The labor historian Selig Perlman, writing in 1922, noted that the usual list of American strikes began with New York's bakers, who stopped work in 1741. He found that those bakers were master bakers, the shop owners, protesting a city rule that set the price of bread. By his account, the 1786 printers' walkout was the earliest real strike of workers against their employers known in America.

The shoemakers' union of 1794

Shoemakers in those days were called cordwainers. Journeymen shoemakers in Philadelphia formed the Federal Society of Journeymen Cordwainers in May 1794, the first trade union in the United States that lasted. Its members called a "turn-out," their word for a strike, to hold a standard wage, the same pay for the same work across the trade.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 9 MINUTES

Factory owners in the first half of the 1800s ran their workers' days by bells. In the mills of Lowell, Massachusetts, young women worked about 12 hours a day. Children tended machines in the mills, and Irish immigrants dug canals and railroads. Through these years workers fought for a working day of ten hours.

Forming a union, a group of workers who join together to bargain with their employers, could be a crime. A Philadelphia jury found shoemakers guilty in 1806 for forming one to raise their pay. By 1842 a Massachusetts judge had ruled that a union could be lawful.

Unions on trial, 1806

The union shoemakers of Philadelphia, the cordwainers, held a turn-out, their word for a strike, in November 1805. Four months later, in March 1806, lawyers led by Jared Ingersoll and Joseph Hopkinson put eight of them on trial. Judge Moses Levy heard the case in the Mayor's Court of Philadelphia, a city court.

The verdict. The jury found the eight men guilty of conspiracy, a secret plan by two or more people to break the law. In the jury's words, their crime was "a conspiracy to raise their wages." Each man had to pay a fine of $8 and the costs of the trial. After this verdict, prosecutors could take workers to court as criminals for forming a union to raise their pay.

Children, diggers and charcoal burners

Children worked in the mills, and that was legal. They tended the machines and did the doffing: they took the full bobbins, the spools that held the spun thread, off a spinning machine and put empty ones on.

Gangs of laborers dug the new canals and graded the new railroad lines, which means they leveled the ground for the tracks. Many of these men were immigrants from Ireland.

Making iron took many workers too, and much of the work was cutting wood and turning it into fuel. At Hopewell Furnace, a place in Pennsylvania where workers made iron, the furnace burned charcoal, wood burned slowly with little air until only a black fuel is left. Hopewell paid more than 200 workers from 1835 to 1837, and more than 100 of them were woodcutters.

Most woodcutters worked part of the year, cutting and splitting hardwood through the winter with only axes. A woodcutter cut about two cords a day and was paid by the cord, a stack of cut wood of a set size.

About 20 colliers, the men who made the charcoal, worked there in the 1830s. A collier tended slowly burning mounds of wood day and night, for up to two weeks at a time, and lived in a hut beside them. He was paid by the bushel of charcoal, about eight gallons.

Who killed the men at Duffy's Cut?

The records do not say. All 57 Irish workers at Duffy's Cut, in Pennsylvania, died in 1832, some of them of cholera, and their remains show that someone killed others.

The 57 men arrived on the ship *John Stamp* in late June 1832. They came from Donegal, Tyrone and Derry in Ireland, and their average age was 22. A contractor named Philip Duffy hired them to dig a cut for the Philadelphia and Columbia Railroad, a channel through high ground so the tracks could run level. They also built up a bank of earth for the tracks. The site was at mile 59 of the line, in Chester County.

The cholera. By early August cholera had reached their camp. Cholera is an infection of the gut, spread by water or food that carries traces of a sick person's waste. In bad cases it causes watery diarrhea and vomiting, and the body loses water so fast that a person can go into shock and die. Local people stayed away from the camp.

The skulls. A team of researchers dug up some of the men's remains from 2009 to 2012. Some of the skulls had been struck by blows at about the time of death, and one man had a bullet in his skull, fired at close range. None of the remains showed wounds from trying to defend themselves. Someone beat several of the men and shot one.

No record shows that anyone was charged. To explain the killings, the historian who led the dig, William E. Watson, points to fear of cholera and perhaps to nativism, hatred of immigrants.

Lowell and the mill girls

The owners of the mills built the mill city of Lowell, Massachusetts, at Pawtucket Falls on the Merrimack River. Most of the mill workers were young New England women, aged 15 to 25, known as the mill girls. Under the companies' rules they had to work at least a year, live in a company boardinghouse and go to church. On average a mill girl stayed about three years.

The Lowell mills belonged to Francis Cabot Lowell and other Boston merchants, called the Boston Associates. Their mills spun cotton that enslaved people had grown in the South. The mills also made a cheap cloth that the owners sold to plantations to clothe enslaved people.

The working day. A report of the Massachusetts lawmakers in 1845 recorded the hours. From May through August, work began at 5 in the morning and ended at 7 at night, with half an hour for breakfast and 45 minutes for the midday meal. From September through April, work began "as soon as they can see" and ran until 7:30 at night. Across the year the mills ran an average of twelve hours and ten minutes a day, and bells rang the start and the end of work.

Whose land it was. The mill owners built on land where the Pennacook people had lived until a war in the 1670s. The falls were a Pennacook fishing and gathering place, and in the 1600s two Pennacook towns stood where Lowell stands now. Their leaders were the sachems, or chiefs, Passaconaway and his son Wannalancet.

King Philip's War. Native nations led by Metacom, a Wampanoag leader the English called King Philip, fought the English colonies of New England in 1675 and 1676. About 9,000 people died in the war. Wannalancet kept peace with the English.

Cocheco, 1676. Wannalancet led about 400 people from the nations allied with him to Cocheco, in New Hampshire, to make peace with an English captain named Richard Waldron. Waldron broke the peace and took them all prisoner. He later let Wannalancet and about half of the group go.

Waldron sent the others to Boston, where the governor and council of Massachusetts decided what to do with them. Officials in Boston hanged seven or eight of them. About 200 were enslaved for life and shipped to Barbados, an island in the Caribbean Sea, and the records do not name the men who sold them.

Wannalancet and his people moved north to St. Francis in Canada. By the end of the war they no longer lived in the lower Merrimack valley.

The Lowell turn-outs of 1834 and 1836

The mill managers announced wage cuts of 12 to 25 percent in February 1834. About 800 women turned out, and the strike failed.

The board increase. The women who ran the boardinghouses told the mill managers in October 1836 that they could not make ends meet. The managers then took more money out of each woman's weekly pay for room and board, which was the same as a cut in pay. About 1,500 women struck and formed the Factory Girls' Association.

They were better organized than in 1834, and this time they won part of what they asked for. Managers at the Boott and Merrimack mills took back the whole increase. At the Hamilton mill, managers took it back only for workers paid by the day.

Harriet Hanson Robinson

Who: A child worker in a Lowell mill who led the girls of her room out on strike at age 11, and later wrote a book about the mill girls.

When and where: Lowell, Massachusetts, 1835 to 1848. Born February 8, 1825. Died 1911.

She was 11 when she led her room out on strike.

Harriet Hanson had started work in a Lowell mill at 10, as a doffer. On the day of the turn-out in October 1836, the girls in her room could not decide whether to leave. She later remembered saying, "I don't care what you do, I am going to turn out, whether anyone else does or not." She walked out, and the others followed her.

She stayed at the mills until 1848. In 1898 she published a book about her years there, *Loom and Spindle, or Life Among the Early Mill Girls*, and in later life she worked for women's right to vote.

The ten-hour day

Workers in Philadelphia, in Lowell and on federal building jobs wanted a working day of ten hours. Coal heavers, the men who moved coal on and off boats on the docks of the Schuylkill River in Philadelphia, stopped work in 1835, and other workers joined them.

The first general strike. By June 10, workers in more than forty trades, or kinds of skilled work, had struck, nearly 20,000 people in all. It was the first general strike in the United States, with workers in many different trades stopping work at the same time. Philadelphia's city officials agreed to the ten-hour day and to raises.

President Martin Van Buren ordered a ten-hour day on March 31, 1840, for laborers on building projects of the United States government. His order covered only workers paid by the federal government, not anyone who worked for a private employer.

Commonwealth v. Hunt, 1842

The judges of the highest court in Massachusetts, the Supreme Judicial Court, heard a case called Commonwealth v. Hunt in 1842. Chief Justice Lemuel Shaw ruled that in Massachusetts a trade union was not a criminal conspiracy just for being a union. Workers there could lawfully form a union, and they could lawfully strike. Thirty-six years earlier, a Philadelphia jury had found union shoemakers guilty of a crime for doing the same thing.

Sarah Bagley and the ten-hour petition

Lowell mill workers formed the Lowell Female Labor Reform Association in the winter of 1844 and 1845, with Sarah Bagley as its president. The women sent petitions, written requests signed by many people, to the Massachusetts lawmakers, asking for a ten-hour day. After the petitions came in, the lawmakers looked into conditions in the mills.

The hearing. Bagley spoke to a committee of the Massachusetts House in 1845 and told them that she had "worked in the Lowell Mills eight years and a half." The chairman, William Schouler, and all the other members agreed "that legislation is not necessary at the present time," meaning that no new law was needed. They turned down the ten-hour petition. Bagley said afterward that the committee had "misrepresented" what she told them.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 15 MINUTES

Police, private guards, state militia (the part-time soldiers of each state) and federal soldiers broke many strikes between 1850 and 1900, and they shot and killed strikers. The workers had formed the first national unions, to fight for higher pay and an eight-hour day.

The work itself was dangerous, in mines, mills, rail yards and sweatshops, crowded workshops where people sewed clothing for long hours and low pay. Children worked beside adults. In the cotton mills of the South, they worked 12-hour days, six days a week.

The Chinese railroad strike, 1867

Thousands of Chinese workers built the Central Pacific Railroad through the Sierra Nevada mountains of California in the 1860s. White workers on the line earned $40 a month, and the Chinese workers earned $35. Several thousand of them went on strike on June 25, 1867, and estimates of their number run from 2,000 to 5,000.

They asked for the same pay as white workers, shorter hours and an end to whipping. The records do not name the men who whipped them. The company's managers cut off the food supply to their camps. After eight days the strike ended with no promises from the company, though pay later rose a little. It was the largest strike by workers in the country up to that time.

Why 110 people died at Avondale, 1869

A fire killed 110 people at the Avondale coal mine, in Plymouth Township near Wilkes-Barre, Pennsylvania, on September 6, 1869. Among the dead were five boys and two men who tried to rescue the workers.

One way out. Above the mine stood the breaker, a tall wooden building where coal was broken up and sorted. It stood over the mine's only shaft, the one way in and out. Sparks from the furnace that pushed air through the mine set the breaker on fire, and the men and boys below had no other way out. Pennsylvania's lawmakers passed a mine safety law in 1870 that required more than one exit from every mine.

The Knights of Labor

A tailor named Uriah Smith Stephens founded the Knights of Labor in Philadelphia on December 9, 1869, as a secret society. Terence V. Powderly later led it and opened it up to the public. The Knights had fewer than 10,000 members in 1879 and about 700,000 by 1886.

The Knights let women join, and in some places Black workers too. Besides higher wages, they called for an eight-hour day, equal pay for equal work, and an end to child labor and to the work of prisoners leased to companies. They also wanted the public, not private owners, to own utilities, the companies that supplied things like gas and water.

Servants, children and sweatshops

Census takers count everyone in the country for the United States government every ten years, and in 1870 they counted women's work carefully for the first time. They found 867,354 domestic servants, people paid to cook, clean and care for other families' homes, about half of all women who worked for pay. Domestic service stayed the largest job for women in every census from 1870 to 1940.

Children at work. At least 18 percent of all children aged 10 to 15 had jobs from 1890 to 1910, nearly 1 in 5. In Philadelphia, the pay children brought home made up 28 to 46 percent of their family's income, depending on the family's ethnic group.

In the South, cotton mill owners hired children in growing numbers. Of the nearly 100,000 textile workers in the South in 1900, 25,000 were children under 16. By 1904 there were 50,000 children in the mills, and 20,000 of them were under 12. They worked 12-hour days, six days a week. Mill owners said the fingers of adult farm workers were too "knotted and gnarled" for mill work.

In the hard-coal fields of Pennsylvania, breaker boys sat on benches in the breakers and picked slate, a kind of rock, out of the coal. In the cities, people sewed clothing in sweatshops set up in lofts, the open upper floors of buildings, and in tenements, cheap apartment buildings packed with families.

The Great Railroad Strike, 1877

John W. Garrett, the president of the Baltimore and Ohio Railroad, cut his workers' wages by 10 percent in July 1877, and it was not the first cut. Workers at Martinsburg, West Virginia, walked off the job. The strike spread through West Virginia, Maryland, Pennsylvania, New York, Missouri and Illinois.

Governors called up their state militias, and President Rutherford B. Hayes sent federal troops. He issued the orders for West Virginia on July 18, Maryland on July 21 and Pennsylvania on July 23.

Pittsburgh. Militiamen brought in from Philadelphia opened fire on a crowd in Pittsburgh on July 21. They killed more than twenty people, among them a woman and three small children. The official death count for Pittsburgh was 26, and the real number was likely higher.

Reading. Two days later, in Reading, Pennsylvania, a crowd threw bricks and stones down on militiamen marching through a deep cut for the railroad. Some of the soldiers fired into the crowd and killed at least ten people. By September 1877, state and federal troops had broken the strike, and the workers won nothing at the time.

The telephone operators

A new job came with the telephone. Calls went through a switchboard, where an operator connected each caller to the person being called, and the first operators were teenage boys. Emma Nutt became the first woman operator on September 1, 1878, at a telephone company in Boston, and her sister Stella started the same day. Emma Nutt earned $10 a month for a 54-hour week. The companies' managers replaced the boys with women, and by the late 1880s nearly all operators were women.

The eight-hour day and Haymarket, 1886

Workers across the country went on strike for an eight-hour day on May 1, 1886, about 35,000 of them in Chicago. Two days later, Chicago police fired on strikers at the McCormick Harvesting Machine Company plant and killed at least two of them.

The bomb. Workers held a meeting in Chicago's Haymarket Square on May 4 to protest the killings. Inspector John Bonfield marched on the meeting with 176 police officers and ordered the crowd to break up. Then someone threw a dynamite bomb at the police, and the police drew their guns and fired wildly. No one has ever proved who threw the bomb.

The dead. Counts differ. A Library of Congress history page lists seven police officers and at least four people in the crowd killed. A Chicago History Museum page lists eight police officers dead and sixty wounded, and an unknown number in the crowd killed or wounded.

The trial. A Chicago jury convicted eight anarchists, people who believe there should be no government, of conspiracy. None was shown to have thrown the bomb. Judge Joseph E. Gary sentenced seven of them to death and the eighth, Oscar Neebe, to fifteen years in prison.

Officials at the Cook County Jail hanged four of the men on November 11, 1887: Albert Parsons, August Spies, George Engel and Adolph Fischer. A fifth, Louis Lingg, killed himself in his cell with a small bomb that someone

smuggled in to him. The last two, Samuel Fielden and Michael Schwab, had asked for mercy, and the governor of Illinois at the time changed their sentences to life in prison.

The pardon. A later governor of Illinois, John Peter Altgeld, pardoned Fielden, Schwab and Neebe, the three men still in prison, in June 1893. The pardon freed them from the rest of their punishment. Altgeld found that the trial had been unfair, and he wrote that Judge Gary ran it with "malicious ferocity," meaning cruel, spiteful anger.

Altgeld's reasons. A court officer named Ryce had the job of calling in the men who would sit on the jury. The state's attorney, the lawyer who brought the case, had suggested Ryce for that job. Altgeld wrote that Ryce called in jurors who were already against the men on trial.

Altgeld also wrote that "much of the evidence given at the trial was a pure fabrication," which means it was made up. Some leading police officials, he wrote, had threatened men with torture and had offered money and jobs to anyone who would swear to what the police wanted.

The Knights. After Haymarket, most members left the Knights of Labor. By 1890 the Knights had about 100,000 members, down from about 700,000 in 1886.

The American Federation of Labor

Leaders of craft unions, each made up of the skilled workers of one trade such as cigar makers or carpenters, met in Columbus, Ohio, on December 8, 1886. There they founded the American Federation of Labor, the AFL. Its union leaders bargained with employers for higher wages and shorter hours, a way of running unions called "pure and simple" unionism.

Samuel Gompers

Who: A cigar maker who became the first president of the American Federation of Labor.

When and where: Born in London, January 27, 1850. Worked in New York. President of the AFL from 1886 to 1924, except for 1895.

A cigar roller from London led the AFL for almost forty years.

Samuel Gompers made cigars from boyhood, and in New York he rolled them in tenement shops. He became the first president of the American Federation of Labor and served from 1886 to 1924, except for one year, 1895.

Gompers built the AFL around wages and hours. Its unions had about 140,000 members in 1886 and nearly 3 million by 1924, about twenty times as many.

Why brakemen lost their fingers

A brakeman on a railroad joined, or coupled, the cars of a train by hand. He stood between two cars as they moved together and guided an iron link into a socket. Brakemen's hands were crushed, and missing fingers were called "the badge of the experienced worker." Thousands of brakemen died.

A safer way. Eli Janney got a patent for an automatic coupler in 1873, the right to be the only one to make and sell it for a set time. The Westinghouse air brake, a brake worked by air pressure, had existed since 1869. Railroad owners did not put either one on most of their cars.

Members of Congress voted through the Safety Appliance Act in 1893, and it required both on trains by 1900. Coupling accidents fell from about 11,000 in 1892 to about 2,000 in 1902, while the number of railroad workers grew.

Homestead, 1892

The lockout. The steelworkers' union contract at Carnegie Steel's works in Homestead, Pennsylvania, was running out in the summer of 1892. Henry Clay Frick, the chairman of Carnegie Steel, cut pay for hundreds of the workers and refused to bargain with the union. On June 29 he shut the plant and locked out all 3,800 workers, keeping them out of their jobs. The workers went on strike, and armed strikers surrounded the plant and closed off the town.

On July 6, 300 agents of the Pinkerton detective agency, a private company that Frick had hired, tried to land from barges and take the plant back. Strikers and Pinkertons fought a gun battle, and seven workers and three Pinkerton agents were killed. Some accounts count more.

Eight thousand state militiamen, sent by the governor of Pennsylvania, arrived at Homestead on July 12. By November the strike had failed, and the steelworkers at Homestead no longer had a union.

Pullman, 1894

The Pullman Palace Car Company's workers made and repaired railroad cars near Chicago. They lived in Pullman, Illinois, a company town, where the company owned the houses and its managers collected the rent. The company's managers cut wages by about 25 to 35 percent in 1893 and 1894, and they did not cut the rents.

The workers belonged to the American Railway Union, founded in June 1893. It was the first industrial union, taking in every kind of railroad worker in one union instead of one craft at a time.

The boycott. The union's members held a convention, a big meeting of delegates sent by its branches, in June 1894, and the delegates voted for a national boycott of Pullman cars. In the boycott, railroad workers across the country refused to handle trains that carried Pullman cars. While it spread, on June 28, 1894, President Grover Cleveland signed a law making Labor Day a federal holiday.

The court order. Attorney General Richard Olney, the federal government's top lawyer, took the union to court. Federal judges William Woods and Peter Grosscup issued an injunction, a court order to stop doing something, on July 2, 1894. They ordered Eugene V. Debs, the union's founder, and its other officers to stop anything that got in the way of the mail or of trade between the states.

The troops. The next day, over the protest of Governor Altgeld, President Cleveland ordered federal troops into Chicago. More than 16,000 troops were called up across the country, and the soldiers arrested boycotters and rioters and sometimes shot them.

About 30 people were killed across the country, and some counts reach 34. Accounts of the strike do not say who killed each of them. Federal judges and soldiers ended the boycott.

Jennie Curtis

Who: A seamstress in the Pullman shops whose speech helped start the Pullman boycott.

When and where: Pullman, Illinois, 1893 and 1894. Born 1871. Died 1917.

Her pay fell from as much as $2.25 a day to 80 cents.

Jennie Curtis spoke to the American Railway Union's convention in June 1894, and her speech helped persuade the delegates to vote for the Pullman boycott.

She had worked for five years as a seamstress in the sewing room of Pullman's repair shops. She told how the women there made "all the carpets, and all the silk, satin, plush, and velvet drapings for the dining cars," and they sewed the cloth covers for the seats.

Two cuts in one week. Before the depression of 1893, a time when many businesses failed and many people lost their jobs, she earned $1.50 to $2.25 a day. Pullman's managers cut her pay twice in one week in November 1893, and it fell to about 80 cents a day. Many of the girls she worked with averaged 40 to 50 cents.

Curtis was president of Local 269, the union's branch for young women workers, which had 125 members. Later in 1894 she told the United States Strike Commission, a panel that looked into the strike, about wages, rents and abusive supervisors. She said her father had worked for Pullman for 13 years. When he died, he owed back rent, and Pullman's managers collected it.

Eugene V. Debs

Who: A locomotive fireman who founded the American Railway Union and went to jail for leading the Pullman boycott.

When and where: Terre Haute, Indiana, and Chicago. Founded the union in June 1893.

Movie: *American Socialist: The Life and Times of Eugene Victor Debs* (2017), a documentary directed by Yale Strom. It is about Debs's life.

He ran for president from a prison cell, as Convict 2253.

As a young man in Terre Haute, Indiana, Eugene V. Debs was a locomotive fireman, the worker who shoveled coal into the engine's fire. He became an officer of the Brotherhood of Locomotive Firemen, a union for that one craft.

He founded the American Railway Union in 1893, for all railroad workers. After the Pullman boycott, judges found him guilty of contempt of court, disobeying a court's order, and he served six months in the jail at Woodstock, Illinois, in 1895.

Convict 2253. Debs later ran for president five times as a Socialist, one of those who wanted the public, not private owners, to own the big industries. He gave a speech against the war in 1918, and he was sentenced to ten years in prison for it.

He ran for the last time in 1920 from his prison cell, as Convict 2253, and got between 900,000 and 1 million votes. President Warren Harding shortened his sentence, and Debs went free at Christmas 1921.

Lattimer, 1897

Nearly 400 immigrant coal miners marched from Harwood to Lattimer, Pennsylvania, on September 10, 1897, to support a strike, and they carried no weapons. Luzerne County Sheriff James Martin had deputized nearly 90 men, which means he had given them the power to act as officers of the law. The deputies fired on the marchers. They killed 19 men, who were Polish, Slovak and Lithuanian, and wounded 38. Many were shot in the back.

Martin and his deputies were tried for murder from February 1 to March 2, 1898, and the jury found every one of them not guilty. By 1900 the United Mine Workers, the coal miners' union, was the fastest-growing union in the country.

Convict leasing

State officials in the South leased, or rented out, prisoners to mines, railroads and planters after the Civil War, and the people who leased them forced them to work. This was called convict leasing. Most of the prisoners were Black men, and in Alabama more than 90 percent of the state prisoners leased out were Black.

The Black Codes. Sheriffs arrested many of them for small offenses under the Black Codes, laws that Southern lawmakers passed from November 1865 to make Black people prove they had work. In Alabama, contractors whipped prisoners who tried to escape or did not work hard enough. Every year, 4 or 5 of every 100 leased state prisoners in Alabama died.

BY 1900

If you remember one thing: Workers built the first national unions in these fifty years, and police, deputies, militiamen and federal soldiers broke many of their strikes by force, firing on strikers and crowds from Pittsburgh to Lattimer.

- 1869: A fire at the Avondale mine kills 110 people, because the mine had only one way out.
- 1886: Workers strike for an eight-hour day, and after the Haymarket bomb officials hang four men who were never shown to have thrown it.
- 1894: Federal judges and soldiers end the Pullman boycott, and about 30 people are killed.

Next: After 1900 children still worked in the mines and mills, and a fire in a New York garment factory killed 146 workers.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 25 MINUTES

Members of Congress passed the first federal laws for a lowest wage, a shorter work week and the right to form a union in the 1930s, after three decades of child labor and deaths on the job. Under the Wagner Act of 1935, forming a union became a legal right. A law of 1938 set a minimum wage of 25 cents an hour and a work week of 44 hours, falling to 40 by 1940, and it banned most work by children under 16.

Children still worked in mills and mines in the first years of the century. In 1900, 1,489 coal miners were killed at work, and in 1907, 3,242. A fire killed 146 workers in a New York garment factory in 1911.

At Ludlow, Colorado, in 1914, National Guard soldiers burned a camp of striking miners' tents, and the fire killed 13 women and children hiding in a pit under one tent. In Chicago in 1937, two years after the union law, police shot and killed ten people who were marching to support a steel strike.

The hard-coal strike, 1902

In Pennsylvania, 147,000 hard-coal miners and breaker boys, the boys who picked waste rock out of the coal, went on strike in May 1902. They stayed out for about five months, until October. President Theodore Roosevelt stepped in as a mediator, a go-between who helps both sides reach a deal. It was the first time a president had done this in a strike. Earlier presidents had sent troops to break strikes, as in 1877 and 1894.

The commission. Roosevelt set up a commission, a group of people chosen to look into the strike. Its members heard 558 witnesses, and some of them were breaker boys younger than nine. The commission's members ruled in March 1903 that the miners should get a 10 percent raise and a nine-hour day.

Mother Jones

Who: Mary Harris Jones, a union organizer for coal miners whom a prosecutor called "the most dangerous woman in America."

When and where: Baptized in Cork, Ireland. Organizing from the 1870s, and for the United Mine Workers from the 1890s. Died 1930.

She led striking mill children on a march toward the president's home.

The children's march. Children who worked in textile mills in Philadelphia were on strike in July 1903. Mary Harris Jones, known as Mother Jones, led them on the March of the Mill Children, from Philadelphia toward the home of President Theodore Roosevelt at Oyster Bay, New York. She wanted people across the country to look at child labor.

How she became an organizer. She had worked as a dressmaker. Her husband and all four of her children died of the disease yellow fever in Memphis, Tennessee, in 1867, and she lost her home and her shop in the great fire in Chicago in 1871. After that she became a full-time organizer, and from the 1890s she worked above all for the United Mine Workers. In 1902 a prosecutor in West Virginia called her "the most dangerous woman in America."

> **Her age.** She celebrated her "100th" birthday on May 1, 1930, and died later that year. The record of her baptism in Cork gives August 1, 1837, which would have made her 92.

How many miners died?

The worst year on record was 1907, when 3,242 coal miners were killed at work out of 680,492, about 1 miner in every 210. In 1900 the number killed had been 1,489.

Monongah. Explosions in mines No. 6 and No. 8 at Monongah, West Virginia, killed hundreds of men and boys on December 6, 1907, and some of the boys were as young as eight. The official count was 362 dead. The West Virginia Mine Wars Museum and later estimates put the dead at more than 500, and about 1,000 children lost their fathers.

Accounts differ on which company ran the mines, the Fairmont Coal Company or the Consolidation Coal Company. The Fairmont company's president, C. W. Watson, blamed "the careless use of a mining lamp." No record shows that anyone was charged.

Lewis Hine photographs the children

Lewis Hine left his job as a teacher in 1908 to take photographs of working children. He worked for the National Child Labor Committee, a group trying to end child labor. From 1908 to 1917 he made thousands of pictures of children at work in mills, mines, food-canning plants and on city streets.

Addie Card

Who: A child spinner in a Vermont cotton mill whose photograph by Lewis Hine appeared on a United States postage stamp in 1998.
When and where: North Pownal, Vermont, 1910. Died 1993.

Hine wrote her name down wrong, as "Addie Laird."

Lewis Hine photographed Addie Card at her spinning machine in the cotton mill at North Pownal, Vermont, in 1910. Hine wrote that she was 12, but the girls at the mill told him she was 10. He called her an "anemic little spinner," anemic meaning pale and weak because the blood is not carrying enough of what the body needs. The picture appeared on a United States postage stamp in 1998.

Her real name. A researcher named Joe Manning, working with the novelist Elizabeth Winthrop, found her real name and traced her life in 2005 and 2006. She married Edward Hatch in 1915, at 17. They split in 1925, and he won custody of their daughter. She married again, to Ernest Lavigne, and got another job in a mill in Cohoes, New York. In her last years she lived in a housing project in Cohoes, and she died in 1993.

The shirtwaist makers and the Triangle fire

Many young immigrant women in New York City sewed shirtwaists, women's blouses, in garment shops. The shirtwaist makers held a meeting at Cooper Union, a hall in New York, on November 22, 1909.

The Uprising of the 20,000. Clara Lemlich, a shirtwaist maker, was still bruised from a beating by men hired by her company. She stood up and spoke in Yiddish, the language of many Jewish immigrants. "I have no further patience for talk," she said. "I move we go on strike." About 20,000 garment workers struck for eleven weeks.

The fire. A fire broke out on the top floors of the Triangle Waist Company's building near Washington Square on March 25, 1911, and it killed 146 workers. Most of them were young immigrant women, and some were only 14. On the ninth floor, the door to one stairway was locked, and no record proves who locked it. Dozens of workers jumped from the building.

The trial. The owners of the company, Max Blanck and Isaac Harris, were tried for manslaughter, the crime of killing someone without meaning to, through a wrongful act or through carelessness. The jury found them not guilty on December 27, 1911, because the prosecutors could not prove that the owners knew the door was locked. New York's lawmakers then set up the Factory Investigating Commission, and they rewrote the state's factory safety laws.

Rose Rosenfeld Freedman

Who: A worker who survived the Triangle fire and spent the rest of her life telling what happened there.

When and where: New York City, March 25, 1911. Died February 15, 2001, at 107, the last survivor of the fire.

For ninety years she told the truth about the locked doors.

Rose Rosenfeld was two days short of her 18th birthday when the Triangle fire broke out. She got out by following the company's executives up the stairs to the roof of the building, on the tenth floor, and from the roof rescuers pulled the survivors across.

She later said that the owners offered her money to keep quiet about the locked doors, and that she turned it down. She died in Beverly Hills, California, in 2001, at 107, the last survivor of the Triangle fire.

Frances Perkins

Who: A woman who watched the Triangle fire, later became the first woman in a president's Cabinet, and pushed for the law that set the country's first federal minimum wage.

When and where: New York, 1911. Secretary of Labor in Washington, 1933 to 1945.

Movie: *Summoned: Frances Perkins and the General Welfare* (2020), a documentary by Mick Caouette, shown on PBS. It is about Perkins's life.

Frances Perkins watched the Triangle workers jump from the building.

She was having tea near Washington Square on March 25, 1911, when the fire broke out, and she ran to the building. She later said that the New Deal, the set of programs President Franklin Roosevelt started in the 1930s, began on that day.

In the Cabinet. After the fire, Perkins worked as an investigator for New York's Factory Investigating Commission. President Roosevelt made her Secretary of Labor in 1933. She was the first woman in a US Cabinet, the group of top advisers who run the government's departments, and she held the job until 1945. She pushed for the Fair Labor Standards Act and for Social Security, the government's program of payments to people who are old or cannot work.

Lawrence, 1912

Massachusetts lawmakers cut the legal work week from 56 hours to 54 in 1912, and mill owners in Lawrence, Massachusetts, then cut their workers' pay. The workers struck on January 12, 1912. Most of them worked for the American Woolen Company. More than half of the mill workers were women and children, and they spoke more than a dozen languages. Leaders of a union called the Industrial Workers of the World sent organizers, who ran committees that gave out food and help.

The children. The strikers began sending their children to other cities in February, to live with relatives or with strangers who could feed them and keep them safe during the strike. On February 24, police at the Lawrence railroad station clubbed women and children who were trying to send children away, and they jailed 30 women. The owners agreed on March 12 to a 15 percent raise, double pay for overtime (extra hours of work) and no punishment for the strikers.

The assembly line

Managers at Henry Ford's plant at Highland Park, Michigan, started a moving line to build car frames, called chassis, on October 7, 1913. The work moved past 140 assemblers along 150 feet of line, and each man did the same few motions over and over, at the speed of the line. Building a chassis had taken more than 12 hours. On the line it took about 93 minutes.

The pace. Many men could not stand the pace, and they quit. Worker turnover at the plant reached 370 percent in 1913, which means that for every job, Ford's managers had to hire nearly four men in a year. Ford announced a pay of $5 for an eight-hour day on January 5, 1914. Before that, pay had been about $2.34 for nine hours.

The $5 day came with conditions. Ford's managers called part of the money "profit-sharing," and they paid that part only to men who passed inspections of their homes. Company investigators, from an office that the managers called the Sociological Department, checked whether a man drank, whether he saved money, how clean his home was and whether he took in boarders, people who paid to live in a room of his home. The managers left out workers under 22 and, at first, most women.

Ludlow, 1914

Coal miners in Colorado went on strike in September 1913. They wanted the state's mining laws enforced, and they wanted the mine owners to recognize their union, the United Mine Workers, which means to accept it and bargain with it. Most of them worked for the Colorado Fuel and Iron Company, whose main owner was John D. Rockefeller Jr. The strikers and their families lived in tent colonies.

The Death Special. Men in an armored car belonging to the company, called the "Death Special," fired on the tent colony at Forbes in October 1913 and killed one person. Governor Elias M. Ammons sent in the Colorado National Guard, the state's soldiers, and the mine owners paid for it.

The fire at Ludlow. Fighting broke out at the tent colony at Ludlow on April 20, 1914, and nobody knows who fired the first shot. Guardsmen burned the tents. At least 19 people were killed: one guardsman, five miners, and thirteen women and children who had hidden in a pit dug under a tent. The women and children suffocated, which means they died because they could not get air. Guardsmen shot the strike leader, Louis Tikas, three times in the back.

Miners then attacked mines across the region and killed supervisors and guards, and nobody knows exactly how many. President Woodrow Wilson sent in the US Army on April 28. The strike ended in December 1914, and the miners won none of their union's goals.

BY 1914: Henry Ford paid $5 for an eight-hour day, and New York had rewritten its factory laws after the Triangle fire, but no federal law yet limited children's work or set a lowest wage.

The first child-labor law, and the justices who threw it out

Members of Congress passed the Keating-Owen Act in 1916, the first federal law against child labor. Under it, a company could not ship goods to another state if it had used child workers to make them. It covered children under 14 in mills, food-canning plants and factories, and children under 16 in mines. Children aged 14 to 16 could not work more than 8 hours a day or 6 days a week, or at night.

Hammer v. Dagenhart. Roland Dagenhart and his sons Reuben, 14, and John, 12, worked in a cotton mill in Charlotte, North Carolina. Under the new law John would have to stop working, and Reuben would lose hours from his 60-hour week. A committee of Southern cotton mill owners recruited Dagenhart to sue and paid his legal costs. He argued that the law took away the money his sons earned.

The justices of the Supreme Court ruled 5 votes to 4 on June 3, 1918, in the case Hammer v. Dagenhart, that the law broke the Constitution and could not be used. The five justices in the majority said that Congress's power over trade between the states did not cover how goods were made, and Justice Oliver Wendell Holmes disagreed. Members of Congress passed a second child-labor law in 1919, and the justices threw that one out too.

Grace Fryer

Who: A painter of glowing watch dials who was poisoned by radium at work and sued the company while she was dying.

When and where: Orange, New Jersey. Worked from 1917 to 1920. Sued in 1927. Settled in June 1928.

Movie: *Radium Girls* (2018), a drama inspired by the dial painters' case. Its main characters are two invented sisters, not Grace Fryer.

"Our instructors told us to point [our brushes] with our lips."

Grace Fryer painted watch dials with glowing paint at the United States Radium Corporation in Orange, New Jersey, from 1917 to 1920. The paint glowed because it contained radium, which gives off radiation, energy that damages the body from the inside. Supervisors taught the women to shape the tip of the brush with their lips, so the radium paint went into their mouths, and they told the women the paint was safe.

What the radium did. Radium is in the same chemical family as calcium, so the body takes it into the bones and teeth, and almost all of it stays in the skeleton. Scientists who studied the dial painters found that it stopped the body from making enough new blood cells, killed the bone of the jaw so that the jawbone broke down, and caused bone cancer.

A dentist named Theodor Blum examined Grace Fryer in 1924 and found that her jawbone was wasting away in a way he had never seen before. As the dial painters fell sick and died, company officials played down and disputed the poisoning.

The lawsuit. A lawyer named Raymond Berry sued the company in May 1927 for five of the women: Grace Fryer, Katherine Schaub, Quinta Maggia Macdonald, Albina Maggia Larice and Edna Hussman. Reporters called them "the five women doomed to die," and some of them were too sick to travel to court.

> The company's officials agreed in June 1928 to pay the women to end the lawsuit, in a deal called a settlement. Each woman received $10,000 (some accounts say $15,000), $600 a year for as long as she lived and payment for her medical bills, which a committee of three doctors had to approve. The company's officials never admitted that the company was to blame.

Catherine Wolfe Donohue's case, 1938

A supervisor named Miss Murray also taught the dial painters at the Radium Dial Company plant in Ottawa, Illinois, to point their brushes with their lips. Catherine Wolfe Donohue was one of them. "We would first dip the brush into water, then into the powder, and then point the ends of the bristles between our teeth," she said.

The box of bones. She came to a hearing on February 10, 1938, with a box of pieces of bone that she said had come from her jaw. When the judge asked her doctor about her chances, she collapsed, and several men carried her from the room. She weighed 71 pounds.

The ruling. The hearing officer, the official who ran the hearing, ruled on April 5, 1938, that her illness came from her work at the plant. He awarded her $5,661, paid as $277 a year for life. The company's lawyers appealed, asking for a new ruling. The members of the Illinois Industrial Commission, a state board that decided workers' claims, turned down the appeal on July 6, 1938, and added $730.

Donohue died later that month, at 35. The last appeal in her case ended in October 1938, after her death.

How many men died digging the Hawks Nest tunnel?

Nobody knows exactly. Almost 5,000 men dug the Hawks Nest tunnel near Gauley Bridge, West Virginia, from 1930 to 1932, most of them Black men from the South, and counts of the dead run from 476 to close to 1,000.

Who had it dug. Managers of the Union Carbide company had the tunnel dug to carry water to a power plant, which was built to supply power to Union Carbide's alloy works, where metals were mixed. They hired the Rinehart and Dennis company of Charlottesville, Virginia, to do the digging.

The dust. The tunnel went through sandstone made mostly of silica, the hard mineral that sand is made of, and a third of it was dug wider so that the silica could be mined. The men worked with no dust control and nothing to protect their breathing, in poor air underground.

Breathing silica dust causes silicosis. The dust forms scar tissue in the lungs, and the scarred lungs cannot take in enough oxygen. Silicosis cannot be cured, and in bad cases it kills.

The counts. Members of a US House of Representatives committee held hearings in 1936 and put the deaths at 476. The scientist Martin Cherniack studied the records in 1986 and found as many as 764. Scientists at the National Institute for Occupational Safety and Health, the federal agency that studies workers' health, said close to 1,000 in 2002.

The workers and their families filed 538 lawsuits. They ended in a settlement of $200,000 in all, and single payments ran from $30 to $1,600.

Building the skyscrapers, the bridge and the dam

Up to 3,400 workers a day built the Empire State Building in New York, and by the official count five of them died. Lewis Hine photographed the ironworkers high on the open steel frame in 1931. Mohawk ironworkers from Kahnawake, a Mohawk community just south of Montreal in Canada, worked in the building crews.

The Golden Gate Bridge. The chief engineer, Joseph Strauss, required workers on the bridge in San Francisco to wear hard hats, and he spent about $130,000 on a safety net under it. The net caught 19 men who fell, and they called themselves the "Halfway to Hell Club." One of them, the ironworker Al Zampa, fell on October 19, 1936, broke four bones in his back and went back to ironwork.

Eleven men died building the bridge. Ten of them died on February 17, 1937, when a falling platform tore through the net.

Hoover Dam. The federal Bureau of Reclamation's official count is 96 deaths on the job. It leaves out 42 deaths that were recorded as pneumonia, a disease of the lungs. The true number of deaths at the dam is not known.

Managers at Six Companies, the company that hired the dam workers, had crews drive gasoline trucks inside the tunnels the men dug at the dam site. The trucks' exhaust filled the tunnels with carbon monoxide, a poison gas from engines. When tunnel workers fell very ill or died, company doctors said they had a form of pneumonia. A history of the dam kept by the University of Nevada, Las Vegas library describes this, and so does a book of dam workers' memories by the historians Andrew Dunar and Dennis McBride.

The lawsuit. Six workers sued Six Companies in 1933. They said the gas had poisoned them and left them with lasting illness, and each asked for $75,000 plus lost pay. Company officials hired a private detective to look into the men's pasts. More workers came forward and joined the case, and in the end the officials settled with 50 workers and paid them an amount they kept secret.

The right to organize and the sit-down strikes

Many businesses closed and millions of people lost their jobs during the Great Depression of the 1930s. At its worst, in 1933, about 12.8 million people, almost one worker in four, had no job. Federal officials hired people who were out of work through programs such as the Works Progress Administration and the Civilian Conservation Corps. Under the Wagner Act, which members of Congress passed in 1935, forming a union became a legal right for workers.

The CIO. That same year John L. Lewis and other union leaders formed a new group inside the American Federation of Labor, the AFL, a large group of unions of skilled workers, to organize whole factories. The AFL's leaders threw them out, and the group became the Congress of Industrial Organizations, the CIO. Its unions took in every worker in a mass-production plant, such as a car factory or a steel mill.

Flint. Autoworkers in Flint, Michigan, sat down inside General Motors' Fisher Body plants on December 30, 1936. In a sit-down strike, workers stop working but stay inside the plant, so the company cannot bring in other workers. They stayed for 44 days, until February 11, 1937.

The Women's Emergency Brigade, led by 23-year-old Genora Johnson, guarded the plants. When police fired tear gas at the men inside one of General Motors' plants, the women broke its windows. "We used our clubs to smash the windows out so the men inside could get some air," Johnson remembered. General Motors' managers agreed to recognize the United Auto Workers.

The Memorial Day Massacre, 1937

Several hundred people marched toward the Republic Steel plant on Sunday, May 30, 1937. The plant stood on Chicago's far Southeast Side, and the marchers were supporting the steelworkers' strike there. They were white, Black and Latino men, women and children, and about 200 of them were women. There, 264 Chicago police met them.

The police threw tear gas, fired their guns and beat the marchers with clubs. They killed ten people and shot 40, and more than 90 people were wounded in all. The Paramount company filmed it, and its officials at first held back the newsreel.

What the senators found. Senators on a committee led by Senator Robert La Follette Jr. looked into the killings. They found that the police had used "excessive force," far more force than was needed, and had made "baseless allegations," claims with nothing true behind them. The senators said the police "did not carry out an honest investigation." No record names any police officer who was ever punished.

BY 1937: Workers had a legal right to form unions, and the Flint sit-down had made General Motors bargain with the autoworkers, but no federal law yet set a lowest wage or kept children out of factories.

A. Philip Randolph

Who: A union leader who organized the Pullman porters and won the first contract between a major American company and a union led by Black workers.

When and where: Founded the Brotherhood of Sleeping Car Porters in August 1925. Contract signed August 25, 1937. Washington, 1941.

Movie: *10,000 Black Men Named George* (2002), a television drama with Andre Braugher as Randolph. Also *A. Philip Randolph: For Jobs and Freedom* (1996), a documentary shown on PBS.

Passengers called the porters "George," whatever their real names were.

A. Philip Randolph founded the Brotherhood of Sleeping Car Porters in August 1925. Porters worked on the Pullman Company's sleeping cars on trains, and all of them were Black men. Pullman's managers required them to serve passengers with a smile.

The name. After the Civil War, George Pullman, whose company ran the sleeping cars, set out to hire men who had once been enslaved to work as his porters. Passengers called the porters "George," after him. The Chicago History Museum says this carried on a practice from slavery, when an enslaved person was called by the owner's name.

The contract. The Pullman Company's officials signed a contract with the union on August 25, 1937, twelve years after it began. It was the first contract between a major American company and a union led by Black workers. The porters' working month had run to about 400 hours, and under the contract it fell sharply. The porters also got $1.25 million in raises.

Order 8802. Randolph threatened in 1941 to lead a march on Washington. On June 25, 1941, President Franklin Roosevelt signed Executive Order 8802, an order from the president. It stated there could be "no discrimination in the employment of workers in defense industries or government because of race, creed, color, or national origin."

> Under the order, defense companies, which made weapons and supplies for the military, and government offices could not refuse to hire people because of their race, religion or the country their families came from. Randolph directed the March on Washington for Jobs and Freedom in 1963.

A lowest wage for the whole country, 1938

President Roosevelt signed the Fair Labor Standards Act on June 25, 1938, and it took effect on October 24. The law set the first federal minimum wage at 25 cents an hour, rising to 40 cents by 1945, and a work week of 44 hours, falling to 40 hours by October 1940. It also banned most work by children under 16 in the jobs it covered, but it did not cover farm work.

The justices of the Supreme Court ruled the other way on child labor in 1941. They decided that Congress did have the power to limit child labor, under the 1938 law.

War work and the braceros

US officials started the bracero program, named for the Spanish word for a man who works with his arms, in 1942 to bring Mexican men to work on American farms and railroads during the war. Over 22 years, more than 4.5 million contracts were signed.

The missing pay. American employers held back 10 percent of every bracero's pay from 1942 to 1946, and many braceros said the holdbacks went on after that. The money went through American banks to banks in Mexico, for a savings fund the braceros were to receive when they went home. Most braceros never got that money, and the records of where it went do not add up. Mexican officials agreed in 2009 to pay former braceros or their families 38,000 pesos each.

Women in the war plants. Women took jobs in war plants in large numbers during World War II. They made up 27 percent of the workforce in 1940 and nearly 37 percent by 1945, when about 6.5 million more women were working. Before the war about 1 percent of aircraft workers were women. In 1943 more than 310,000 women built aircraft, about 65 percent of all the workers in that industry.

Naomi Parker Fraley

Who: A war worker in the machine shop of the Naval Air Station at Alameda, California, and the woman in a 1942 photograph linked to the "We Can Do It!" poster.

When and where: Alameda, California, 1942. Died January 20, 2018, at 96.

She drilled, patched airplane wings and riveted in a Navy machine shop.

Naomi Parker went to work at the Naval Air Station in Alameda, California, during World War II. She was assigned to its machine shop, where her jobs included drilling, patching airplane wings and riveting. In March 1942 a photographer took her picture at work on a turret lathe, a metal-cutting machine for making many copies of the same part.

The photograph and the poster. People later linked her photograph to a poster of a woman worker with the words "We Can Do It!", which became famous in the 1980s. For decades the woman in the photograph was said to be someone else. Then a scholar named James J. Kimble found the original print, and its caption named Naomi Parker. Nobody has proved that the poster's artist used this photograph.

The strike wave of 1945 and 1946

When the war ended, workers in steel, coal, railroads and car plants struck in greater numbers than ever before. There were 4,750 strikes involving 3.47 million workers in 1945. The Bureau of Labor Statistics, the federal office that counts jobs and workers, recorded 4,985 strikes involving 4.6 million workers in 1946, and no other year in its records has more.

BY 1950

If you remember one thing: In these fifty years workers won federal laws for a lowest wage, a 40-hour week, an end to most child labor and the right to form unions.

In 1900: Children worked in mills and mines, no federal law set a lowest wage, and 1,489 coal miners were killed at work.

In 1950: Federal law set a minimum wage and a 40-hour week, banned most work by children under 16, and made forming a union a legal right.

Next: After 1950 the share of workers in unions reached its peak and then fell, while new groups of workers organized.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 15 MINUTES

Union membership reached its peak in 1954, when about one American worker in three belonged to a union, and after that the share fell for the rest of the century. By 1956 more Americans worked in offices, stores and schools than with their hands in factories, mines and building trades. Factory jobs reached their highest number in June 1979 and then fell, and by 2000 about 13 percent of workers belonged to a union.

New groups of workers organized in these years: farmworkers, city garbage collectors, flight attendants and office clerks. The share of women with paid jobs rose from 34 percent in 1950 to 60 percent in 2000.

Unions at their peak, and the move to the office

In the peak year, 1954, 34.8 percent of Americans who worked for wages or salaries belonged to a union. Leaders of the AFL and the CIO joined their groups into one, the AFL-CIO, on December 5, 1955. It had about 15 million members, and George Meany was its first president.

Offices and stores. For the first time, by 1956, more Americans worked in white-collar jobs, in offices, stores and schools, than in blue-collar jobs, working with their hands in factories, mines and building trades.

Women went to work for pay in growing numbers. In 1950, 34 percent of women were in the labor force, which means they had a paid job or were looking for one, and by 2000 the figure was 60 percent. Over the same years, women's share of all workers rose from 30 percent to almost 47 percent.

The braceros at work

The bracero program went on after the war. Men who wanted contracts went through reception centers at the border, run by officials of the federal agency that handled immigration. One was the Rio Vista farm in El Paso, Texas, and men who went through it remembered "poor food, humiliating medical examinations, and the fumigation."

The spraying. Officials had the men strip off their clothes, line up and be sprayed with DDT, a white powder that kills insects. The officials believed that Mexican workers carried insects and germs.

Growers could hire braceros right at the border from 1948, which let them skip the cost of moving the men and avoid government checks. Braceros worked six or seven days a week on farms and railroads in 26 states. Some were paid little and lived in poor housing, and supervisors cursed at some of them and attacked some of them physically. They worked with pesticides, chemicals that kill insects and weeds, and researchers later found these chemicals very harmful to farmworkers.

The end of the program. Members of Congress agreed in late 1963 to keep the program going for only one more year. They did not renew it again, so the law behind it, Public Law 78, ran out on December 31, 1964, and the program ended. Labor unions had pushed to end it. By then growers were also using more farm machines, and the public had learned about the braceros' working conditions.

The Mohawk ironworkers

Ironworkers from the Mohawk communities of Kahnawake, just south of Montreal, and Akwesasne, which lies across the border of the United States and Canada on the St. Lawrence River, worked high steel from the 1920s onward. That means they built the steel frames of bridges and skyscrapers, walking on narrow beams far above the ground. They helped build the Empire State Building, the Chrysler Building and Rockefeller Center in New York, and later the World Trade Center. The 9/11 Memorial and Museum has an exhibit about them called "Skywalkers."

Cesar Chavez and Dolores Huerta

Who: Organizers who built the farmworkers' union, together with the Filipino American grape pickers led by Larry Itliong, who walked out first.

When and where: Delano, California, 1965 to 1975.

Movie: *Cesar Chavez* (2014), a drama directed by Diego Luna, with Michael Peña as Chavez. *Dolores* (2017), a documentary about Dolores Huerta directed by Peter Bratt.

About 1,500 grape pickers, most of them Filipino American, walked out first.

Cesar Chavez and Dolores Huerta led farmworkers to win the first union contracts in the California grape fields. The pickers who walked out of the vineyards around Delano, California, on September 8, 1965, belonged to the Agricultural Workers Organizing Committee, or AWOC, a union led by Larry Itliong. Eight days later, on September 16, members of Chavez and Huerta's National Farm Workers Association voted to join the strike.

The march. Strikers marched about 300 miles from Delano to Sacramento, the state capital, from March 17 to April 11, 1966, and about 10,000 supporters were with them when they arrived. The two unions joined together and became the union now called the United Farm

Workers. Chavez went without food for 25 days in February and March of 1968 as a call for nonviolence, and Senator Robert Kennedy was with him when he ended the fast on March 10.

The boycott. Across the country, people stopped buying California table grapes, in what was called the grape boycott. Twenty-six grape growers in Delano signed the first union contracts on July 29, 1970. Dolores Huerta negotiated the contracts, and she made up the union's slogan, "Sí, se puede," Spanish for "Yes, it can be done."

The federal labor law of 1935 left out farmworkers. California's lawmakers passed the Agricultural Labor Relations Act in 1975, the first law in the United States to give farmworkers the right to collective bargaining, bargaining as a union with their employers.

The accounts of 2026. The New York Times reported in March 2026 that Chavez had sexually abused two girls in the 1970s. The two women, Debra Rojas and Ana Murguia, are daughters of union organizers, and they said the abuse began when they were 12 and 13. Rojas said Chavez raped her in a motel room when she was 15, forcing her into sex.

Dolores Huerta then said publicly that Chavez had pressured her into sex once and had raped her in a car in 1966, and that she became pregnant both times. She said she had kept the secret for 60 years because she believed the truth would hurt the farmworker movement.

Chavez died in 1993, so no court has ever heard these accusations. Leaders of the United Farm Workers canceled the union's events for Cesar Chavez Day. On March 26, 2026, California's lawmakers voted to rename the state holiday Farmworkers Day, and Governor Gavin Newsom signed the change into law.

Pesticides in the fields

Farmworkers who worked in fields sprayed with pesticides had high rates of birth defects, cancer and burns. Cesar Chavez and Dolores Huerta campaigned to ban DDT on grape and lettuce ranches. In the 1980s, children in several towns of California's San Joaquin Valley had cancer at rates "800% above the norm."

Fired for marrying or turning 32

Managers at US airlines fired stewardesses who married or who turned 32, and at some airlines 35, into the late 1960s. They also weighed the women and checked that they wore girdles, tight undergarments.

Dusty Roads. Barbara "Dusty" Roads flew for American Airlines from 1950. She pressed members of Congress to change the rules and helped found the Association of Professional Flight Attendants, a union. The Civil Rights Act of 1964 banned treating workers unfairly in hiring and firing because they were women or men. Flight attendants brought cases under that law, and in those years airline managers dropped the age and marriage rules.

Memphis, 1968

Two Memphis garbage collectors, Echol Cole, 36, and Robert Walker, 30, took shelter from the rain on February 1, 1968, inside the compactor of their garbage truck, the part that crushes the garbage. The truck was not working properly, and the compactor crushed both men to death.

Eleven days later, 1,300 Black sanitation workers went on strike. They wanted the city's leaders to recognize their union, which means to accept it and bargain with it, and they wanted the work made safe and pay that was enough to live on. Many of them were paid so little that they were on welfare, government help for people without enough money, and hundreds relied on food stamps to feed their families. The strikers carried signs that read "I AM A MAN."

The mayor. The members of the City Council voted to recognize the union on February 22, and Mayor Henry Loeb rejected the vote. He said only the mayor could recognize a union, and he would not. He also kept the worn-out trucks on the streets and would not pay overtime for late-night shifts. The next day, police sprayed Mace, a stinging chemical, and fired tear gas at marchers walking to City Hall.

Violence broke out during a march on March 28, and some people looted downtown shops. Members of a young Black Power group called the Invaders were accused of starting it. Police followed the marchers back to Clayborn Temple, a church, fired tear gas inside and clubbed people lying on the floor.

Larry Payne. A Memphis police officer shot and killed Larry Payne, a 16-year-old student. The officer said Payne came at him with a knife. Most people who saw it said Payne came out of a basement with his hands up, and none of them saw a knife. The officer was never charged or disciplined.

Dr. Martin Luther King Jr. came to Memphis to support the strikers. James Earl Ray shot and killed him on the balcony of the Lorraine Motel on the evening of April 4, 1968. City negotiators agreed on April 16 that the City Council would recognize the union and raise wages. The union was AFSCME Local 1733, part of a national union of city and state workers.

Coal dust and a new safety law

An explosion in the Consol No. 9 mine at Farmington, West Virginia, killed 78 miners on November 20, 1968. Members of Congress then passed the Federal Coal Mine Health and Safety Act of 1969. Under it, federal inspectors had to inspect every underground coal mine four times a year, and they could shut a mine down if it put lives in danger. The law also provided federal payments for miners with black lung.

Black lung is a disease caused by breathing coal dust, which scars the lungs. In the worst form, masses of scar tissue leave the miner "gasping for every breath." More than 76,000 miners have died of black lung since 1968.

Fewer deaths. The number of coal miners killed at work fell from 311 in 1968 to 133 in 1980 and 38 in 2000. President Richard Nixon signed the Occupational Safety and Health Act, a federal law on safety at work, on December 29, 1970. That year about 14,000 workers were killed on the job, about 38 a day.

Office workers organize

Two office workers in Boston, Karen Nussbaum and Ellen Cassedy, founded 9to5 in 1973. Its members were women who did clerical work, such as typing, filing and answering phones. They organized over pay, promotion and harassment on the job, treatment meant to upset, shame or frighten a worker. In an early lawsuit, they won $1.5 million in back pay, the pay the women were owed, from publishing companies in Boston.

At the checkout. With barcode scanners, cashiers no longer had to key in each price by hand. The scanners also recorded, hour by hour, what sold, and managers later used those records to set workers' schedules. The first sale rung up by scanning a barcode came at a Marsh supermarket in Troy, Ohio, at 8:01 in the morning on June 26, 1974, when the cashier Sharon Buchanan scanned a ten-pack of Juicy Fruit gum.

The mills close

The managers of Youngstown Sheet and Tube suddenly shut the company's Campbell Works steel mill in Youngstown, Ohio, on September 19, 1977, and 5,000 workers lost their jobs. People in Youngstown remember that day as "Black Monday." Factory jobs in the United States reached their highest number, 19.6 million, in June 1979, and after that the number fell for forty years.

The share of wage and salary workers in unions was 20.1 percent in 1983 and about 13.4 percent by 2000.

Frank Lumpkin

Who: A Black steelworker who lost his job, his last paycheck and his pension when his Chicago steel mill shut down, and who fought for 17 years to win the money back.

When and where: Wisconsin Steel, South Deering, Chicago, from the 1950s. Born 1916. Died March 1, 2010.

In April 1980, the bank said their last paychecks were worthless.

Frank Lumpkin spent 17 years fighting to win back the pay and pensions, money paid to workers after they retire, that he and more than 3,000 other steelworkers lost when their mill closed in 1980.

A working life. Lumpkin was born in Georgia in 1916 to a family of sharecroppers, who farm land that belongs to someone else and pay the owner with part of the crop. At 6 he hauled stone for an uncle, and at 15 he left school to work on citrus plantations. He also boxed for money as "KO" Lumpkin.

He moved north to Buffalo, New York, in 1940, worked in construction, in an aircraft factory and at Bethlehem Steel, and served in the Merchant Marine, the crews of American cargo ships. In the 1950s he went to work at Wisconsin Steel in the South Deering neighborhood of Chicago, and he stayed about 30 years.

How the mill closed. Wisconsin Steel ran out of money in 1980. Its main buyer, International Harvester, had stopped buying its steel, and Harvester's managers then demanded the money they were owed.

Harvester had owned the mill from 1902 until 1977. That year its managers sold the mill to Envirodyne, a company with no experience in steel, and lent Envirodyne the money to buy it. When Harvester's own workers went on strike in late 1979, Harvester's managers bought none of the mill's steel while the strike lasted. That steel had been about 40 percent of what the mill made.

In March 1980 Harvester's managers moved to collect the money Envirodyne still owed for the mill. They also told Chase Manhattan Bank, which had lent Envirodyne money, that they would no longer back the bank's emergency loans to the mill. The *International Directory of Company Histories*, a reference book about companies, describes these steps.

The mill closed without warning in late March 1980, while Envirodyne owned it, and the accounts do not name the person who gave the order. The workers lost their jobs, their health benefits, their back pay and their pensions. In April, officers of Chase Manhattan Bank told them that their final paychecks were worthless.

Save Our Jobs. Lumpkin and his wife, Bea Lumpkin, started the Wisconsin Steel Save Our Jobs Committee. Its members were Black, Mexican American and other steelworkers and their families, and they helped families with food, medical care and utility bills. First the members tried to get the mill reopened. Then they fought to recover the lost pay and benefits, and they sued International Harvester and Envirodyne.

Six hundred former workers had died in the seven years since the closing, the committee counted in 1987. The lawyer Thomas Geoghegan won a settlement of $14.5 million from International Harvester in 1988. Over 17

> years the committee won about $17 million in all, about a third of the $40 million the workers were owed. Lumpkin also ran to become an Illinois state lawmaker and lost.

The air traffic controllers, 1981

About 13,000 federal air traffic controllers, the workers who guide airplanes in and out of airports, went on strike on August 3, 1981. Federal law did not allow federal workers to strike. President Ronald Reagan gave them 48 hours to return to work, and on August 5 he fired 11,345 of them. Federal officials also stopped accepting their union as the workers' union. The historian Joseph McCartin, who wrote a book about the strike, argues that the firings showed private employers that they could fight strikes and beat their unions.

El Monte, 1995

State and federal agents and El Monte police raided a fenced apartment complex in El Monte, near Los Angeles, on August 2, 1995. Inside they found 72 Thai garment workers who had been forced to sew clothes and were not allowed to leave, and they freed them. Suni Manasurangkun and her sons ran the operation. The recruiters who brought the workers from Thailand took their passports when they arrived, and the workers owed about $5,000 for the trip.

Behind the fence. A high fence topped with razor wire surrounded the buildings, and an armed guard sat in the courtyard. The workers sewed clothes 84 hours a week, from early morning to midnight, for about $1.60 an hour. One worker, Rotchana Cheunchujit, was paid five to seven cents a garment. The owners made the workers buy food at their own store at high prices, and some workers had not been outside the fence for as long as seven years.

One woman escaped through a second-story window. A letter in pencil with a hand-drawn map reached the authorities, and the raid followed. The clothes carried "Made in the USA" labels and were sold at chain stores including Miller's Outpost, Mervyn's and Montgomery Ward.

The guilty pleas. Suni Manasurangkun, three of her sons and three other people pleaded guilty to federal crimes in February 1996, which means they told the court they had broken federal law. Two of her sons fled and were never caught. Officials of the companies that had sold the clothes agreed in 1997 to pay the workers the wages they were owed, to end lawsuits against them. One account puts the total at more than $4.5 million, and another at $4 million.

After the case, and partly because of it, members of Congress passed a federal law in 2000 against human trafficking, the buying, selling and moving of people to force them to work.

BY 2000

If you remember one thing: The share of workers in unions peaked in 1954 and fell for the rest of the century, while farmworkers, garbage collectors, flight attendants and office clerks organized.

One number: 13.4 percent. That was the share of wage and salary workers in unions in 2000. In 1954 it had been 34.8 percent, more than two and a half times as high.

Next: After 2000 some workers found jobs through apps on their phones, and workers at Starbucks and Amazon voted in their first unions.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 14 MINUTES

Millions of Americans now work for themselves and sell their work to companies, outside most labor laws, including the minimum wage law. About 11.9 million of them were independent contractors in their main job in July 2023, and some find their work through apps on their phones. One worker in ten belonged to a union in 2025, according to the federal Bureau of Labor Statistics. Workers at Starbucks coffee shops and at an Amazon warehouse voted in their first unions in 2021 and 2022.

Workers are still killed on the job. In 2024, 5,070 workers were killed at work, about 14 a day.

Unions and pay today

Union members were 10.0 percent of wage and salary workers in 2025, 14.7 million people, according to the Bureau of Labor Statistics. They were 32.9 percent of government workers and 5.9 percent of workers at private companies. The share had been 20.1 percent in 1983 and about one worker in three in 1954.

The federal minimum wage has been $7.25 an hour since July 24, 2009, and as of September 2026 members of Congress have not raised it. The first one, in 1938, was 25 cents.

Working through an app

Some independent contractors find work through apps that send them rides to drive or food to deliver, and the laws on the minimum wage and overtime pay do not cover them. Counting only people for whom it was their main job, independent contractors were 7.4 percent of all workers in 2023.

Gig work. Researchers at the Pew Research Center, a research group, counted more widely: anyone who had ever earned money through an online gig platform, an app or website that hands out short jobs one at a time. In their survey of August 2021, 16 percent of American adults had done so at least once, and 9 percent had done so in the past year.

Proposition 22. The managers of the app companies treat their drivers as independent contractors. California voters approved Proposition 22, a question put on the ballot, on November 3, 2020, with 58.63 percent of the vote. Under it, the app companies could keep treating drivers as independent contractors, but they had to pay drivers at least 120 percent of the minimum wage for the time they spent on a ride or a delivery, plus pay for each mile.

Raef Lawson

Who: A food-delivery driver for Grubhub whose court case asked whether an app driver is an employee.

When and where: Los Angeles, 2015 and 2016. A federal judge ruled on his case in 2018 and 2023, and approved a settlement in 2026.

After years in court, a judge awarded him $65.11.

Raef Lawson was an actor, writer and director in Los Angeles who was trying to make a career. He signed up in August 2015 to deliver food for Grubhub, a company whose app takes food orders from restaurants.

He picked blocks of two to five hours around mealtimes, week by week, and Grubhub paid him for the blocks he worked, 105 hours in his busiest month. It paid nothing toward his gas or his phone, so those costs came out of his own pocket. In 2016 Grubhub's managers classed all 4,000 of its California delivery drivers as independent contractors.

Let go. Grubhub's managers ended the company's agreement with him on February 15, 2016, saying he had not worked many of the blocks he signed up for. The judge at his trial also found that he sometimes "gamed" the app, which means he tricked it: he logged on late, and he switched his phone to airplane mode so no new orders came.

The case. Lawson sued Grubhub for the minimum wage, for overtime pay, which is extra pay for hours past 40 in a week, and for his costs, saying that he had been its employee. Judge Jacqueline Scott Corley ruled in 2018 that he had been an independent contractor. Three months later, the justices of California's Supreme Court set a new rule: a company must prove that a worker is not an employee.

A federal appeals court, a higher court that checks the rulings of lower courts, sent Lawson's case back to Judge Corley on September 20, 2021. She ruled on March 30, 2023, that under the new test Lawson had been

an employee. She wrote that "food delivery is not outside the usual course of" Grubhub's business, and she awarded him $65.11 in unpaid minimum wages for four months of work.

The settlement. Grubhub's officials agreed in 2026 to pay $24.75 million to California drivers to end their claims, and the judge approved the deal on July 30, 2026. About 60,000 drivers are in the settlement, and each gets at least $25. Judge Corley called it "my oldest case."

The pandemic, 2020

About 48.7 million employed people, 35.4 percent of them, worked from home in May 2020 because of the COVID-19 pandemic, according to the Bureau of Labor Statistics. By April 2022 that share had fallen to 7.7 percent, and many office workers kept working from home for part of the week. Workers in grocery stores, warehouses, delivery and health care, called essential workers, kept going to work in person.

Unions at Starbucks and Amazon

Baristas, the workers who make the coffee drinks, at a Starbucks on Elmwood Avenue in Buffalo, New York, voted 19 to 8 to form a union on December 9, 2021. The Washington Post and ABC News reported that it was the first union at one of the roughly 9,000 US stores that Starbucks owned itself. Workers at hundreds of other stores followed.

Workers at Amazon's JFK8 warehouse on Staten Island, New York, voted 2,654 to 2,131 for the Amazon Labor Union. Officials of the National Labor Relations Board, the federal agency that runs union elections, announced the result on April 1, 2022. It was the first union at an Amazon warehouse in the United States.

Chris Smalls

Who: An Amazon warehouse worker who was fired and then organized the first union at an Amazon warehouse in the United States.

When and where: The JFK8 warehouse, Staten Island, New York, 2020 to 2022.

Movie: *Union* (2024), a documentary by Brett Story and Stephen Maing about the union campaign at JFK8. It won a Special Jury Award at the Sundance Film Festival in 2024.

He built a union from a bus stop across the road.

Chris Smalls worked as a process assistant at Amazon's JFK8 warehouse on Staten Island. He led a walkout over safety from COVID-19 in March 2020, with workers leaving their jobs together in protest, and Amazon's managers fired him.

Smalls and other workers then started the Amazon Labor Union. At a bus stop across the road from the warehouse they set up a table with food and talked with workers as they came and went, thousands of conversations over many months. The workers won the vote in April 2022.

Where the new unions stand in 2026

Baristas at 600 Starbucks stores, about 12,000 workers, had joined the union Starbucks Workers United by June 2025, according to the union. They began a national strike on November 13, 2025, and it grew to about 4,500 workers in more than 130 cities. The union's leaders called it the longest strike in the company's history. As of September 2026, no Starbucks store's workers have voted to approve a first contract.

Members of the National Labor Relations Board ordered Amazon on April 2, 2026, to begin talks with the union at JFK8 on a contract for pay and working conditions. They found that Amazon had "illegally and willfully" ignored the union, according to a Teamsters union press release. As of September 2026, no contract has been reported.

Injuries in the warehouses

Staff members working for Senator Bernie Sanders, who led a US Senate committee on labor, published a report on Amazon warehouses in December 2024. It was a report by his own staff, not by the whole committee, and they interviewed 135 workers for it.

What they found. In each of the past seven years, the staff found, Amazon workers had been nearly twice as likely to be injured as other warehouse workers.

In 10- to 12-hour shifts, workers repeat the same movements "hundreds and thousands of times," the report states. A computer tracks how fast each worker goes, and workers who fall behind get penalties from the computer system automatically, which can end in firing.

Children in the slaughterhouses

Managers at Packers Sanitation Services, a cleaning company based in Wisconsin, put 102 children aged 13 to 17 to work on night shifts, officials of the US Department of Labor reported in February 2023. The children worked at 13 meatpacking plants in 8 states, where animals are killed and cut up for meat, according to reporting by KCUR, a public radio station in Kansas City.

They cleaned back saws, brisket saws and head splitters, machines that cut up animals, using chemicals strong enough to burn skin, and at least three of them were injured. The JBS plant in Grand Island, Nebraska, had 27 of the children, and the Cargill plant in Dodge City, Kansas, had 26.

The fine. Packers Sanitation Services paid $1.5 million, the most the law allowed. Jessica Looman of the Labor Department's Wage and Hour Division called the violations "systemic," which means built into the way the company worked, and "a corporate-wide failure."

On farms, federal law still allows children to work at younger ages than in other jobs. Outside school hours, a child under 12 may work on a farm owned or run by a parent, or, with a parent's permission, on a small farm that does not have to pay the minimum wage. Children of 12 and 13 may work with a parent's permission or on a farm where a parent works, and any child 14 or older may do farm jobs outside school hours.

Heat, floods and mines

Sixty-eight crop workers died of heat from 1992 to 2006, according to a 2008 report by the Centers for Disease Control and Prevention. Their death rate from heat was 0.39 for every 100,000 workers, against 0.02 for all civilian workers, nearly 20 times as high. A 56-year-old tobacco worker in North Carolina died in July 2005 with a body temperature of 108 degrees. He was in the United States on a temporary farmworker visa, and the report does not name him.

Across all jobs, 345 workers died of heat from 2011 to 2019, 43 of them in 2019, according to the Bureau of Labor Statistics. Officials of the Occupational Safety and Health Administration, the federal job-safety agency, proposed a rule on August 30, 2024, to protect workers from heat, a requirement that employers would have to obey by law. The officials held public hearings from June 16 to July 2, 2025. As of September 2026 there is no final federal rule on heat at work.

Erwin, Tennessee. Floods from Hurricane Helene reached the Impact Plastics plant in Erwin, Tennessee, on September 27, 2024, and five employees and a contractor who cleaned the offices drowned. One worker who survived and the families of some who died said no one told the workers they could leave until the flood had covered the road and the plant had lost power.

Inspectors from Tennessee's job-safety agency found that the company had "exercised reasonable diligence," which means it had taken reasonable care. They gave the company no citations, the official notices for breaking safety rules.

The local chief prosecutor, District Attorney General Steven Finney, looked into whether the workers had been told they could not leave, or that they would be fired if they left. He found "no evidence" of either and closed the case with no charges in July 2025. The family of Johnny Peterson, one of the men who died, filed a lawsuit.

Upper Big Branch. An explosion of gas and coal dust killed 29 miners at the Upper Big Branch mine in West Virginia on April 5, 2010. The mine belonged to Massey Energy. Its chief executive, Don Blankenship, was found guilty in December 2015 of conspiring, plotting with others, to break federal mine safety laws. Judge Irene Berger gave him the longest sentence the law allowed on April 6, 2016, one year in prison and a fine of $250,000. He was not convicted of causing the deaths.

The count. Injuries at work killed 5,070 workers in 2024, according to the Bureau of Labor Statistics, one worker every 104 minutes, about 14 a day. Road crashes and other transportation accidents killed 1,937 of them. In 1970 about 38 workers a day had been killed on the job.

Wage theft and the tomato fields

Some employers do not pay workers all the money the law says they have earned, and this is called wage theft. Researchers at the Economic Policy Institute, a research group that sides with labor unions, studied the ten states with the most people in 2017. They found that 2.4 million workers there were paid less than the minimum wage, and together they lost $8 billion a year. A worker who worked all year lost about $3,300, nearly a quarter of what they had earned.

The Fair Food Program. Tomato pickers in Immokalee, Florida, formed the Coalition of Immokalee Workers in 1993, and the coalition's Fair Food Program has run since 2011. Big buyers such as McDonald's and Walmart pay a little extra for each pound of tomatoes and buy only from growers who follow a code of conduct written by the workers. The code sets a lowest pay, requires shade and water and bans harassment. Checkers visit the farms, and workers can call a complaint line.

More and more farmworkers come to the United States on temporary H-2A visas, which allow them to do farm work for a season. About 48,000 H-2A jobs were approved in fiscal year 2005, the government's budget year, and nearly 400,000 in fiscal year 2025, more than eight times as many. More than 90 percent of the visas go to Mexican workers.

THE THREE QUESTIONS, ANSWERED

1. **Which workers were not free to leave their work?** Native people forced to work under Spanish rule, indentured servants bound for years, enslaved people, prisoners leased to Southern mines and planters, and the Thai garment workers held behind a fence in El Monte until 1995. Virginia judges sentenced John Punch in 1640 to serve for the rest of his life.
2. **What happened when workers went on strike?** Some won, like the Philadelphia printers in 1786 and the Flint autoworkers in 1937. Many times police, hired guards and soldiers broke the strike, and at Lattimer in 1897, Ludlow in 1914 and Chicago in 1937 they killed strikers, their families and people marching with them.
3. **What made work less deadly?** Laws written after workers died: more than one way out of every Pennsylvania mine after the Avondale fire, safer couplers after thousands of brakemen died, new factory laws in New York after the Triangle fire, and the 1969 coal mine law after Farmington. Deaths on the job fell from about 38 a day in 1970 to about 14 a day in 2024.

What changed: Work moved from households, forced labor and bound servants to jobs for wages, and wage workers won a shorter week, a lowest wage and safety laws, though their share in unions has fallen since 1954 to one in ten.

FIVE DATES TO KEEP

July 9, 1640: Virginia judges sentence John Punch to serve his master for life.

June 2, 1786: Philadelphia's printers begin the earliest proven strike of workers in one trade in the United States.

March 25, 1911: The Triangle fire kills 146 workers in a New York factory where a stairway door was locked.

June 25, 1938: President Roosevelt signs the law that sets the first federal minimum wage, 25 cents an hour.

April 1, 2022: Workers at an Amazon warehouse on Staten Island win the first union at an Amazon warehouse in the country.

NOT KNOWN: No one has ever proved who threw the bomb at Haymarket Square in 1886.

Where to go: Hopewell Furnace National Historic Site, in Pennsylvania, is the National Park Service site of the ironworks where more than 100 woodcutters and about 20 colliers worked in the 1830s.

Next: Chapter 15, Food and Farming. It asks what Americans ate and how they grew it, and the braceros and farmworkers of this chapter appear there too.

Chapter 15: Food and Farming

CHAPTER 15 OF 37 · FOOD AND FARMING · 10 ERAS · ABOUT 75 MINUTES

American food began with crops that Native farmers bred, and since then much of it has been grown on taken land by people who were enslaved or paid little.

On Cape Cod in November 1620, men from the *Mayflower* found baskets of corn buried in the ground. Nauset farmers had buried the corn to plant the next spring. The Englishmen dug it up and named the spot Cornhill. They wrote that they would "satisfy them for their corn," meaning they would pay the owners later. It was the first corn the Plymouth colonists ate. Native farmers had spent thousands of years turning a wild grass into that corn.

This chapter follows American food from those fields to the drive-in and the lab. Watch two things as you go. The first is whose land and whose work the food came from: Native farmers, enslaved Africans in the rice and cotton fields, families who farmed for a share of the crop, Mexican farmworkers, and today's crop pickers. The second is how far the food travels. When the country began, about nine of every ten working people were farmers. Then came tin cans, pond ice, cold railroad cars, frozen dinners and fast food. In 2022 the country had fewer than 2 million farms for the first time since before the Civil War.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did Native farmers turn a wild grass into corn?
2. Who did the hardest farm work, and what did they get for it?
3. How did Americans come to eat food grown far away by people they never met?

Five minutes? Read "Who got the cotton money?" in 1900 to 1950.

Can skip: "Farming began in the East too", "Why turn corn into whiskey?", "The potato blight", "Organic farming rules become law". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 5 MINUTES

Native farmers turned a wild grass into corn, and by 1500 corn fed whole towns. Farming here was already thousands of years old. People in each region also ate what grew or lived best around them: bison on the Plains, salmon in the Northwest, wild rice around the Great Lakes.

Europeans later carried corn, beans and squash from these fields across the ocean.

How corn was made

Native farmers made corn out of a wild grass called teosinte. A teosinte seed head holds only a few hard kernels. Farmers began changing it about 9,000 years ago in the Balsas River valley of southern Mexico. Each year they took seed only from the plants they chose and planted it again, so the crop changed a little at a time. After thousands of years of this breeding, the grass had become corn.

Scientists have confirmed the date and the place in two ways. Ancient corn dug from the ground shows it, and so do the genes of corn and teosinte, the tiny instructions inside every living thing that parents pass on to their young.

Corn is so changed from the wild grass that it cannot reseed itself. It grows only where people plant it. Native farmers grew it a little farther north at a time, over thousands of years, until it reached what is now the United States.

The Three Sisters

Native farmers planted corn, beans and squash together in the same field, and each crop helped the other two grow. The three crops are called the Three Sisters.

The corn grew tall, and the bean vines climbed the corn stalks. Bean roots hold tiny living things called bacteria. These bacteria take nitrogen, a gas in the air, and put it into the soil. Plants need nitrogen to grow, so the beans fed the soil that all three plants shared. The squash spread wide leaves over the ground, and their shade kept water in the soil and blocked the sunlight that weeds needed.

Corn and beans eaten in the same meal also feed people better than either food does alone. Together they give the body a fuller mix of protein, the part of food the body uses to build muscle.

Farming began in the East too

Native people in the eastern part of North America started farming on their own, long before corn reached them. They took wild plants and bred them into crops. About 5,000 years ago they had tamed a kind of squash.

They also grew six plants for their seeds: sunflower, goosefoot, sumpweed, maygrass, little barley and erect knotweed. Sunflower and sumpweed seeds are rich in oil. The other four have starchy seeds. Maygrass and little barley are grasses whose grain can be ground into flour, and people cooked and ate goosefoot's small seeds.

Scientists call this group of crops the Eastern Agricultural Complex. Eastern North America is one of the places in the world where people started farming on their own, without learning it from anyone else.

Foods by region

Cahokia was a Native town near where St. Louis is today. Around the year 1100, between about 10,000 and 20,000 people lived there, and corn farming fed them.

People in other regions lived mainly on other foods. On the Great Plains, hunters killed bison. By a widely used estimate, about 30 million bison still lived there in the early 1800s. Along the Northwest coast and its rivers, salmon was the main food. People on the coasts gathered shellfish. In the Northeast, people collected sap from maple trees.

Around the Great Lakes, people harvested manoomin, a wild rice that grows in shallow water, from canoes. In Ojibwe, the word means "the good berry." The Ojibwe are one of the Anishinaabe peoples, a family of related nations that also includes the Odawa and the Potawatomi. In an Anishinaabe prophecy, a teaching about what was to come, the people were led to the place where they would find "the food that grows on water." Manoomin is still a central food of Ojibwe life.

No farmer from before 1500 is known by name. Because corn cannot reseed itself, every generation of Native farmers had to save the seed and plant it again. Seed keepers in Native nations still grow these crops.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

European ships began carrying crops and farm animals across the Atlantic in both directions in the 1500s. Corn, potatoes and turkeys went east to Europe, and wheat, cattle and pigs came west. Africans, most of them carried across in chains by slave traders, brought crops of their own. The historian Alfred W. Crosby named this movement the Columbian Exchange, in his 1972 book of that name. Native people here still grew and ate their own foods, and in Florida a Spanish army lived on the corn it took from them.

What crossed the ocean

Europeans carried American crops and animals home to Europe. These included corn, potatoes, tomatoes, beans, squash, peanuts, peppers, vanilla, turkeys and cacao, the bean that chocolate is made from. Corn and potatoes later became main foods across Europe, Africa and Asia.

Europeans brought wheat, rice, sugarcane, citrus fruit (the family of fruit that includes oranges and lemons), and honeybees to the Americas on their ships. They also brought cattle, pigs, sheep, goats and chickens. Columbus brought horses on his second voyage, in 1493. Spanish colonists founded St. Augustine, in Florida, in 1565, and began a colony in New Mexico in 1598. In both places they planted wheat and citrus and raised cattle.

The word exchange can sound like a friendly trade, but Europeans took American crops home from lands they were invading. Much of what arrived was grown to feed the colonists. Before long, planters were forcing enslaved people to grow sugarcane on plantations.

Enslaved Africans brought their own crops and the skill to grow them, among them okra, watermelon, yams, sorghum, black-eyed peas and African rice.

De Soto's army and Apalachee corn

The Spanish soldier Hernando de Soto landed near Tampa Bay, in Florida, in May 1539, with an army of more than 600 people. He carried no food supplies except a small herd of pigs. Men who marched with him wrote accounts of the trip, and those accounts say the herd began with about 13 pigs. By 1542 it had grown to about 700. The army rarely killed the pigs for food, and pigs that escaped ran wild across the Southeast.

De Soto's army moved from town to town and took the corn that Native villagers had stored, and the soldiers ate it. Without that corn, the villagers were often at risk of starving. De Soto also seized dozens of Native men, women and children. His soldiers forced them to carry the army's equipment and supplies and to do the work of the camp.

The captives. Rodrigo Ranjel, de Soto's secretary, kept a diary of the march. An account written from it states that the Spaniards took the men "to have more slaves and servants." Some of the captives died and others ran away, so the soldiers seized more. The same account records that the soldiers wanted the women "for their lewdness and lust," which means they wanted them for sex. The women were prisoners and could not refuse. The soldiers raped them, forcing them to have sex.

De Soto's army seized Anhaica, the main town of the Apalachee, in October 1539. Tallahassee, Florida, stands there today. The army lived in the town until March 1540 and took its stored food, which was enough to feed 600 men and 220 horses for five months.

Archaeologists, scientists who study the past by digging up what people left behind, have found burned corncobs at the site. The Apalachee fought back with quick raids and ambushes, and they went after the Spaniards' horses.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 6 MINUTES

Native corn kept the first English colonists at Jamestown and Plymouth alive in the 1600s. The colonists bought some of that corn and grew some of it with Native teaching, and they took some by force. In Virginia, planters then grew tobacco in place of food.

Jamestown: hunger, and corn the English took by force

The colonists at Jamestown, in Virginia, planned to live partly on food they traded from the Powhatan people and partly on supply ships from England. In the autumn of 1609, Powhatan leaders stopped trading food with them, and Powhatan warriors surrounded the fort. The winter of 1609 to 1610 is called the Starving Time. About 500 colonists were alive when it began. By spring, about 61 were still alive.

The colonists ate their horses, dogs and rats, and they ate leather. Some ate the bodies of people who had died. Archaeologists found the bones of a girl whom researchers call Jane. The bones show that colonists ate her body after she died. Scientists at the Smithsonian announced the finding in 2013.

Percy's raid. English soldiers also took corn by force and destroyed Native fields. On August 10, 1610, George Percy led English soldiers against the Paspahegh town near Jamestown. They burned the houses, cut down the cornfields and took corn. Percy wrote that they killed 15 or 16 people. Other accounts put the number of villagers killed as high as 75.

The soldiers captured the wife and two children of Wowinchopunck, the Paspahegh weroance, or leader. When Percy hesitated, his men complained. Percy then agreed to kill the children. His soldiers threw the children overboard from a boat and shot them in the head in the water.

That night at Jamestown, Captain Davis told Percy that Lord De La Warr, the colony's governor, wanted the children's mother burned alive. Captain Davis and two soldiers took her into the woods and killed her with a sword. Percy wrote that he did not believe the order really came from the governor.

Ten years of raids. Powhatan warriors attacked the English settlements in March 1622. After that, colonial soldiers marched out almost every summer for ten years to attack Powhatan towns and cornfields. At a peace meeting in 1623, colonists poisoned the Powhatans' wine, shot them, and then destroyed their cornfields.

Why Virginia planters grew tobacco instead of food

Tobacco sold for so much money that many Virginia planters grew it in place of food crops. John Rolfe grew the colony's first successful tobacco crop in 1612, from a sweet kind of tobacco.

Members of Virginia's assembly, the colony's lawmaking body, passed laws again and again to make planters grow food. Under a tobacco law of 1629 and 1630, a family could grow 2,000 tobacco plants for each family member and no more. The lawmakers set the limit partly so that families would still plant food crops.

Plymouth: corn dug up, then corn planted

The first corn the Plymouth colonists ate was corn they took. In November 1620, men from the *Mayflower* went exploring on Cape Cod. There they found baskets of corn that the local people had buried in the ground. The owners were saving it as seed for the next spring.

The Englishmen dug up about ten bushels of the corn (a bushel holds about 8 gallons) and a bag of beans. They wrote that they planned to "satisfy them for their corn," which meant to pay the owners later. They named the place Cornhill.

The same group of men dug up graves nearby. They opened bundles that held the bones of a man and a small child. They wrote that they "brought sundry of the prettiest things away," meaning they took several of the objects buried with the dead.

The owners of the corn were Nauset people. In the summer of 1621, the colonists met one of them and promised to pay him. They offered to bring the owners as much corn as they had taken. Later in 1621 the colonist Edward

Winslow wrote that the owners had been given "full content," meaning they were fully satisfied. His letter does not say what they were given.

The colonists built their town on the land of Patuxet, a Wampanoag town. An epidemic, a disease that spreads quickly through many people, had killed most of the people of Patuxet between 1616 and 1619. One reason the colonists gave for settling there was the "good corn-ground ready to our hands." The Patuxet people had cleared those fields.

The colonists planted about 20 acres of corn in the spring of 1621. The corn did well, and their first harvest, that autumn, fed them through their second winter.

Squanto (Tisquantum)

Who: A Patuxet man who taught the Plymouth colonists to plant corn, after an English captain had kidnapped him.

When and where: Patuxet, where the colonists built Plymouth, in what is now Massachusetts. Kidnapped 1614, home 1619, taught the colonists in the spring of 1621, died 1622.

Movie: *Squanto: A Warrior's Tale* (1994), a feature film that mixes his real story with invented events.

He taught the colonists to bury fish with their corn.

Squanto, also called Tisquantum, showed the Plymouth colonists how to plant corn in the spring of 1621. He also interpreted between the colonists and the Wampanoag, which means he put each side's words into the other's language.

An English captain named Thomas Hunt kidnapped Squanto in 1614 and took him to Spain to be sold as a slave. Squanto reached England and learned English there. In 1619 he came home with an English expedition and found his town of Patuxet empty. An epidemic had killed most of its people.

The colonist Edward Winslow described the planting in a letter of December 1621. Following "the manner of the Indians," he wrote, "we manured our ground with herrings, or rather shads," two kinds of fish. The colonists buried the fish in the soil with the corn seed to feed the crops, and Squanto taught them to do it.

Scholars have argued for decades about where Squanto learned the method. In 1975 Lynn Ceci, an anthropologist (a scientist who studies how people live), argued in the journal *Science* that burying fish with corn was a European method. She found little evidence that many Native farmers used fish this way, and she argued that Squanto probably learned it during his years among Europeans. Other scholars defended the older account, the one Winslow gave.

KNOWN:	Squanto showed the colonists how to bury fish with their corn.
NOT KNOWN:	Where he learned the method, from Native farmers or among Europeans, is still not settled.

What the colonists ate

The English colonists learned corn dishes from Native cooks, and Americans went on eating them for centuries. One was hominy, which is dried corn cooked in water. For samp, cooks pounded corn into coarse meal and boiled it into a mush, and the name comes from the Narragansett word *nasàump*. Johnnycakes were flat cakes baked from cornmeal. Along with their corn, the colonists ate beans, and once their hogs had multiplied, they ate pork and drank cider made from apples.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 6 MINUTES

Planters in the Carolina Lowcountry, the flat, wet land along the coast of South Carolina, became some of the richest people in the colonies by forcing enslaved Africans to grow rice. The enslaved Africans built the rice fields and did the work in them. Planters paid more for captives from West Africa who already knew how to grow rice.

Farther north, farmers in Pennsylvania, New York and New Jersey grew more wheat than they could eat and shipped flour to other places. New Hampshire's town histories say that settlers there planted the first potato patches in North America that lasted.

Carolina rice and African skill

English settlers first brought a small amount of rice to Charles Town, now Charleston, in 1670. No record shows that anything grew from it. By July 1699, samples of Carolina rice were on sale in London to test whether buyers wanted it. The first crops grew on dry, high ground. By the 1720s, planters had moved their rice into freshwater swamps inland, and they had enslaved workers build dams to hold the water in ponds.

The rice boom. Carolina planters shipped out about 269,000 pounds of rice a year from 1698 to 1702. Forty years later, from 1738 to 1742, they shipped out more than 30 million pounds a year, more than a hundred times as much. One kind of Carolina rice later became known as Carolina Gold.

Planters put out advertisements asking for captives from the part of West Africa known as the Rice Coast. That coast included Senegambia, the land along the Senegal and Gambia rivers, and Sierra Leone. Planters paid more for people from there because those people knew how to grow rice.

African methods. Records from Carolina fields show African methods at work. Enslaved workers built earth banks around fields beside the tidal rivers so they could flood and drain them. They sowed seed by pressing it into the mud with the heel and toe. They separated the grain from its husks by tossing it in coiled baskets called fanner baskets.

What is certain, and what is argued. It is certain that planters paid more for captives from the Rice Coast and that enslaved Africans used African methods in the Carolina fields. Scholars argue about how much the whole rice business owed to that African knowledge. In 2001 the scholar Judith Carney argued that African knowledge was its base, and in 2005 three historians answered that she had made the African share too large.

Most scholars now hold a middle view: planters built the rice business with their money and by force, and they also depended on African skill. Records from the colony also show that in its early years, more captives came from Angola than from any other place, and Angola is not on the Rice Coast.

Whose land the rice grew on

The Kiawah, Etiwan and Stono people lived along the Ashley, Cooper and Stono rivers. They were still there in 1670, when English colonists settled among them at Charleston Harbor.

English colonists captured Kussoe people who fought back in 1671, and Stono people in 1674, and sold them into slavery in the Caribbean. The Kiawah left the Ashley River in the early 1680s and moved to the island now named for them. By then no nation of the Lowcountry had more than fifty bowmen, and the Stono had sixteen hunters. In the spring of 1684, leaders of eight nations signed away their land claims to the English who ran the colony.

English colonists in Carolina made their biggest profits before 1720 from two kinds of goods they shipped out. One was ship supplies, such as tar made from pine trees. The other was Native people, whom they sold as slaves. In 1770 a colonist named William Bull wrote of the Native nations along the coast that "there remains now, except a few Catawbas, nothing of them but their names, within three hundred miles of our sea coast."

The rice workers, unnamed in the records

Planters' records list the enslaved rice workers by first name, age and price. They say almost nothing else about them. No single rice grower from these years can be followed through life in the records.

Planters gave each enslaved worker a set task every day. The usual task was to work a quarter of an acre of land. A worker who finished the task had the rest of the day. Workers labored in direct sun, standing in water or mud, among mosquitoes, horseflies, snakes and alligators.

Enslaved Africans dug the banks and canals of the rice fields. Nic Butler, a historian at the Charleston County Public Library, has written that the earth they moved across the Lowcountry is about as much as all the great pyramids of Egypt put together.

More enslaved people died in the Lowcountry than were born there until the 1760s. Many of the dead were children. Planters kept buying new captives to replace them, and by 1708 more Black people than white people lived in South Carolina.

The slave ships. Slave traders rarely landed more than 300 enslaved Africans a year at Charles Town in 1710. By 1720 they landed more than 1,000 a year, and by 1770 more than 3,000. More than four of every ten Africans brought to North America in the slave trade came in through Charleston Harbor.

Eliza Lucas Pinckney

Who: A planter's daughter who ran her family's South Carolina plantations as a teenager and made the colony's first successful indigo dye.

When and where: Wappoo plantation, near Charleston, South Carolina. Indigo experiments from 1739, first successful dye in 1744.

She was about 16 when she took charge of three plantations.

Eliza Lucas produced South Carolina's first successful dye from indigo, a plant that colors cloth blue, in 1744. Indigo is a farm crop but not a food.

Her father, George Lucas, went back to the island of Antigua, in the Caribbean, in 1739 to serve as its lieutenant governor, the official just below the governor. Eliza was about 16. She took charge of Wappoo plantation and of the 20 enslaved people who worked it. She also oversaw the family's two other plantations, which were much larger.

That same year she began experimenting with indigo seed. Turning the plant into dye was skilled work done by experts. She first worked with an indigo maker from the island of Montserrat. Her best results came with an indigo maker of African descent whom her father hired from the French islands of the Caribbean.

She used her 1744 crop to make seed and gave the seed to other planters. Planters in South Carolina shipped out about 5,000 pounds of indigo in the shipping year 1745 to 1746. By 1748 they shipped out 130,000 pounds. She later married and took the name Pinckney.

Wheat, potatoes and everyday meals

Pennsylvania, New York and New Jersey were called the breadbasket colonies. Farmers there grew more wheat than their families needed. Merchants shipped the extra wheat as flour out of the ports of Philadelphia and New York.

Settlers known as the Scots-Irish, families of Scottish background who had lived in the north of Ireland, planted potatoes at Londonderry, New Hampshire, in 1719. New Hampshire's histories count their patches as the first lasting potato fields in North America. The potato first grew as a crop in the Andes mountains of South America. People carried it to Europe, and settlers later brought it back across the ocean to North America.

Most colonial families ate corn, pork and bread, and drank cider. Rich families also bought tea, sugar and wine from overseas, and they ate bread made of wheat.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 5 MINUTES

About nine of every ten working people in the United States were farmers when the country began, by a widely used estimate from the US Department of Agriculture. The first census, a count of the people, was taken in 1790. It counted about 4 million people.

Thomas Jefferson wrote that farmers were God's chosen people, while people he enslaved farmed his land. In 1796 Amelia Simmons became the first American to write a cookbook for American kitchens, and some of its recipes used American cornmeal.

Matthew Patten

Who: A New Hampshire farmer, carpenter and judge whose diary records what his family grew, caught and ate.

When and where: Bedford, New Hampshire, on the Merrimack River. His surviving diary runs from 1754 to 1788.

In ten days of fishing, he sent 354 fish home.

Matthew Patten kept a diary that shows how one farm family in New Hampshire fed itself. He headed each little booklet of it "A Day Book continued." His entries for the year 1767 record the family's food through the seasons.

Patten was a joiner, a carpenter who does the finer woodwork in a house. He also farmed, worked as a judge, and surveyed land, which means he measured it and marked its borders.

What the family ate. The Pattens grew corn, rye, wheat, peas, potatoes, barley and turnips. They butchered their own hogs, calves and sheep, and they caught shad and salmon in the Merrimack River. They bought tea, sugar, molasses and rum. The family paid and was paid in bushels of grain as often as in money.

Winter. Neighbors paid Patten in corn for surveying their land and for writing deeds, the papers that prove who owns a piece of land. In January he took corn and rye to a neighbor's mill to be ground into meal and flour, and on January 30 he butchered the family's hogs.

Spring. The family's potatoes had spent the winter buried in a pit. Patten opened it on March 4 and wrote that they were "sound and good." In April and May the family sowed peas and planted potatoes and corn, and "the boys" spread manure from the barn on the field behind it. They also sowed hemp and flax, plants whose fibers are made into rope and cloth.

Fishing. In May Patten helped haul a net for shad, a fish the family took from the Merrimack each spring. From May 28 to June 6 he fished at Amoskeag Falls and sent 354 fish home.

The name Amoskeag comes from a Pennacook word that means roughly "good fishing place." Long before Bedford was a town, Pennacook people strung large nets across the river at the falls and caught sturgeon, salmon and a fish called the alewife. Bedford lies in Pennacook country.

Summer. In June and July Patten caught salmon and split them with two neighbors. In August he reaped his rye, and later that month he mowed his meadow for hay.

Patten died on August 27, 1795, in one of the town's fields. He had carried dinner out to the men who were mowing.

Jefferson's farmers and Monticello's rations

Thomas Jefferson believed that family farms made free citizens. He wrote about the idea in his book *Notes on the State of Virginia*, first printed in 1785: "Those who labour in the earth are the chosen people of God, if ever he had a chosen people." For about a hundred years afterward, American leaders wrote land laws meant to put land in the hands of family farmers.

People Jefferson enslaved did the farm work at Monticello, his plantation in Virginia. He enslaved more than 600 people during his adult life. In the years Jefferson had tobacco grown at Monticello, enslaved children picked worms off the tobacco plants.

The rations. Each week, Jefferson gave each enslaved worker at Monticello a set amount of food, called a ration: a peck of cornmeal (about 8 quarts), half a pound of pork or pickled beef, and four salted fish. Nursing mothers received extra, and workers got whiskey at harvest. Researchers who studied the Monticello records found that these rations were not enough food for a person to live on. So in their little free time, enslaved people hunted, fished, trapped, kept gardens and raised animals.

Enslaved families also sold chickens and vegetables from their own gardens and flocks to the Jefferson family. Jefferson's granddaughter Anne Cary Randolph wrote down these purchases in the household accounts. Most of the

sellers she recorded were enslaved people who worked in the house, many of them members of the Hemings family.

Why turn corn into whiskey?

Farmers in the backcountry, the land far from the coast beyond the older farms and towns, could not easily haul wagons of corn over the long roads to buyers. So they turned their extra corn into whiskey, which they could carry to market in jugs.

Amelia Simmons

Who: The author of *American Cookery*, the first cookbook written by an American for American kitchens.
When and where: Hartford, Connecticut, 1796.

On her title page she called herself "an American orphan."

Amelia Simmons wrote *American Cookery*, the first cookbook written by an American for American kitchens. It was printed in Hartford, Connecticut, in 1796. Beyond those words on her title page, nothing about her life is known.

Her book contains the first known printed recipes that used American cornmeal. Among them were johnnycake, "Indian slapjack" and Indian pudding. Colonists called corn "Indian corn" and cornmeal "Indian meal," so the word Indian in these names meant that the dishes were made with cornmeal.

It also contains the first printed recipe that used pearlash, a salt made from wood ashes, to make dough rise. Bakers used pearlash before baking powder existed. The book includes some of the earliest printed uses of the words "cookey" (cookie) and "slaw" (a salad of shredded cabbage), which came into American English from Dutch settlers in America.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 7 MINUTES

Sealed in tin cans or kept cold with ice cut from frozen ponds, food could now be sold far from the farm where it grew, to people the grower never met. In the Deep South, planters, the owners of large farms worked by enslaved people, spread cotton fields over land that federal troops had forced Native nations to leave. On the prairie of the Midwest, farmers used a new steel plow to turn thick grassland into fields of wheat and corn.

Food in cans, and ice from ponds

A Frenchman named Nicolas Appert proved in 1809 that food sealed in a container and then heated would keep without spoiling. The method is called canning.

Americans soon took it up. William Underwood opened a cannery in Boston in 1820 or 1821. In New York, Thomas Kensett canned seafood, fruit and vegetables, and in 1825 he received an American patent for tin cans, a government paper that gave him the sole right to make and sell them for a set number of years.

Other merchants sold ice. Workers cut blocks of ice from frozen ponds in New England in winter, including Walden Pond. Merchants shipped the ice to cities. People used it to keep food, fresh fish and drinks cold. Families kept ice in a box called an icebox, which became a common piece of kitchen furniture.

Frederic Tudor

Who: A Boston merchant, called the Ice King, who built a business shipping New England pond ice to warm places around the world.

When and where: Boston. First cargo of ice to Martinique in 1806. Ice to India in 1833. Died 1864.

His ship carried 180 tons of pond ice to India.

Frederic Tudor built a business selling New England pond ice in hot countries far away. His first cargo of ice left Boston in 1806, bound for the Caribbean island of Martinique. A Boston newspaper, the *Boston Gazette*, printed: "No joke. A vessel has cleared at the Custom House for Martinique with a cargo of ice." The ship had permission from the port's officials to sail, and the paper hoped the trip would "not prove a slippery speculation," a speculation being a risky business deal.

Much of the ice melted during the three-week voyage. Tudor sold what was left. He lost about $4,500 on the trip, though some accounts say $4,000. He kept at the business for years, and in 1812 and 1813 he spent time in debtors' prison, a jail for people who could not pay what they owed.

His ship the *Tuscany* sailed from Boston for Calcutta, in India, on May 12, 1833. It carried 180 tons of ice cut the winter before. The ship reached India in September, about four months later. About 100 tons of the ice were still frozen, and about 80 tons had melted on the way.

Cotton fields on Native farms

Across the Deep South, planters spread cotton so widely that they pushed food crops to the edges of their land. Many planters bought corn and pork from Midwestern farms instead of growing enough food on their own plantations.

Who did the work. Enslaved people did the work in the cotton fields. The planters held them as property and forced them to work without pay. They worked in groups called gangs, from sunup to sundown, six days a week.

Solomon Northup, a free Black man who was kidnapped and sold into slavery, was held in Louisiana from 1841 to 1853, nearly ten of those years on Edwin Epps's cotton plantation. He wrote that "an ordinary day's work is two hundred pounds." Each night the cotton was weighed, and pickers who brought in less were whipped, usually fifty strokes. Epps did some of the whipping himself.

Whose land it was. The new cotton fields were the farms and hunting grounds of the Cherokee, Muscogee (Creek), Choctaw, Chickasaw and Seminole nations. In 1830 President Andrew Jackson signed the Indian Removal Act. Under it, federal troops forced these nations off their land and moved them west. Chapter 2, Native Nations, tells the removals in full.

The Trail of Tears. The Cherokee were one of those nations, and their removal of 1838 and 1839 is called the Trail of Tears. Soldiers under General Winfield Scott forced more than 16,000 Cherokee from their homes and held them in crowded, dirty camps, with too little food and water and no shelter from the weather.

Measles, whooping cough and dysentery, a disease of the gut that causes bloody diarrhea, spread through the camps. More than 4,000 Cherokee died of disease, hunger and cold in the camps and on the march west, and one scholar has estimated that twice as many died.

Breaking the prairie

Farmers moving onto the prairie of Illinois found thick, sticky sod, the top layer of soil, held together by the tangled roots of grass. Prairie sod stuck to iron plows and stopped them.

John Deere, a blacksmith in Grand Detour, Illinois, made a plow of polished steel in 1837. The sod slid off its smooth blade instead of sticking, so the plow could cut through the prairie. By 1846 Deere was selling nearly a thousand plows a year.

Cyrus McCormick had shown his reaper, a machine that cuts grain, in Virginia in 1831, six years before Deere made his plow. Before it, farmers cut wheat by hand, with tools such as the sickle, a curved blade. A reaper cut grain many times faster than a person with hand tools, so a family could plant far more wheat. Within one generation, farmers had turned the prairie into fields of wheat and corn.

Deere's plows broke land that Native nations had lived on. Early settlers at Grand Detour saw signs of a Ho-Chunk village inside the bend of the river.

War on the Mississippi. US soldiers and militia, citizens called up to fight, went to war in 1832 against Sauk and Meskwaki people led by Black Hawk. On August 1 and 2, at Bad Axe on the Mississippi River, Black Hawk's band of perhaps 500 men, women and children tried to cross the river. Soldiers on the army steamboat *Warrior* fired on them.

About 1,300 soldiers and militia under General Henry Atkinson attacked the people still on the east bank. The soldiers shot some of the Sauk and Meskwaki before they could reach the far shore, and others drowned trying to get across. Thomas Ford, a governor of Illinois, later estimated that 150 were killed and as many drowned. Others have disputed his count.

The treaties. With two treaties, written agreements between nations, US officials got Native land in northern Illinois and southern Wisconsin in 1832 and 1833, a few years before Deere made his plow. Farmers moved onto that land and plowed it.

Ho-Chunk leaders signed the first treaty with General Winfield Scott and the governor of Illinois in September 1832. They gave up their lands in southern Wisconsin and northern Illinois in return for yearly payments. At a treaty meeting in Chicago in 1833, Potawatomi leaders sold the last of their land in northern Illinois and all of their land in southeastern Wisconsin. In return they got land farther west, in Iowa, and they had to leave Wisconsin by 1838.

The potato blight

A potato disease called late blight broke out near the ports of Philadelphia and New York in 1843. It is caused by a water mold, a tiny living thing that destroys potato plants. The blight spread through potato fields in the eastern United States. American farmers lost potato crops, but they had other food to eat.

The blight reached Europe by 1845. In Ireland, poor families depended on potatoes and had no other food, and the blight destroyed their crop. About 1 million people died in Ireland's Great Famine, a time of so little food that people starved, from 1845 to 1852.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 8 MINUTES

Families claimed millions of acres of free farmland under the Homestead Act, land that US officials and soldiers had taken from Native nations. By 1900, growing, packing and shipping food had become a big business, from Texas ranches to Chicago meatpacking plants to the cities of the East. Cowhands drove millions of cattle north from Texas, and meatpackers in Chicago shipped their beef east in cold railroad cars.

Farmers formed groups of their own, starting in 1867, to buy supplies together and to speak up against the rates railroad companies charged them.

Homestead farms on taken land

The Homestead Act became law on May 20, 1862. Under it, a person could claim 160 acres of public land for free. To keep the land, the person had to live on it and farm it for five years. Women could claim land. After 1868 Black Americans could claim land too. Most Native people could not.

Over the years the law was in force, people filed about 4 million claims. About 1.6 million of them finished the five years and received a land patent, the government paper that made the land theirs. Together they received about 270 million acres, close to one tenth of all the land in the United States.

All of this land had belonged to Native nations. US officials and soldiers had taken it by treaty, by purchase and by war.

The Dawes Act. Members of Congress passed the Dawes Act in 1887. Under it, federal officials broke up land that each Native nation held together into separate plots for single families. Officials then sold the land they called surplus, meaning left over, and much of it went to white farmers. Native nations held about 138 million acres in 1887 and about 48 million by 1934. Through the plots and the sales, federal officials had taken about 90 million acres from them, two of every three acres they had held.

Oklahoma. Federal officials opened land in Oklahoma to settlers in 1889, two years after the Dawes Act. US officials had taken that land from Native nations, and settlers raced in to claim it.

Uriah and Mattie Oblinger

Who: A homesteading family whose letters describe the food and work of a Nebraska farm claim.

When and where: Fillmore County, Nebraska. Uriah filed his claim in 1872. Mattie and their baby, Ella, arrived in May 1873. The family letters run from 1862 to 1911.

Uriah built the family's house out of blocks of prairie sod.

The letters of Uriah and Mattie Oblinger describe what one homestead family in Nebraska grew and ate in the 1870s. The Library of Congress and the Nebraska State Historical Society keep the family's letters, and the Library of Congress collection holds 318 of them, written from 1862 to 1911.

Uriah went ahead from Indiana to Nebraska in the fall of 1872. He filed a claim about eleven miles west of the town of Geneva, in Fillmore County, broke the prairie sod and built a house out of blocks of sod. On December 1 he wrote about the other young families starting out around him: "We will all be poor here together."

The Otoe-Missouria and the Pawnee had signed over most of their land in this part of Nebraska in treaties of 1854 and 1857. Homesteaders began filing claims in the county in 1866.

Mattie and their baby daughter, Ella, joined Uriah in May 1873. On June 16 Mattie wrote that Uriah had planted sod corn, corn set straight into newly plowed prairie sod. She spelled words her own way: "Uriah has 23 acres of sod corn planted it looks real well."

An Iowa settler, L. S. Coffin, described in 1902 how sod corn was planted. A man struck an axe deep into the sod, and a boy or girl dropped three or four kernels into the slot and stamped it shut with one foot.

> Mattie's garden had "Squashes and Cucumbers & Mellons & Beans comeing on," and tomato plants too. She bought milk and butter from a neighbor, Mrs. Furgison, and paid twelve cents a pound for the butter. "I like the sod house the best," she wrote, and "every lick we strike is for our selves and not half for some one else."
>
> Over the next years the family lived through blizzards, drought, swarms of grasshoppers and low prices for their crops. In February 1880 Mattie died giving birth, and her newborn son died with her. She was 36. She left three daughters, Ella, Stella and Maggie, and Uriah moved the family to Minnesota that year.

Sharecropping: growing a crop someone else sold

After the Civil War, most freedpeople, the men, women and children who had been freed from slavery, had no land of their own. Many became sharecroppers, families who farmed someone else's land for a share of the crop. A landowner gave a sharecropping family food, seed, tools and a cabin on credit, which meant the family would pay for them later. This was called the furnish. The family usually worked about twenty acres.

At harvest the landowner sold the crop and took out the cost of the furnish plus interest, an extra charge for paying later. Then the landowner paid the family its share, usually half of the crop's value or less.

The debt. The landowner held a lien on the crop, a legal claim to it until the debt was paid, and kept the account books. Most sharecropping families stayed in debt to the landowner year after year. They grew food and cotton but did not control the money from selling it.

The bison killed, the cattle driven north

About 30 million bison lived on the Great Plains in the early 1800s, and by 1900 fewer than 1,000 were left. Hunters killed them to sell their hides, and the herds also shrank from railroad building, disease and drought. US Army commanders encouraged the killing, because the herds were the food supply of the Plains nations.

The people of the Lakota leader Sitting Bull were starving by 1881, because the bison herds were nearly gone. They surrendered at Fort Buford in July 1881.

Ranchers put cattle on the grasslands where the bison had lived. Between 1866 and 1884, cowhands drove about 5.2 million Texas cattle north to railroad towns. In 1867 Joseph McCoy built a market for cattle at Abilene, Kansas, where the railroad line reached, and herds came up to it along the Chisholm Trail. In Texas, as many as one cowhand in four was Black. Many others were Mexican or Mexican American.

Fences. The long drives ended when barbed wire fences and quarantine lines closed the open range, the unfenced grassland where cattle could graze and travel freely. Joseph Glidden received a patent for barbed wire on November 24, 1874. Under a Kansas law of 1885 and 1886, passed to keep out a cattle disease called Texas fever, Texas cattle could not cross the quarantine line into Kansas. Herds could no longer use the trails that crossed such lines.

Charles Goodnight

Who: A Texas cattleman who invented the chuckwagon, the kitchen on wheels that fed cowhands on cattle drives.

When and where: Texas, 1866.

His chuckwagon's pantry box dropped flat to make a table.

Charles Goodnight invented the chuckwagon in 1866. A cattle drive crossed open grassland for months, and its crew had to eat every day. Goodnight took a leftover Army wagon and built a hinged pantry box onto it. Part of the box dropped down flat to make a table where the cook could work.

The chuckwagon carried the food for the trail, such as beans, bacon, biscuits and coffee. On a drive, the cook ranked second only to the trail boss, the man in charge of the whole drive. Some characters in the novel *Lonesome Dove* are partly based on Goodnight.

Beef from the Plains to a city plate

The Union Stock Yards opened in Chicago on December 25, 1865. Their pens, where cattle, hogs and sheep were held until they were sold, became the largest market for farm animals in the world.

Gustavus Swift was a meatpacker, a businessman who ran a plant where animals were killed and cut up into meat for sale. He shipped beef east from Chicago already butchered, instead of shipping live animals.

An engineer named Andrew Chase designed a railroad car for Swift in 1878 that was cooled with ice, and beef packed in it stayed cold all the way to the cities of the East. A steer, one of the male cattle raised for beef, could now be raised in Texas, killed in Chicago and eaten in New York.

Farmers join together

Oliver Hudson Kelley, a Minnesota farmer and a clerk in the federal Department of Agriculture, founded the Patrons of Husbandry in 1867 (husbandry is an old word for farming). People knew it better as the Grange. It was the first large farmers' group with members across the whole country. Grange members met in their own halls and bought supplies together to get lower prices, and they spoke up together against the rates the railroad companies charged to carry their crops.

Colleges for farming. Members of Congress had already passed the Morrill Act in 1862. Under it, federal officials gave each state 30,000 acres of public land for each of the state's members of Congress, land that had been taken from Native nations. State officials sold the land and used the money to start colleges that taught farming and the skills of working with machines. These schools are called land-grant colleges.

Experiment stations. Under the Hatch Act of 1887, each state's land-grant college received $15,000 a year at first to run a farm experiment station. The act was named for William Hatch, a member of the US House of Representatives from Missouri who led the House committee on farming. At these stations, which today run in all 50 states, scientists studied soil, seed and farm animals and sent their results to farmers.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 17 MINUTES

Federal inspectors went to work inside the meatpacking plants in 1906, and in the years that followed federal officials took on many new jobs in how Americans got their food. In the 1930s, officials paid farmers to grow less, bought up extra food and gave it to hungry families. During World War II they limited how much sugar, meat and coffee each person could buy. In 1946 President Harry Truman signed a law that made school lunch a permanent federal program.

On the farms, tractors began to take the place of horses, and new kinds of seed corn and chicken farming began.

What was in the meat: the 1906 food laws

President Theodore Roosevelt signed two food laws on the same day, June 30, 1906. Under the Pure Food and Drug Act, no one could sell food or medicine from one state to another if it was mislabeled or adulterated, meaning made impure or mixed with something that should not be in it.

Scientists at the Bureau of Chemistry enforced this law at first, and since 1930 the Food and Drug Administration, or FDA, has done that work.

The second law was the Meat Inspection Act. Under it, federal inspectors worked inside the packing plants and checked the meat. Members of Congress passed both laws within a few months after a novel about Chicago's meatpacking plants came out.

Upton Sinclair

Who: A novelist whose book about the Chicago meatpacking plants came out months before the 1906 food-safety laws.

When and where: Chicago, 1904. His novel *The Jungle* came out as a book in February 1906.

He wrote about the workers, and readers noticed the meat.

Upton Sinclair wrote *The Jungle* to show how immigrant workers in Chicago's meatpacking plants lived. In 1904 he spent about seven weeks working undercover in the plants. His novel was printed in parts in 1905 and came out as a book in February 1906.

Readers fixed instead on what Sinclair described going into the meat. In the novel, spoiled ham and moldy sausage were dosed with chemicals and ground up again, along with meat that had fallen on the dirty floor. The packers put out poisoned bread for the rats in the storerooms, and then "rats, bread, and meat would go into the hoppers together." The hoppers fed the machines that ground the sausage.

Within months, Roosevelt signed the two food laws of June 30, 1906. Later that year Sinclair wrote about how readers had taken his book: "I aimed at the public's heart, and by accident I hit it in the stomach."

George Washington Carver

Who: A scientist who taught poor Southern farmers how to rebuild worn-out cotton land and grow their own food.

When and where: Born enslaved near Diamond, Missouri, about 1864. Taught at Tuskegee Institute, Alabama, from 1896 until his death in 1943.

Movie: *George Washington Carver: An Uncommon Life* (Iowa PBS, 2018), a documentary.

His most famous booklet listed 105 ways to prepare peanuts.

George Washington Carver taught Southern farmers to plant crops that rebuilt their soil. Moses and Susan Carver enslaved his mother, Mary, and so they claimed him as their property too.

When he was a few months old, a band of men kidnapped him and his mother from the farm to sell them. A neighbor got the baby back. His mother was not brought back. Moses and Susan Carver raised him and his older brother, Jim.

He was the first Black student at Iowa State, and later he taught there. He took charge of farming studies at Tuskegee Institute in Alabama in October 1896 and stayed until he died in 1943.

Year after year of cotton had worn out the soil on many Southern farms. Carver taught crop rotation, which means changing the crop planted in a field from one year to the next. A farmer planted peanuts, cowpeas (a kind of bean) or sweet potatoes, which built the soil back up, and then went back to cotton, which wore it down.

Carver wrote 44 practical bulletins, small printed booklets, and gave them to farmers for free. He also sent out the Jesup wagon, a wagon pulled by a mule that was used to show farmers new ways of farming. His best-known bulletin came out in 1916 and was reprinted for decades. It was called *How to Grow the Peanut and 105 Ways of Preparing It for Human Consumption*. In his laboratory he made hundreds of test products from peanuts and sweet potatoes.

> Many people believe that Carver invented peanut butter. He did not. The Aztecs of Mexico made peanut paste centuries earlier. Marcellus Gilmore Edson received a patent, the sole right to make and sell an invention, for a peanut paste in Canada in 1884, and John Harvey Kellogg received one in 1895.

Pellagra: a disease from a corn diet

About 3 million Americans got pellagra, a disease caused by a diet missing a vitamin called niacin, between 1900 and 1940. About 100,000 of them died of it. Those hit hardest were poor farmers, sharecroppers (families who farmed someone else's land for a share of the crop) and cotton-mill workers in the South. They lived mostly on cornmeal, molasses and dried pork, with few fresh vegetables and little meat or milk.

Many mill owners paid workers in scrip, a kind of paper money that could be spent only at the company's own store. Those stores sold mostly cornmeal, dried meat and molasses.

A person with pellagra got skin rashes, diarrhea and dementia, which means confusion and loss of memory. The disease could end in death.

The prison test. Most scientists of the time thought pellagra was an infection, spread by germs. Joseph Goldberger, a doctor with the US Public Health Service, thought the diet caused it, and he tested the diet on prisoners in 1915, with the agreement of Mississippi's governor, Earl Brewer.

At the Rankin State Prison Farm, Goldberger fed eleven volunteer prisoners the corn-based meals poor Southerners ate, starting on April 19. They got biscuits, mush, grits, gravy, cornbread, sweet potatoes, cane syrup and coffee. In return, the men were promised pardons, meaning they would be let out of prison.

About half of the eleven men got pellagra, five or six depending on the account, and the others showed some signs of it. The men had skin rashes and stomach illness, and the men who got pellagra recovered. Goldberger had shown that he could cause pellagra by keeping fresh food from people.

In 1916 Goldberger injected himself, his wife and other volunteers with blood from pellagra patients, to show that the disease did not spread from person to person.

A scientist in Wisconsin found in 1937 that the missing nutrient was niacin, also called vitamin B3. Federal and state laws passed during World War II required that niacin be added to bread.

Sugar and pineapple from Hawaii

Sugar plantations made up most of the business of the Hawaiian Islands. The planters brought in contract workers from overseas, bound to work for a set number of years, many of them from Japan and, after 1908, from the Philippines. Around 1899 a Japanese contract worker earned about $13 a month, and his food and the cost of his trip both ways came out of that pay.

James Dole started the Hawaiian Pineapple Company in 1901, and workers at his company canned pineapple in huge amounts for kitchens on the mainland. US officials had taken over the islands three years before, in 1898.

The takeover. Hawaii was a kingdom with its own queen until 1893. On January 17 of that year, a group of mostly American businessmen moved to overthrow Queen Liliuokalani. Some of the group's members were sons of partners in the companies that controlled more than half of Hawaii's sugar crop, and the group pushed for the United States to take over the islands.

John L. Stevens, the top US official in Hawaii, had 162 US sailors and Marines brought ashore from the warship USS *Boston*, and the queen gave up her power under protest.

Native Hawaiians signed 21,269 names on petitions in 1897, asking that Hawaii not be joined to the United States. On July 7, 1898, President William McKinley signed the Newlands Resolution, a measure to annex Hawaii, which means to take it over and make it part of the country.

Tractors, hybrid corn and chickens

Henry Ford's company began selling a cheap tractor called the Fordson in 1917. Even so, American farms in 1920 had 246,000 tractors and about 26 million horses and mules, and animals still did most of the pulling. The International Harvester company brought out the Farmall in 1924. It could also cultivate row crops, meaning it could work the soil between rows of growing plants, the last big farm job that still needed horses.

A farm horse ate crops too. It took about five acres to grow the feed for one horse. When a farmer sold a horse or stopped using it, the farmer could plant those acres with food for people.

Henry A. Wallace founded Pioneer Hi-Bred in 1926. It was the first company that sold hybrid seed corn, seed that comes from crossing two different parent plants.

BY 1930: Federal inspectors were working inside the meatpacking plants, tractors were starting to replace farm horses, and farmers could buy hybrid seed corn.

Cecile Steele

Who: A Delaware farmer who began the business of raising chickens for meat after a hatchery sent her 500 chicks by mistake.

When and where: Ocean View, Delaware, 1923. She lived from 1900 to 1940.

She ordered 50 chicks, and the hatchery sent her 500.

Cecile Long Steele had ordered the chicks in 1923 for her farm in Ocean View, Delaware. She raised all 500 indoors and sold them at 16 weeks old for 62 cents a pound.

She ordered 1,000 chicks on purpose in 1924, and by 1926 she was raising 10,000. By 1928 about 500 farms on the Delmarva Peninsula, the land where Delaware, Maryland and Virginia meet, were raising broilers, young chickens raised for their meat.

Chicken later became the meat Americans eat most, by weight. By the count of the National Chicken Council, a group that speaks for chicken companies, each American ate about 32 pounds of chicken in 1965. Its figures for 2025 put each American at about 103 pounds of chicken, 59 pounds of beef and 49 pounds of pork.

Dust, pigs and food stamps in the 1930s

Farmers on the southern Great Plains had plowed up the grassland to plant wheat during World War I, when wheat sold for high prices. A drought began in 1931, and the wheat died. The bare, dry soil blew away in dust storms. The storm of April 14, 1935, is called Black Sunday. Crops failed year after year. Farm families lived on vegetables from their gardens, canned food, food handed out by federal officials, and jackrabbits.

No one kept an official count of the people the dust killed. In Kansas alone, dozens of people died of dust pneumonia in 1935. Dust pneumonia happened when dust settled deep in a person's lungs. It stopped the cilia, the tiny hairs that sweep the airways clean, from moving. The person had fever, chest pain, coughing and trouble breathing.

Paid to grow less. Under the Agricultural Adjustment Act of May 1933, federal officials paid farmers to grow less, so that crop prices would rise. That year farmers plowed under about 10 million acres of cotton that was already growing, turning the young plants back into the ground. Federal officials bought about 6 million pigs and had them killed. At the same time, hungry people across the country stood in breadlines, long lines for free food.

Judges threw out the farm law in 1936, and members of Congress wrote a new one in 1938. Federal payments to farmers have continued ever since.

Many Americans were angry that federal officials were having food destroyed while people went hungry. Federal officials set up the Federal Surplus Relief Corporation to give extra farm food to families on relief, meaning families getting government help.

Food stamps. The first Food Stamp Program began in Rochester, New York, on May 16, 1939, and Mabel McFiggin was the first buyer. People bought orange stamps that paid for food. With them came free blue stamps, which could buy only foods that federal officials listed as surplus, meaning extra.

Who got the cotton money?

The landowners got most of it. Under the cotton contracts of 1934 and 1935, federal officials paid landowners to take land out of cotton. The sharecroppers who farmed that land, families who farmed someone else's land for a share of the crop, were supposed to get a part of the payment, but under the contracts their share was only about 11 percent.

A landowner could keep the whole payment by evicting the sharecroppers, meaning forcing them off the land, and hiring day laborers, workers paid one day at a time, instead. When planters cut their cotton land by 40 or 50 percent, they cut the number of families working it by the same share.

The lawyers. Some lawyers at the Agricultural Adjustment Administration, the federal office that ran the farm payment program, tried to stop the evictions. Led by Jerome Frank, they decided that landowners had to keep the same families on their land. In February 1935 the office's head, Chester Davis, had Secretary of Agriculture Henry Wallace fire them.

The union. Seven Black men and eleven white men met at the Sunnyside School in Poinsett County, Arkansas, in July 1934 to fight the evictions. They started a union, a group of workers who join together to demand better pay and treatment, and called it the Southern Tenant Farmers' Union (a tenant farmer works land that someone else owns).

Planters and lawmen answered with force. Sheriff J. D. Dubard of Poinsett County arrested a white organizer, Ward Rodgers, at the end of a union meeting in Marked Tree in January 1935, and Rodgers was held in jail there.

About forty armed planters broke up a union crowd at Birdsong on March 15, 1935, along with lawmen and the planters' riding bosses, the men on horseback who watched over the field workers. Later that month a mob attacked the home of the union's lawyer, Cornelius Tyree Carpenter.

At a union meeting in Gilmore, four armed white men broke in. They ordered the Black members to leave and told them they would be lynched, meaning killed by a mob, if they were caught at another union meeting. Many members were beaten and threatened with guns. The Encyclopedia of Arkansas account of the union does not name the men who did it.

Ration books and victory gardens

Federal officials rationed food during World War II, which means they limited how much of it each person could buy. Every person got a ration book of stamps, even babies. Sugar was the first food rationed, in May 1942. Coffee followed that November. In March 1943 meat, cheese, fats and canned foods were added. Sugar was also the last food to come off the list, in June 1947.

Federal officials allowed each person 26 pounds of sugar a year, about 8 ounces a week. In 1945 they cut the amount to as little as 4.5 ounces a week. Every month each person got 64 red points for meat and fats and 48 blue points for processed foods, such as canned goods. A shopper had to hand over the right points, along with money, to buy these foods.

Victory gardens. Americans planted about 20 million victory gardens, home vegetable gardens grown to help feed the country during the war. By 1943 and 1944, these gardens grew about 40 percent of the country's fresh vegetables, roughly 9 to 10 million tons. Accounts differ on which of the two years was the peak.

Frozen food was already on sale by the war years. Clarence Birdseye's quick-frozen foods first went on sale on March 6, 1930, in 18 stores in Springfield, Massachusetts.

Adelaide Wisdom Benjamin

Who: A girl whose family grew a victory garden and shopped with ration stamps during World War II.

When and where: New Orleans, Louisiana, and El Paso, Texas, 1941 to 1945. She was born in New Orleans in 1932.

She put 10 cents of her 25-cent allowance into war stamps.

Adelaide Wisdom grew up in New Orleans. During the war her father tried to join the Army and the Navy but did not meet their requirements. The Marines accepted him. After boot camp he was posted to El Paso, Texas, as a Marine recruiter, and the family moved with him.

At the store, the family could buy sugar, butter and some vegetables only with the right ration stamps. Beef and lamb were hard to find. With so little to serve, the family could not have guests over for meals.

The family grew a victory garden in New Orleans and in El Paso. "We grew mirlitons, and string beans and tomatoes in our backyard," she said in a 2013 oral history for the National WWII Museum (a mirliton is a pale green squash). The crops grew well in New Orleans but not in El Paso. She collected scrap with her brother, such as old coat hangers and bicycle tires, and she put 10 cents of her 25-cent weekly allowance into war savings stamps.

When Germany surrendered in 1945, she bought a chocolate soda, a comic book and bubble gum. She later became a lawyer and practiced law with her husband, Eddie Benjamin, for 55 years.

Farms taken from Japanese Americans

President Franklin Roosevelt signed Executive Order 9066, an order from the president that has the force of law, on February 19, 1942. In March and April, General John L. DeWitt ordered about 120,000 people whose families came from Japan forced out of their homes on the West Coast. Under his orders, US officials sent both citizens and noncitizens away and locked them up in prison camps behind barbed wire.

Many of these families were farmers. By 1940 Japanese American farmers and their children grew almost 40 percent of California's vegetables. When they were forced out, many had to leave their orchards and fields with crops ready to harvest.

Farms lost. The Farm Security Administration was the federal office put in charge of their farms. Its officials handed more than 1,000 of the farms to new farmers in March 1942 alone.

Farming in the camps. The prisoners farmed inside the camps too. At Tule Lake, California, they harvested almost 30 crops, among them potatoes, rutabagas and daikon radishes. Most of the field workers there were paid $12 a month, a quarter of what farmworkers outside earned, and camp officials sold more than 2 million pounds of what they grew.

Braceros in the fields

US officials started the bracero program in 1942 to bring Mexican workers, called braceros, into the country for farm and railroad work. Over 22 years, workers signed more than 4.5 million contracts. Braceros picked much of the country's fruit and vegetables until the program ended in 1964.

US employers also held back 10 percent of each bracero's pay, and many braceros never got that money back. Chapter 14, Work and Workers, tells the story of the missing pay.

Why school lunch became a law

Many young men called up to serve in World War II failed their physical exams because of malnutrition, not having had enough of the right food. General Lewis Hershey ran the draft, the system that called men into the military. After the war he told members of Congress that malnutrition put the country's safety at risk.

Towns and charities had already run school meal programs for decades, and in the 1930s federal officials gave these programs extra food they had bought from farmers. On June 4, 1946, President Harry Truman signed the National School Lunch Act. The law states that Congress passed it "as a measure of national security," a way to keep the country safe, and to protect the health of the nation's children. Under it, federal money for school lunches became permanent.

BY 1950

If you remember one thing: Between 1900 and 1950, federal officials began inspecting Americans' meat, paying farmers to grow less, rationing food and paying for school lunches.

- June 30, 1906: Theodore Roosevelt signs the Pure Food and Drug Act and the Meat Inspection Act.
- May 16, 1939: The first food stamps go on sale in Rochester, New York.
- June 4, 1946: Harry Truman signs the National School Lunch Act.

Next: After 1950 farms grew fewer and bigger, and Americans started buying frozen TV dinners and fast-food hamburgers.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 12 MINUTES

Fewer, bigger farms grew more food on each acre after 1950. Farmers used tractors, hybrid seed, fertilizer and pesticides. Swanson sold 25 million frozen TV dinners in 1955, and fast-food stands served hamburgers in seconds. In the 1980s the owners of about 300,000 farms could not pay their loans, after land prices fell and interest rates rose. Meanwhile some farmers and cooks began to grow food by organic methods, without man-made chemical fertilizers and pesticides, and to serve food from nearby farms.

Tractors outnumber horses, and farms grow bigger

The 1954 Census of Agriculture, the federal government's count of the country's farms, was the first in which American farms had more tractors than horses and mules. Farms had about 4.6 million tractors that year and about 4 million horses and mules. In 1920 there had been about 25 to 26 million horses and mules.

The number of farms fell too. In 1935 the country had 6.8 million farms, the most it ever had. After that the number kept dropping, toward 2 million. The farms that were left were bigger. Many of them grew only a few kinds of crops and relied on chemical fertilizers and pesticides.

Nearly all the corn in the country grew from hybrid seed by the 1950s. For about a hundred years before that, farmers had grown roughly 25 to 30 bushels of corn on an acre, a bushel being about 8 gallons. By the 1970s farmers were growing more than 100 bushels an acre, more than three times as much.

Fast food and the TV dinner

Richard and Maurice McDonald opened a drive-in restaurant in San Bernardino, California, in 1940. In 1948 they rebuilt it around what they called the Speedee Service System, with a menu cut down to 15-cent hamburgers, french fries and milkshakes. The carhops, the servers who had carried food out to people's cars, lost their jobs. Workers made the food on a kind of assembly line, where each worker did one job over and over, and customers got their food in seconds.

The Swanson company put a frozen turkey dinner in an aluminum tray on sale in 1953 and called it a TV dinner. It cost about 98 cents. The company sold more than 10 million in 1954 and 25 million the next year. According to company stories, Swanson had too many turkeys left over after Thanksgiving.

Whose idea it was. Who thought of the TV dinner is disputed. For decades a salesman named Gerry Thomas said the idea was his. The company's owners were the brothers Gilbert and Clarke Swanson. Their relatives, and a Swanson scientist named Betty Cronin, said the brothers came up with it at the company and that Thomas took the credit. Frozen meals had been sold before either claim: in 1945 the Maxson company made frozen "Strato-Plates" to serve on airplanes.

Ray Kroc

Who: A milkshake-machine salesman who became the McDonald brothers' franchise agent and then bought them out.

When and where: Visited San Bernardino, California, in 1954. Opened his first McDonald's in Des Plaines, Illinois, on April 15, 1955. Bought out the brothers in 1961.

Movie: *The Founder* (2016), a drama based on his story and the brothers'.

He bought out the McDonald brothers for $2.7 million in 1961.

Ray Kroc sold milkshake machines. In 1954 he went to see the McDonald brothers' stand in San Bernardino. He became the brothers' agent for franchises, deals that let other people open stores under the brothers' name and system in return for fees.

Kroc opened his own McDonald's in Des Plaines, Illinois, on April 15, 1955. In 1961 he bought the brothers out for $2.7 million. The brothers said Kroc had made a handshake promise to keep paying them royalties, a share of the money from every sale, and never kept it. Kroc also opened a McDonald's near their original stand, in competition with it.

Norman Borlaug

Who: An Iowa-born plant scientist whose wheat helped poor countries grow far more grain, in what was called the Green Revolution.

When and where: Mexico from 1944. India and Pakistan in the 1960s. Nobel Peace Prize in 1970.

Movie: *The Man Who Tried to Feed the World* (PBS American Experience, 2020), a documentary.

His short-stemmed wheat came from crossing thousands of kinds.

Norman Borlaug bred wheat that grew more grain on the same land. Starting in 1944, he worked in Mexico for a program run by the Rockefeller Foundation, a charity started by the Rockefeller family. He crossed thousands of kinds of wheat. The result was a semi-dwarf wheat, with short stems, that resisted plant diseases. By 1956 Mexican farmers grew all the wheat the country needed.

Experts in the 1960s predicted famines, times when there is so little food that people starve, in India and Pakistan. Farmers there planted Borlaug's wheat, and the famines the experts predicted did not happen. Borlaug won the Nobel Peace Prize in 1970, the only farm scientist to have won it.

Many writers credit his work with saving as many as a billion lives, a common estimate rather than a count. The rise in grain harvests in poor countries that followed is called the Green Revolution.

Farmers grew his wheat together with chemical fertilizer and irrigation, water brought to the fields by pipes and ditches, so they came to depend on chemicals they had to buy. Many farmers also stopped planting old kinds of crops, so fewer kinds were grown.

Pesticides in the fields

Farmers sprayed their crops with pesticides, chemicals that kill insects and weeds. One of them, DDT, which kills insects, was in wide use from the mid-1940s, and it made the shells of eagles' eggs thin. Rachel Carson's book *Silent Spring*, published in September 1962, described what these long-lasting pesticides did to birds, soil, water and people. By 1963 only 417 pairs of bald eagles were nesting in the lower 48 states. Officials at the Environmental Protection Agency banned DDT in 1972.

Farmworkers in steady contact with pesticides had high rates of burns, cancer and children born with birth defects. In the 1980s, children in several towns of California's San Joaquin Valley had cancer at rates "800% above the norm," according to the Walter P. Reuther Library at Wayne State University.

The farmworkers' union. Cesar Chavez and Dolores Huerta campaigned to ban DDT on grape and lettuce ranches. With the United Farm Workers, they organized the people who picked the crops. They are known for the grape strike in Delano, California, when grape pickers refused to work until growers met their demands.

In March 2026 the New York Times reported that two women said Chavez had sexually abused them as girls in the 1970s, and Dolores Huerta then said that he had raped her, forcing her into sex. Chavez died in 1993, so no court has heard these accusations. Chapter 14, Work and Workers, tells the strike and these accounts in full.

Black farmers and their land

Black farmers ran more than 900,000 farms in 1920. Between 1910 and 1997, the amount of farmland Black Americans owned fell by nearly 90 percent.

Loans held back. Researchers at the Union of Concerned Scientists, a science group, named two of the causes in a 2023 report. The first was that officials of the US Department of Agriculture, or USDA, had stopped Black farmers from getting the loans and grants that would have kept them on their land. Lloyd Wright, who once ran the department's civil rights office, called it "the last plantation," after the big farms where enslaved people had been forced to work.

Heirs' property. The second cause was heirs' property. When a landowner died without a will, a paper that says who gets a person's things after the person dies, the land passed to the landowner's heirs, the family members who inherit it. All the heirs owned the land together. Each owned a share of the whole farm, not a piece of land of their own.

Any one of the heirs could ask a court to force a sale of the whole farm. A land buyer could buy one heir's share and then ask a court to sell the farm at auction, and farms sold that way went for far less than they were worth. USDA officials have called heirs' property "the leading cause of Black involuntary land loss," meaning land lost when the owners did not choose to sell.

What it cost. In a study published in 2022, five economists put the value of the land Black farmers lost from 1920 to 1997 at about $326 billion in today's dollars. By 2007 Black farmers ran 32,938 farms, about 1.5 percent of the country's farms.

The court case. Black farmers took the USDA to court in a case called *Pigford v. Glickman*. They showed that from 1983 to 1997, USDA officials treated Black farmers worse than white farmers because of their race, and that the officials failed to look into the farmers' complaints.

Members of local county committees made the decisions on USDA farm loans. Black farmers said committee members turned down their loans, or made them wait longer for approval than white farmers. The Congressional Research

Service report on the case does not name the committee members.

Judge Paul L. Friedman approved a settlement, an agreement that ends a lawsuit, on April 14, 1999. Under it, 15,645 farmers had their claims approved, out of 22,721 who qualified. Those approved under the part of the settlement called Track A each received $50,000, and USDA officials canceled what they owed on their USDA loans. The payments and debt relief came to about $1.06 billion. A second settlement, of $1.25 billion, was announced on February 18, 2010, for farmers who had missed the first deadline.

Organic farming rules become law

Organic farmers grow food without man-made chemical fertilizers and pesticides, and they build up their soil with compost, rotted plant and animal matter. J.I. Rodale began a magazine called *Organic Farming and Gardening* in Emmaus, Pennsylvania, in 1942 and spent decades urging farmers and gardeners to farm this way.

Members of Congress passed the Organic Foods Production Act in 1990. It required national rules for what could be sold as organic. The USDA organic seal, a label for food that meets those rules, came into use on October 21, 2002.

Alice Waters

Who: A cook who built her restaurant around food from nearby farms and started a school garden where children grow and cook their own food.

When and where: Chez Panisse restaurant, Berkeley, California, opened in 1971. The Edible Schoolyard, Berkeley, started in 1995.

Movie: *Alice Waters and Her Delicious Revolution* (PBS American Masters, 2003), a documentary.

In her school garden, students grow food, cook it and eat it.

Alice Waters opened a restaurant called Chez Panisse in Berkeley, California, in 1971. She cooked with food that was fresh, grown nearby, in season and organically grown. Chez Panisse was one of the first restaurants of the style later called California cuisine, cooking built on fresh food from local farms. Waters helped start the farm-to-table idea, which means buying food straight from local farms.

Waters started the Edible Schoolyard at Martin Luther King Jr. Middle School in Berkeley in 1995. Students there grow a garden, cook what they grow and eat it.

The farm crisis of the 1980s

American farmers sold large amounts of grain to other countries in the 1970s. They planted "fencerow to fencerow," every acre up to the fences. Expecting the good years to last, many farmers borrowed from banks to buy more land and machines.

Then, in the early 1980s, interest on loans, the extra money a borrower pays back on top of a loan, rose high. At the same time, the price of farmland fell. In parts of the Midwest, farmland lost as much as 60 percent of its value between 1981 and the mid-1980s. By 1984 American farmers owed about $215 billion, twice what they had owed in 1978, and many could not earn enough to keep up with their loan payments.

The owners of an estimated 300,000 farms defaulted during the 1980s, meaning they could not pay back their loans. About 300 banks in farm country failed, running out of money and closing.

Farm Aid. Willie Nelson, John Mellencamp and Neil Young held a concert called Farm Aid in Champaign, Illinois, on September 22, 1985. About 80,000 people came, and more than $7 million was raised for farm families. Farm Aid concerts still take place.

Russel and Mary Jane Jordan

Who: An Iowa farm couple who sold their machinery, livestock and household goods at auction to pay their bank, while their daughter filmed it.

When and where: Iowa. The family had owned its farm for 125 years. Their bank was in Atlantic, Iowa.

Movie: *Troublesome Creek: A Midwestern* (1995), a documentary about the family. It won the Grand Jury Prize at the Sundance Film Festival and was nominated for an Academy Award.

To pay the bank, they sold everything but the land.

Russel and Mary Jane Jordan owned a farm in Iowa that had been in their family for 125 years. A company called Norwest, which owned banks in several states, bought their bank in Atlantic, Iowa, and a man from the company's headquarters, Tim Wolf, took over their loans.

The debt. In the spring of 1990 the bank's officers called in an old debt of $70,000, which meant they demanded that it be paid. That same spring the Jordans had taken out their yearly loan of $150,000 to pay for the season's farming. To keep the bank from taking the farm, they decided to pay off both, about $220,000 in all.

The auction. The Jordans sold all their machinery, their livestock and even their household goods at an auction. They kept only the land. The sale raised about $300,000, more than enough to pay what they owed. Russ and Mary Jane moved to a rented house in Atlantic. Their son Jim took over farming the home place with his own equipment. Later the crop land was rented out to neighbors.

Their daughter, Jeanne Jordan, and the filmmaker Steven Ascher made the film about the family.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 11 MINUTES

Americans have argued since 2000 over what goes into their food, who picks it and who can get enough of it. Meanwhile the number of farms kept falling. The 2022 Census of Agriculture, the USDA's count of the country's farms, found 1.9 million farms in the United States, 7 percent fewer than in 2017. It was the first count below 2 million since before the Civil War. In 1935 there had been 6.8 million.

Weight, hunger and food stamps

Researchers at the Centers for Disease Control and Prevention, or CDC, measure obesity, a body weight high enough to raise the risk of illness. By their count, about three American adults in every ten had obesity in 1999 and 2000, and about four in every ten in the years 2021 to 2023.

Doctors link diet to heart disease and to type 2 diabetes, an illness in which the body cannot keep the sugar in the blood at a healthy level.

Some Americans live far from a place to buy fresh food. USDA officials map low-income areas that are far from a supermarket, and people call these areas food deserts. In a city, far means more than 1 mile away. In the country, it means more than 10 miles. An area counts when at least 500 people, or a third of the people who live there, are that far away.

By that measure, about 19 million people, about 6 percent of the population, lived in food deserts in 2019.

USDA economists had counted households that did not always have enough food since 1995. In September 2025, USDA officials under Agriculture Secretary Brooke Rollins announced that they would end the count. They called it "redundant, costly [and] politicized," meaning a repeat of other work, too expensive and slanted by politics. The last report came out on December 30, 2025. It reported that in 2024 about one household in seven did not always have enough food: nearly 48 million people, including more than 14 million children.

President Donald Trump signed the One Big Beautiful Bill Act on July 4, 2025. Under it, federal spending on SNAP, the Supplemental Nutrition Assistance Program once called food stamps, goes down. Economists at the Congressional Budget Office, which works out costs for Congress, figured that the cut will come to $186.7 billion over ten years.

Farmers' markets and the 2020 pandemic

Farmers' markets, where farmers sell their own crops straight to shoppers, grew in number. USDA officials counted 1,755 of them in 1994 and 8,771 in 2019, five times as many. The number grew about 7 percent a year until about 2011, and then it stopped growing much.

The meat plants. Other food reaches shoppers from people they never see, such as the workers in plants that process meat and poultry, meaning chickens and turkeys. The disease COVID-19 spread through those plants in 2020.

Officials in 23 states reported 16,233 cases of COVID-19 among workers in 239 plants in April and May 2020, and 86 of those workers died. This count comes from a CDC report of July 2020. Of the sick workers whose race was recorded, 87 percent were members of racial or ethnic minority groups.

Changed seeds and new kinds of meat

Most of the country's corn, soybeans and cotton grows from genetically engineered seed. Scientists made it by changing the seed's DNA, the chemical instructions inside every cell, in a laboratory, so that the plants survive sprays that kill weeds. In 2025 farmers planted it on about 92 percent of the country's corn acres, 96 percent of its soybean acres and 93 percent of its cotton acres, according to USDA economists.

Industry histories name the Flavr Savr tomato, sold in 1994, as the first engineered food sold in stores. Scientists of the National Academies of Sciences, a group of leading American scientists, reviewed about 1,000 studies in 2016. They wrote that they found no convincing proof that eating these foods harms people's health. Many Americans still argued against them. Under federal rules in force since January 2022, foods that contain changed DNA that tests can detect must carry a "bioengineered" label.

New kinds of meat. The Impossible Burger, made from plants, came out in 2016. Beyond Meat also makes meat from plants. The public could buy its shares, small parts of the company, for the first time in 2019, and their price rose more on the first day than that of any other company's new shares that year.

USDA officials gave two companies, UPSIDE Foods and GOOD Meat, the first approval in the United States to sell chicken grown from animal cells instead of from a live bird in June 2023. People call it lab-grown meat.

On vertical farms, workers grow vegetables indoors on shelves stacked high. Investors put money into these companies, and the business grew fast. AeroFarms, an early company of this kind, filed for bankruptcy, a court process for a business that cannot pay its debts, in June 2023. The company later reorganized and stayed in business.

Who picks the food?

Most hired crop workers in the United States were born in other countries, USDA economists report. In recent years about 15 percent of crop-farm jobs have gone to workers on H-2A visas, papers that let a farmworker from another country come for one season of farm work. More than 90 percent of H-2A workers come from Mexico.

The number of H-2A jobs grew more than eight times over from 2005 to 2025. Chapter 14, Work and Workers, gives the numbers.

Heat and children. Crop workers in the fields died of heat at nearly 20 times the rate of all American workers from 1992 to 2006, a CDC count found. Federal law also lets children work on farms at younger ages than in other jobs. Chapter 14 tells the death of one of those crop workers, a 56-year-old tobacco picker in North Carolina, and sets out the rules for children on farms.

Lucas Benitez

Who: A tomato picker who helped start the Coalition of Immokalee Workers and its Fair Food Program.

When and where: Born in Guerrero, Mexico. Moved to Immokalee, Florida, at 17. The coalition began in 1993, and the Fair Food Program began in 2011.

Movie: *Food Chains* (2014), a documentary about the coalition. Benitez appears in it.

In one case, he helped free about 700 workers held in slavery.

Lucas Benitez came to Immokalee, Florida, from the state of Guerrero in Mexico when he was 17. He picked tomatoes in the fields there. In 1993 he helped start the Coalition of Immokalee Workers, a group of farmworkers.

The orange groves. In 2000 Benitez looked into slavery in the orange and grapefruit groves around Lake Placid, Florida, north of Immokalee. Two brothers, Ramiro and Juan Ramos, supplied as many as 700 pickers

to the growers there. They made the workers pick fruit ten hours a day, six days a week, and threatened them at gunpoint with torture and death if they tried to escape.

The brothers charged each worker $1,000 for the trip to Florida. Each week they took most of the workers' pay, saying it went to that debt and to food and rent, but no worker was ever set free. In April 2001 four of the workers escaped with the coalition's help. A federal court convicted the brothers in 2002, and Ramiro Ramos was later sentenced to 15 years in prison. WGCU, a public radio station in Florida, credits Benitez with helping to free about 700 workers in that one case.

The Fair Food Program. The coalition and Florida's tomato growers began the Fair Food Program in 2011. Big buyers such as McDonald's and Walmart pay about a penny more for each pound of tomatoes. The program's managers suspend any farm where workers are forced to work, children are put to work as a regular practice, or workers suffer sexual assault, any sexual touching or attack against a person's will, including rape. Chapter 14 tells the rest of how the program works.

Benitez received the University of Michigan's Wallenberg Medal, an award for people who defend human rights, in October 2023.

Black farmers in the new century

The 2022 Census of Agriculture counted 46,738 Black farmers on 32,653 farms, according to a USDA report of June 2024. They made up 1.4 percent of all the country's farmers and worked 5.3 million acres. The number of farms run by Black farmers was 8 percent lower than in 2017. In 1920 Black farmers had run more than 900,000.

USDA officials paid about $2 billion on July 31, 2024, to more than 43,000 farmers, ranchers and forest owners who had faced discrimination in USDA farm loans, meaning they had been treated worse because of who they were, such as their race. The NAACP Legal Defense Fund reported the payments that day. The money came from a section of the Inflation Reduction Act, a law that members of Congress passed in 2022.

The first farmers, still farming

People in Native nations are working to control their own food, which is called food sovereignty. Tribes run bison herds, seed banks that save the seeds of old crops, and programs that bring back traditional foods. Native chefs and seed keepers are rebuilding the ways their nations cooked and ate. Among the Ojibwe of the Great Lakes, manoomin, or wild rice, is harvested by canoe and is still a central food.

Nephi Craig

Who: A White Mountain Apache and Diné (Navajo) chef who opened a café built around Apache foods.

When and where: Café Gozhóó, Whiteriver, on the White Mountain Apache Reservation in Arizona, opened in 2021.

Movie: *Gather* (2020), a documentary about Native food sovereignty that features him.

He cooks Western Apache foods like parched corn and acorn powder.

Nephi Craig is a chef who cooks the foods of the Western Apache. He opened Café Gozhóó, a café built around Apache foods, in Whiteriver, Arizona, on the White Mountain Apache Reservation, in 2021. Apaches who are recovering from addiction to alcohol or drugs work in its kitchen through a job-training program run by the tribe's Rainbow Treatment Center.

The food. Craig's Western Apache seed mix has pine nuts, amaranth (a plant whose tiny seeds are eaten like grain), pumpkin seeds and parched corn. To parch corn, he swirls white corn kernels in a hot pan until they toast. He has also served grilled squash with Apache acorn powder, made from ground acorns.

Craig said in 2026 that he had been sober himself for 15 years. That year he published a book about his life and his cooking, *Our Knives Will Save Us*. He also founded the Native American Culinary Association, a group for Native cooks.

The 2020 documentary *Gather* follows him and others who are bringing back Native foods. Among them are Twila Cassadore, a San Carlos Apache woman who gathers wild foods, and Elsie DuBray, a student scientist from the Cheyenne River Sioux.

THE THREE QUESTIONS, ANSWERED

1. **How did Native farmers turn a wild grass into corn?** For thousands of years, starting in southern Mexico about 9,000 years ago, they saved seed only from the teosinte plants they chose, until the grass became corn.
2. **Who did the hardest farm work, and what did they get for it?** Enslaved people worked the rice and cotton fields for no pay, and sharecroppers got half the crop's value or less and stayed in debt. From 1992 to 2006, crop workers died of heat at nearly 20 times the rate of all American workers.
3. **How did Americans come to eat food grown far away by people they never met?** With canning, pond ice and railroad cars cooled with ice, food could be sold far from the farm, and the farms grew fewer, down to 1.9 million in 2022.

What changed: Growing food went from the work of nearly every family to the business of fewer, bigger farms, while the hardest field work stayed with people who were enslaved, in debt or far from home.

FIVE DATES TO KEEP

About 9,000 years ago: farmers in southern Mexico begin breeding corn.

November 1620: the *Mayflower* men dig up Nauset seed corn.

May 20, 1862: the Homestead Act becomes law.

June 30, 1906: Roosevelt signs the pure food and meat inspection laws.

April 14, 1999: a judge approves the *Pigford* settlement.

NOT KNOWN: No farmer from before 1500 is known by name.

Where to go: You can read 318 of the Oblinger family's letters online at the Library of Congress, in its Prairie Settlement collection.

Next: Chapter 16, Economy. It follows how the country has made its living, through booms and panics.

Chapter 16: Economy

CHAPTER 16 OF 37 · ECONOMY · 10 ERAS · ABOUT 80 MINUTES

Much of this country's wealth came from work that people were forced to do for little or no pay, and in crash after crash, the poorest families lost the most.

The census of 1860 lists Mayer Lehman, a merchant in Montgomery, Alabama, as the owner of seven enslaved people. He and his brothers, Henry and Emanuel, took cotton grown by enslaved people as payment for the goods they sold, and then they began trading cotton. Their company, Lehman Brothers, failed on September 15, 2008, owing about 619 billion dollars. It was the largest bankruptcy, the court case of a company that cannot pay its debts, in the country's history.

This chapter follows how people here made a living, from Native trade before 1500 to the jobs of 2026. They made it first mostly by farming, then more and more in mines, mills and factories, and by 2026 mostly in services: stores, offices, hospitals and schools. Two things come back in era after era. One is who did the work and who kept the money: servants, enslaved people, convicts and sharecroppers did much of it for little or nothing. The other is the crash: the panics of 1819, 1837, 1857, 1873 and 1893, the Great Depression of the 1930s and the crash of 2008. In each one, watch who lost a job, a farm or a home.

Four words for hard times. In a panic, fear spreads, many people rush to take their money out of the banks at once, and businesses close. A crash is a sudden fall in prices, of stocks or of homes. A depression is the long stretch of hard times that can follow, lasting years. A recession is a shorter one, measured in months.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did slavery make money for people far from any plantation?
2. What happened to ordinary families when a boom turned into a crash?
3. When did the national government start helping people who lost their jobs?

Five minutes? Read "The Panic of 1837" in 1800 to 1850.

Can skip: "Shell, copper and obsidian", "Parliament's molasses and iron laws", "Where the name Gilded Age comes from", "Why farmers joined the Grange". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 2 MINUTES

Native people here traded without money. They had economies of their own, ways of making, sharing and trading the things they needed. Nobody had coins or wages, and nothing had a set market price. They traded by barter, swapping one good for another, and by giving gifts between people and between nations. Stone tools, shells and copper traveled hundreds of miles this way. No record names any one person who took part in this trade.

How far did Cahokia's hoe blades travel?

The people of Cahokia controlled the making and trading of stone blades for hoes, farm tools for breaking up soil. Archaeologists, scientists who study the past from the things people left behind, have found these blades more than 400 miles away, from Louisiana to Minnesota and in the Arkansas River valley.

The city. Cahokia stood near what is now St. Louis. It was the largest city north of Mexico, and it was at its biggest from about 1050 to 1150. Its farmers grew more corn than they ate, and that surplus, the extra corn, fed specialists: people who spent most of their time on one kind of work, such as making tools, instead of growing food.

The stone. Workers chipped the blades from Mill Creek chert, a tough stone found only in southern Illinois. They dug it out of quarries, open pits for stone, and some of the pits were 10 to 20 feet deep.

Shell, copper and obsidian

People carried the shells of whelks, large sea snails, north from the coast of the Gulf of Mexico. Traders moved copper from the land around Lake Superior. At Cahokia, workers made shell beads in large numbers, and families on small farms made them too.

In the West, people traded obsidian, a natural glass that forms in volcanoes, across their own trade networks. Archaeologists have traced pieces found in western Canada back to Obsidian Cliff, in what is now Wyoming, and Bear Gulch, in what is now Idaho. Some pieces had traveled as far as 750 miles from where the stone formed.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

Explorers found no gold or silver in the land that became the United States, though the kings and queens of Spain, France and England paid for their voyages in the 1500s to find it. The Spanish silver came from mines in Mexico and South America. Fishing was the first steady European business in these waters. Some ship crews traded with Native people on the coast, and some of that trade was for furs. Almost no Europeans settled here yet, so there was no colonial economy.

Fish, furs and a rope from a cliff

European fishing crews worked the cod waters off the northeast coast all through the 1500s and dried their catch on shore.

The rope. Abenaki people on the coast of what is now Maine traded with the crew of Giovanni da Verrazzano's ship in 1524 from the top of a cliff. They would not let the crew come ashore, so they lowered baskets of goods to the ship on a rope.

Crews of earlier European ships had already taken Native people from the Maine coast to sell as slaves. That is why the Abenaki kept this crew off the land. Verrazzano called the place "the land of bad people." The records do not say whether the baskets held furs.

Furs on sticks. Mi'kmaq traders held up beaver furs on sticks to the crew of Jacques Cartier at Chaleur Bay, north of Maine in what is now Canada, in July 1534. They traded the furs for knives and other iron goods. Cartier wrote the trade down in his own account of the voyage, one of the earliest records of furs traded between Europeans and Native people on the Atlantic coast of North America. The fur trade reached the land that became the United States in the next century.

St. Augustine. The Spanish town of St. Augustine in Florida began in 1565 as a military post, and the Spanish king's government paid its costs. Unlike the English colonies that came later, it was not set up to make a profit.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 7 MINUTES

Tobacco became Virginia's main business in the 1600s. The planters who owned the fields changed who did the work. At first the field workers were indentured servants from England, people who had signed contracts to work for a master for a set number of years. Near 1700 the planters switched to buying enslaved Africans, whom they could hold for life. Farther north, Dutch traders shipped beaver skins to Europe, and lawmakers in London wrote rules that required colonists to ship their main crops only to England or its colonies.

Tobacco in the Chesapeake

The first colonists at Jamestown hoped to find gold. John Smith wrote that there was "no talk, no hope, no work but dig gold, wash gold, refine gold, load gold." They found none. Colony officials tried glassmaking and other small businesses, and none of them made money.

Tobacco. Then Virginia's planters began to grow tobacco as a cash crop, a crop grown to sell rather than to eat. They shipped about 2,300 pounds of tobacco in 1615 and 1616, about 20,000 pounds by 1617, and about 1.5 million pounds by 1629 and 1630.

The trade kept growing. Planters in Virginia and Maryland, the two colonies around Chesapeake Bay called the Chesapeake colonies, together sent about 22 million pounds of tobacco a year to England by 1700. They also used tobacco as money.

John Rolfe

Who: A Jamestown colonist whose tobacco shipments to London began Virginia's trade in its main crop.

When and where: Jamestown, Virginia, 1612 to 1614.

Rolfe grew tobacco from West Indies seed and shipped it to London.

John Rolfe began Virginia's export trade in tobacco, the business of sending it away to be sold in another place. He lived at Jamestown, the English colony in Virginia. By July 1612 he was growing tobacco from seed brought in from the West Indies, the islands of the Caribbean Sea. He sent his first shipments to London in 1614.

Who worked the tobacco fields?

Indentured servants did the tobacco work for most of the 1600s. Each servant's contract was called an indenture. In return for the servant's years of work, the master paid for the trip across the ocean and gave food, clothing and a place to sleep.

The terms. Adults usually served four to seven years, and children sometimes served much longer. At the end of the term, the master owed the servant "freedom dues." Depending on the contract and the colony, these could be land, tools, clothes or farm animals.

How many. Of about 120,000 English people who moved to Virginia and Maryland in the 1600s, about 90,000 came as servants, three out of every four. These are historians' estimates from ship records and court records.

The headright. Planters gained from each servant in two ways. Under Virginia's headright rule, whoever paid for a person's passage, the cost of the ocean trip, received 50 acres of land for that person. So a planter who paid a servant's passage got the servant's years of work and 50 acres as well. The large tobacco planters built their estates, their large holdings of land, this way.

What servants went through

Officers of the Virginia Company could hang, burn to death or shoot runaway servants they caught, under the company's first form of contract, used from 1609 to 1619. The Virginia Company of London, a group of investors in England, started Jamestown in 1607 and ran the colony until 1624. That year the king of England took the colony away from the company and put it under his own control.

Whippings and added years. Masters could whip their servants. When a servant ran away, judges in the colony's courts added years to the servant's term. They also added years when a woman servant had a child outside marriage. Under a Virginia law of March 1662, she served two more years or paid her master 2,000 pounds of tobacco.

When the master was the father. Some of the fathers were the masters themselves. Virginia's lawmakers wrote a second law in December 1662 about a woman servant "gott with child by her master," that is, made pregnant by him. When her years ran out, officers of the local church, called churchwardens, sold her to work two more years "for the good of the parish," the church district where she lived. Under this law the churchwardens sold the woman, not the master who was the father.

Some masters also forced women servants into sex. Julie Richter, a historian of colonial Virginia, writes that some masters "physically and sexually abused their servants." She gives no count of how many.

The rules for masters. A Virginia law required masters to give servants "Competent Dyet, Clothing & Lodging," which meant enough food, clothes and shelter. The same law required masters not to "exceed the Bounds of moderation in correcting them," which meant not to go too far in punishing them.

Many servants died of disease before their contracts ended. Most of those who lived to the end of their terms stayed poor.

From servants to enslaved Africans

About 300 Africans lived in Virginia by 1650, next to about 4,000 white servants. In the 1660s, members of Virginia's assembly, the colony's lawmakers, passed the colony's first laws that treated Africans as slaves for life.

The first law. Under a law of March 1661, an English servant who ran away together with Africans had to serve extra time for the Africans' missing time as well as his own. Judges punished runaway servants by adding years to their terms. But the law's words said the Africans were "incapable of makeing satisfaction by addition of time." Judges could add no years to their time, because they were already held for life.

Servants and enslaved Africans fought on the same side in Bacon's Rebellion of 1676 and 1677, an armed uprising in Virginia. Nathaniel Bacon led colonists who wanted to kill or drive out every Native person in Virginia. When the governor, William Berkeley, tried to stop him, Bacon's men turned on the governor and burned Jamestown in September 1676.

The rebellion showed that poor white and Black people could unite, and the planters who ruled Virginia feared it would happen again. After it, the planters passed new laws. Historians at the College of Charleston describe the purpose of those laws as "to harden Virginia's racial caste system," a system that sorts people at birth into ranks they can never leave.

The slave code. Members of Virginia's assembly gathered the colony's slave laws into one slave code in 1705. Under it, enslaved people were property, and being baptized, going through the church ceremony that makes a person a Christian, did not free anyone. A master who killed an enslaved person while "correcting" them faced no punishment.

The planters' choice. Planters chose to buy enslaved Africans instead of servants near 1700. Fewer English servants were coming by then, because life in England had improved. In the same years the Atlantic slave trade grew, as ship crews carried captive Africans across the ocean to be sold.

The economist David Galenson, a scholar who studies how people make and spend money, explains the choice in money terms. A servant worked for a master for about five years. A planter who bought an enslaved person held that

person, and that person's children, for life. So the planter got a whole lifetime of unpaid work, and the work of the children too, instead of five years.

Beaver skins, and rules from London

One ship of the Dutch West India Company, the *Arms of Amsterdam*, carried 7,246 beaver skins to Amsterdam in a single cargo in 1626, along with the skins of otters, minks, lynxes and muskrats. A letter known as the Schaghen letter lists the cargo. People in Europe bought hats made of felt from beaver fur, and those buyers were the reason traders wanted the skins.

English leaders followed an idea called mercantilism, the belief that colonies existed to make the home country richer. Colonists were to send raw goods, such as tobacco, to England and buy back finished goods, things already made in England.

The Navigation Acts. Members of Parliament, England's lawmakers, wrote this idea into laws called the Navigation Acts. Under the act of 1651, colonists had to ship their trade goods only in English or colonial ships. The act of 1660 listed "enumerated goods," a phrase that means listed goods, and colonists could ship these only to England or to other English colonies. The list included tobacco, sugar, cotton, ginger and indigo, a plant used to make blue dye.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 6 MINUTES

Much of the colonies' wealth, most of all in the South, came from the work of enslaved people, who were paid nothing. Free colonists were doing well. By 1774 they earned more on average than the people of England, the economic historians Peter Lindert and Jeffrey Williamson found. Among free colonists only, income was spread more evenly than in any other place the two could measure at that time. In the rice country of South Carolina, though, the wealth from rice stayed with a small group of white planters.

Convicts for sale. From 1718, British judges sent about 50,000 convicts across the ocean to be sold as laborers.

What the colonies sold

Tobacco came from the Chesapeake colonies, wheat and flour from the middle colonies, such as Pennsylvania, New York and New Jersey, and fish, rum and ships from New England. In the Lowcountry of South Carolina, the low land along the coast, enslaved workers grew rice and indigo and prepared them for sale.

Timber cost little in the colonies, so colonial shipbuilders could build ships for less than builders in England. By the Revolution, about one-third of the British merchant fleet, all the ships that carried Britain's goods for trade, had been built in America.

Rice, and the people who knew how to grow it

Enslaved Africans built and worked the rice fields of the South Carolina Lowcountry. Rice was the Lowcountry's main cash crop from the early 1700s. Enslaved Africans were a majority of the people in South Carolina from about 1708, and by 1740 they were about two out of every three.

Nic Butler of the Charleston County Public Library writes that enslaved people "moved earth on a massive scale" to build the rice fields. By the 1720s, Carolina planters were asking slave traders for Africans from the region called the Rice Coast, because people from there already knew how to grow rice. The wealth from rice, Butler writes, "remained concentrated in the hands of a small minority of white planters."

The children. Historians at the College of Charleston record that enslaved children in the Lowcountry died at especially high rates. Their account gives no count of those children's deaths in the early 1700s. The number of enslaved people there did not grow through births until the 1760s.

Eliza Lucas Pinckney

Who: A young woman who ran her father's three South Carolina plantations from the age of 16 and directed the colony's first successful indigo dye crop.

When and where: South Carolina, 1744 to the 1750s.

Her first crop, in 1744, made 17 pounds of blue dye.

Eliza Lucas directed the first successful crop of indigo dye in South Carolina in 1744 and shared her seed with neighboring planters. From the age of 16 she had run her father's three plantations. She later married and became Eliza Lucas Pinckney.

What followed. South Carolina's indigo exports grew from about 5,000 pounds in 1745 and 1746 to about 130,000 pounds by 1748. By the middle of the 1750s, planters there shipped more than a million pounds a year. Indigo became the colony's second biggest export after rice, and by the Revolution it made up more than a third of the value of the colony's exports.

Whose work. Enslaved workers on her father's plantations did the growing. Her father sent skilled dye-makers from the Caribbean, and enslaved workers did the processing, the work of turning the plant into dye. She relied on their knowledge and their labor.

Convicts sold at the dock, 1718 to 1775

British judges sent about 50,000 people convicted of crimes to the North American colonies between 1718 and 1775, and merchants sold them there as laborers. The convicts were about one in four of all the people who moved from Britain to colonial America in those years.

The law. Members of Parliament passed the Transportation Act in 1718. Transportation here meant sending convicts away across the ocean as a punishment. Under the act, a judge could send a person convicted of a felony, a serious crime, to the colonies instead of hanging them: for seven years for one of the less serious felonies, and for fourteen years for worse crimes.

Sold at the dock. Most convicts went to Maryland and Virginia. There, merchants sold them at the dock as bound laborers, people who had to work for whoever bought them until their term ended. In the records of four Maryland counties, about 82 of every 100 convicts were men and 18 were women. On two ships of 1721 and 1724, most convicts were between 20 and 29 years old, and about half were laborers with no trade.

The money. British government officials paid a London merchant named Jonathan Forward £3, three British pounds, for each convict he carried, and later £5. A Maryland firm, Stevenson, Randolph and Cheston, sold convicts in Maryland from 1767 to 1775. The firm's own sales books record that most men sold for £11 to £14 and most women for £9 to £10. The planters who bought them got years of work without paying wages.

Convicts died on the crossing. On 38 voyages from London between 1718 and 1736, the ships carried 3,599 convicts, and 385 of them died, about 11 of every 100. The historian A. Roger Ekirch points out that the records of some of these voyages list no deaths at all. If those blanks are gaps in the clerks' records, the true count was about 15 of every 100. On 12 voyages from Bristol in the 1770s, 23 of 990 convicts died.

Rhode Island's slave ships

Merchants in Rhode Island sent out at least 1,000 slaving voyages in the century before 1807. That year members of Congress made a law that banned bringing captive Africans into the United States, starting on January 1, 1808. The Rhode Island ships carried more than 100,000 Africans into slavery.

About 60 of every 100 slaving voyages that left North America sailed from Rhode Island, and in some years more than 90 of every 100 did. These numbers come from *Slavery and Justice*, a 2006 report from Brown University.

The loop. The merchants who sent out these ships made their money by buying and selling human beings. Their crews sailed a loop around the Atlantic Ocean. Colonists made rum from Caribbean molasses, a thick, dark syrup left over when sugar is made.

Captains carried the rum and other goods to West Africa and traded them for captive people. Crews then carried the captives across the ocean, on the crossing called the Middle Passage, to be sold in the Caribbean and on the mainland. The ships brought sugar and molasses back north.

Parliament's molasses and iron laws

Members of Parliament passed the Molasses Act in 1733. Under it, colonists had to pay a duty, a tax on goods brought in, on molasses from colonies that did not belong to Britain. The duty was sixpence, six British pennies, for each gallon. Many colonists dodged it by smuggling, bringing the molasses in secretly.

Under the Iron Act of 1750, raw iron from the colonies could enter Britain with no duty. The act forbade colonists to build new steel furnaces, rolling and slitting mills or plating forges, the works that turned raw iron into finished goods. Colonists built them anyway.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 6 MINUTES

Americans paid for the Revolution with paper money and debt. In 1790 the new national government and the states still owed about 79 million dollars for the war, and Alexander Hamilton wrote the plan to pay those debts in full. Members of Congress taxed whiskey to help pay them, and in 1794 farmers in western Pennsylvania rose up against that tax. Both before and after the war, Rhode Island merchants sent ships to Africa to buy captive people.

The Browns and the slave ship Sally

Four merchant brothers of Providence, Rhode Island, sent their ship *Sally* to West Africa to buy people in 1764. They were Nicholas, John, Joseph and Moses Brown. The ship carried 17,274 gallons of rum, along with chains, guns and shackles, metal rings locked around a person's wrists or ankles. By that year Rhode Island had about 30 rum distilleries, places where rum was made, and 22 of them were in Newport. The distillers made the rum from molasses shipped from the Caribbean.

The voyage. The captain, Esek Hopkins, bought 196 Africans, and at least 109 of them died, by the count in Brown University's report. Hopkins kept the ship on the African coast for more than nine months while he bought them. The captives died from disease and starvation, by killing themselves, and in an uprising.

Nineteen died before the ship left Africa. They included several children and a woman who hanged herself below deck. On the day the ship sailed, another woman was "left for dead," in the words of the report, which does not say who left her or what became of her.

Sixty-eight people died during the crossing. Four of them, a woman and three children, died in the first week at sea. Twenty more died soon after the ship reached the West Indies, and one more died on the way to the Brown brothers in Providence.

The uprising. When the captives rose up, Hopkins's crew fired on them. Hopkins wrote in his account book: "Slaves Rose on us was obliged fire on them and Destroyed 8 and Several more wounded badly." By "Destroyed 8" he meant that his crew killed eight people. The survivors were so sick that buyers paid only £5 for some of them.

Brown's next ship. John Brown kept trading in people. In 1795 the crew of his ship *Hope* took 229 Africans from the Gold Coast of Africa, and 198 of them lived to be sold in Cuba. Under a law of 1794, Americans could not own, equip, put money into or work on ships that carried captive people to other countries.

The trial. Members of the Providence Abolition Society, a group working to end slavery, took Brown to a United States court for breaking that law. On August 5, 1797, he became the first American tried under it. The jury found him not guilty and ordered the society's members who had charged him to pay his court costs. He did not get the *Hope* back.

Paying for the war with paper money

Members of the Continental Congress had almost no power to tax. From 1775 they paid for the war by printing paper money called Continental dollars, and the paper dollars quickly lost their value. By the end of 1777 it took about 4 paper dollars to buy what 1 silver dollar bought, and by 1781 it took about 100. The paper money was close to worthless. The saying "not worth a Continental," meaning worth nothing at all, comes from this money.

Alexander Hamilton

Who: The author of the plan to pay the Revolution's debts in full.
When and where: The new United States government, 1790 and 1791.
Movie: Alexander Hamilton (American Experience, 2007), a two-hour documentary shown on PBS, with Brían F. O'Byrne as Hamilton.

After a dinner deal, members of Congress voted his debt plan through.

Alexander Hamilton planned how the new United States would pay the debts of the Revolution. He set out the plan in his First Report on Public Credit in January 1790. He counted the national debt at about 54 million dollars, and the states owed about 25 million dollars more for the war.

Paying in full. Hamilton proposed that the national government pay every debt in full and take over the states' war debts, a step called assumption. The people who were owed money would then look to the new government to be paid, and they would want it to last so that they got their money. Paying in full would also build the government's credit, the trust lenders have that a borrower will pay back what it borrows.

The dinner. Assumption did not have enough votes to pass in the House of Representatives in June 1790. Thomas Jefferson invited Hamilton and James Madison, a member of the House from Virginia, to dinner, and the three men made a deal.

The deal. Madison agreed to stop blocking assumption and to win over enough Southern members to pass it. In return, Hamilton agreed to find Northern votes for putting the country's permanent capital on the Potomac River, where Washington, D.C., stands today. Members of Congress passed both: first the capital on the Potomac, then assumption.

Factories. Hamilton's Report on Manufactures is dated December 5, 1791. In it he laid out a plan to grow American manufacturing, the making of goods in workshops and mills, with tariffs (taxes on goods brought in from other countries) and subsidies (money paid to help a business grow). Members of Congress never brought the plan to a vote.

Hamilton also helped found the Society for Establishing Useful Manufactures. Through it, he and the other founders started a factory town at the falls of the Passaic River, which is Paterson, New Jersey.

Why farmers fought the whiskey tax

Farmers in western Pennsylvania sent their corn to market as whiskey, so a tax on whiskey fell on the crop they sold. Members of Congress passed that tax in 1791 to help pay the war debt. It was an excise, a tax on goods made and sold inside the country, of 7 cents a gallon on distilled spirits such as whiskey.

Tar and feathers. A gang in disguise caught a tax collector named Robert Johnson in September 1791 and tarred and feathered him: they coated him with hot tar and stuck feathers to it.

Bower Hill. About 600 armed men attacked the house of John Neville, the tax inspector, at a place called Bower Hill in July 1794. When their leader, James McFarlane, stepped into the open, someone inside the house shot and killed him. The accounts do not say who fired. The attackers then set the house on fire. This uprising is called the Whiskey Rebellion. President George Washington called up about 13,000 militia, soldiers drawn from the states, and the rebels broke up without a battle.

The Dreadful Night. Troops under General Henry Lee broke into houses on the night of November 13, 1794, pulled people from their beds and arrested about 150 of them. They held the prisoners in animal pens and basements. For years afterward, people in the area called it "the Dreadful Night."

The troops took 20 of the prisoners to Philadelphia for trial. Two men, Philip Wigle and John Mitchell, were found guilty of treason, the crime of making war against their own country. Washington pardoned them both, setting aside their punishment.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 11 MINUTES

In 1800 most American families grew and made most of what they used. By 1850 far more of them grew crops and made goods to sell, and bought what they needed, a change called the market revolution. The biggest thing Americans sold to other countries was cotton grown by enslaved people, and by 1860 enslavers valued the people they held at 3 billion dollars or more.

Two panics. In the panics of 1819 and 1837, many people rushed to get their money out at once, and businesses closed. About 50,000 people in three big cities had no steady work in 1819, and by one estimate a third of all workers had no jobs by the fall of 1837.

From household to market

Farm families and workshops could sell goods far from home once moving them got cheaper. Before the Erie Canal opened in 1825, it cost about 100 dollars to haul a ton of goods by road from Buffalo to New York City. By canal boat the same ton cost about 10 dollars, and the trip took about ten days instead of twenty.

The owners of the new cotton mills in New England hired young women from farm families and paid them wages in cash. These women were among the first large groups of Americans who worked for cash wages.

Copper and gold. A rush for copper began on the Keweenaw Peninsula of Michigan, a point of land with water on three sides, in 1843. It began after Douglass Houghton, a scientist who studied rocks for the state as its geologist, reported on the copper there. By 1849 miners there dug 96 of every 100 pounds of copper mined in the United States.

Gold was found at Sutter's Mill in California early in 1848. About 80,000 people went to dig for it in 1849, and about 300,000 people came to California between 1848 and 1855. The merchants who sold the miners their supplies made steadier money than most of the miners did.

King Cotton

Cotton was the most valuable American export, and enslaved people did the work of growing it. They planted it, picked it and got it ready for sale. The crop was known as King Cotton.

More than half. Cotton made up 51.6 percent of the value of everything the United States sold to other countries in 1840, and it stayed above half almost every year until the Civil War. About three of every four pounds grown here were sent abroad. From 1820 to 1860, about 80 of every 100 pounds of cotton used in the world came from the United States.

The cotton crop more than doubled in six years. Enslaved people grew about 300 million pounds of cotton in 1831 and more than 600 million pounds in 1837.

Forced south. To grow it, enslavers forced people out of the older slave states and into the new cotton states. They moved about 155,000 enslaved people this way in the 1820s and at least 250,000 in the 1830s. Between about 1790 and 1860, enslavers moved more than 1 million people from the Upper South, the older slave states farther north such as Virginia, to the Deep South, the cotton states farther south.

People counted as property worth billions

Enslavers counted the people they held as capital, money or property that an owner uses to make more money. Census takers, the government workers who count every person in the country, counted 3,953,760 enslaved people in the United States in 1860. Enslavers valued them at 3 billion dollars or more. That was the price enslavers put on human beings as property, and it was more than all the money invested in American railroads and factories put together.

Enslavers used enslaved people as capital in two ways. The people grew the cotton and were paid nothing for it. Enslavers could also borrow money by promising the people themselves to a lender, and if the loan was not repaid, the lender could take the people and sell them.

Banks and bond sellers

Planters in Louisiana and Mississippi set up their own banks in the 1830s. The banks lent planters money on mortgages, loans in which the borrower promises property to the lender, and these mortgages covered land and enslaved people. The banks then sold bonds, paper promises to repay a loan with interest, to investors in Europe and in the Northern states. The mortgages on land and people backed those bonds.

Far from any plantation. Investors in Europe and the North who bought these bonds made money from loans backed by enslaved people. Bankers in London, Amsterdam and New York sold the bonds to them. Baring Brothers of London and its partners in New York sold 7 million dollars in bonds for the Union Bank of Louisiana in 1832. Hope and Company of Amsterdam sold 12 million dollars in bonds for the Citizens' Bank of Louisiana in 1833.

A bank's own report. Two Louisiana banks, the Citizens Bank and the Canal Bank, lent planters money and took about 13,000 enslaved people as collateral, property a borrower promises to hand over if the loan is not repaid. When planters failed to pay, the two banks came to own about 1,250 of those people.

JPMorgan Chase, a bank that grew in part out of those two, made these figures public in a report in January 2005. JPMorgan Chase's leaders apologized and set up a 5-million-dollar scholarship fund for students in Louisiana. They made the report because, under a 2003 Chicago law, companies that did business with the city had to search their records for ties to slavery.

Insurers, cotton traders and Northern mills

Northern insurance companies sold enslavers policies, written deals, on the lives of enslaved people. The enslaver paid the company a fee, and when an enslaved person died, the company paid the enslaver.

Two insurers. New York Life, then called Nautilus Insurance, insured the lives of 520 people from 1846 to 1848. Those people appear to have been enslaved, and the company paid out money for 15 of their deaths. In March 2000, leaders of the insurer Aetna apologized for policies the company sold on enslaved people's lives in the 1850s. They said Aetna would pay no reparations, payments made to make up for a wrong.

The Lehmans. The Lehman brothers of Montgomery, Alabama, whose story opens this chapter, made their start as merchants who took slave-grown cotton as payment and then traded it.

The Lowell mills. Northern mill owners made money from slave-grown cotton too. Francis Cabot Lowell, Nathan Appleton, Patrick Tracy Jackson and the other Boston merchants who built the Lowell mills were called the Boston Associates. They founded the Boston Manufacturing Company in 1813, and their mills spun cotton grown by enslaved people in the South.

The mills also made a cheap, rough cloth known then as "negro cloth," from the word white Americans of that time used for Black people. The mill owners sold the cloth to planters, who used it to clothe the people they enslaved. By 1845, 31 cloth companies tied to the Boston Associates, in Massachusetts, New Hampshire and southern Maine, made one-fifth of all the cotton and wool cloth in the United States.

Senator Charles Sumner of Massachusetts named the two sides by their tools: the lash, a whip, and the loom, a machine that weaves thread into cloth. He called the tie between planters and mill owners an "unholy union ... between the lords of the lash and the lords of the loom."

The Panic of 1819

The Panic of 1819 began the first major depression that the American public lived through, a long stretch of hard times, from about 1819 to 1822, when businesses closed and many people lost their work.

What caused it. The prices that buyers paid for cotton fell sharply. Officers of the Second Bank of the United States called in loans, asking borrowers to pay back money right away. Under an 1817 order from Congress, buyers of land from the national government had to pay in gold or silver coin. Owners closed American factories because buyers chose cheaper goods from Britain.

No work. During the panic, employers let workers go, and judges jailed people who could not pay their debts. In New York, Philadelphia and Baltimore, about 50,000 people had no work or only odd jobs. One observer from abroad estimated that half a million people across the country had no work. Nobody made a real count.

Debtors' prison. In those years, a person who was owed money could sue, and a judge could order the borrower arrested and locked in a debtors' prison, with no set date for release. In Philadelphia, judges sent 1,808 people to debtors' prison this way. In Boston, judges sent 3,500.

Land lost its value. Farmland in Pennsylvania fell from 150 dollars an acre in 1815 to 35 dollars in 1819, and property in Richmond, Virginia, lost half its value.

The poor. In New York City, a city of about 120,000 people, the number of paupers, people too poor to feed themselves without help, rose from 8,000 in 1819 to 13,000 in 1820. Mathew Carey, a publisher and economist in Philadelphia, estimated that 3 million people, about one-third of the nation, were hurt by the panic.

Small cotton planters went bankrupt in 1819, and again in 1837: they could not pay their debts, so their lenders could take what they owned. Larger planters bought up the small planters' land and the enslaved people those planters had held.

The Panic of 1837

A depression began with the Panic of 1837 and lasted until about 1843. In the years before it, buyers speculated in western land and in cotton, buying in the hope of selling later at a higher price. Then British lenders made loans harder to get, and the price of cotton fell, by half in New Orleans.

The banks stop paying. The bankers of New York City stopped paying out gold and silver on May 10, 1837. People who brought in the banks' paper money could no longer trade it for coins.

Of the country's 850 banks, 343 closed, about 4 of every 10, and 62 more partly failed, by the count in a history collection edited by Hubert Howe Bancroft in 1902. A college textbook gives a smaller count, 200 banks closed. The governments of seven states and one territory did not pay back their loans.

How many lost work. By one widely repeated estimate, a third of all workers had no jobs by the fall of 1837, and within two years employers cut the pay of people who kept their jobs by 30 to 50 percent. Other estimates put New York's unemployment, the share of people who want work and cannot find it, at about 25 or 30 percent in 1837 and 1838.

Nobody counted the jobless at the time, so these are later estimates, and the teaching guides that repeat them do not say who made them.

The flour riot. Food had already grown costly before the banks stopped paying. A barrel of flour in New York rose from 7 dollars to 12 between 1836 and 1837. About 5,000 New Yorkers met in City Hall Park on February 13, 1837, to protest the price of food and fuel.

Part of the crowd broke into the store of the flour merchants Eli Hart and Company. They took or destroyed 500 to 600 barrels of flour and 1,000 bushels of wheat, about 60 pounds of wheat to each bushel.

Who paid. Mississippi planters owed 33 million dollars to the banks of New Orleans, and their 1837 cotton crop sold for only 10 million dollars. What happened next depended on whom a debtor owed.

Some planters had borrowed from banks in Mississippi and Florida whose bonds those states had backed. A bond is a paper promise to repay borrowed money with interest, and a state that backed a bank's bonds promised to pay the buyers itself if the bank could not. Lawmakers in both states later refused to pay those bonds. So the investors in Europe and the North who had bought them lost their money, and the planters who owed those banks kept their land and the people they enslaved.

Families sold apart. Debtors who owed other creditors, the people they owed money to, could lose the people they enslaved. When such a debtor could not pay, a judge could order his property taken, and the creditors seized the people he enslaved and sold them. Two Louisiana banks came to own about 1,250 enslaved people when planters failed to repay their loans. Many debtors fled to Texas at night and took the people they enslaved with them.

A single creditor's claim against a debtor who failed to pay could force the sale of a whole enslaved community. The creditors sold its people to different buyers and scattered them, and sales like these split families. By the count of the Equal Justice Initiative, a group that studies the history of slavery, enslavers and traders separated nearly half of all the people they moved inside the country from a husband, a wife or a parent.

Philip Hone

Who: A New York merchant whose diary recorded the Panic of 1837 as it happened.

When and where: New York City. He kept the diary from 1828 to 1851.

Hone wrote down the crash of 1837 and lost money in it.

Philip Hone sold goods at auction in New York City, and he had served as the city's mayor in 1826 and 1827. During the Panic of 1837 he wrote in his diary how business in the city stopped: "No goods are selling, no business stirring, no boxes encumber (crowd or block) the sidewalks of Pearl Street."

Hone lost part of his own fortune in the crisis years. His diary was printed in 1889, after his death, as *The Diary of Philip Hone*.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 14 MINUTES

American mills made 11.4 million tons of steel in 1900, more than Britain and Germany together. By then the United States was an industrial country, one where much of the work is done in mines, mills and factories. Railroad track grew from about 9,000 miles in 1850 to 193,346 miles by 1900. The era is called the Gilded Age.

In the South. After slavery ended, Southern landowners farmed with sharecroppers, families who worked a landowner's land for a share of the crop and stayed in debt to him. Officials in Southern states leased prisoners, renting them out to private companies, and in Alabama 90 or more of every 100 prisoners were Black.

Hard times. About one in four workers in New York City lost their jobs after the Panic of 1873, by estimates of the time. For the Panic of 1893, estimates for the whole country run from about 17 to 25 percent of workers.

Where the name Gilded Age comes from

The name Gilded Age comes from an 1873 novel by Mark Twain and Charles Dudley Warner, *The Gilded Age: A Tale of Today*, in which the two writers made fun of their own time. Something gilded is covered with a thin layer of gold, so the name means a thin shine of gold over serious problems underneath.

Steel, rails, cattle and metal

Steel rails got cheap in these years. According to histories of the steel industry, a ton of steel rails cost about 140 dollars in 1872, about 35 dollars in 1882 and about 20 dollars by 1900. American mills made more steel than Britain's by about 1889 or 1890.

Cattle. Cattle ranchers in Texas drove herds north to the railroads in Kansas, where a Texas longhorn worth up to about 5 dollars at home could sell for up to about 40 dollars. From 1866 to 1884, cowboys drove more than 5 million cattle north.

Ranchers also kept cattle on the open range, land with no fences, where the animals grazed wherever they wandered. Four things ended the open-range cattle business. Barbed wire fences went up across the range, and more railroads were built. Officials put a quarantine on cattle in 1885 and 1886, keeping animals apart from others to stop the spread of a disease. The last was the winter of 1886 to 1887.

Homesteads. Members of Congress passed the Homestead Act in 1862. Under it, a settler could claim up to 160 acres of land and own it after living on it and farming it for five years. Settlers filed about 4 million claims, and about 270 million acres, about a tenth of the country's land, became private farms. US officials had taken that land from Native nations.

Silver, copper and aluminum. The Comstock Lode, a long vein of silver running through rock near Virginia City, Nevada, was the richest body of silver in North America. It was found in 1859. Copper from Michigan, and later from Butte, Montana, became the wire for electric lights and telephones.

Charles Martin Hall, a 22-year-old college graduate, made aluminum by a new method in his family's woodshed in Oberlin, Ohio, on February 23, 1886, with help from his sister Julia. The Pittsburgh Reduction Company began making the metal by his method in 1888, and a new industry began. A pound of aluminum cost about 12 dollars in the early 1880s and less than 1 dollar by the middle of the 1890s.

The panics of 1857 and 1873

The Ohio Life Insurance and Trust Company failed on August 24, 1857. Its manager in New York had stolen from it, and its officers had made bad loans. News of the failure went out by telegraph, and people in many places rushed to take their money out of banks, a rush called a bank run. A short but deep depression followed.

The Panic of 1873 began on September 18, when Jay Cooke and Company failed. It was an investment bank, a firm that sold bonds and shares to raise money for businesses such as railroads, and Jay Cooke and his partners had put too much money into bonds of the Northern Pacific Railroad.

The exchange closes. The New York Stock Exchange, where people buy and sell shares of companies, closed for ten days. It had never closed like this before. About 18,000 businesses failed. Economists at the National Bureau of Economic Research set the dates when hard times begin and end, and by their count this depression lasted 65 months, until March 1879. It was the longest stretch of hard times on their record until the 1930s.

New York's jobless. About one of every four workers in New York City had lost their jobs by the winter of 1873 to 1874, according to estimates drawn from newspapers of the time. The historian Howard Zinn wrote that more than 90,000 homeless workers, almost half of them women, slept in New York police stations.

Tompkins Square. About 7,000 people with no work met in Tompkins Square Park in New York City on January 13, 1874. They wanted Mayor William F. Havemeyer to create public jobs. Soon after 10 in the morning, New York police, some of them on horseback, charged into the crowd. The police commissioner, the official in charge of the city's police, was Abram Duryée.

The police beat people with clubs, and men, women and children ran. The accounts give no count of the people who were hurt. Men from a German workers' club fought back, and someone hit one policeman on the head with a hammer. The police drove the crowd out of the square and arrested 46 people.

Why farmers joined the Grange

Farmers were angry about what railroads charged to ship their grain and what grain elevators, the tall buildings where grain is stored before it is shipped, charged to hold it. In 1867 Oliver Hudson Kelley founded the Patrons of Husbandry, known as the Grange (husbandry is an old word for farming). By the middle of the 1870s it had about 800,000 members.

Grange members pushed state lawmakers to pass the Granger laws, which set the highest rates that railroads and grain elevators could charge. In *Munn v. Illinois* in 1877, the justices of the Supreme Court ruled that those laws were allowed under the Constitution.

The Panic of 1893 and Coxey's Army

About 500 banks and 15,000 businesses failed in the Panic of 1893, and more than 150 railroad companies later went bankrupt. Nobody counted the people out of work at the time. Later estimates for the worst of it run from about 17 to 25 percent of workers. The economic historian Stanley Lebergott estimated that unemployment rose from about 3 percent in 1893 to 18.4 percent in 1894.

The march. A businessman named Jacob Coxey led a march of men without work from Massillon, Ohio, to Washington, D.C., in 1894. About 100 men left on March 25, and about 500 arrived on May 1, while a crowd of about 30,000 watched them. It was the first large protest march on Washington.

The marchers, called Coxey's Army, asked the national government for a 500-million-dollar program of public works. Under it, federal officials would have hired people without jobs to build public projects. When Coxey tried to speak at the Capitol, police arrested him for walking on its grass, and he served 20 days in jail.

Sharecropping and debt

Most freedpeople in the South, the people freed from slavery, had no land after the Civil War. Many families went to work as sharecroppers.

The furnish. A landowner gave a family a plot of land, usually about twenty acres. He also "furnished" the family with food, seed, tools and a cabin on credit, to be paid for later, and this was called the furnish. On the furnish, landowners charged interest, the fee a borrower pays for borrowing, far above a fair rate.

At harvest the landowner sold the crop and took out the cost of the furnish and the interest. Then he gave the family its share, usually half of what was left or less.

Landlords held a lien on the crop, a legal claim on it until the debt was paid, and they kept the account books. So most sharecroppers were still in debt when the landlord settled the yearly accounts, year after year. A landlord could put a sharecropping family off the land whenever he chose.

Sharecropping lasted into the 1930s. Census takers counted 1,831,470 tenant farmers in the South in 1930, farmers who worked land they did not own, about half of all farmers there. About 700,000 of them were share tenants, who owned mules or tools and kept two-thirds to three-quarters of the crop.

Most Black farmers in the country owned no land by 1935: 77 of every 100. Nearly half of white farmers owned none. In 1937 members of the President's Committee on Farm Tenancy counted about 775,000 sharecroppers in the South, almost equal numbers of white and Black.

Debt peonage and Alonzo Bailey

Members of Congress banned peonage, forcing a person to work to pay off a debt, in the Peonage Abolition Act of 1867. Lawmakers in Southern states then wrote laws that had the same effect. Peonage was most common in the cotton belt, the part of the South where cotton was grown, and in the turpentine camps of southern Mississippi, Alabama, Georgia and the Florida panhandle, where workers collected sap from pine trees to make turpentine, a liquid used in paint.

Alonzo Bailey, a Black farm laborer in Montgomery County, Alabama, signed a work contract on December 26, 1907, with the manager of the Riverside Company, a company that ran a farm. Bailey received 15 dollars before he started work, to be paid back out of wages of 12 dollars a month. He quit after about a month.

The charge. Under Alabama law, a worker who quit without paying back money he got this way was a criminal. An Alabama court found Bailey guilty, fined him 30 dollars and sentenced him to 136 days of hard labor, heavy work done as a punishment.

The appeal. A Montgomery lawyer, Edward S. Watts, and a city judge, William H. Thomas, helped Bailey take his case to the United States Supreme Court, and Booker T. Washington helped in secret. On January 3, 1911, in *Bailey v. Alabama*, the justices ruled that the Alabama law broke the Thirteenth Amendment, the part of the Constitution that bans slavery. Other states' peonage laws stayed in force until the justices struck down Georgia's and Florida's in the 1940s.

Convict leasing in Alabama

The Thirteenth Amendment bans slavery "except as a punishment for crime." Under that exception, state and county officials in the South rented out prisoners to private companies, which was called convict leasing. The companies paid the government a fee for each prisoner, and the companies' bosses made the prisoners work in mines, on farms and in lumberyards.

Officials in Alabama leased prisoners from 1846 to July 1, 1928. After a money crisis in the state government in 1875, the warden John G. Bass, the official in charge of the state's prisoners, leased them to coal mines, farms and lumberyards for monthly fees.

Three coal companies. From 1883, under the warden John Hollis Bankhead, officials leased most state prisoners to three coal companies: the Pratt Coal and Iron Company, the Tennessee Coal, Iron and Railroad Company, called TCI, and the Sloss Iron and Steel Company. In 1888 TCI signed a ten-year contract for every state prisoner able to work, paying the state 9 to 18.50 dollars a month for each prisoner.

More than 95 of every 100 county prisoners in Alabama were Black, and so were 90 of every 100 state prisoners. The companies' bosses whipped prisoners to make them work. Coal company officials wrote false reports of "bad conduct" so that the prisoners would have to serve longer sentences.

What the state made. Alabama's state officials collected money from leasing prisoners. Fees for leased prisoners were about 10 of every 100 dollars the state took in during 1883, and in 1898 they were nearly 73 of every 100 dollars.

Deaths. Leased prisoners died at about ten times the rate of prisoners in states that did not lease them, according to Digital History, a history website of the University of Houston. By the same source, 25 of every 100 Black leased prisoners in Alabama died in 1873. At Sloss's Coalburg mine, 9 of every 100 prisoners died each year, Dr. Thomas D. Parke, the health officer of Jefferson County, reported in 1895.

Alabama's mines held 1,710 state prisoners and 745 county prisoners in 1896. In the two years before, 233 state prisoners and 181 county prisoners had died.

James Knox. A prisoner named James Knox, from Mobile, was killed at Sloss's Flat Top mine in 1924. Men there whipped him with a steel wire and lowered him into a vat of boiling water. The published accounts of his death do not name the men who did it.

His death was first reported as a suicide by poison, and it led to an investigation. An autopsy, an examination of a dead body by doctors, found that his heart had stopped and that the poison had been put into his body after he died. Investigators found that the whipping and the boiling water caused the injuries that killed him.

Sloss's managers kept county prisoners working in the company's mines until 1928. That year Alabama's officials ended convict leasing. Alabama was the last state to end it, about five years after Florida.

Breaking strikes. TCI's managers also used leased prisoners in Tennessee, where officials leased prisoners from 1871 to 1896. A TCI official told the *New York Times* that "one of the chief reasons" the company took up convict leasing "was the chance it offered for overcoming strikes," the times when workers stop working until their employer agrees to better pay or conditions.

The official said free miners would not want to strike once they saw the company had plenty of prisoners to put to work. The account of the interview does not give his name. TCI's managers used prisoners to keep unions, groups of workers who join together to bargain with their employer, out of the mines.

Andrew Carnegie

Who: A Scottish immigrant who started work as a mill boy, built a steel company, sold it for 480 million dollars and gave away more than 350 million dollars.

When and where: Scotland and Pennsylvania, 1835 to 1919. He built steel mills from the 1870s and sold his company in 1901.

Movie: The Richest Man in the World: Andrew Carnegie (American Experience, 1997), a documentary about him shown on PBS.

His first job, at about 13, paid 1.20 dollars a week.

Andrew Carnegie's family moved from Dunfermline, Scotland, to Allegheny, Pennsylvania, in 1848. At about 13 he went to work in a cotton mill as a bobbin boy, changing the spools that held the thread. He worked as a telegraph messenger and then as a manager for the Pennsylvania Railroad. From the 1870s he built steel mills, among them the Edgar Thomson works.

Selling and giving. In 1889 Carnegie wrote an essay called "The Gospel of Wealth." In 1901 he sold Carnegie Steel to a group led by J. P. Morgan for 480 million dollars. He gave away more than 350 million dollars, including money for about 2,500 public libraries. Counts of the libraries vary, and some go above 2,800 around the world.

Homestead. Workers at Carnegie Steel's works in Homestead, Pennsylvania, went on strike in 1892. Henry Clay Frick, one of the men running Carnegie's company, hired 300 armed agents of the Pinkerton detective agency, a private company that hired out guards and detectives, to take back the plant. On July 6 the Pinkertons came up the river on barges, and they and the strikers fought a gun battle.

Seven workers and three Pinkertons were killed, and some accounts count more. No record names the men who fired the shots that killed them. Governor Robert E. Pattison of Pennsylvania sent about 8,000

state soldiers. By November the strike had failed, and Frick and the company's other managers had broken the steelworkers' union at Homestead.

John D. Rockefeller

Who: The founder of Standard Oil, which by 1880 controlled about 90 percent of oil refining in the United States.

When and where: Cleveland, Ohio, from 1870. He lived from 1839 to 1937.

Movie: The Rockefellers (American Experience, 2000), a documentary shown on PBS about four generations of his family, not about him alone.

Lamp oil dropped from about 26 cents a gallon to 7 cents.

John D. Rockefeller built the company that controlled most of America's oil refining, the work of turning crude oil from the ground into fuels people can use. He founded the Standard Oil Company in Cleveland in 1870, and by 1880 his company controlled about 90 percent of the oil refining in the United States.

Cheap light. Kerosene was the fuel that ordinary families burned in their lamps. A gallon of it cost about 26 cents in 1870, about 9 cents by 1880 and about 7 cents by 1890, so lamp light became cheap for ordinary homes.

Rockefeller became the richest man in the country. Later he gave large sums of money to universities and to medical research.

BY 1900

If you remember one thing: After slavery ended, Southern landowners and state officials used debt and prison leasing to keep many Black workers laboring for little or nothing.

One number: 73. In 1898 nearly 73 of every 100 dollars that Alabama's state government took in came from leasing prisoners, up from about 10 in 1883.

Next: After 1900 Henry Ford roughly doubled his workers' pay, and after the crash of 1929 hungry families stood in breadlines.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 14 MINUTES

Stock prices, the prices of shares in companies, crashed in October 1929, and by 1933 about one of every four workers had no job. In Chicago and Pittsburgh, more than half of Black workers had no job in 1932, by later estimates. In 1935 members of Congress and President Franklin D. Roosevelt set up old-age pensions and unemployment insurance in the Social Security Act. The pensions were regular payments to people too old to work, and the insurance paid workers who had lost their jobs.

Farm and household workers. The law did not include farmworkers and domestic workers, people who cleaned, cooked and cared for children in other people's homes. Most Black workers did those two jobs, so most of them could get neither payment. Two accounts disagree about who left these workers out. One points to Southern members of Congress, and the other to the Treasury Secretary, who asked for the change for reasons that had to do with collecting the tax.

War work. Unemployment fell to 1.2 percent in 1944, when factories were making goods for the Second World War.

Henry Ford

Who: The carmaker who roughly doubled his workers' pay in 1914 and cut the price of his Model T car from 825 dollars to 260 dollars.

When and where: Ford's Highland Park car factory. He announced the five-dollar day on January 5, 1914.

Movie: Henry Ford (American Experience, 2013), a documentary about him shown on PBS.

Ford's managers hired almost four new workers a year for every job.

Henry Ford roughly doubled his workers' pay in 1914. He did it to stop workers from quitting, and workers who earned more could also buy the cars they built.

Why they quit. Ford's managers put in an assembly line, which moves each car past a row of workers who each do one step over and over. After that the work never let up and was dull. Turnover, the count of workers who quit and had to be replaced, reached 370 percent at the Highland Park factory in 1913.

The five-dollar day. Ford announced five dollars for an eight-hour day on January 5, 1914, and the new rate began on January 12. Before, a Ford worker earned about 2.34 dollars for a nine-hour day.

The raise came with conditions. Ford paid the extra money as profit-sharing, a share of the company's profits, and a worker qualified only after six months. Staff of the company's Sociological Department inspected workers' homes before granting the full rate. They checked whether workers saved their money and whether they drank alcohol, and they checked for what they called "proper" living. Ford left out men under 22, and at first most women.

After the raise, fewer workers quit. The price of the Model T kept falling, from 825 dollars in 1908 to 260 dollars by 1925.

> Ford fought unions, the groups workers form to bargain with their employer, for decades. He owned a newspaper, the *Dearborn Independent*, and through the 1920s he published antisemitic articles in it, articles hateful toward Jewish people. Ford later apologized in public for the articles.

The crash and the Great Depression

The Dow Jones average is a number built from the stock prices of a group of large companies. It climbed through most of the 1920s and reached 381 on September 3, 1929. Prices fell hard on Black Thursday, October 24, 1929, and again on Black Tuesday, October 29. By July 8, 1932, the Dow stood at 41, about 89 percent below its peak.

The hard times of the 1930s are called the Great Depression. By 1933 about 25 percent of workers, one in four, had no job, and about 9,000 of the country's 25,000 banks had failed and closed. Government officials and scholars made the jobless estimate later, because nobody counted the jobless every month at the time.

Output and prices. GDP, the total value of all the goods and services made in the country in a year, fell from about 104 billion dollars in 1929 to about 56 billion dollars in 1933. Part of that drop came only from lower prices: from October 1929 to April 1933, the prices of the things people bought every day fell by about 27 percent.

Economists take the change in prices out of GDP to see how much less the country actually made. Counted that way, as real GDP, output fell by about 30 percent.

Hungry people stood in breadlines, lines for free food. Some lived in shantytowns, groups of shacks, which people called Hoovervilles.

The Bonus Army

Veterans of the First World War camped in Washington, D.C., in the summer of 1932 to ask for a bonus they were owed for their war service. The bonus was not due until 1945, and the veterans asked to be paid early in cash. Estimates of their number run from about 10,000 to more than 20,000, and many had their families with them. Members of the Senate voted the payment down on June 17.

The shooting. Police trying to clear veterans out of some buildings in the city on July 28 shot and killed two veterans, William Hushka and Eric Carlson. Hushka had come from Lithuania. He sold his butcher shop to join the army in the First World War and became a citizen while he served. He was buried at Arlington National Cemetery less than a week after he was shot.

The Army. President Hoover then ordered the Army to clear the camps. General Douglas MacArthur sent in infantry, soldiers on foot, and cavalry, soldiers on horseback, with tanks and tear gas. The gas stings the eyes, nose and throat, so people cough and their eyes stream with tears. MacArthur's soldiers burned the main camp.

Members of Congress later voted to pay the bonus over the veto of President Franklin D. Roosevelt, who had refused to sign the bill. The payments began in June 1936.

Benjamin Roth

Who: A lawyer in Youngstown, Ohio, who kept a diary of the Great Depression for more than ten years.

When and where: Youngstown, Ohio. He began the diary in 1931.

People sold their frozen bank savings for 50 cents on the dollar.

Benjamin Roth's diary records the banks that closed in Youngstown, the stocks that became worthless, prices, and what lawyers and workers earned. When the banks closed, people could not get their savings out. Even after the banks reopened, savers could take out only a small part. Roth wrote down how people with cash bought up these frozen bank accounts for 50 cents on the dollar, half of what was in them.

When cash ran out, he wrote, people turned to barter, trading goods instead of paying money, and to scrip, paper that stood in for money.

The umbrella. In 1931 Roth wrote that "banks are absolutely terrible in their insistence on payments of notes and mortgages," meaning that bankers demanded that borrowers pay back their loans. "It is the old story of lending you an umbrella when the sun is shining and then demanding it back when it rains."

His son, Daniel B. Roth, and James Ledbetter edited the diary in 2009, and the publisher PublicAffairs printed it as a book, *The Great Depression: A Diary*.

Last hired, first fired

Black workers lost their jobs first and at higher rates than white workers. Employers hired Black workers last and fired them first, a pattern called "last hired, first fired." By 1932 nearly half of all Black Americans had no work, according to the National Museum of African American History and Culture.

More than half of Black workers in Chicago and Pittsburgh had no job in 1932, History.com reports, drawing on the Library of Congress. About a quarter of white workers in Northern cities had none. In Atlanta in 1934, nearly 70 percent of Black workers had no job. These numbers are all later estimates, because nobody kept an official count by race.

Forced to Mexico. Government officials and private employers forced people whose families came from Mexico to leave for Mexico, starting in 1929. Federal officials and the officials of local welfare agencies blamed Mexican immigrants for taking scarce jobs and for costing public money when they got relief, the aid given to people without work.

California's lawmakers found in 2005 that about 400,000 American citizens and legal residents had been forced to go from California alone. They estimated that about two million people were forced out across the country, and that about 1.2 million of them had been born in the United States. Local officials sold some families' property to pay for sending them away.

The New Deal

The federal government, the national government in Washington, paid no unemployment insurance and no old-age pensions before 1933. Members of Congress set up both in the Social Security Act of 1935. President Roosevelt and his officials started many programs from 1933 on, including the CCC, the WPA and Social Security, and together they are called the New Deal.

Jobs. President Roosevelt set up the Civilian Conservation Corps, or CCC, a federal jobs program for young men, on March 31, 1933. About 3 million young men worked in it over the years it ran. They earned 30 dollars a month and sent about 25 dollars of it home.

The Works Progress Administration, or WPA, ran from 1935 to 1943. About 8.5 million people worked for it. WPA workers built about 650,000 miles of roads, 125,000 public buildings and 75,000 bridges.

The first check. President Roosevelt signed the Social Security Act on August 14, 1935. The first monthly old-age check went to Ida May Fuller of Ludlow, Vermont, on January 31, 1940. It was for 22.54 dollars, and she had paid a total of 24.75 dollars in Social Security taxes.

Frances Perkins

Who: The Secretary of Labor who chaired the committee that planned Social Security, and the first woman in a United States Cabinet.

When and where: Secretary of Labor from 1933 to 1945. She lived from 1880 to 1965.

Movie: Summoned: Frances Perkins and the General Welfare (2020), a documentary about her.

Her committee wrote the plan for Social Security in under seven months.

As chair of the Committee on Economic Security, Frances Perkins led the planning of Social Security. She was Secretary of Labor from 1933 to 1945 and the first woman in a United States Cabinet, the group of the president's top officials.

The committee. President Roosevelt set up the committee on June 29, 1934, and its members planned old-age pensions and unemployment insurance. They sent their report to Roosevelt on January 15, 1935, and he signed the Social Security Act on August 14, 1935.

According to the historian Larry DeWitt, Perkins wanted farmworkers and domestic workers covered by the new law, and so did Harry Hopkins, the official in charge of aid to the jobless.

Who was left out of Social Security

Of every 100 Black workers in 1930, 65 were farmworkers or domestic workers, the two kinds of work the Social Security Act of 1935 did not include. So about two-thirds of Black workers could get neither an old-age pension nor unemployment insurance, and in the South the share was higher. The president of the NAACP, a civil rights group, gave these figures in 2020.

What Houston said. Charles Hamilton Houston spoke for the NAACP at the hearings on the bill in 1935. He used the word Negro, the common word for Black people at that time. The bill, he said, would leave out "Negro sharecroppers and Negro cash tenants, who are just about at the bottom of the economic scale." Sharecroppers paid for the land they farmed with part of the crop, and cash tenants paid in money.

Houston called the law "a sieve with the holes just big enough for the majority of Negroes to fall through," comparing it to a strainer full of holes.

Who made the choice. Two accounts disagree about who left these workers out. Jon Dubin, in a 2024 article in a Stanford law journal, points to Southern members of Congress. One of them, Representative Howard Smith of Virginia, argued for keeping Black sharecroppers and domestic workers dependent on their employers.

Dubin also points to Senator Harry Byrd of Virginia, whose words show what Southern members feared from the bill. Byrd opposed a rule that payments be high enough for "decency and health." He said that rule "might serve as an entering wedge," a first step that opens the way to more, "for federal interference with the handling of the Negro question." Byrd did not want federal officials to have a say in how matters touching Black people were handled.

The executive director of Perkins's committee reported that Byrd's position was "supported by nearly all of the southern members of both committees," the two committees in Congress that worked on the bill.

The other account. Larry DeWitt, a historian at the Social Security Administration, gave a different account in 2010. He found that Treasury Secretary Henry Morgenthau asked for the changes to the bill that left these workers out, for reasons that had to do with collecting the tax. DeWitt wrote that charges of racial bias, unfair treatment because of race, in the founding of Social Security did "not hold up under detailed scrutiny," meaning close study.

The changes. Members of Congress changed the law in 1950 to cover farm and domestic workers who worked regularly for one employer, and in 1954 they covered the rest. Representative Smith opposed these changes too. Of eight House members who voted against them, six were Southern Democrats. In the Senate, Byrd opposed them, and so did a senator from Mississippi.

Farm payments and evicted sharecroppers

Federal farm payments in the 1930s went to landowners, and many sharecroppers lost their places on the land. The landowners are also called landlords, or planters.

Paid to grow less. Members of Congress passed the Agricultural Adjustment Act in May 1933. Under it, officials of the Agricultural Adjustment Administration, or AAA, ran a farm program under Agriculture Secretary Henry Wallace, and they paid farmers to grow less. Their aim was to raise farm prices: with less cotton and pork for sale, buyers would have to pay more for them.

That year farmers plowed under about 10 million acres of growing cotton, turning the plants back into the soil. AAA officials bought about 6 million pigs and had them killed.

Who got the checks. Under the AAA's cotton contracts of 1934 and 1935, officials paid landowners to take land out of cotton. Agriculture Secretary Henry Wallace "rented" about three-eighths of the country's cotton land in this way. Sharecroppers got only about 11 percent of the payments.

A landlord could keep the whole check by evicting the sharecroppers, putting them off the land and out of their homes, and hiring day laborers, who were paid by the day. When planters cut their cotton land by 40 or 50 percent, they

cut the number of their tenants, the families who farmed their land, by the same share. More than two-thirds of Black sharecroppers made no profit or went into debt, according to the National Museum of African American History and Culture.

The union. Seven Black men and eleven white men founded the Southern Tenant Farmers' Union in Arkansas in July 1934 to protest the evictions. Planters and the men who worked for them attacked the union.

Lawmen arrested and jailed a white organizer. Four armed white men told Black members they would be lynched, killed by a mob, if they were caught at another union meeting. Many members were beaten and threatened with guns, and the accounts do not name the men who beat them. A mob attacked the home of the union's lawyer. Chapter 15 tells the union's story in full.

The purge. A group of AAA lawyers, led by Jerome Frank, ruled that landlords had to keep the same tenants. AAA administrator Chester Davis had Wallace fire those lawyers in February 1935, a firing called the AAA purge.

The justices of the Supreme Court ruled the Agricultural Adjustment Act unconstitutional, against the Constitution, in 1936. Members of Congress wrote a new version in 1938, and federal officials have paid farmers ever since.

War work ends mass unemployment

Factory workers made war goods during the Second World War, and unemployment fell from 14.6 percent in 1939 and 1940 to 1.2 percent in 1944. The figure for 1939 and 1940 was estimated later. The official yearly records begin in 1944, and 1.2 percent is the lowest rate in them.

Workers in American factories built 299,230 military aircraft from January 1940 to August 1945. Real GDP rose about 72 percent from 1940 to 1945. By 1945 the United States made about half of all the manufactured goods in the world.

BY 1950

If you remember one thing: During the Great Depression, members of Congress set up the first national payments for people out of work or too old to work.

In 1929: The federal government paid no unemployment insurance and no old-age pensions.

In 1950: Old-age checks had gone out since 1940, and members of Congress changed the law to cover farm and domestic workers who worked regularly for one employer.

Next: In 1956 a ship carried 58 shipping containers from Port Newark to Houston, and in 1985 three musicians played the first Farm Aid concert to raise money for farm families.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 7 MINUTES

The income of the typical American family roughly doubled between 1947 and 1973, counted with the rise in prices taken out. Families who were poor, in the middle and rich all gained. In the 1970s prices and unemployment rose at the same time, and after June 1979, when factory jobs peaked at 19.6 million, their number fell.

Mills and farms. About 50,000 people in the Mahoning Valley around Youngstown, Ohio, lost jobs in steel and related work within about five years of 1977. The owners of about 300,000 farms could not repay their loans in the 1980s. By the 2000s, more than 80 of every 100 jobs outside farming were in services, in places such as stores, offices, hospitals and schools. The country went 120 months in a row without a downturn from March 1991 to March 2001.

The postwar boom

Pay rose for families at every level of income for about twenty-five years after the Second World War. Between 1947 and 1973 the median family income, the income of the family in the middle, roughly doubled, counted with the rise in prices taken out. Half of all families earned more than the median family, and half earned less. A general rise in prices like that is called inflation, and it means each dollar buys less than before.

The economists Claudia Goldin and Robert Margo studied the gap between high wages and low wages. They found that the gap narrowed sharply in the 1940s and stayed narrow into the 1970s, and they named this the Great Compression, from compress, to squeeze together.

The G.I. Bill. Under the G.I. Bill, veterans of the Second World War could use federal money for school or job training, and federal officials backed their home loans, promising to repay the lender if a borrower could not. By July 1956, when the first version ended, 7.8 million of the 16 million veterans had used its money for education or job training. From 1944 to 1952, officials of the VA, the federal agency for veterans, backed about 2.4 million home loans.

A duty to keep people working. Members of Congress made "maximum employment, production, and purchasing power" (how much people can buy with their money) a stated duty of the federal government in the Employment Act of 1946. Under the same act they created the Council of Economic Advisers, a group of economists who advise the president.

The ideas behind the act came from the British economist John Maynard Keynes, who argued for government spending against slumps, the times when business falls off. Members of Congress took a promise of full employment out of the bill before they passed it.

Shipping boxes. Malcom McLean's ship *Ideal X* carried 58 large shipping boxes, called containers, from Port Newark to Houston on April 26, 1956. By the economist Marc Levinson's calculation, loading loose cargo onto a ship by hand cost about 5.86 dollars a ton in 1956, and loading it in containers cost about 16 cents a ton.

What was stagflation?

Stagflation was the name for a mix of inflation and a stagnant economy, one that is not growing. In the 1970s prices and unemployment rose together, which most economists had thought could not happen.

The oil embargo. Leaders of Arab oil-selling countries stopped the sale of their oil to the United States in October 1973, a ban on trade called an embargo. The price of oil roughly quadrupled in six months. Consumer prices, the prices of the things people buy for daily life, rose about 11 percent in 1974, and unemployment reached 9.0 percent in May 1975.

Inflation passed 13 percent in 1979 and 1980, and in 1980 prices rose 13.5 percent. Unemployment reached 10.8 percent in November and December 1982, the highest rate since the Great Depression.

Factory jobs fall

A shrinking share of American workers had jobs in manufacturing, making goods in factories, after 1950. In 1955, 30.6 of every 100 jobs outside farming were in manufacturing, by 2005 about 11 of every 100 were, and by the 2020s about 8. The number of factory jobs peaked at 19.6 million in June 1979. By the 2000s, more than 80 of every 100 jobs outside farming were in service industries.

Black Monday. The managers of Youngstown Sheet and Tube announced on September 19, 1977, that they would close the company's Campbell Works steel mill in Youngstown, Ohio. About 5,000 workers lost their jobs at once, and the day became known as Black Monday. Within about five years, about 50,000 people in the Mahoning Valley around Youngstown lost jobs in steel and related work. These numbers come from later news reports.

Gerald Dickey

Who: A Youngstown steelworker who proposed that the workers and the town buy their closed mill and reopen it.

When and where: Youngstown, Ohio, 1977 to 1979.

The mill stayed closed after federal officials said no in 1979.

After the Campbell Works closed, Gerald Dickey proposed that the steelworkers and the people of Youngstown buy the mill and reopen it. To buy it, they needed about 100 million dollars in federal loan guarantees, the government's promise to repay the loans if the borrowers could not. From 1976 to 1979 Dickey was the recording secretary, the keeper of the written record of meetings, of Local 1462, a branch of the United Steelworkers union.

The coalition. Church leaders led the Ecumenical Coalition of the Mahoning Valley, a group that brought together people of different churches, and its members took up Dickey's plan.

The answer. Officials in President Carter's government first signaled that they supported the guarantees. In 1979 officials of the Economic Development Administration, a federal agency, turned the guarantees down, and the mill stayed closed. Accounts differ a little on when officials first signaled support, and all of them agree on the refusal and the closing.

Dickey and the coalition spread the idea of workers owning their own workplaces among unions and their members.

The farm crisis of the 1980s

The owners of about 300,000 farms defaulted in the 1980s, which means they could not repay their loans. About 300 farm banks failed.

Borrowing. Farmers sold more crops abroad in the 1970s, planted more of their land and borrowed at low rates of interest, the extra money a borrower pays a lender for a loan. They borrowed against the value of their land.

Higher rates. Then officials of the Federal Reserve, the country's central bank, which sets interest rates for other banks, raised interest rates to bring down inflation, which passed 13 percent in 1979 and 1980. Under their chairman, Paul Volcker, the rate they set for banks passed 20 percent in 1981. Every new loan now cost farmers more than the cheap loans of the 1970s.

The grain embargo. After Soviet troops invaded Afghanistan, President Jimmy Carter stopped many sales of American farm goods to the Soviet Union, the main rival of the United States. With his order of January 4, 1980, he canceled contracts for about 17 million metric tons of wheat, corn and soybeans (a metric ton is about 2,205 pounds). Farmers lost those sales abroad, and exports fell.

With loans costing more and fewer crops sold abroad, the land that farmers had borrowed against lost value. In parts of the Midwest, farmland lost up to 60 percent of its value from 1981 to 1986. Farm debt reached about 215 billion dollars by 1984, double the debt of 1978.

Farm Aid. Willie Nelson, John Mellencamp and Neil Young played the first Farm Aid concert at Memorial Stadium in Champaign, Illinois, on September 22, 1985. About 80,000 people came, and the three musicians raised more than 7 million dollars for farm families.

The 1980s and 1990s

Income tax rates on the highest incomes fell in the 1980s. Under the Economic Recovery Tax Act of 1981, President Reagan's tax cut, the top income-tax rate, the tax on each dollar of income above a high level, fell from 70 percent to 50 percent. Under the Tax Reform Act of 1986, it fell to 28 percent.

Inflation fell from 13.5 percent in 1980 to between 3 and 4 percent by the middle of the 1980s. The national debt, the total that the federal government owes on money it has borrowed, roughly tripled during the 1980s.

The long boom. The country went 120 months in a row without a downturn, from March 1991 to March 2001. A stretch of growth like this is called an expansion, and it was the longest on record until then, according to the National Bureau of Economic Research, the group of economists that dates the country's booms and downturns.

Unemployment fell to 3.9 percent in the fall of 2000. In the government's budget years of 1998 through 2001, federal tax money coming in was more than federal spending, which is called a budget surplus.

The NASDAQ index, a single number built from the stock prices of many companies, among them many technology companies, rose about 600 percent from 1995 to March 2000.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 8 MINUTES

Three recessions have come since 2000, stretches of months when output falls and people lose their jobs. The longest ran from December 2007 to June 2009, after home prices crashed. In that crash lenders foreclosed on homes, taking them because the borrowers could not keep up the loan payments. They foreclosed on Black and Latino families at higher rates than on white families.

Where things stand. The unemployment rate was 4.1 percent in August 2026, and about 86 of every 100 jobs outside farming were in services. From April to June 2026, the richest tenth of households held about 69 of every 100 dollars of household wealth, and the poorer half held about 2.

The dot-com crash

Technology stock prices crashed from 2000 to 2002. The NASDAQ index peaked at 5,048 on March 10, 2000, and by October 2002 it had fallen about 78 percent. The boom and the crash are called the dot-com bubble, after companies that did business on the internet: prices climbed far above what the companies were worth and then fell. A recession followed. It lasted eight months, from March to November 2001.

The crash of 2008

The Great Recession, from December 2007 to June 2009, began with a crash in home prices. Home prices rose for years before the crash, and lenders made home loans, called mortgages, that many borrowers could not repay. Bankers bundled many of these mortgages together into investments and sold the investments as safe. When home prices fell, the investments failed, and some of the biggest financial firms began to fail too.

Lehman Brothers. The financial firm Lehman Brothers failed on September 15, 2008, owing about 619 billion dollars. It was the largest bankruptcy, the court process for a person or company that cannot pay its debts, in the country's history. It was the same firm that the Lehman brothers began in Alabama, trading cotton grown by enslaved people.

The rescue. Members of Congress passed a rescue plan for financial firms in October 2008, the Troubled Asset Relief Program, or TARP, worth up to 700 billion dollars. Treasury officials paid out about 443 billion dollars under it, and the firms that got the money paid most of it back.

Employers cut about 8.7 million jobs in the Great Recession, and unemployment peaked at 10.0 percent in October 2009. Lenders foreclosed on about 3.8 million homes from 2007 to 2010, and they kept taking homes for years after. Counting those later years, estimates for the whole crisis run from 7.7 million to 10 million homes.

Who lost homes and wealth

Black and Latino homeowners lost their homes at higher rates than white homeowners, and they lost more of their wealth. Latino and Hispanic both name Americans whose families came from Spanish-speaking countries, and African American is another name for Black Americans.

The foreclosure counts. The Center for Responsible Lending, a research group that campaigns on lending, studied the people who took out home loans from 2005 to 2008. By 2010, lenders had foreclosed on about 8 percent of the African American borrowers in that group and 8 percent of the Latino borrowers, against 4.5 percent of the non-Hispanic white borrowers. Because there were more white borrowers, white families still lost more than half of all the homes that lenders took.

Countrywide. Lawyers at the Justice Department said that from 2004 to 2008, Countrywide Financial, a mortgage lender, charged at least 200,000 qualified Black and Latino borrowers higher fees and rates or steered them into subprime loans, loans with higher interest rates meant for borrowers that lenders think are more likely to fall behind.

Bank of America had bought Countrywide, and in December 2011 its officers agreed to pay 335 million dollars in a settlement, an agreement to pay money to end a legal case. It was the largest settlement up to that time in a case about lenders treating borrowers unfairly because of their race.

Wells Fargo. The Justice Department's lawyers said Wells Fargo charged Black and Latino borrowers higher rates and fees, and steered some into subprime loans when they qualified for regular ones. The lawyers said at least 34,000 borrowers were treated this way from 2004 to 2009.

Officers of the bank agreed on July 12, 2012, to pay at least 175 million dollars. Of that, 125 million dollars went to borrowers, and 50 million dollars went to help with down payments, the part of a home's price that the buyer pays at the start.

Assistant Attorney General Tom Perez said that a Black borrower in the Chicago area with one kind of Wells Fargo loan paid on average 2,937 dollars more than a similar white borrower. Wells Fargo's officers denied that the bank discriminated, treating people unfairly because of their race, and said they settled to avoid a fight in court.

What families lost. Researchers at the Pew Research Center reported in 2011 on wealth, or net worth, what a household owns minus what it owes. From 2005 to 2009, with the rise in prices taken out, the wealth of the typical Hispanic household fell 66 percent. For the typical Black household it fell 53 percent, and for the typical white household 16 percent.

The typical white household had 113,149 dollars in wealth in 2009. That was 20 times as much as the typical Black household had, and 18 times as much as the typical Hispanic household had. These were the largest gaps since government officials began collecting the numbers in 1984.

About 35 of every 100 Black households and 31 of every 100 Hispanic households owned nothing or owed more than they owned, against 15 of every 100 white households.

Ed Neufeldt

Who: A worker who built cabinets for recreational vehicles in Elkhart, Indiana, lost his job in 2008 and introduced President Obama in 2009.
When and where: Elkhart, Indiana, from 2008 into the middle of the 2010s.

He built RV cabinets for 32 years, then lost his job.

Ed Neufeldt worked at Monaco Coach, a plant in Elkhart, Indiana, until the fall of 2008. The plant built RVs, recreational vehicles that are homes on wheels, and Elkhart was known as the "RV capital of the world." As the RV plants shut, unemployment in Elkhart's county went from about 5 percent to nearly 20 percent in about a year.

The president's visit. Neufeldt introduced President Obama at a town hall meeting in Elkhart on February 9, 2009. Obama was on his first trip to promote the stimulus bill, a plan to spend federal money to bring back jobs.

Reporters from ProPublica, NPR and NBC News followed Neufeldt for years. He worked three low-wage jobs, and later he got a factory job again. NPR reporters visited him again in 2015 and 2016.

The long recovery and the shift to services

The recovery after 2009 was slow at first, with years of high unemployment. It then became the longest expansion in the country's records, which go back to 1854. It lasted 128 months, from June 2009 to February 2020, and the National Bureau of Economic Research announced these dates on June 8, 2020.

Gig work. Researchers at the Pew Research Center found that by August 2021, 16 percent of American adults had earned money at some time through an online gig platform, an app or a website that connects workers with short, one-time jobs.

Where the jobs are. The country had 159.1 million jobs outside farming in August 2026. About 12.6 million of them, about 8 percent, were in manufacturing, and about 137.5 million, about 86 percent, were in services, counting government jobs. The Bureau of Labor Statistics, the government office that counts jobs and prices, gave these numbers. They are early figures, and the bureau's staff can still change them.

2020 and the price rises after

The shortest recession on record lasted two months, from February to April 2020, as the COVID-19 pandemic, a disease that spread around the world, began. Unemployment reached 14.8 percent in April 2020.

The CARES Act. Members of Congress passed the CARES Act, a relief law of about 2 trillion dollars, on March 27, 2020. It was the largest relief law up to that time. GDP fell at a yearly rate of 31.4 percent from April to June 2020, which means output would have fallen that far in a full year at that speed. From July to September, output rose at the fastest rate on record.

Prices jump. Consumer prices rose 9.1 percent in the 12 months to June 2022, according to the Bureau of Labor Statistics, the largest rise since November 1981. By the middle of 2023, prices were rising near 3 percent a year.

Economists disagree about the causes. Some blame breakdowns during the pandemic in supply chains, the chains of factories, ships and trucks that bring goods to stores. Others point to federal relief spending, or to higher energy prices after Russian forces invaded Ukraine.

The economy in 2026

Who holds the wealth. In 2026 the richest tenth of American households held most of the country's wealth, and the poorer half held almost none of it. Economists at the Federal Reserve, the country's central bank, keep the count. Of every 100 dollars of household wealth from April to June 2026, the richest 10 percent of households held about 69 dollars, the next 40 percent held about 29, and the poorer half held about 2.

The same economists also divide the wealth by race. Households they count as white held about 82 of every 100 dollars, Black households about 3, and Hispanic households about 2.

Jobs and prices. The unemployment rate was 4.1 percent in August 2026, about 7.0 million people. It was 6.0 percent for Black workers, 4.8 percent for Hispanic workers, 3.7 percent for white workers and 3.2 percent for Asian workers. Consumer prices rose 3.4 percent in the 12 months to August 2026. As of September 2026, the National Bureau of Economic Research had announced no recession since the two months in 2020.

THE THREE QUESTIONS, ANSWERED

1. **How did slavery make money for people far from any plantation?** Bankers in London, Amsterdam and New York sold bonds backed by mortgages on enslaved people, Northern companies insured their lives, and Boston mill owners spun the cotton that enslaved people grew. Rhode Island merchants sent out ships that carried more than 100,000 Africans into slavery.
2. **What happened to ordinary families when a boom turned into a crash?** Judges jailed debtors in 1819, creditors sold enslaved families apart in 1837, one worker in four had no job by 1933, and lenders took 7.7 million to 10 million homes in the crisis that began in 2007. In the 1930s and after 2007, Black families lost jobs and homes at higher rates than white families.

3. **When did the national government start helping people who lost their jobs?** In the 1930s. Before 1933 the federal government paid no unemployment insurance or old-age pensions, and members of Congress set up both in the Social Security Act of 1935, though farm and domestic workers had to wait until 1950 and 1954.

What changed: People here went from trading by barter, with no money at all, to working for wages, and by 2026 about 86 of every 100 jobs outside farming were in services.

FIVE DATES TO KEEP

1614: John Rolfe sends his first tobacco to London.

1860: Census takers count 3,953,760 enslaved people.

October 29, 1929: Stock prices fall hard on Black Tuesday.

August 14, 1935: President Roosevelt signs the Social Security Act.

September 15, 2008: Lehman Brothers fails.

> NOT KNOWN: Nobody kept a regular count of the jobless in 1837, in 1893 or in the early 1930s, so every figure for them is a later estimate.

Where to go: Lowell National Historical Park, in Lowell, Massachusetts, tells the story of the Lowell mills and the slave-grown cotton they spun.

Next: Chapter 17, Money. It follows coins, paper dollars, banks and the Federal Reserve.

Chapter 17: Money

CHAPTER 17 OF 37 · MONEY · 10 ERAS · ABOUT 70 MINUTES

Most American money since 1690 has been a written promise to pay, and when the people who made the promise could not keep it, the people holding the money took the loss.

Soldiers from Massachusetts came home from a failed attack on Quebec in 1690, and the colony's treasury held too few coins to pay them. In December the colony's lawmakers began voting to pay them in paper. Each bill stated that the treasurer would accept it "in all Public payments" and that it could later be traded for coins. No government in Europe or its colonies had printed paper money before. People took the bills and passed them from hand to hand.

This chapter follows money from the shells and copper traded before 1500 to bitcoin. As you read, watch what stood behind a dollar, from Spanish silver to nothing but the law. Watch, too, who took the loss when a promise to pay was broken: whoever held Continental bills in 1781, savers at the banks that failed from 1837 to 1933, and about 31,000 depositors of the Freedman's Bank who never got any money back. In Louisiana in 1837, enslaved people pledged for loans were sold to pay the debts.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. What has stood behind the dollar, and what stands behind it now?
2. Why did people rush to pull their money out of banks, and who lost when a bank failed?
3. How did enslavers and bankers use enslaved people to raise money?

Five minutes? Read "1930 to 1933: the runs, the holiday and deposit insurance" in 1900 to 1950. The Lydia Lobsiger story follows it.

Can skip: "The ATM", "War bonds", "Payday loans". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 1 MINUTE

Wampum, beads made from shell, later passed as money between colonists and Native traders. Before 1500, though, nobody in this land used money of any kind: there were no coins, paper bills, banks or prices. People got what they needed by barter, trading one thing straight for another, and by gifts, and Chapter 16 tells how they carried shells, copper and obsidian, a volcanic glass, hundreds of miles.

Was wampum money?

Wampum was not money before Europeans came. People used it to keep records, to make agreements between nations, in ceremonies and as gifts.

The white beads came from the shells of whelks, large sea snails. The purple-black beads came from the shells of quahogs, hard-shelled clams of the Atlantic coast. People strung the beads on cords or wove them into belts.

Among the Haudenosaunee, a league of Native nations in what is now New York State, the beads of a belt recorded spoken agreements and histories. People presented the belts at meetings of leaders, called councils, and read them there.

Wampum first passed as money in the 1600s, when colonists and Native traders used it in their dealings with each other.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 3 MINUTES

The American dollar was later based on a Spanish silver coin, and Spanish officials forced Native men to dig the silver for it. The mines lay far to the south, in lands the king of Spain ruled. Workers at Spanish mints, workshops where coins are made, struck the silver into a coin called the piece of eight. Almost none of those coins reached the land that became the United States in the 1500s. This land still had no mint of its own.

The piece of eight

The piece of eight was a silver coin worth 8 of the Spanish money units called reales. In English it was also called the Spanish dollar. Workers at Spanish mints in the Americas made it from silver dug at Potosí, in what is now Bolivia, and at Zacatecas, in Mexico. Silver was found at Potosí in 1545.

Native men of the Andes, the high mountains of South America, did the digging at Potosí. Francisco de Toledo, the viceroy who governed Peru for the king of Spain, began forcing thousands of them to work in the mines in 1573. They worked in turns, under a system called the mita. Toledo took the name and the idea of turns of work from an older system used by the Inca.

Toledo's rules applied to Native men aged 18 to 50 in the highland provinces between Potosí and Cuzco. Each year about one man in seven from those villages had to go to the mines, more than 11,000 men a year.

The men worked in shifts, one week in the mines and then two weeks of rest. Many brought their families and carried most of their own food. They were paid a little, and most of that pay went to the tax they owed the colonial government. The work was dangerous and unhealthy. By sending the men away from their home villages, Toledo broke up life there too.

Across the Andes, disease killed far more Native people than work in the mines did. No reliable count shows how many of the forced workers died from the work at Potosí.

Traders carried the piece of eight from South America to Europe, and across the Pacific Ocean to Asia. Writers on the history of money, among them Alejandra Irigoin and Bridget Millmore, call it the first money used around the whole world.

Almost none of that silver reached this land. Some did reach St. Augustine, the Spanish military post in Florida that Chapter 16 describes. Pedro Menéndez de Avilés had founded it in September 1565 at Seloy, a Timucua village. Its soldiers were paid from Spanish colonial funds, in the coin of a foreign empire.

Later, Thomas Jefferson and members of Congress based the United States dollar on the piece of eight. Until February 21, 1857, Spanish coins were legal tender in the United States: the law said people had to accept them to pay a debt. The piece of eight was divided into eight parts called bits, so two bits made a quarter of a dollar. Americans still call a quarter "two bits."

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 4 MINUTES

English colonists never had enough coins, so they paid each other in goods and then began to make money of their own. Little English coin reached the colonies. Colonists spent what they did get on goods shipped in from overseas, and those coins went back across the ocean. To trade with each other, they paid in tobacco, corn, beaver skins and wampum. Massachusetts leaders opened a mint without England's permission. In 1690 they began printing paper money.

Money made of goods

Colonists called payment in goods "country pay." Colonial lawmakers set how much each kind of goods was worth when it was used to pay a debt. Money of this kind is called commodity money, because the money is a useful thing in itself.

English money was counted in pence, shillings and pounds. Twelve pence made a shilling, and twenty shillings made a pound.

Virginia lawmakers set a value on tobacco so it could be used as money from the 1620s, and in 1642 they made it legal tender. People in Virginia, Maryland and North Carolina paid with tobacco through much of the colonial period. In the northern colonies, beaver pelts and corn passed as money too.

New England colonists used wampum for small payments, though the nations that made it had not used it as money before colonists came. Members of the Massachusetts General Court, the colony's lawmakers, accepted wampum for small sums from 1637, made it legal tender for small debts in 1650 and canceled that law in 1661.

The pine-tree shilling, 1652

Members of the Massachusetts General Court voted in 1652 to set up a mint in Boston. They did not ask anyone in England first. By English law, only the king could make coins. In 1652 England had no king.

Why England had no king. Supporters of the king had fought a civil war against supporters of Parliament, England's lawmakers. Afterward the judges of a court set up by Parliament found King Charles I guilty of making war on Parliament and on the people of England. Their sentence called him a "traitor" and a "murderer." Fifty-nine of the judges, Oliver Cromwell among them, signed the order for his death. On that order the king was beheaded in London on January 30, 1649.

Workers at the Boston mint struck silver coins worth threepence, sixpence and a shilling. One was the pine-tree shilling, named for the tree stamped on it. They struck pine-tree shillings from about 1667 to 1682, but nearly all of the colony's silver coins carry the date 1652.

A date as a cover. Coin experts who write in the magazine CoinWeek and in older books on early American coins explain the 1652 date this way. Charles II became king of England in 1660. A coin dated 1652 could pass as a leftover from the years without a king. A coin with a later date would show that the men of Massachusetts were still making coins without the king's permission.

The mint closed in 1682. In 1684 officials acting for King Charles II canceled the Massachusetts charter, the legal paper that gave the colony the right to exist and stated what it could do. The illegal mint was one of their complaints against the colony.

John Hull

Who: A Boston silversmith who ran the colony's mint against English law and struck the pine-tree shilling.

When and where: Boston, Massachusetts. Mintmaster from 1652 until the mint closed in 1682. Lived 1624 to 1683.

He kept a share of every batch of coins he struck.

John Hull ran the Massachusetts mint from 1652 until it closed in 1682, without permission from England. He was a blacksmith's son from Market Harborough, England, and came to Boston with his parents in 1635, when he was 11. He trained as a silversmith, a craftsman who makes things out of silver.

Members of the Massachusetts General Court named him mintmaster, the man in charge of the mint, in 1652, when he was 27. His appointment was dated May 27. Robert Sanderson worked with him as his partner. Under his contract he was paid in coins from every batch, and that pay made him one of the richest men in New England. He later became the colony's treasurer, the official in charge of its money.

A story says Hull gave his daughter Hannah her weight in pine-tree shillings as her dowry, the money or goods a bride's family gives when she marries. The story is a legend. The writer Nathaniel Hawthorne retold it in his book *Grandfather's Chair* and added details of his own.

The first government paper money, 1690

The soldiers in the chapter's opening were paid in paper bills called bills of credit, and the first ones, voted from December 1690, totaled 40,000 pounds. The soldiers had come home from a failed attack on the French city of Quebec, in Canada, during King William's War. According to accounts from the time, the unpaid troops were close to mutiny, an uprising against their officers.

These bills were the first paper money printed by any government in Europe or the lands Europeans had settled. China had used paper money centuries earlier.

The paper spreads. By 1714 Massachusetts lawmakers had put out 240,000 pounds in paper money. By 1718 lawmakers in the other New England colonies were printing their own.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 4 MINUTES

Lawmakers in colony after colony printed paper money in the early 1700s, until every colony had its own. The bills held their value only where the lawmakers printed limited amounts.

Benjamin Franklin argued for paper money in Pennsylvania and then printed it. In South Carolina, which had no banks, enslavers borrowed money by pledging land and the people they enslaved. If a loan was not paid back, the lender could take the land or the enslaved people who had been pledged.

Paper that held its value and paper that lost it

Economists at the Federal Reserve Bank of Cleveland, who study how money and trade work, compared the paper money of the colonies. In Pennsylvania, New York and New Jersey, lawmakers printed limited amounts, and the bills held their value. In New England and the Carolinas, lawmakers printed large amounts. Prices counted in paper money rose there, and each bill was worth less silver than before.

South Carolina's paper. Lawmakers there began printing paper money in 1703, when 1.5 South Carolina pounds were worth one English pound. By the late 1720s it took about 7.

In Virginia, people began to pass paper receipts for tobacco as money. Virginia lawmakers set up public warehouses for tobacco, with government inspectors, in the 1720s and 1730s. A planter, a farmer who grew tobacco to sell, brought his tobacco to a warehouse. An inspector checked it, and it stayed in the warehouse. The inspector then wrote a receipt, called a tobacco note, for the inspected tobacco. People passed tobacco notes from hand to hand as money.

Benjamin Franklin

Who: A Pennsylvania printer who argued for paper money, then printed it with leaf patterns that were almost impossible for counterfeiters, people who make fake money, to copy.

When and where: Pennsylvania, from 1729.

Movie: *Benjamin Franklin* (2022), a documentary by Ken Burns, shown on PBS. It is about his whole life, not only his work on money.

He printed the veins of real leaves on paper money.

Benjamin Franklin printed paper money for three colonies and made it hard to fake. In 1729, when he was 23, he published a pamphlet, a short printed booklet, arguing that Pennsylvania needed more paper money. Its title was *A Modest Enquiry into the Nature and Necessity of a Paper-Currency*, a modest look at what paper money is and why it is needed.

Partly because of the pamphlet, Franklin won the contract to print Pennsylvania's bills in his shop. His firm printed money for Pennsylvania, New Jersey and Delaware.

To stop counterfeiters, Franklin printed the shapes of real leaves on the bills. Every leaf has its own pattern of veins. A counterfeiter could almost never carve that pattern into a printing plate by hand. The method is called nature printing. Franklin almost certainly worked it out from leaf prints he made with his friend Joseph Breintnall. The printing plates were probably cast in metal from plaster molds of real leaves.

Scientists at the University of Notre Dame looked closely at 600 notes printed by Franklin's firm. In their 2023 study they found the leaf prints, tiny shiny flakes of a mineral called mica in the paper, and colored fibers mixed into it. Printers kept putting leaf prints like Franklin's on colonial money into the Revolution.

Colonial bills carried the words "To Counterfeit is Death." Under colonial laws, judges could sentence a counterfeiter to death.

Paper money lent against land and people

South Carolina's lawmakers lent some of the colony's paper money out on land. In 1712 they set up a public land bank, through which officials lent paper money to people who pledged their land as security, something a borrower promises to hand over if a loan is not paid back.

People also borrowed from one another through private agreements. One kind was a bond, a written promise to pay back a loan. Another was a mortgage, a loan in which the borrower pledges property as security, so the lender can take that property if the borrower does not pay.

A mortgage could be on land, or on movable property, called chattel. In these loan papers, enslavers and lenders listed enslaved people as chattel. So when an enslaver did not pay, the lender could take the people he had pledged.

Nic Butler of the Charleston County Public Library described in 2024 how these loans worked, including loans from slave brokers, dealers in enslaved people. "A slave owner could mortgage their human chattel to a slave broker to secure credit used to purchase more slaves," he wrote. The enslaver pledged the people he enslaved to get a loan and used the loan to buy more people. Then he paid off the debt with what the people's forced work earned.

Hundreds of colonial land mortgages survive in the Charleston County Register of Deeds, the county office that keeps records of land. Thousands of early chattel mortgages survive in the South Carolina Department of Archives and History.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 6 MINUTES

Paper money was one of the colonists' quarrels with Britain, and then it was how they paid for the Revolution. Members of the British Parliament banned new paper money as legal tender in New England in 1751 and in all thirteen colonies in 1764. Colonists added the ban to their complaints against Britain. During the war, members of the Continental Congress paid with paper bills that were nearly worthless by 1781.

After the war, Thomas Jefferson, Alexander Hamilton and members of Congress planned a new money system. Members of Congress chose a dollar divided into tenths and hundredths in 1785, set up a national bank in 1791 and created a mint in 1792.

The Currency Acts

Members of Parliament, Britain's lawmakers, passed the first Currency Act in 1751 because New England's paper money had lost so much of its value. Under the act, Massachusetts Bay, Rhode Island, Connecticut and New Hampshire could no longer print new paper bills as legal tender.

A second Currency Act followed thirteen years later. On April 19, 1764, members of Parliament extended the ban to all thirteen colonies. Colonists were already short of coins. Without new legal-tender paper, they had even less money to pay debts and buy goods. Colonists listed the Currency Acts among their complaints against Britain.

Not worth a Continental

People working for the British side printed fake Continental bills on purpose, so that the real bills would lose their value faster. Continental bills were the paper money that members of the Continental Congress, the men from the thirteen colonies who led the Revolution, printed from June 1775 to pay for the war. In all, they put out $241,552,780 in Continental bills, and Chapter 16 tells how fast the bills lost their value.

Made in New York. Most of the British faking was done in New York City, which the British army held for most of the war. Someone placed an advertisement in the *New York Gazette* of April 14, 1777, asking people going into the other colonies to take fake bills with them.

The general's letter. General Henry Clinton, the British commander, wrote about the plan in January 1780. His letter went to Lord George Germain, the official in London in charge of the American colonies. Stuart Hatfield, writing about the British faking in the *Journal of the American Revolution* in 2015, calls that letter the clearest sign that British leaders approved the plan.

People had stopped using the paper by 1781. In North Carolina it took 210 paper dollars to buy what one silver dollar bought.

Continental bills with about $226 million printed on them ended up worthless. Counted in silver, the loss was about $40 million. Whoever was holding the bills as they lost value lost that money, and most of them were ordinary people. The saying "not worth a Continental" comes from these bills, and by the late 1800s people in Britain were using it too.

Counterfeiting was a hanging crime

Officials in New York hanged Owen Sullivan, whose name was also spelled Syllavan, in 1756 for faking that colony's paper money. Colonial bills were printed with the warning "To Counterfeit is Death," and New York officials carried it out.

Sullivan was born in Ireland in about 1720. As an engraver, he cut designs into metal plates for printing, and as an armorer he had made and repaired weapons for colonial soldiers. He ran gangs of counterfeiters who passed fake colonial bills from New England to New York.

Before that, officials in Rhode Island had punished Sullivan for faking that colony's bills. On October 9, 1752, the *Boston Evening Post* printed a report from Providence, Rhode Island. The report states that he had "lately had both his Ears crop'd, and been branded on both his Cheeks with the Letter C."

Cropping meant cutting off part or all of each ear. Branding meant burning the letter C, for counterfeiter, into the skin of each cheek with a hot iron. The C marked him as a counterfeiter to anyone who saw his face. The report does not name the officials who carried out the punishment.

Sullivan went on counterfeiting. At a session of the Supreme Court for the City and County of New York, he was found guilty of faking and passing New York's bills of credit from 1737. He was hanged on Monday, May 10, 1756. A pamphlet about his life, which says it was "taken from his own mouth," was printed the same year.

Why a dollar has a hundred cents

A dollar has a hundred cents because the men who planned American money chose to count it by tens. In notes he wrote in 1784, Thomas Jefferson proposed the Spanish dollar as the basic unit, divided into tenths and hundredths. The English system of pounds, shillings and pence did not divide by tens.

Members of Congress voted on July 6, 1785, "that the money unit of the United States of America shall be one dollar." They also voted that the coins should "increase in decimal ratio," counting up by tens. With that vote, the United States became the first nation whose coins were fully based on tens.

Under the Coinage Act of April 2, 1792, members of Congress set up the United States Mint in Philadelphia. The Mint's building was the first building the national government put up under the Constitution. The act defined the dollar as the unit of money. Under it, the decimal system of dollars, dimes, cents and mills became law (a mill is one tenth of a cent).

The act listed coins in three metals: gold coins, including a ten-dollar coin called the eagle, silver coins from the dollar down to the half-dime, and copper coins, the cent and the half-cent.

Alexander Hamilton

Who: The first Secretary of the Treasury, who planned the national bank and the United States Mint.

When and where: Secretary of the Treasury, 1789 to 1795. Lived 1757 to 1804.

Movie: *Alexander Hamilton* (2007), a documentary in the PBS series *American Experience*.

Jefferson and Madison said the Constitution did not allow his bank.

Alexander Hamilton planned the national bank and the Mint in reports he wrote for Congress. President George Washington chose him on September 11, 1789, to be the first Secretary of the Treasury, the head of the government department in charge of money.

Hamilton sent Congress his *Report on a National Bank* in December 1790. He proposed a bank that would hold the government's money and put out banknotes, paper money printed by a bank, that people could trust.

Lawmakers in Congress then passed a bill to charter the First Bank of the United States, in Philadelphia, for twenty years. Thomas Jefferson and James Madison argued that the Constitution did not allow Congress to create a bank. In the House, Madison asked whether the power to start a bank was "among the powers" listed for Congress in the Constitution.

President Washington asked Hamilton to answer the objections, so that he would have "the arguments for and against the measure." Then Washington signed the bill, on February 25, 1791. Twenty years later, in 1811, a new charter lost by one vote in each house of Congress.

Hamilton had already sent Congress his *Report on the Establishment of a Mint*, in January 1791. In it he defined the dollar in both silver and gold, with 15 ounces of silver worth 1 ounce of gold. Members of Congress built the Coinage Act of 1792 on his plan and set up the Mint under it.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 11 MINUTES

Americans in these years paid with paper money printed by hundreds of different banks. Some of that paper was lent out against enslaved people, and some against land that had belonged to Native nations.

The country had a national bank twice before 1850, and both banks lost their federal charters, the government papers that allowed them to exist. The First Bank's charter ran out in 1811. President Andrew Jackson vetoed, or refused to sign, a new charter for the Second Bank in 1832, and its federal charter ran out in 1836.

With no national bank and no national paper money from 1836 until 1862, people used gold and silver coins and the notes of state banks. A bank's notes were worth less the farther from that bank a person tried to spend them.

Banknotes lent against enslaved people

Planters in Louisiana, the enslavers who ran large farms, had set up banks by the 1830s that lent out their own paper money against mortgages on enslaved people. In such a loan the enslaver pledged the people he enslaved, and the bank could take them if he did not pay. The paper notes people carried in their pockets in Louisiana had been lent out against enslaved human beings.

At the Consolidated Association of the Planters of Louisiana, an enslaver pledged "slaves and cultivated land" to the bank in a mortgage. He could then borrow up to half of what the bank's officers judged those people and that land to be worth. He received the loan in the bank's own paper notes.

To raise money to lend, the banks put out bonds. Each bond was a paper promise to repay a loan with interest, an extra payment for the use of the money. Louisiana lawmakers backed $2.5 million of the Consolidated Association's bonds, at 5 percent interest, which meant the state promised to pay the bonds if the bank did not.

Baring Brothers, bankers in London, paid the money up front and sold the bonds to investors in Europe. Chapter 16 lists the other Louisiana banks that raised money this way and the firms that sold their bonds.

A typical bond was for $1,000. Edward E. Baptist wrote in 2010 that this was "roughly the price of a field hand," an enslaved man who worked in the fields. An investor in Europe could own a share of a debt backed by thousands of enslaved people without owning any one person.

Before the banks. The merchant Vincent Nolte lent $48,000 to the Louisiana enslaver Alonzo Walsh in 1824. Walsh pledged "from 90 to a 100 head of first rate slaves," using head, the word for counting cattle. The account of the loan gives no names for these people. At New Orleans auction prices they were worth up to $80,000.

The crash. Many enslavers had placed several mortgages on the same person. Then cotton prices fell, from 18 cents a pound in 1834 to under 10 cents by late 1836, and by March 1837 ten large New Orleans cotton firms had failed.

When enslavers could not pay, the people they had mortgaged were sold in forced sales to pay their debts. The accounts of the crash do not name who ran each sale. Buyers spent what little cash they had at the first sales, and then the prices of land and of enslaved people fell sharply.

Chapter 16 tells the rest of the crash. It explains why some enslavers kept the people they held, and it gives a 2005 bank report's count of the enslaved people that two Louisiana banks took as security.

The Bank War

The Bank War was the fight over whether the country should keep a national bank, a bank chartered by the national government to hold the government's money. Members of Congress chartered the Second Bank of the United States in 1816, for twenty years, after the money troubles of the War of 1812. Its main office was in Philadelphia.

Nicholas Biddle became president of the Bank in 1823. Under him the Bank held the government's deposits, the money the government kept in the Bank's care, and moved money across the country. Its officers also collected the notes of state banks and presented them to those banks for payment in gold and silver coins. A state bank had to hold enough coins to pay, so its owners could not print as many notes as they wanted.

Andrew Jackson and his supporters argued that the Bank was a private company with public power, with owners in other countries and no control by voters. They said its officers gave favors to rich people with connections. Biddle and the Bank's defenders argued that with the Bank, the country's money was worth the same everywhere and kept its value. They said that without it, nothing would stop state bankers from printing too much paper.

Henry Clay was running against Jackson for president in 1832. That July, four years before the old charter ran out, Clay led the push for a new one, and members of Congress passed it. Jackson vetoed the charter on July 10, 1832.

The veto. In his veto message Jackson called the Bank "unauthorized by the Constitution" and "dangerous to the liberties of the people." He said it weakened the rights of the states. That fall Jackson beat Clay and won a second term.

The deposits. Jackson ordered the government's money moved out of the Bank in 1833 and into state banks he chose, which his opponents called "pet banks." Two Treasury secretaries would not move the money, and Jackson replaced them. Roger Taney, the third, moved it. Biddle struck back in 1833 and 1834 by cutting the Bank's lending to force a new charter. Borrowing became hard, and Biddle lost supporters.

Members of the Senate censured Jackson on March 28, 1834, voting to blame him officially for what he had done. The Bank's federal charter ran out in 1836, and the Bank, which went on as a Pennsylvania state bank, failed for good in 1841.

Andrew Jackson

Who: The president who vetoed the Second Bank's new charter and moved the government's money out of it.

When and where: The United States. Veto in 1832, removal of the deposits in 1833.

Movie: *Andrew Jackson: Good, Evil and the Presidency* (2007), a two-hour PBS documentary narrated by Martin Sheen. It covers his whole presidency, not only the Bank War.

He sold 68,000 acres for paper notes that turned out worthless.

Andrew Jackson distrusted banks and paper money after he lost money on a land deal. In August 1795, at 28, he sold 68,000 acres of land to David Allison. The accounts of the sale do not say where the land lay or which Native nation had lived on it. Jackson was selling for himself, for John Overton and for others.

Allison paid with promissory notes, written promises to pay money later, and Jackson used the notes to buy supplies for a trading post. In 1797 Allison could not pay his debts, and his notes were worth nothing. The people holding the notes came to Jackson for payment instead. It took him about 15 years to pay his way out.

Allison's creditors, the people he owed, had him put in debtors' prison in Philadelphia, a jail for people who could not pay what they owed. He died there on September 28, 1798.

A 2001 article in *American Heritage* magazine describes what Jackson took from all this. By the end, the article states, he had settled ideas about debt, paper money and speculation, which is buying something only to sell it later at a higher price. "He hated them all."

State banknotes and counterfeit detectors

Each bank that state lawmakers chartered printed its own notes, in its own designs. A note was worth only as much as people trusted the bank that printed it. Far from that bank, people would take its notes only for less than the amount printed on them, and the difference was called a discount.

Store owners checked notes against a printed guide before they took them. The guides were called bank note reporters and counterfeit detectors, and publishers put them out weekly or monthly from about 1826 to 1866. Each issue listed the discount on each bank's notes and described the fake notes going around. Shopkeepers kept them by the cash drawer.

Some banks were called wildcat banks. They were set up under state laws, called free-banking laws, with few rules for opening a bank. The story went that some stood so far out in the woods that only wildcats lived nearby, so nobody could get there to trade the notes for coins.

Economists today, among them Gerald Dwyer and the team of Rolnick and Weber, have found that most free banks were not frauds. The people holding their notes did lose money, but less than the legend says.

Whose land the Michigan banks lent against

Michigan's wildcat bankers lent money in the late 1830s against land in the southeast of the state, around Ann Arbor. Until 1807 that land belonged to the Potawatomi, Ojibwe, Odawa and Wyandot nations.

In the Treaty of Detroit, a written agreement between nations, leaders of those four nations signed the land over to the United States on November 17, 1807. William Hull, the governor of Michigan Territory, signed for the United States. The land included the place that later became Ann Arbor.

How much land, for how much. United States officials paid $57,717.32 for the land, according to a history page of the Ann Arbor District Library, which puts the land's estimated value at $6,400,000. That price was less than 1 dollar for every 100 dollars the land was worth. The library counts the land at about 5.6 million acres, and the treaty page of the Nottawaseppi Huron Band of the Potawatomi counts it at about 8 million.

Alpheus Felch

Who: A Michigan bank commissioner, later the state's governor and a US senator, who wrote down the frauds he found in 1838.

When and where: Michigan, 1838 and 1839. Lived 1804 to 1896.

Under a top layer of coins, the boxes held nails and glass.

Alpheus Felch was one of three officials who inspected Michigan's banks in 1838, and he wrote down the frauds he found. A lawyer in Monroe, Michigan, he had been one of four state lawmakers who voted against Michigan's free-banking law.

Michigan lawmakers passed that law on March 15, 1837. Before it, Michigan had 9 banks. Within months there were 18, and then 40. Three bank commissioners were appointed on December 30, 1837, to inspect them, and Felch served as one of them in 1838.

Felch described the inspections in 1880. Some banks kept "grossly insufficient books," records far too poor to show what the bank held. One bank had nothing of value at all. At another, bankers showed the commissioners boxes of coin. Under a top layer of coins, the boxes were filled with nails and glass.

At three banks in a row, the bankers showed the commissioners the same coins as their own. Local accounts say the bankers sent word ahead of the commissioners' route and carried the coins from bank to bank.

The commissioners could close a bank by court order. They could also hand it to a receiver, an official who takes over a failed bank and pays its debts from what is left. After the commissioners' reports, many banks closed and criminal cases followed in the courts.

Michigan lawmakers suspended the free-banking law in 1838. By September 1839 only 9 banks were left. In 1845 the judges of the Michigan Supreme Court ruled that the law broke Michigan's constitution, the state's basic set of laws.

How much people lost. People holding the notes of Michigan's failed banks lost an estimated 60 percent of the amount printed on them, according to the Ann Arbor District Library. A note printed for 10 dollars ended up worth about 4.

Economists' estimates of the total lost run from about $350,000, for the "perhaps a dozen" true wildcat banks alone, to about $1 million, for all of Michigan's failed free banks. Some of those economists argue that the judges' 1845 ruling against the law itself made many notes worthless.

The Panic of 1837: the runs

Chapter 16 describes what the Panic of 1837 did to jobs and food prices. At the banks, it began with a rush for coins.

In a money panic, fear spreads and many people try to get their money out of banks at once. At a single bank, that rush is called a run: people crowd in to trade the bank's notes or their deposits for coins. A bank keeps only part of its money in coin, so it cannot pay everyone at the same time.

The officers of New York City's banks stopped paying out gold and silver for their notes and deposits on May 10, 1837. Bank officers across the country did the same. This was called suspending specie payments, specie meaning coins of gold and silver. People who lined up at the banks got paper promises or nothing.

KNOWN:	Hundreds of the country's about 850 banks closed in the hard times that lasted to about 1843, about 4 in 10 by the count most often given.
NOT KNOWN:	No surviving record counts the depositors who lost their savings.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 10 MINUTES

Members of Congress gave the country one national paper money during the Civil War. For the rest of the century, Americans argued over what should stand behind it: gold alone, or gold and silver together.

Before the war, more than 10,000 different kinds of banknotes were in use by 1860. Federal officials estimate that from one-third to nearly one-half of that paper money was fake. Members of Congress created the national paper money in 1862 and then taxed state banknotes until bankers stopped printing them.

Greenbacks

The new national paper money was printed with green ink on the back, so people called the notes greenbacks. Members of Congress passed the Legal Tender Act on February 25, 1862, to help pay for the Civil War. Under the act, they approved $150 million in paper money called United States Notes, and later acts raised the total to $450 million.

No gold behind them. Nobody could trade these notes at the Treasury for gold or silver. They were money because members of Congress made them legal tender, which means the law said people had to accept them to pay debts.

Salmon P. Chase, the Treasury Secretary, managed the new paper money. He put his own portrait on the first $1 United States Note, in 1862.

Members of Congress created national banks, which got their charters from the national government, in the National Banking Acts of February 25, 1863, and June 3, 1864. These banks put out national bank notes of one design, backed by government bonds.

The tax. In 1865 members of Congress put a tax of 10 percent on state banknotes. Bankers stopped printing their own notes. The state notes still in use fell from $143 million in 1865 to $4 million by 1867. By then, people everywhere in the country used the same national paper money.

In God We Trust. The words "In God We Trust" first appeared on American coins in these same years. In November 1861 a Pennsylvania minister, the Reverend M. R. Watkinson, wrote to Chase asking that God be named on the coins. His letter survives in Treasury records. Chase told officials at the United States Mint to prepare a motto.

A two-cent coin was the first United States coin to carry the words IN GOD WE TRUST. Members of Congress approved it in the Coinage Act of April 22, 1864. Chapter 29, Religion, tells how the words became the national motto in 1956.

Counterfeiters and the Secret Service

Fake bills made up somewhere between a third and a half of the paper money in use in the 1860s, but nobody made a full count at the time. History pages of the US Marshals Service and the Secret Service give about one-third. A 2025 release from the Department of Homeland Security gives nearly one-half.

Treasury officials formed the Secret Service Division on July 5, 1865, as part of the Treasury Department, to catch counterfeiters. Its first chief was William P. Wood, and Treasury Secretary Hugh McCulloch swore him in.

Guarding presidents was not part of the job at first. On September 6, 1901, Leon F. Czolgosz shot President William McKinley at a public event in Buffalo, New York. McKinley died on September 14. Afterward, members of Congress asked the Secret Service to protect presidents. In 1902 its agents took on full-time protection of the president.

Emanuel Ninger

Who: A sign painter who drew fake money by hand and was caught when his ink ran on a wet bar top.

When and where: New Jersey and Manhattan, 1883 to 1896. Lived 1845 to 1924.

He drew each fake bill by hand, and one took weeks.

Emanuel Ninger drew fake banknotes by hand for thirteen years, until his ink smudged on a wet bar. He was a sign painter, born in Germany, who lived in New Jersey. He drew United States banknotes, mostly $50 and $100 bills, with a pen, a pencil and a brush made of camel's hair.

To make a bill, Ninger laid a real note against glass and traced over it. He used colored inks for the parts printed in color. One bill took him weeks. From 1883 to 1896 he spent his fakes in Manhattan.

Ninger laid one of his bills on a wet saloon bar on March 28, 1896, and the ink smudged. A man working for the bartender followed him and had him arrested. The tellings of the story differ a little on how the arrest happened, but all of them include the smudged ink on the wet bar.

Ninger pleaded guilty in May 1896, and a judge sentenced him to six years in prison. Newspaper writers and experts at the time marveled that each fake had cost him more work than honest sign painting would have paid.

The Freedman's Savings Bank, 1865 to 1874

The Freedman's Savings Bank held the savings of people freed from slavery. It failed in 1874, and about 31,000 of its depositors never got any of their money back.

President Abraham Lincoln signed the bank's charter into law on March 3, 1865. The full name was the Freedman's Savings and Trust Company. By 1871 it had about 37 branches in 17 states and Washington, D.C. Most accounts were small, from about $5 to $50. Depositors put money in and took it out over the years, and all their deposits together added up to more than $57 million.

At first the bank could hold only safe government bonds. In 1870 members of Congress changed its charter to let it make loans on land and buildings, and other loans.

Henry Cooke. Henry D. Cooke sat on the bank's board and also served his family's banking business. The Office of the Comptroller of the Currency, the government office that oversees national banks, published a history of the bank. It states that Cooke used the Freedman's Bank's money and property "to benefit the latter," meaning his family's business.

The headquarters. The bank's headquarters, on Lafayette Square across from the White House, cost more than $200,000 to build and furnish. The Comptroller's history notes that the bank spent that money when it already had problems.

Charles Meigs, an examiner who inspected banks for the Comptroller's office, reported in February 1873 and again in 1874 that the bank was in growing danger of failing. In between, in the Panic of 1873, many of the Freedman's Bank's loans went bad.

Frederick Douglass became the bank's president in March 1874. He put $10,000 of his own money into the bank to restore trust in it. Then he saw that it could not be saved. The bank closed on June 29, 1874.

When the bank closed, it owed about 61,000 depositors nearly $3 million, by the count in the Comptroller's history. Only about half of them ever collected anything.

Who got paid. Between 1875 and 1883 the commissioners who closed out the bank's business made five rounds of payments. Depositors who turned in their passbooks, the small books that recorded their savings, got back 62 cents for every dollar they were owed. About 31,000 depositors never turned in their passbooks and got nothing, and the records do not say why.

The bank's signature books and deposit records from 29 branches survive at the National Archives. They list depositors' names, ages, jobs and family members. Black families today use them to trace their history.

Bank runs of 1873 and 1893

There was no deposit insurance in the 1800s, no promise backed by the government to repay people's savings if their bank failed. Every depositor in a failed bank waited for whatever the receiver, the official who took over the failed bank, could collect from the bank's leftover property.

At least 100 banks failed in the Panic of 1873, in Washington, D.C., Pennsylvania, New York, Virginia, Georgia, Indiana, Illinois and Ohio. On September 20, 1873, the New York Stock Exchange, the market in New York City where people buy and sell shares of companies, closed for ten days. It was the first time it had ever closed.

More than 440 banks suspended in the Panic of 1893, from June to mid-August, by the count of writers for the Federal Reserve's history website. To suspend meant to shut the doors or stop paying out cash, and some of those banks later reopened. Chapter 16 gives the count of banks and businesses that failed.

No surviving record counts how many depositors lost savings in 1873 or 1893, or how much they lost.

Gold against silver

Americans argued over whether gold alone or gold and silver should stand behind the dollar. Farmers and others who owed money were on one side, and bankers on the other.

With the dollar tied to gold, the supply of money grew slowly. Prices fell through most of the years from 1865 to 1896. A farmer's crop brought fewer dollars each year, but his mortgage payment, the money he owed each year on a loan against his farm, stayed the same.

Supporters of "free silver" wanted the government to coin all the silver brought to it, at 16 ounces of silver to 1 ounce of gold. That would have put more money in use and raised prices, which would have made debts easier to pay. Debtors and many people in the states that mined silver wanted silver. Bankers and bondholders, people who had lent money by buying bonds, wanted gold alone.

Members of Congress dropped the standard silver dollar from the list of coins in the Coinage Act of February 12, 1873. After that, in practice, the dollar was tied to gold alone and not to silver, just as miners in the West were digging more and more silver. People on the silver side called the act "the Crime of '73."

Two later laws required the government to buy some silver. The Bland-Allison Act of 1878 required the Treasury to buy $2 million to $4 million of silver each month and coin it into silver dollars. Lawmakers passed it over President Hayes's veto.

Under the Sherman Silver Purchase Act of 1890, the purchases rose to 4.5 million ounces a month. Treasury officials paid for the silver in notes that could be traded for gold. As holders traded the notes in, the Treasury's gold fell, from $190 million in 1890 to about $100 million in 1893. In 1893, during the panic, members of Congress canceled the Sherman Act because President Cleveland insisted on it.

William Jennings Bryan

Who: A 36-year-old former congressman from Nebraska who became the Democratic Party's candidate for president with a speech for silver.
When and where: The Democratic convention in Chicago, July 9, 1896.

"You shall not crucify mankind upon a cross of gold."

William Jennings Bryan became the Democratic Party's candidate for president in 1896 with a speech for silver. On July 9, 1896, at the Democratic convention in Chicago, he gave the last speech in the debate over the party's platform, its list of positions.

He ended the speech with words aimed at the supporters of gold. "You shall not press down upon the brow of labor this crown of thorns," he said. Then he said, "you shall not crucify mankind upon a cross of gold," crucify meaning to put someone to death by nailing them to a cross.

Both pictures come from the Bible's account of the death of Jesus. Bryan was comparing that suffering to the gold standard, a dollar backed by gold alone. Under it prices fell, and farmers and working people found their debts harder to pay each year.

After the speech, the delegates, the party members sent to the convention, chose him as their candidate for president on the fifth round of voting. Republicans wrote support for the gold standard into their platform. Their candidate was William McKinley. Bryan's votes came mostly from the South, the rural Midwest and the Rocky Mountain states. McKinley was strongest in the cities and in the Northeast, the Upper Midwest and the Pacific Coast.

McKinley won the election, with about 51 percent of the votes from the people to Bryan's 47 percent. Gold stayed behind the dollar. Bryan ran against McKinley again in 1900 and lost again.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 11 MINUTES

The Federal Reserve and deposit insurance, the two protections Americans still have for their savings, both began in these fifty years. Members of Congress and two presidents set them up.

The Federal Reserve, a bank for the nation's banks, came in 1913, six years after the Panic of 1907. Deposit insurance, a government promise to pay savers back if their bank fails, became law in 1933 and began on January 1, 1934, after thousands of banks had failed. Lawmakers meant both to stop bank runs, when many people rush to take their money out of a bank at once.

What stood behind the dollar changed too. In the Gold Standard Act of March 14, 1900, members of Congress made gold the only metal behind the dollar, at $20.67 an ounce. After that, silver was no longer a standard in law. In 1933 President Franklin Roosevelt ordered Americans to turn in their gold coins. From 1934 on, a dollar in an American's hand was paper that could not be traded for gold.

The Panic of 1907

Depositors rushed to pull their money out of New York's trust companies in October 1907. A trust company was a kind of bank that took people's deposits and managed their money. The country had no central bank, a bank that holds other banks' cash and lends to them in a crisis, so a private banker, J.P. Morgan, organized the rescue.

The trouble began with a failed attempt to corner the stock of United Copper, buying up so much of it that the buyers could set its price. When the attempt failed, the banks of the men behind it were ruined, and depositors grew afraid of other banks linked to those men.

So many depositors demanded their money from the Knickerbocker Trust Company on October 22, 1907, that its officers stopped paying out money. It was one of the largest trust companies in New York. Depositors then ran on the Trust Company of America and others, standing in lines around the block. Some hired people to hold their place in line. Charles T. Barney, the Knickerbocker's former president, shot himself on November 14, 1907.

J.P. Morgan

Who: A New York banker who ran the rescue in the Panic of 1907 from his own library.

When and where: New York City, October and November 1907.

Locked in his library, the bankers pledged their own $25 million.

J.P. Morgan was 70 years old when he took charge of stopping the Panic of 1907. He worked from his private library at 36th Street and Madison Avenue in New York City.

Under Morgan's rescue, teams of examiners went through the books of the trust companies and decided which ones were sound enough to save. Officials of the Treasury, the government department in charge of its money, deposited $25 million of the government's money with Morgan's group of banks. Morgan also got the presidents of banks and trust companies to promise money to shared rescue funds.

The locked room. Morgan gathered the presidents of the trust companies in his library on the night of November 2 to 3, 1907, and had the doors locked. He kept them in the room until they agreed to put up $25 million of their own, separate from the Treasury's $25 million, to save the weakest trusts. They signed the deal near 5 in the morning.

In the account told by the Morgan Library & Museum and others, Morgan kept the key in his pocket. Memoirs differ on who held the key and on the exact hour, but not on the locked doors. The museum's exhibition on the panic describes the meeting.

People at the time drew a lesson from the panic: the country's money system had depended on one 70-year-old private banker. In the Aldrich-Vreeland Act of 1908, members of Congress created the National Monetary Commission to design a better system.

Jekyll Island and the Federal Reserve, 1913

The Federal Reserve, the central bank of the United States, began with a secret meeting in November 1910. Six men traveled to the Jekyll Island Club, on an island off Georgia, and to keep the trip secret they traveled as a duck-hunting party. They were Senator Nelson Aldrich, his secretary, a Treasury official and three bankers, among them Paul Warburg. On the island they wrote a plan for a central bank.

The men who were there did not admit to the meeting in public until the 1930s. The Federal Reserve's own published history describes the trip. Members of Congress never passed their plan, called the Aldrich Plan. Three years later they used much of its design in the law they did pass.

President Wilson signed the Federal Reserve Act on December 23, 1913. The act provided for twelve Reserve Banks in different parts of the country, run under a board in Washington. The Reserve Banks opened on November 16, 1914.

The Federal Reserve is a bank for banks. It holds their reserves, the money a bank keeps on hand instead of lending it out, and its officers move money between banks. They can lend to a sound bank that is facing a run, so the bank can pay its depositors and stay open.

Black-owned banks, and Greenwood's losses

Black Americans started their own banks in the early 1900s, among them Maggie Lena Walker in Richmond and Jesse Binga in Chicago. Black depositors and business owners later lost money when banks failed and when a white mob burned Tulsa's Black district in 1921.

Maggie Lena Walker opened the St. Luke Penny Savings Bank in Richmond, Virginia, in November 1903, and became its first president. She was the first Black woman to found a bank in the United States. On the first day, people deposited more than $8,000, in amounts from 31 cents to over $100.

During the Great Depression of the 1930s, Walker merged her bank with other Black-owned banks into the Consolidated Bank and Trust Company. That bank lasted into the 2000s as the longest continuously run Black-owned bank in the country. Walker lived from 1864 to 1934.

Jesse Binga opened a private bank in Chicago in 1908, mainly for Black customers, because many bank managers turned them away. In 1921 he opened the Binga State Bank. Binga lived at 5922 South Park Avenue, in a white neighborhood. His home and his offices were bombed at least five times. The records do not say who set the bombs.

Illinois state officials closed the Binga State Bank in 1930, when it could not meet a requirement to hold $400,000 in cash. Accounts date the closing to June or to July 31, 1930. Binga lost his own fortune. Many depositors lost their savings, and the records do not count them.

A jury found Binga guilty in 1933 of embezzlement, taking money a person was trusted to look after. A judge sentenced him to ten years in prison. Governor Dwight H. Green of Illinois pardoned him in 1941, an official act that forgave the crime and ended the punishment.

Greenwood, 1921. A white mob attacked Greenwood, the Black district of Tulsa, Oklahoma, where about 10,000 people lived, on May 31 and June 1, 1921. The mob included men whom the Tulsa police had deputized, or sworn in as temporary officers, and National Guard units took part in the attack. The attackers destroyed more than 1,000 homes and businesses.

Estimates of the number of people killed run from 50 to 300. The count is uncertain because many of the dead were never identified and lie in unmarked graves. Most Black Tulsans lost their homes, and thousands lived in tents through the winter of 1921 to 1922.

No white person went to prison for the murders or the burning. An all-white grand jury, a group of citizens who decide whether to charge people with crimes, blamed Black Tulsans.

Greenwood's residents filed more than $1.8 million in damage claims with the city of Tulsa between June 1921 and June 1922. All but one of the claims were turned down. A 2021 Brookings study of the claims does not name the officials who turned them down. The one claim paid went to a white shop owner, for guns taken from his store.

Officers of the insurance companies refused to pay for the burned property. They called the attack a "riot," and their policies did not cover riot damage. No rebuilding money came from the city, the state or the federal government.

Greenwood's residents rebuilt the district. Members of the National Negro Business League, whose name used the common word of the time for Black people, held their national meeting in Greenwood in 1925. By the 1940s Greenwood had 242 Black-owned businesses.

1930 to 1933: the runs, the holiday and deposit insurance

More than one American bank in three failed from 1930 to 1933, and their depositors lost about $1.34 billion. Federal deposit insurance did not begin until 1934, so the losses fell on the depositors.

The count. Banks had failed at a rate of more than 600 a year even in the 1920s, mostly small banks in farm country. The count grew after 1929. The records of the Federal Deposit Insurance Corporation, or FDIC, the government agency that insures bank deposits, list 9,096 banks that suspended from 1930 to 1933, meaning they closed their doors or stopped paying depositors. The country had about 25,000 banks. By one estimate, about nine million savings accounts had been lost by March 1933.

The Bank of United States in New York City failed on December 11, 1930, the largest bank failure in the country up to then. It had about 400,000 depositors. Many were immigrants who worked in the clothing factories, and small savers in the Bronx and Brooklyn.

A history published by the FDIC in 1998 states that officials of the Federal Reserve, the bank for the nation's banks, "did little to ease the liquidity problems of banks," meaning the banks' lack of cash on hand to pay depositors. Most of the banks that failed in 1930 had not joined the Federal Reserve system, and its officials felt no responsibility for them.

The governor of Michigan closed every bank in the state on February 14, 1933, for eight days. That left 900,000 depositors unable to reach their money. Runs, when many people rush to take their money out of a bank at once, then spread from state to state.

Franklin Roosevelt became president in March 1933. On March 6, two days after he took office, he closed every bank in the country, and this was called the bank holiday. On March 9 members of Congress passed the Emergency Banking Act.

The fireside chat. On the night of Sunday, March 12, Roosevelt gave the first of his radio talks called fireside chats, and about 60 million people listened. He explained in simple terms how banks work, and he said money was safer in a

reopened bank than under the mattress. Banks reopened from March 13 to 15, after federal officials reviewed them. When they opened, people put in more money than they took out.

Deposit insurance. Members of Congress created the Federal Deposit Insurance Corporation in the Banking Act of June 16, 1933. Its insurance began on January 1, 1934, and covered each depositor up to $2,500. In July 1934 the limit rose to $5,000. If an insured bank failed, its depositors would be paid back from the insurance fund, up to the limit. With that promise, depositors no longer had a reason to rush to the bank to get their money out first.

The gold. In the same months, Roosevelt and members of Congress took gold out of Americans' hands. Roosevelt signed Executive Order 6102, a written order from the president, on April 5, 1933. It required Americans to turn in their gold coins, gold bars and gold certificates, paper notes that could be traded for gold, to the government at $20.67 an ounce. Americans could keep small keepsakes and collections.

Members of Congress moved all the gold the country used as money to the Treasury in the Gold Reserve Act of January 30, 1934. They set a new price of $35 an ounce. From then on, Americans could not trade their dollars for gold. Foreign governments still could.

Lydia Lobsiger

Who: The first depositor in the United States to be paid back by federal deposit insurance.

When and where: East Peoria, Illinois, 1934. Her grave record gives her life as 1870 to 1956.

A check for $1,250, dated July 3, 1934.

Lydia Lobsiger received the first federal deposit insurance check ever paid. She was about 64 years old, and the $1,250 was her life savings, by the FDIC's own history.

Her bank was the Fond du Lac State Bank of East Peoria, Illinois, and it failed in the spring of 1934. It was the first bank with FDIC insurance to fail, a few months after the insurance began.

When Lobsiger's bank failed, reporters at newspapers across the country wrote that a depositor with a small account had not lost her savings.

War bonds

About 85 million Americans, roughly half the country, lent money to the government during World War II by buying war bonds. Together they paid in about $185.7 billion.

One kind was the Series E bond. A buyer paid $18.75 for it and got back $25 ten years later. Children bought war stamps for 10 cents or 25 cents each and saved them toward a bond.

Officials of the Treasury and the Office of Education ran a program called Schools at War from 1942 to 1945. Students bought stamps and bonds toward goals set at their schools. About 200,000 schools and 30 million students took part, and they raised more than $2 billion.

Their money paid the price of at least 90,000 jeeps and several thousand airplanes for the armed forces. Eleanor Roosevelt spoke in support of the program on the radio on September 25, 1942.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 9 MINUTES

President Nixon cut the dollar's last tie to gold on August 15, 1971, when he ended the right of foreign governments to trade dollars for gold. Since then no metal has stood behind the dollar. In the same years Americans began to pay with plastic cards and take cash from machines.

Prices rose fast for about seventeen years, from about 1965 to 1982, and a dollar saved in 1965 bought about a third as much in 1982. Paul Volcker, head of the Federal Reserve, stopped that rise in the early 1980s by letting interest rates rise past 20 percent.

Plastic: the charge card and the credit card

The first card that people could use to pay at many different businesses was the Diners Club card, in 1950. Frank McNamara started the company with Ralph Schneider and other partners. The cards were made of cardboard, and at first a couple dozen restaurants in New York took them. The card was first used at Major's Cabin Grill in February 1950.

The Diners Club card was a charge card: the holder had to pay the whole bill each month.

The forgotten wallet. A story often told says that McNamara had the idea in 1949 after he forgot his wallet at dinner. Matty Simmons, the company's first publicity man, was there, and he said later that the story was made up for publicity. According to Simmons, McNamara simply had the idea and worked on it.

Officers of Bank of America mailed about 60,000 ready-to-use cards, called BankAmericards, to people in Fresno, California, in September 1958. None of those people had asked for a card. The BankAmericard was a true credit card: the holder could pay part of the bill and owe the rest later.

About 22 percent of the accounts fell behind on payments, against the 4 percent the bank's officers had planned for. There was fraud too, cheating to get money or goods. The bank lost millions of dollars in the card's first years.

Members of Congress banned mailing credit cards to people who had not asked for them in 1970. Officers of Bank of America licensed the card to other banks across the country, and in 1976 it was renamed Visa.

A lender who turned down a woman for credit because she was a woman broke no federal law until 1974. A blog post by the Consumer Financial Protection Bureau, a federal agency, states that "discrimination against women applying for credit was common."

Lenders who made mortgages, or home loans, "often discounted a married woman's income, especially if she was of childbearing age," counting her pay as worth less when they decided whether to lend to her. Lenders were more likely to turn down single women.

The law. Members of Congress passed the Equal Credit Opportunity Act in October 1974. Under the act, it became illegal for lenders to treat people differently because of their sex or whether they were married. In March 1976 members of Congress added race, color, religion, national origin, age, and receiving public assistance, money from a government aid program.

The ATM

The first automated teller machine in the United States, a machine that pays out cash without a bank clerk, opened on September 2, 1969. It stood at a Chemical Bank branch in Rockville Centre, New York. Docutel, a company in Dallas, built the machine, called the Docuteller, from an idea by Don Wetzel. The bank's advertisement stated: "On September 2, our banks will open at 9:00 and never close again."

August 15, 1971: the last tie to gold

Foreign governments could still trade dollars for gold after 1934, at $35 an ounce, though Americans could not. This deal was part of an agreement that the governments of many countries made after World War II, called the Bretton Woods system.

Far more dollars were held outside the country by 1971 than the United States had gold to pay for them. Foreign governments were trading in dollars for American gold, and the country's gold was running down. It was a run on the nation's gold.

President Nixon spent a weekend at Camp David with his advisers. They included Arthur Burns, the chairman of the Federal Reserve, John Connally, the Treasury Secretary, and Paul Volcker, a Treasury official. On Sunday night, August 15, 1971, Nixon announced that Treasury officials would no longer trade gold for the dollars foreign governments turned in. He called the change temporary. No president has reversed it.

Since that night the dollar has been fiat money, money backed by no metal and worth what it can buy. People accept it because the law makes it legal tender and because they trust the government that prints it. The greenbacks of 1862 worked the same way.

The Great Inflation

Prices in the United States rose fast year after year from about 1965 to 1982. Economists call it the Great Inflation, because inflation is the word for prices rising so that each dollar buys less.

Prices had risen only 1 or 2 percent a year in the early 1960s. Food prices rose more than 20 percent over the year to late 1973, and prices overall rose about 11 percent in 1974.

WIN buttons. President Ford started a campaign called "Whip Inflation Now" in 1974, with buttons printed with the word WIN. Prices went on rising. At the peak, in 1979 and 1980, they rose more than 1 percent a month, and for all of 1980 they rose 13.5 percent.

A dollar saved in 1965 bought about a third as much in 1982, so savings put aside in 1965 had lost about two-thirds of their buying power. Borrowing became costly. In October 1981 the average interest rate on a 30-year home mortgage was 18.63 percent. That is the highest rate ever recorded in the Freddie Mac survey of home loan rates.

Bruce Bent and Henry Brown

Who: Two men who set up the first money market fund, a way for small savers to earn more than the legal limit on bank interest.

When and where: The United States, 1969 to 1973. Bent was born in 1937. Brown lived from 1926 to 2008.

By federal rule, a bank could pay savers no more than 5 percent.

Bruce Bent and Henry Brown set up a fund that let ordinary savers earn the higher interest that only large investors could get before.

Federal Reserve officials put a rule called Regulation Q in place in September 1933. It forbade banks to pay more than a set rate of interest on a savings account. In July 1973 they raised the limit on an ordinary savings account from 4.5 percent to 5 percent. Most banks paid exactly the limit. Prices rose about 11 percent in 1974, so money in a savings account at 5 percent lost about 6 percent of its buying power that year.

Large investors could earn more by buying short-term debt from the government and from large companies, such as Treasury bills, short loans to the government. Only large investors could buy that debt directly.

Bent and Brown met while working at TIAA-CREF, a company that manages retirement money. In August 1969 Bent proposed a fund that would pool the money of many small savers and buy that debt for them.

They set up the Reserve Fund in 1970. A saver needed $1,000 to start, and each share cost $100. Sources differ on whether the fund opened to savers in 1971 or 1972.

Bent and Brown had no sales staff, so they phoned financial advisers and handed out brochures. The reporter Robert D. Hershey Jr. wrote an article about the fund in the *New York Times* on January 7, 1973. By the end of that year the fund held $100 million.

Federal Reserve History lists 1 money market fund in 1972, 36 in 1975, 90 in 1980 and 649 in 1990. The limits of Regulation Q were phased out by 1986 under a law members of Congress passed in 1980. The Reserve Fund later grew into the Reserve Primary Fund, which held about $62 billion in 2008.

Paul Volcker

Who: The chairman of the Federal Reserve who brought down the Great Inflation with interest rates above 20 percent, at the cost of a recession with 10.8 percent unemployment.
When and where: Washington, D.C., 1979 to 1983.

Interest rates passed 20 percent, and farmers drove tractors to Washington.

Paul Volcker stopped the Great Inflation by letting interest rates rise past 20 percent. He was six feet seven inches tall and known for smoking cheap cigars. President Jimmy Carter appointed him chairman of the Federal Reserve in August 1979.

Volcker announced a new policy on Saturday night, October 6, 1979. He and the other Federal Reserve officials would control how much money was in the economy. They would let interest rates rise as high as that took them. The federal funds rate, the rate banks charge one another for overnight loans, passed 20 percent in 1981.

In the recession of 1981 and 1982, a time when business shrank and people lost jobs, unemployment reached 10.8 percent, the highest since the 1930s. Farmers drove tractors to the Federal Reserve's building in protest. Home builders in debt mailed sawed-off pieces of two-by-four lumber to the Federal Reserve.

Inflation fell from 13.5 percent in 1980 to 3.2 percent in 1983.

The savings and loan crisis

Federal officials closed 747 failed savings and loans from 1989 to 1995. These were businesses, also called thrifts, that took in people's savings and made long-term home loans at fixed interest rates. Kenneth Robinson, writing for the Federal Reserve's history website, estimates that taxpayers paid as much as $124 billion of the cost.

When interest rates climbed in the late 1970s and early 1980s, the thrifts lost money in two ways. Under Regulation Q, federal officials kept the interest thrifts could pay on savings far below what savers could earn elsewhere, so savers took their money out. And the thrifts' old home loans kept paying the low fixed rates of years before, while the rates the thrifts had to pay to attract savers' money rose sharply.

Riskier loans. In the Garn-St Germain Act of 1982, members of Congress let thrifts make new kinds of loans beyond home mortgages. Many of those loans carried more risk. By 1983 closing the thrifts that could not pay their debts would have cost about $25 billion. Their insurance fund, the Federal Savings and Loan Insurance Corporation, or FSLIC, held only $6 billion.

Members of Congress closed the FSLIC in a 1989 law and moved thrift deposit insurance to the FDIC. They also created the Resolution Trust Corporation to shut down failed thrifts. By the end of 1995 its officials had closed the 747 savings and loans, which together held more than $407 billion in loans and other property. Savers with insured accounts were paid in full.

Banks failed in the same years. In 1984 federal officials rescued Continental Illinois National Bank, which held $45 billion in loans and other property, instead of letting it fail. FDIC records list 748 failed insured banks from 1985 through 1988.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 10 MINUTES

Most Americans pay with cards today, and the runs came back where deposit insurance did not reach. Cards made up 65 percent of payments in 2024, according to the Federal Reserve's yearly payment diary. Cash was used for 14 percent of payments in 2025.

Savers ran from money market funds in 2008, and depositors ran from Silicon Valley Bank and other banks in 2023. Both times, federal officials promised to cover money that no insurance protected. Since 2009 people have also used digital coins such as bitcoin, which no government and no bank puts out.

2008: the run comes back

The run of September 2008 hit money market funds, the kind of fund Bruce Bent and Henry Brown had started. In such a fund, the managers pool many people's money to buy short-term loans to the government and to large companies. Many people treated these funds like bank accounts. A share was meant to stay worth exactly $1. The funds had no deposit insurance.

The large financial firm Lehman Brothers failed on September 15, 2008. The next day the Reserve Primary Fund "broke the buck": its shares fell below $1, to 97 cents. The fund held $62.5 billion, and $785 million of it was in Lehman's debt.

According to a study in the *Journal of Financial Crises*, published by Yale University, investors pulled more than $40 billion out of the fund in two days. On September 17 alone they pulled about $144.5 billion out of money market funds across the country.

Treasury officials announced a guarantee for money market funds on September 19, 2008. President George W. Bush approved it, and Treasury Secretary Henry Paulson put up to $50 billion of the Treasury's Exchange Stabilization Fund behind it. The guarantee worked like deposit insurance, set up within a week, and the run stopped.

Banks failed too. According to a history the FDIC published in 2017, 489 insured banks failed from 2008 through 2013. Their failures cost the deposit insurance fund about $73 billion.

IndyMac failed on July 11, 2008, with losses of about $12 billion, the most costly failure in the FDIC's history. Washington Mutual, which held $307 billion in loans and other property, failed on September 25, 2008, the largest bank failure in the country's history. Members of Congress raised the deposit insurance limit from $100,000 to $250,000 on October 3, 2008, and made it permanent in 2010.

The trial. Officials of the Securities and Exchange Commission later charged Bruce Bent and his son with fraud over the Reserve Primary Fund's collapse. In 2012 a jury cleared both of fraud and found the son careless, which the law calls negligence, on one charge.

Money issued by nobody

Bitcoin is a digital coin that no government and no bank puts out. It runs on a public record of who owns which coins, kept by many computers that check one another's work.

A person or group using the name Satoshi Nakamoto published a paper describing Bitcoin on October 31, 2008. On January 3, 2009, Nakamoto started the system by creating its first block of records.

The code of that first block includes a headline from that day's *Times* of London: "Chancellor on brink of second bailout for banks." The headline was about the British government's top money official, the Chancellor, and a bailout, government money given to businesses in trouble. No one has shown who Nakamoto is.

People hold bitcoin as an investment, hoping its price will rise, and others use it to pay for things. Economists disagree about whether it is money, property owned for its value, or a bet on a price.

Laszlo Hanyecz

Who: A programmer who made the first recorded purchase with bitcoin: two pizzas for 10,000 coins.

When and where: Florida, May 22, 2010.

Two pizzas for 10,000 bitcoins, later worth about $1.1 billion.

Laszlo Hanyecz paid 10,000 bitcoins for two pizzas on May 22, 2010. It was the first recorded time anyone traded bitcoin for a real thing.

Hanyecz was a programmer in Florida who had worked on Bitcoin's code. He wrote the first version of the Bitcoin program for Apple's Mac computers. He was the first to use a computer's graphics card to create new bitcoins, a job called mining.

In May 2010 he posted an offer on the Bitcoin forum, a website where users wrote to one another. He would give 10,000 bitcoins to anyone who got two large pizzas delivered to him. A forum user named jercos took the deal and ordered the pizzas, which cost jercos about $25. At the time of the offer, the 10,000 bitcoins were worth about $41, according to the bitcoin.it wiki.

The same wiki estimates that at the high point of May 2025, those 10,000 coins would have been worth about $1.1 billion. In a 2019 interview, reported by the news site CoinDesk, Hanyecz said, "A trade happens because both parties think they're getting a good deal." May 22 is now marked each year as Bitcoin Pizza Day.

Payday loans

A payday loan is a small loan meant to be paid back from the borrower's next paycheck. Researchers at the Consumer Financial Protection Bureau released a study of these loans on April 24, 2013. They looked at a $350 payday loan with the typical fee of $15 for every $100 borrowed. Its annual percentage rate, the cost over a full year as a share of the amount borrowed, came to 391 percent.

Storefront payday lenders charged fees of $10 to $20 for every $100 borrowed, the study found. Nearly half of payday borrowers took out more than 10 loans in a year, and 14 percent took out 20 or more. The typical borrower was in debt to a payday lender 199 days of the year, more than half of it.

Inflation returns, 2021 to 2026

Prices rose fast again from 2021 to 2023, and Federal Reserve officials raised interest rates faster than at any time since Volcker. Prices rose 9.1 percent in the 12 months to June 2022, according to the Bureau of Labor Statistics, the largest rise since November 1981. Energy prices rose 41.6 percent that year and food prices 10.4 percent.

Federal Reserve officials raised their main interest rate from near zero in March 2022 to more than 5 percent in 2023. By the middle of 2023, prices were rising at close to 3 percent a year.

According to a report by the Congressional Research Service, which does research for members of Congress, economists still disagree about the causes. The causes they name include broken supply chains (the network of factories, ships and trucks that moves goods), federal spending on pandemic relief and higher energy prices.

Prices rose 3.4 percent in the 12 months to August 2026, the Bureau of Labor Statistics reported. Energy prices rose 16.3 percent, and food prices 2.7 percent.

FTX and stablecoins

FTX was a company where people bought, sold and kept cryptocurrency, digital money such as bitcoin. It went bankrupt in November 2022: it could not pay what it owed and went to court to settle its debts. Its founder was Sam Bankman-Fried. According to the *Washington Post*, he had used customers' money to buy luxury real estate, to make investments and to give political donations.

A federal jury found him guilty in November 2023 of wire fraud, cheating people by phone, email or the internet. The jurors also found him guilty of two conspiracies, plans made with other people to commit a crime. One was to commit fraud, and the other was to commit money laundering, hiding where money from a crime came from. Judge Lewis Kaplan sentenced him on March 28, 2024, to 25 years in prison and ordered him to give up more than $11 billion.

The people running the bankruptcy paid customers back what their accounts were worth on the day FTX filed for bankruptcy in November 2022. On that day one bitcoin sold for $16,080. By May 2024 it sold for close to $62,675, according to CBS News. Customers who had held bitcoin did not get back that later value.

Another payment went out to customers on July 31, 2026. An FTX press release in 2026 states that, after it, customer claims had received 105 percent of their value in all, and small claims 120 percent. Payments above 100 percent were interest added to the claims. FTX's chief executive, John Ray, described the plan in 2024 as "100% of bankruptcy claim amounts plus interest."

President Trump signed the GENIUS Act on July 18, 2025. The law contains rules for stablecoins, digital coins whose makers promise to trade each one for a fixed amount, such as one dollar. Under the law, a company that puts out stablecoins must hold at least one dollar of approved reserves, such as cash, insured bank deposits or Treasury bills, for every coin. The law states that stablecoins are not federally insured, according to a 2025 report by the Congressional Research Service.

Like the old state banknotes. In the 1800s, before national paper money, banks chartered by the states printed their own notes. Each note was only that bank's promise to pay in coin. A stablecoin works the same way: a private promise to pay, backed by what the company holds, with no federal insurance behind it.

2023: the run on Silicon Valley Bank

Federal officials protected every depositor at two failed banks in March 2023, including money above the insurance limit. Depositors took $42 billion out of Silicon Valley Bank in California in a single day, March 9, 2023. About 88 percent of the bank's deposits were above the $250,000 insurance limit. If the bank failed, the owners of that money stood to lose it.

Officials of California's Department of Financial Protection and Innovation closed the bank on March 10. On Sunday, March 12, officials of New York's Department of Financial Services closed Signature Bank, where about 90 percent of the deposits were uninsured.

The rescue. Treasury Secretary Janet Yellen, after consulting the president, used an emergency power that same Sunday and protected every depositor at both banks, insured or not. FDIC Chairman Martin Gruenberg told Congress on March 27, 2023, that FDIC officials estimated the cost at about $20 billion for Silicon Valley Bank and $2.5 billion for Signature Bank. They planned to collect that money from other banks through special fees, not from taxpayers.

California officials closed First Republic Bank on May 1, 2023, and JPMorgan Chase took over all its deposits.

Cash fades, and the penny ends

Cash was the third most used way to pay in the United States in 2025, after credit cards and debit cards. Federal Reserve researchers track this with the Diary of Consumer Payment Choice, in which people record the payments they make.

Cash was the most used way to pay in 2016, at about a third of all payments. By 2024 cash was used for 14 percent of payments, credit cards for 35 percent and debit cards for 30 percent. Adults aged 18 to 24 paid by phone 45 percent of the time that year.

People made about 47 payments a month in 2025, according to the diary's report released in May 2026. Cash was 14 percent of them, about 6 a month. It was the sixth year in a row that cash came third.

Who still uses cash. People aged 55 and older paid cash about 10 times a month, against about twice for people aged 18 to 24. In the countryside the count was about 9 a month, and in cities and suburbs about 6. Ninety percent of people said they planned to keep using cash.

Each penny cost the US Mint 3.69 cents to make and ship in the 2024 budget year. The Mint's losses on pennies came to about $85 million that year. On February 9, 2025, President Trump said he had told the Treasury Secretary to stop making new pennies. A PBS and Associated Press report at the time stated that it was unclear whether he had that power, because members of Congress set the rules for coins.

The last pennies. The last pennies made for everyday use were struck at a ceremony at the Philadelphia Mint on November 12, 2025. The first federal cents had been made 232 years earlier, in 1793. The expected savings were about $56 million a year. Pennies already made are still legal tender.

Members of the House of Representatives passed the Common Cents Act on September 14, 2026, and senators passed it on September 28. Under the bill, penny production would end in law. When a customer paid cash and exact

change was not available, the total would round up or down to the nearest five cents. Payments by card or check would not round. As of October 2, 2026, the bill was waiting for President Trump's signature.

THE THREE QUESTIONS, ANSWERED

1. **What has stood behind the dollar, and what stands behind it now?** Silver and gold stood behind it, then gold alone. Since August 15, 1971, only the law and people's trust in the government that prints it have stood behind it.
2. **Why did people rush to pull their money out of banks, and who lost when a bank failed?** A bank keeps only part of its money in cash, so the first in line got paid. Until deposit insurance began in 1934, the rest took the loss, about $1.34 billion from 1930 to 1933.
3. **How did enslavers and bankers use enslaved people to raise money?** Enslavers pledged them for loans, and in the 1830s Louisiana banks lent out their own paper money against them. When the loans went unpaid, the people were sold.

What changed: People here went from living without money to paying with cards, and the dollar went from silver and gold to paper backed only by the law.

FIVE DATES TO KEEP

December 1690: Massachusetts lawmakers vote for paper money.

July 6, 1785: members of Congress vote for a dollar counted in tens.

December 23, 1913: President Wilson signs the Federal Reserve Act.

January 1, 1934: federal deposit insurance begins.

August 15, 1971: President Nixon ends the dollar's last tie to gold.

NOT KNOWN: No surviving record counts the depositors who lost savings when banks failed in 1837, 1873 and 1893.

Where to go: The National Archives keeps the Freedman's Savings Bank's signature books, which list depositors' names, ages and jobs.

Next: Chapter 18, Marketplace and Consumer Life. It asks how Americans bought things, from the peddler at the door to the online store.

Chapter 18: Marketplace and Consumer Life

CHAPTER 18 OF 37 · MARKETPLACE AND CONSUMER LIFE · 10 ERAS · ABOUT 75 MINUTES

Americans have taken goods home and paid later since the 1600s, and new ways of selling, from the peddler's trunk to the online store, kept changing who could buy and what they paid.

In Springfield, Massachusetts, the merchant John Pynchon kept a page in his account book for John Stewart, a Scottish soldier captured in battle in 1650 and "sold for eight years service." On December 29, 1653, Pynchon wrote that Stewart owed him 30 pounds in English money "for releasing him from my Service." Stewart had bought his freedom on credit. For 36 years his page filled with iron, boots, pepper and sugar. He paid in shell beads, blacksmith's work, land and a day of haymaking, almost never in coins.

This chapter describes buying and selling from the trading place on the Columbia River, long before there were shops, to buying online. The peddler at the door, the department store with a price tag on every item, the mail-order catalog, the supermarket, the mall and the credit card come in between. Watch how people paid: in shells and crops, in work, on the shopkeeper's book, a little each month, and at last with plastic. Watch, too, who was turned away and who was sold. Printers ran advertisements offering enslaved people for sale in the same newspapers as everything else, and in the South the people who ran Woolworth's lunch counters served white customers only.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did colonists pay for goods when they had almost no coins?
2. Where were people bought and sold like goods?
3. How much of what Americans buy today is bought online?

Five minutes? Read "The ledger" and the story of John Stewart, in the 1600s.

Can skip: "Barnum's American Museum", "The franchise", "Buying secondhand clothes". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 3 MINUTES

People in this land traded copper, seashells and stone blades across hundreds of miles long before there were any stores. They traded one thing for another, and goods passed from hand to hand. At a few great trading places, people from many nations gathered to fish and to trade.

Where was the biggest market in the Northwest?

The biggest trading place in the Northwest was a ten-mile stretch of the Columbia River. It ran from Celilo Falls down to a place called The Dalles, on the border of what are now Oregon and Washington. People fished and lived there. Archaeologists, scientists who study the past from what people left behind, date the first human use of the site to at least 10,000 years ago. Some newspaper and museum writers give 15,000 years.

Traders came from as far north as what is now British Columbia and as far south as California. Some accounts, cited by the Oregon Historical Society, state that traders came from as far east as the Great Lakes.

Northern traders brought coiled baskets, skins and berries. Traders from the south carried obsidian, a black volcanic glass that makes sharp blades, along with bows and captives, people seized by force and traded away with the other goods. The accounts of the trade do not identify who seized them. From the east came buffalo hides and camas, a root that people dug up and ate. From the coast came whale oil, dentalium shells and wapato, another root people ate.

Dentalium shells. These are the shells of a small sea animal. Each one is shaped like a tiny elephant tusk and can grow a few inches long. Most of them came from the sea off Vancouver Island, and people passed them from hand to hand over a wide area. So many people accepted them that traders used them to measure what other goods were worth.

Horses came later, after 1500. Spanish colonists had brought horses to the Americas. In the early 1700s, Native traders passed horses north to this part of the river.

Much later, in October 1805, two American explorers, Meriwether Lewis and William Clark, reached this stretch of river. President Thomas Jefferson had sent them west to look for a water route to the Pacific Ocean. In his journal, Clark called the place a "mart," an old word for a market: the "Great Mart of all this Country." People had been trading there long before his visit.

Under the lake. The trading place is now under water. Workers for the US Army Corps of Engineers, the part of the army that builds dams and other large works, built The Dalles Dam eight miles downstream. At 10 o'clock on the morning of March 10, 1957, the dam's floodgates were closed.

Four and a half hours later, Celilo Falls lay under the lake behind the dam. The villages of Wyam, on the Oregon side, and S'kin, on the Washington side, went under too. US government officials later paid the Warm Springs, Yakama, Umatilla and Nez Perce nations $26.8 million for the fishing sites they lost.

Goods that traveled without a store

Archaeologists have found copper from Lake Superior, shells from the Gulf of Mexico, obsidian from the West and turquoise from the Southwest hundreds of miles from where each was dug up or gathered. People carried and traded these goods over those distances, one exchange at a time.

Cahokia was a city near what is now St. Louis. It was at its largest from about 1050 to 1150. Around 1100, about 10,000 to 20,000 people lived there. People at Cahokia controlled the trade in hoe blades made from Mill Creek chert, a hard stone that holds a sharp edge. Archaeologists have found those blades more than 400 miles away. People that far from Cahokia got the blades by trading for them.

No trader from before 1500 is known by name.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

Native traders chose which European goods to take, and copper and brass kettles were among the things they wanted most. They traded for them with the crews of European whaling and trading ships off what is now eastern Canada. There were still no stores. Archaeologists can see the traders' choices in the kettles they cut up and made into new things, and in the metal they passed far inland, as far as the Great Lakes.

What Native customers chose

Native buyers in the Northeast and around the Great Lakes traded for copper and brass kettles in the late 1500s. Basque, French and Dutch traders carried the kettles across the ocean because those buyers asked for them. Crews from the Basque Country, a mountain region on the border of Spain and France, crossed the ocean to hunt whales. They traded with the Beothuk of Newfoundland, the Innu of Labrador and the Mi'kmaq.

Many of these kettles were not used for cooking. Archaeologists dig them up cut into flat sheets. Native craftspeople turned the sheets into beads, tubes, arrow points and pendants, which are ornaments that hang from a cord. For a long time, people in these nations had made the same shapes from copper found as pure metal in the ground. Buyers like these used a kettle as a supply of metal.

Pieces of Basque copper kettles from the late 1500s and early 1600s turn up from the Canadian Maritimes, on the Atlantic coast, to the lower Great Lakes. Native traders passed the metal along among themselves, far inland. Basque kettles and axes reached the lands of the Huron and their neighbors in what is now Ontario.

Native traders chose carefully what they took in trade, and they kept doing so as the trade grew. In the fur trade of later years, they were skilled bargainers who asked for useful tools and for fine goods alike, such as iron knives, wool

cloth and glass beads.

Good guns. One fur-trading company, the Hudson's Bay Company, began in 1670. Its Native customers demanded good guns, so the men running the company sent gunsmiths to its trading posts to check the guns and repair them.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 5 MINUTES

Colonial shoppers in the 1600s took their goods home first and paid later, mostly in crops, other goods and work. In Springfield, Massachusetts, John Pynchon wrote down in his account books what each customer owed and let the debts run for months. In the same century, public markets opened in the colonial towns, and colonists built trading posts to trade with Native people.

Market days

A market day was a set day when farmers brought meat, milk, butter, cheese, fruit and vegetables into town to sell. Town people could not travel out to the farms for these foods, so the farmers came to them.

Governor John Winthrop of Massachusetts ordered a market for Boston in 1634. It is the first public market of the European kind recorded by officials in the English colonies. Hartford, in Connecticut, had a market in 1643. New York had one by 1686, and Philadelphia had one in 1693.

Trading posts

A trading post was a building where colonists traded goods with Native people and with other traders. In 1627, the colonists of Plymouth Colony built one at Aptucxet, on the Manomet River on Cape Cod. It was about 20 miles from Plymouth. The post stood on land of the Wampanoag people, who used the place as summer fishing grounds. The name Aptucxet meant "little trap in the river."

At Aptucxet the Plymouth colonists traded with the Wampanoag for corn and beans, and with Dutch traders. That same year, Isaack de Rasieres, the secretary of the Dutch colony, brought wampum, small beads made from shells and strung together, into Plymouth's trade.

The ledger

A colonial shopkeeper kept two books. The first, the journal, listed every sale and every purchase in the order it happened. The second, the ledger, gave each customer a page of their own. The customer's purchases went on the left side of the page and the customer's payments on the right.

Customers bought on credit, taking the goods home and paying for them later. A shopkeeper usually let a customer's debt run for up to a year. Customers paid in crops, in other goods, in work and sometimes in coins.

John Pynchon kept a shop in Springfield, Massachusetts. The town and the shop stood on land on both sides of the Connecticut River that his father, William Pynchon, bought from the Agawam people on July 15, 1636. William Pynchon paid for the land in goods, with no coins: 18 fathoms of wampum, strings of beads six feet long, and 18 coats, 18 hatchets, 18 hoes and 18 knives. The Agawam kept their planted fields and the right to fish, hunt deer and gather nuts there.

Seven of John Pynchon's account books survive, with entries from 1651 to about 1702. Almost every adult in Springfield bought goods at his shop. The editors who printed the books found only a few payments in coins. Books like these record what ordinary colonists bought, item by item.

John Stewart

Who: A Scottish soldier, captured in war and sold into forced labor, who became the blacksmith of Springfield and bought on credit at John Pynchon's shop for more than thirty years.
When and where: Springfield, Massachusetts, 1653 to 1689.

A prisoner of war who owed 30 pounds for his freedom.

Soldiers of Oliver Cromwell's army captured John Stewart, a Scottish soldier, at the Battle of Dunbar, in Scotland, in 1650. The men on the council that ruled England ordered the governor at Newcastle to hand over 150 of the Dunbar prisoners to the agents of two men who had put money into an ironworks in Massachusetts. In his own recorded words, Stewart was "sold for eight years service." He was forced to work for whoever owned his service until the eight years ran out.

Stewart and the other prisoners crossed the ocean on a ship called the *Unity*. He reached New England in December 1650 and worked at the ironworks at Lynn, in Massachusetts. Then the merchant John Pynchon bought his service and took him to Springfield.

Buying his freedom. Pynchon wrote in his account book on December 29, 1653, that Stewart owed him 30 pounds, the main English unit of money, "for releasing him from my Service." While Pynchon waited for the money, Stewart agreed to pay an extra 12 shillings, a smaller unit, each year for three years. He paid that extra in blacksmith's work, "in mending or making of Iron worke."

Stewart became the Springfield blacksmith, and his page in Pynchon's ledger lists what he bought, item by item. For his forge, the fire where a blacksmith heats iron to shape it, he bought 241 pounds of iron by weight in one purchase, then more bars of iron every few weeks, bars of steel and a coal basket. Pynchon charged him for using Pynchon's tools at the shop and for an old bellows, the air pump that blows on a forge fire.

He bought a sword and belt, a grindstone, a pair of boots, wool cloth, silk and buttons, a bushel of apples, soap, a comb, pepper and ginger. Almost none of it was paid in coins. By December 23, 1654, he had paid in two lots of wampum and in smith's work, including work on Pynchon's mill, and neighbors had paid wheat to Pynchon for him. He still owed 13 pounds 6 shillings. Later he paid in land and in a day of haymaking.

The editors of the account books explain that he was fined in 1660 for striking a man named William Morgan and breaking his nose, and in 1662 for playing cards at his house.

Ten years on. By 1664 he was still buying on the book: sugar again and again, salt, gunpowder, scissors, pins, a knife for "the Boy," and iron for the horseshoes of the troopers, soldiers on horseback. On February 20, 1666, he owed 11 pounds 17 shillings and 1 penny.

His wife. By then Stewart was married. The books charge him for church seats for himself and his wife, but they never give her name. His page also records a charge of 1 pound, a fine for the two of them, for "unseasonable night meetings" (meetings at an improper hour of the night).

Pynchon's books list his purchases until 1689. They do not say what became of his wife. Stewart died at Springfield on April 21, 1691. The Scottish Prisoners of War Society, a group that traces the Dunbar prisoners, records that he left "no family, so far as is known."

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 5 MINUTES

Goods made in Britain became cheap enough in the 1700s for colonial families to buy them in large amounts. Shops in the port towns sold these goods, and in Philadelphia Benjamin Franklin made advertisements pay for much of his newspaper. Colonists bought and sold enslaved people in the same towns. In New York, city officials set up a market for those sales, and printers, Franklin among them, ran advertisements offering people for sale.

The consumer revolution

Colonists began buying many of the clothes, tools and kitchen things they had once made for themselves, mostly from Britain. Historians call this big change in buying by consumers, the people who buy goods to use them, the "consumer revolution."

In Britain, makers found better ways to make goods. Merchants got better at shipping goods across the ocean and at selling them on credit. Prices fell. At the same time, colonial families earned more. Goods that only rich families had owned became ordinary.

Families who drank tea bought a whole set of goods to go with it: a teapot, cups, sugar and a table to set them on. Buying goods like these became a sign that a family was respectable.

A market where people were sold

In New York, colonists bought and sold enslaved people at a market created by the men who ran the city, the aldermen of the Common Council. They set it up by law on November 30, 1711, at the bottom end of Wall Street, near Pearl Street and Water Street.

Slaveholders sold enslaved Africans at this market and rented them out to others as workers. They sold and rented out Native people held in slavery there too. Under the law, owners who rented out enslaved people as workers by the day had to do it at this market. Buyers inspected the people for sale there, looking them over before buying. The accounts of the market do not describe how the inspections were done.

The building. The market was a wooden building with a roof and open sides. Slaveholders used it for 51 years, until 1762.

New York had about 5,000 people in 1700, and at least 750 of them, about one person in seven, were enslaved. Jim O'Grady, a reporter for the New York radio station WNYC, wrote in 2015 that thousands of people were sold at the market: men, women, shiploads of children and captured Native people. The accounts of the market do not identify the men who bought and sold people there.

A sign now marks the place. Jumaane Williams, a member of the New York City Council, asked for it in 2015, and in June of that year Mayor Bill de Blasio officially opened it at Wall Street and Water Street.

Newspaper advertising begins to pay

Benjamin Franklin bought a newspaper in Philadelphia, the *Pennsylvania Gazette*, from a printer named Samuel Keimer on October 2, 1729. It had about 90 subscribers, the people who paid to get every copy. Under Franklin, the money that sellers paid to print their advertisements became one of the main ways the paper made money.

Franklin changed the way the advertisements looked. He put more empty space around them and used letters of different sizes. He made the *Gazette* four pages instead of two, partly to make room for more advertisements. By 1748 it had more than 1,500 subscribers, and it was the most widely read newspaper in the colonies.

The partnership. Franklin stepped back from printing in 1748, when he was 42. He made a partnership with a printer named David Hall, who ran the shop while Franklin kept a share of the profits. Much of the money that let Franklin stop working at his trade so early came from the paper's advertising.

Benjamin Franklin

Who: The Philadelphia printer who ran advertisements offering enslaved people for sale in his newspaper, and took the fees.

When and where: Philadelphia, from October 2, 1729.

Movie: *Benjamin Franklin* (2022), a documentary by Ken Burns, shown on PBS. It covers Franklin's whole life.

At least 277 of his paper's advertisements listed enslaved people for sale.

Benjamin Franklin published the *Gazette* for 37 years, counting the years when he was David Hall's partner in the paper. In those 37 years, the *Gazette* contained at least 277 advertisements offering at least 308 enslaved people for sale. Franklin ran these notices and took the fees for them. He also acted as the go-between for the buyers and the sellers.

The runaways. Slaveholders paid Franklin to print notices about enslaved people who had run away from them. He printed notices about runaway servants too: workers bound to a master for a set number of years, who had left before their years were up.

Shops and shopkeepers in the port towns

Shopkeepers in the port towns ordered cloth and other goods from London and sold them. Some sold haberdashery, small sewing goods such as thread, ribbons and buttons. Colonists who bought on credit could end up in debt to a local shopkeeper or to a merchant in London.

Women ran some of these shops. Elizabeth Murray came to Boston from Scotland in 1749, when she was 23. She opened a shop that sold cloth and other goods from Britain. Her brother's business friends helped her get started. She traveled to London to choose the goods for her shop, and she earned enough to support herself. Later she helped other women open shops.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 7 MINUTES

Many colonists refused to buy British goods from 1767 to 1770, as a protest against British taxes. Merchants promised not to bring the goods in, and families made their own cloth instead of buying it. Members of merchants' committees warned the shopkeepers who kept selling British goods. In Boston, Ebenezer Richardson fired from his house during a protest at one of those shops, next door, and killed a boy named Christopher Seider. Away from the ports, a single storekeeper sold a whole farming neighborhood its goods on credit until the next harvest.

The boycott of British goods

Members of Parliament, the lawmakers in London, passed a tax law called the Townshend Revenue Act in 1767. Under it, customs officials collected duties, taxes on goods brought into the colonies from Britain. Colonists who opposed the duties answered with a boycott, refusing to buy British goods as a protest.

The seniors at Harvard College in Massachusetts voted in the autumn of 1767 not to drink tea or wear clothes from Britain at their graduation, as a protest against the Townshend duties. At the next year's graduation, the seniors' theses, a printed sheet of the ideas they were ready to argue for in public at the ceremony, were on paper made in New England.

The agreement. About 60 Boston merchants and traders signed the Boston Non-Importation Agreement on August 1, 1768. They promised not to bring in most British goods from January 1, 1769, to January 1, 1770. Within two weeks, all but 16 of the town's merchants had joined.

The value of British goods brought into Boston fell by about half, from about 420,000 pounds in 1768 to about 208,000 pounds in 1769. In 1770, members of Parliament took back most of the Townshend taxes. The agreement in Boston ended that year.

Spinning instead of buying

Families who did not buy British cloth had to make their own, called homespun. To make it, women first spun wool or flax, a plant whose stems give the threads for linen, into yarn on a spinning wheel. Then the yarn was woven into cloth.

Women in New England held at least 46 spinning meetings between 1768 and 1770, where they spun together in public. In all, 1,644 women took part. Ministers held 30 of the meetings, and 94 out of every 100 spinners came to those 30.

One day in Brookfield. Women in Brookfield, Massachusetts, met at the minister's house from 5 o'clock in the morning one day in August 1769. The young woman who did best on the linen wheel spun 70 knots, measured lengths of yarn. One married woman did her morning work at home and made cheese first. Then she rode more than two miles carrying her wheel, spun from 9 in the morning to 7 at night, and finished 53 knots. After that she went home to do the milking.

Members of a society in Hartford, Connecticut, offered a prize of 12 pounds to whoever made the most yards of woolen cloth in a year. Printers ran newspaper stories about the meetings. Only six of those stories called the spinners "Daughters of Liberty," a name for women on the side of the protest.

Ame and Elizabeth Cuming

Who: Two sisters who kept a shop in Boston, refused to join the boycott and were named in the newspaper and the town record for it.

When and where: Boston, 1765 to 1776, then Halifax, Nova Scotia.

A shipment worth 300 pounds, and a warning of "consequences."

Ame and Elizabeth Cuming kept a shop in Boston and would not stop selling British goods when the town's merchants told them to. The sisters were in their middle thirties and not married, and by 1765 they earned their own living. They sold fashionable goods from London, taught embroidery, sewing pictures and patterns with colored thread, and took in young women who paid to live with them. Elizabeth Murray had helped them start their business.

The warning. A shipment of silk and haberdashery worth 300 pounds reached them from London in late 1769. In the middle of November, men from the merchants' committee came to the shop and warned the sisters of "consequences" if they sold the goods. The sisters refused. They said they had never signed any agreement to stop bringing in goods. They called themselves "two industrious Girls" (two hard-working girls) who were trying "in an honest way" to earn their bread.

A notice in the *Boston Gazette* described them as "enemies to their country" who "preferred their own little private Advantage to the Welfare of America." On March 19, 1770, the men at Boston's town meeting voted to write the sisters' names into the town record. The wording of the vote states that this was so that "POSTERITY" (the people who live later) "may know" they had "opposed their Country."

The sisters left Boston in March 1776 with the Loyalists, the colonists who sided with Britain in the Revolutionary War, and went to Halifax, Nova Scotia. By 1780 they were "more prosperous than ever they were in Boston."

A killing at a shop door, 1770

A Boston man named Ebenezer Richardson shot and killed a boy, Christopher Seider, during a protest at a shop door in February 1770. Theophilus Lillie kept the shop, in Boston's North End, and he went on selling British goods during the boycott.

A carved head on a long pole went up in front of Lillie's shop door on February 22, 1770. According to some accounts, it was a sign that read "Importer." Thomas Hutchinson, the acting governor of Massachusetts, wrote about that day in a letter. Hutchinson was running the colony for the king while the governor was away in England. A crowd of boys and young men gathered and let no one go into the shop.

Richardson lived next door to Lillie and worked as a customs informer. Customs officials collected the taxes on goods brought in by ship, and they paid informers like him to report smugglers. When Richardson tried to pull the pole down, the crowd threw stones and sticks at him, chased him into his house and broke his windows. From inside, he fired a musket at the boys. The shot hit Christopher Seider in the chest, and he died soon after.

Hutchinson wrote that Richardson "killed one & wounded another." The second boy was hit in the thigh. Christopher was 10 and a half years old in Hutchinson's letters, and 11 in most other accounts.

The funeral. Christopher Seider's funeral was on February 26, 1770. Hutchinson wrote that people said the procession, the line of people walking behind the coffin, "reached from the Town House to Liberty Tree," two places in Boston. The modern editors of his letters call it the largest procession ever seen in Boston, as people reported it at the time.

Richardson was tried for murder on April 20, 1770, and the next day the jury found him guilty. The judges believed he was innocent, and they put off his sentence. Richardson stayed in jail for almost two years. On March 10, 1772, the news came that the king had pardoned him, and he went free.

The country store and the crop ledger

Away from the port towns, one country storekeeper sold goods to a whole farming neighborhood. Customers paid in crops, in work and in promises to pay later. The storekeeper wrote each family's debt in a ledger. A farm family bought goods all through the year and paid after the harvest. When a harvest failed, the family could not pay, and the debt carried into the next year.

A shop near the city. Not every store worked this way. Robert Townsend kept a shop in Oyster Bay, on Long Island, close to New York City, and kept account books there and in New York. His surviving books record sales from 1773 to 1785. Staff at the East Hampton Library have copied them out and published them.

One book records sales from April 1, 1773, to November 15, 1779. In 1773 it lists tea at 4 shillings 8 pence a pound, stockings, calico, a cotton cloth, linen cloth, gloves, packs of pins, molasses, a dark sweet syrup, and large barrels of spirits, a strong liquor.

Townsend sold on credit too, and he let a customer's debt run for months, but usually not for more than a year. Unlike the farm families above, most of his customers paid in cash. Library staff counted the payments in his book from 1773 to 1779. In their count, 73 out of every 100 were cash, 22 were farm goods and 5 were notes, written promises to pay. Some customers paid with their work, as a washerwoman, a doctor, a barber or a tailor.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 6 MINUTES

Peddlers carried goods from house to house in the first half of the 1800s, selling to farm families in the country. In the cities, P.T. Barnum sold tickets to his shows with posters and newspaper advertisements, and he lied in them. His first show was an enslaved woman, Joice Heth, whom he advertised as 161 years old. A. T. Stewart opened a store in New York in 1846 with several floors of goods and a set price on each one.

The peddler's trade

A peddler traveled a route through the countryside and sold goods at people's doors. Some went on foot. Others drove a wagon. They carried tinware, clocks, pins, needles, combs, books and patent medicines, bottled remedies sold under a brand name. The best known were the tin peddlers from Connecticut, who sold tinware: pots, pans, cups and other things made of thin sheets of metal coated with tin.

James Guild

Who: A Vermont farm boy who set out to peddle with a trunk of goods and wrote down what happened to him.

When and where: Tunbridge, Vermont, and the roads beyond it, 1818 to 1824.

Three days on the road, and 30 cents' worth of goods sold.

James Guild grew up in Tunbridge, Vermont, bound out from the age of 9 to work on a farm, which meant he had to work for a farmer until he turned 21. His journal does not say who bound him out. He turned 21 on July 9, 1818. He wrote that his "disposition," his nature, "would not allow me to work on a farm."

Guild held a note, a written promise that someone would pay him money. He could not turn the note into cash, so he traded it for "a trunk of goods." The first entry in his journal is headed "Tunbridge Oct, 5th 1818." Tunbridge is a town about thirty miles from Montpelier. He felt ashamed of the work and wondered why he "should stoop so low as to follow so mean a calling" (so low a trade).

At the houses he visited, he asked, in his own spelling, "do you wish to by some harecombs, needles, buttons, buttonmolds, sewing silk." Customers who wanted to buy "would want to banter" (haggle over the price) "until they could get it for nothing."

On the road. At first he sold very little. On the road toward the Dog River, he wrote, "I think I traveled 3 days and selling but 30 cent worth of goods." At poor houses that wanted "a needle or a few pins," he gave them away, and he believed he gave away more than he sold.

He killed a partridge with a stone and traded it for "a dish of bread and milk." A flood had carried off a bridge, so he crossed the river on a log and fell in with his trunk.

Over the next six years, Guild went from peddling to mending pots and pans as a tinker, then to teaching school, then to painting portraits. In the end he went to London. In 1937 an editor at the Vermont Historical Society printed his journal as *From Tunbridge, Vermont, to London, England*.

P.T. Barnum

Who: A showman who sold tickets through advertising, and whose first paid show was an enslaved woman he put on show under a false claim.
When and where: New York City and towns across the Northeast, from 1835.
Movie: *The Circus* (2018), a two-part documentary in the *American Experience* series on PBS. It is about the American circus and tells a large part of Barnum's story.

He advertised an elderly blind woman as 161 years old.

Phineas Taylor Barnum started his career in show business by showing an enslaved woman named Joice Heth to paying crowds. In 1835 a man named R. W. Lindsay of Kentucky signed a contract selling Barnum possession of Heth, the right to hold her and show her for ten months. Heth was Black, elderly and blind. Barnum advertised her as George Washington's nurse and said she was 161 years old. He lied about her age.

On show. For seven months, Barnum and his partner, Levi Lyman, showed Heth to paying crowds in cities and towns across the Northeast. They put her on show in taverns and inns, places where people drank, ate and stayed the night, and in museums, railway houses and concert halls. To bring in the crowds, they used posters and advertisements in the *New York Sun*.

When fewer people came, Barnum wrote a letter to a Boston newspaper without signing his name. In it he claimed that Heth was a machine made of whalebone and old leather, and not a person. People came back to see for themselves.

After her death. Joice Heth died in February 1836. Barnum then sold tickets to a dissection of her body, the cutting open of a dead body to look at its insides. On February 25, 1836, at the City Saloon in New York, 1,500 people paid 50 cents each to watch.

Dr. David L. Rogers, a surgeon, cut open her body while doctors and medical students watched from the crowd. Rogers examined her heart, her lungs, her brain and the places where the bones of her skull join. He decided that she had been no more than 75 years old, or at the most 80.

Barnum called himself the "Prince of Humbug," from humbug, a trick or a false claim made to fool people. He wrote a book called *The Humbugs of the World*, which came out in the middle of the 1860s. In it he wrote that humbug did not include crimes or swindles, tricks to cheat people out of their money.

The Greatest Showman, a musical movie about Barnum, came out in 2017. Its story is mostly made up, and Joice Heth does not appear in it.

Barnum's American Museum

Barnum bought John Scudder's American Museum, at Broadway and Ann Street in New York, in 1841. A day's ticket cost 25 cents.

Barnum showed the Feejee Mermaid there in 1842. His advertisements showed pictures of a beautiful creature, half woman and half fish. The object in the museum was the head and upper body of a monkey sewn to the tail of a fish. Large crowds came to see it in New York for about a month.

The Marble Palace

Alexander Turney Stewart opened a dry goods store, selling cloth, clothing and sewing supplies, at 280 Broadway in New York on September 21, 1846. The building was faced with Tuckahoe marble, and it became known as the Marble Palace.

Stewart sold goods to shoppers on several floors, and that was new. Before, shopkeepers sold to shoppers only on the ground floor and used the upper floors for wholesale, selling goods in bulk to other sellers, or as living space. Stewart set one standard price on his goods, so that customers did not haggle, and he held sales to bring in women customers.

Many writers call the Marble Palace the first American department store, a large store with many kinds of goods, each kind in its own section, called a department. Other writers name Macy's or Wanamaker's as the first, because definitions of a department store differ. The building still stands and is now called the Sun Building.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 13 MINUTES

City shoppers got the department store between 1850 and 1900, and farm families got the mail-order catalog. Store owners such as John Wanamaker made price tags and money-back promises common. Edward Clark, a partner in the Singer sewing machine business, sold the machines across the whole country on monthly payments. Sellers used advertisements to sell medicines that harmed people. In 1859 a slave dealer advertised the largest recorded sale of people in the United States.

Paying a little each month

Edward Clark began selling Singer sewing machines on installments in 1856, letting buyers take a machine home and pay for it in small amounts over time. Isaac Singer's company made the machines, and Clark, a lawyer, was Singer's business partner.

The trade-in. Clark announced in February 1856 that customers could trade in any old sewing machine, even a worthless one, for $50 off a new Singer. In September he began the installment sales. Furniture makers in New York and clock makers in New England already sold goods this way. But no business selling across the whole country had done it before, Peter Lyon wrote in 1958, in a history of Singer's machine for the magazine *American Heritage*.

Paying more. A writer for the magazine *Scientific American* thought buyers would pay twice as much in order to pay a little at a time. He said that a woman "would rather pay $100 for a machine in monthly installments" than pay $50 all at once. A Singer machine that sold for $110 could cost as little as $23 to make.

The department store

Rowland Hussey Macy opened a small dry goods store at Sixth Avenue and 14th Street in New York on October 28, 1858. It grew into Macy's department store. On the first day he took in $11.06, by most accounts. In his first year he took in about $85,000.

John Wanamaker opened a store called the Grand Depot in Philadelphia in 1876. It stood at Thirteenth Street and Market Street, in an old freight station of the Pennsylvania Railroad, a building where trains loaded and unloaded goods.

Wanamaker gets the credit for making three practices common: one price for every customer, a printed price tag on the goods and a promise of money back on anything returned. Before stores like his, customers bargained over prices, as James Guild's customers did when he peddled in Vermont. Wanamaker was not the first to use all three. A. T. Stewart had set fixed prices in 1846, and histories of the Wanamaker stores describe Wanamaker as "one of the first" to use the other two.

With a money-back promise, a customer who bought something poor could return it and get the money back. Montgomery Ward, a mail-order seller, made the same promise to customers who bought goods without seeing them first.

John Wanamaker

Who: The Philadelphia store owner who bought the first full-page newspaper advertisement for an American department store, and who later ran the national mail service.

When and where: Philadelphia, from 1861, and the Grand Depot from 1876.

A whole newspaper page for one advertisement, in 1879.

John Wanamaker bought a whole page of a newspaper in 1879 and filled it with one advertisement. It was the first full-page newspaper advertisement bought by an American department store. His first store, which he opened in Philadelphia in 1861 with his brother-in-law Nathan Brown, sold men's clothes.

Postmaster General. From 1889 to 1893, Wanamaker was the US Postmaster General, the official in charge of the national mail service. He pushed for rural free delivery, a service in which postal workers carried mail to farm families' homes. Later, mail carriers on those rural routes brought catalogs from mail-order companies, his competitors, to the same farms.

People sold at auction: Savannah, 1859

Slave dealers advertised sales of people in the newspapers, the same way sellers advertised goods. Pierce Mease Butler held people in slavery on Georgia plantation land. On March 2 and 3, 1859, he sold between 429 and 436 of them, men, women and children, to pay his gambling debts. The sale took place at the Ten Broeck Race Course, a racetrack near Savannah, Georgia. It was the largest single sale of enslaved people recorded in the United States.

The advertising. Joseph Bryan, a slave dealer in Savannah, ran the sale. He advertised it for weeks in the Savannah newspapers and in papers in seven other Southern cities, from Richmond to New Orleans. The sale brought Butler $303,850. It rained hard on both days.

Mortimer Thomson, a reporter for the *New York Tribune*, went to the sale pretending to be a buyer. He wrote a long account of what he saw, and the *Tribune* printed it under the title "What Became of the Slaves on a Georgia Plantation?"

Sold in families. Butler had ordered that the people be sold in families as far as possible, and Bryan's advertisement promised it. But a couple counted as a family only if they were married. Thomson told of a young man named Jeffrey, 23, who planned to marry a woman named Dorcas. Dorcas was to be sold in a family of four, and no buyer could buy her alone.

The man who bought Jeffrey thought about buying Dorcas too, until he learned that she could not be bought without the rest of her family. Jeffrey begged him, "Please buy Dorcas, mas'r" (master). Another buyer bought her. At this sale, parents were sold away from their children, and couples who planned to marry were sold away from each other. Black Georgians remembered the two days as "the weeping time."

Chain stores and the five-cent store

George Gilman started a business in New York selling tea and coffee in 1859. By most accounts, George Huntington Hartford was his partner from the start.

The A&P. The owners named the business the Great Atlantic and Pacific Tea Company in 1869, to mark the finishing of the first railroad across the country, and people called it the A&P. It grew into a chain store, one of many stores that belong to the same owners and sell the same kinds of goods. The A&P had 70 stores by 1878 and nearly 200 by 1900.

Frank Winfield Woolworth opened a store in Utica, New York, on February 22, 1879. Everything in it cost five cents. The store did well for about two weeks and then failed. On June 21, 1879, he opened another five-cent store in Lancaster, Pennsylvania, and that one succeeded.

Advertising agencies and patent medicines

Francis Wayland Ayer was 21 when he started an advertising agency in Philadelphia in 1869. He planned advertisements for sellers and bought space for them in newspapers and magazines. His father, Nathan Wheeler Ayer, gave him $250, and Francis named the business after him: N. W. Ayer & Son. It is usually called the first advertising agency in the country.

Ayer showed his customers what each newspaper charged for space. That way the sellers knew he was working for them and not for the newspapers.

Lydia E. Pinkham's Vegetable Compound, a patent medicine, went on sale in the middle of the 1870s. Its advertisements stated that it cured almost any "female complaint," meaning a health problem of women. Smithsonian museum records and other histories state that the mixture was 18 to 20 percent alcohol. Its label stated that the alcohol was there to dissolve and preserve the other ingredients.

Pinkham's sons put her picture in the newspaper advertisements. She asked customers to write to her personally, and she used their letters to sell more of the compound.

A syrup for babies. Mrs. Winslow's Soothing Syrup was older. Jeremiah Curtis and his partner, Benjamin A. Perkins, began selling it in 1849, to mothers to give to babies who were teething, growing their first teeth. The syrup held alcohol and morphine, about 65 milligrams of morphine in each ounce. Morphine is a strong painkilling drug. It slows a person's breathing, and too much can kill, especially a child.

One teaspoon of the syrup held enough morphine to kill an average child. The makers advertised it on recipe cards, in newspapers, on calendars and on trade cards, small printed cards given out to customers.

Members of Congress passed a food and drug law in 1906. Under it, makers had to list the drugs in their medicines on the label. Some time after that law, the makers of Mrs. Winslow's syrup took out the morphine and dropped the word "soothing" from its name.

The American Medical Association, the national organization of doctors, printed a book in 1911 called *Nostrums and Quackery*, which means fake cures and the selling of fake medicine. The book listed Mrs. Winslow's syrup under the heading "Baby Killers." No one counted how many children the morphine in the syrup killed.

Mail order reaches the farm

Aaron Montgomery Ward mailed his first catalog, a printed list of goods that customers could order by mail, from Chicago on August 18, 1872. It was one sheet of paper. It listed 163 items, by the Chicago History Museum's count.

Leaders of the Illinois Grange, an organization of farmers, made Ward their buyer late in 1872. His catalog grew to 32 pages in 1874 and to 152 pages in 1876, with about 3,000 items.

Richard Warren Sears began selling watches in 1886, while he was the railroad worker in charge of a station in Minnesota. He moved his watch business to Chicago, where he worked with a watchmaker, Alvah Roebuck. In 1893 their company became Sears, Roebuck and Company, and that year its catalog ran to 196 pages.

Mail to the farm. In 1890 nearly 41 million Americans, about 65 out of every 100, lived in the countryside. Many city people had their mail brought to their homes for free from 1863, but farm families had to pick up their mail at the post office. A Postal Service history describes farmers who had to unhitch the horse from the plow and go five or six miles into town to get it.

Postal workers began bringing mail to farm families' homes in West Virginia on October 1, 1896, on three routes that started from Charles Town, Halltown and Uvilla. This service was called rural free delivery. Within a year, 44 routes were running in 29 states.

Aaron Montgomery Ward

Who: A traveling salesman who worked out that a farm family could buy from a printed list instead of from a country store.

When and where: Chicago, from August 18, 1872.

A newspaper called his company a "swindling firm," then took it back.

Aaron Montgomery Ward built his mail-order business on a complaint he heard from farmers about their country stores. He had worked as a clerk at the Chicago store that later became Marshall Field's, and then as a traveling salesman for a St. Louis company that sold goods in bulk to stores.

On the road, Ward heard the farmers' main complaint. Country general stores charged high prices and had few goods to choose from. The farmers blamed the middlemen, the sellers between the maker and the buyer, for taking too much profit. Ward's plan was to buy straight from the factories, pay cash and sell straight to customers by mail.

The Chicago Fire of 1871 destroyed Ward's savings. In 1872 he started over with $1,600 of his own and $800 from his brother-in-law, George R. Thorne.

"Grangers, Beware!" Editors at the *Chicago Tribune* printed an article with that heading on November 8, 1873. It described Montgomery Ward & Co. as a "swindling firm" that hid behind a post-office box. Ward sued the *Tribune* for libel, printing something false that harms a person's name, and asked for $20,000.

The editors printed a notice taking back the charge on December 24, 1873. In it they called Ward's company "a bona fide firm" (a real one), "composed of respectable persons, and doing a perfectly legitimate business."

Ward promised that customers could send goods back for their money. By 1875 his catalog included the words "satisfaction guaranteed or your money back." When he died in 1913, his company sold $40 million worth of goods a year and had 6,000 workers.

Richard Sears

Who: A railroad station agent who started by selling watches and went on to build the Sears catalog.

When and where: Minnesota in 1886, then Chicago.

Movie: *Mr. Sears' Catalogue* (1989), a documentary in the *American Experience* series on PBS, about Richard Sears and his catalog.

A box of watches a jeweler refused, sold for $14 each.

Richard Sears was 22 when 1886 began. He was the station agent for the Minneapolis and St. Paul Railroad at North Redwood, Minnesota, next to the town of Redwood Falls.

That year a jeweler refused a shipment of watches that came to Sears's station. Sears got permission to sell the watches himself, and he sold them to other station agents along the line for $14 each. Then he quit the railroad and started the R. W. Sears Watch Company in Minneapolis. He moved the business to Chicago, where he hired a watchmaker, Alvah C. Roebuck, to repair watches that customers sent back.

The big book. Sears wrote the words in the catalog himself. At its biggest, the Sears catalog ran to about 1,500 pages and listed about 100,000 items. The documentary *Mr. Sears' Catalogue* states that it went to about 20 million people at its height.

Sears resigned as president of the company in 1908 or 1909. He died on September 28, 1914.

Persis Foster Eames Albee

Who: The first woman to sell door to door for the company that later became Avon.

When and where: Winchester, New Hampshire, and across the Northeast, from 1886.

At 50, she took perfume from door to door.

Persis Foster Eames Albee was 50 years old in 1886 when David McConnell hired her to sell perfume door to door. McConnell had sold books from house to house. He gave away perfume as a free gift with the books, and he found that customers liked the perfume more than the books. He started a perfume company, the California Perfume Company. It later became Avon.

Albee, who lived in Winchester, New Hampshire, became the company's first General Traveling Agent. Her product was the Little Dot Perfume Set, which held five scents: violet, white rose, hyacinth, lily of the valley and heliotrope, a small purple flower. She sold it from house to house in Cheshire County, New Hampshire, and then across the Northeast, and she found other women to sell for the company and trained them.

Most of what is known about Albee comes from Avon's own history of itself.

Selling without a vote. Albee could sell across the Northeast and train other women to sell, but she could not vote. When she started selling, women could vote in only three western territories, lands that were not yet states: Wyoming, Utah and Washington. In 1887, lawmakers in Congress took the vote away from women in Utah, and judges on Washington's highest court struck down that territory's law.

A change called the Nineteenth Amendment became part of the Constitution in 1920, 34 years after Albee started selling. It states that no state and no federal official may keep a citizen from voting because of whether the citizen is a man or a woman.

BY 1900

If you remember one thing: Between 1850 and 1900, shoppers began paying by the month, buying at marked prices and ordering from catalogs, while dealers in the South still sold people like goods.

- 1856: Edward Clark starts selling Singer sewing machines on monthly payments.
- 1859: Pierce Butler sells between 429 and 436 people at a racetrack near Savannah, the largest recorded sale of people in the United States.
- 1872: Montgomery Ward mails his first catalog, one sheet of paper.
- 1876: John Wanamaker opens the Grand Depot in Philadelphia. He gets the credit for making price tags and money-back promises common.

Next: After 1900, one grocery chain grew to about 15,000 stores, and shoppers began taking goods off the shelves themselves.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 14 MINUTES

Chain stores spread across the country, and the biggest grocery chain, the A&P, grew from about 200 stores in 1900 to about 15,000 by 1930. Grocers began letting customers take goods off the shelves themselves, and families bought cars and radios on monthly payments. Sellers began paying radio and television stations to air their advertisements. Coal companies paid miners in their own money, which only the company store accepted at full value. During the Second World War, shoppers needed ration stamps as well as money to buy many foods.

The chain store at full size

The A&P had 1,600 stores by 1915. By 1930 it had about 15,000 stores and sold $2.9 billion worth of goods a year. That made it the world's largest retailer, a business that sells goods to the people who use them. The A&P was the largest grocery seller in the United States from 1915 to 1975.

The lunch counter. Woolworth's stores had lunch counters, where customers sat and ate. In the South, the people who ran these counters served white customers only, and the rule was still in force in 1960. On February 1 of that year, four Black students from North Carolina A&T, a college in Greensboro, North Carolina, sat down at the Woolworth counter there and asked to be served. They were Ezell Blair Jr., Franklin McCain, Joseph McNeil and David Richmond. The counter staff refused to serve them.

Hundreds of people joined their protest over the next six months. On July 25, 1960, the staff of the Greensboro counter began serving Black customers. By the account of Geneva Tisdale, who worked in the store's kitchen, the manager of the lunch counter picked her and two other Black kitchen workers to be the first. He told them to get dressed, walk around the store like customers and then sit at the counter. Tisdale ordered an egg-salad sandwich. Chapter 25, Rights Movements, tells the sit-ins in full.

F. W. Woolworth

Who: The storekeeper who built a national chain of five-cent and ten-cent stores and paid cash for the tallest building in the world.

When and where: Utica and Lancaster, 1879, and New York, 1911 to 1913.

$13.5 million for the world's tallest building, paid in cash.

Frank Winfield Woolworth turned his five-cent stores of 1879 into the largest store company in the world. On November 12, 1911, he signed agreements to join his chain with four rival chains, the Knox, Kirby, Charlton and C. S. Woolworth chains.

The new F. W. Woolworth Company started with 596 stores and $65 million in capital, the money put into a business to run it. The company was formally set up in 1912, so some histories list that year as its start.

The building. The Woolworth Building in New York was finished in 1913. At 792 feet, it was the tallest building in the world at the time. It cost $13.5 million, and Woolworth paid for it himself, in cash.

Who first let shoppers serve themselves?

Clarence Saunders started self-service shopping when he opened the first Piggly Wiggly store at 79 Jefferson Street in Memphis, Tennessee, on September 6, 1916, by most accounts. His customers picked goods off the shelves themselves instead of asking a clerk to fetch them.

The turnstile. Customers came in through a turnstile, a gate with turning arms that lets one person through at a time. Then they had to follow a single fenced path past every shelf in the store before they reached the place where they paid.

Saunders asked the government for a patent, a paper that lets only the inventor use an invention for a number of years. He applied for one on his "Self-Serving Store" on October 21, 1916, and received Patent 1,242,872 on October 9, 1917.

Michael J. Cullen opened King Kullen in Jamaica, in Queens, New York, on August 4, 1930. He had worked for the Kroger grocery company and had sent its managers a plan for a supermarket, which they ignored.

By the account of the Smithsonian, the national museum in Washington, King Kullen was the first supermarket. It met the museum's five tests: separate departments, self-service, low prices, many stores under one name and buying goods in huge amounts. Cullen's slogan, a short phrase repeated in advertising, was "Pile it high. Sell it low."

Clarence Saunders

Who: The Memphis grocer who started self-service shopping and then lost his company fighting traders on Wall Street.

When and where: Memphis, Tennessee, 1916 to 1923, and later stores. He died in 1953.

Orders for 196,000 of the 200,000 shares, and he still lost.

Clarence Saunders built Piggly Wiggly into a chain of 1,268 stores and then lost it in a fight over its stock. By 1923 the stores sold $100 million worth of groceries a year, and Piggly Wiggly was the third-largest grocery business in the country. Saunders had put the company's stock up for sale on the New York Stock Exchange, a market where people buy and sell shares, small pieces of ownership in a company.

Writers on the history of money and business describe the fight this way. In early 1923, some Piggly Wiggly stores in New York that other owners ran under the Piggly Wiggly name failed. Traders then began selling Piggly Wiggly stock short. Selling short is a bet that a stock's price will fall. The trader sells shares he has borrowed, and later he must buy the same number of shares to give back. If the price has fallen by then, he buys them for less than he sold them for.

Saunders fought back. He borrowed about $10 million from bankers in the South, added his own money and kept buying shares. In the end he held orders for 196,000 of the 200,000 shares that existed.

Why he still lost. Many of the shares Saunders bought came from the short sellers, who now had to hand them over. Saunders held almost every share, so if they had to buy from him, he could name the price.

Then the men who ran the Stock Exchange stopped trading in the stock. They gave the short sellers five days to hand over the shares, instead of the usual one day. In those five days, shares poured in from distant places, and the short sellers used them to pay what they owed.

> Saunders still owed the bankers, and a payment of $2.5 million on his loan was due on September 1, 1923. He did not have the money. In August he gave up the company and handed what he owned to the people he owed. He was bankrupt, which means he could not pay his debts.
>
> He started again with a new chain called the "Clarence Saunders, Sole Owner of My Name" stores. They did well until the 1930s, when they failed during the Great Depression, the years of hard times that began in 1929. Later he built the Keedoozle, a grocery store that worked like a vending machine. It never made a profit. Saunders died on October 15, 1953.

The company store

Many coal companies in Appalachia owned the store in their mining towns and paid their miners mostly in scrip, the company's own money, made as metal coins or paper. A miner could draw scrip against pay he had already earned. The company store accepted it at full value, but a miner could not turn it in for cash.

Scrip at other stores. Other merchants nearby took scrip only at a discount of 10 to 30 percent. A miner who spent $1 of scrip at another store got only 70 to 90 cents' worth of goods.

Researchers for the US Coal Commission, a government group that studied the coal industry, checked prices in coal towns in 1922. Food cost 4.2 percent more at company stores than at independent stores in southern West Virginia, and 7 percent more in Alabama. Later, Price Fishback, an economist who studies how money, work and business fit together, looked at these numbers. He found that at most companies a miner's store debt ran no longer than two weeks.

Two views. A page by the West Virginia Mine Wars Museum describes scrip differently. It describes the system as debt bondage, being forced to keep working to pay off a debt. In its words, scrip "created a kind of debt bondage

that kept coal miners and their families tied to their employer for almost everything they needed to survive." Fishback found small price gaps and short debts.

West Virginia lawmakers passed a law in 1891 under which companies could give out scrip only as pay for work already done or as an advance on wages. In 1925 they made it against the law to pass scrip from one person to another. Scrip disappeared when the coal industry collapsed in the 1950s.

The catalog under Jim Crow

Jim Crow is the name for the laws and customs in the South under which white lawmakers and officials kept Black people apart from white people in schools, railroad cars, waiting rooms, courtrooms and cemeteries, and at water fountains. White mobs enforced it with murder. Between 1877 and 1950, white mobs lynched more than 4,400 Black people, killing them without any trial, by the count of the Equal Justice Initiative.

Hyman's argument. Louis Hyman, a historian at Cornell University, argued in 2018 that mail-order catalogs helped Black farm families in the South get around Jim Crow at the store. NPR, the *Washington Post* and America's Black Holocaust Museum reported his argument.

According to Hyman, many Black farm families had to buy on credit at a white-owned country store, often owned by the landlord whose land they farmed. The storekeeper set the prices and made Black customers wait until white customers were served. A catalog order cost the same national price for everyone, and no clerk decided who was served first. Instead of the landlord's credit, the family could use the mail-order company's.

Hyman says that some Southern storekeepers held bonfires to burn catalogs, and told white customers that Sears was owned by Black people to keep them from buying there. These are Hyman's claims.

Buying on time

Americans began buying cars, radios, furniture and household machines on installments in the 1920s, paying a little at a time, as buyers of sewing machines had since the 1850s. By the end of the 1920s, about 60 percent of cars and about 80 percent of radios were bought on installments, according to the reference site Encyclopedia.com. The number of cars registered in the United States grew from about 9 million in 1920 to nearly 27 million by 1929, nearly three times as many.

Members of the National Association of Finance Companies, a group of lending companies, agreed on standard terms for car buyers in 1924. A buyer paid one-third of the price at the start for a new car and two-fifths for a used car. The buyer then had no more than twelve months to pay the rest.

Advertising on radio and television

The first paid radio advertisement went on the air on August 28, 1922, on the station WEAF in New York. The Queensboro Corporation paid $50 for about ten minutes of air time to promote the Hawthorne Court apartments in Jackson Heights, Queens.

No television station could sell advertising until officials of the Federal Communications Commission, the government office that licenses stations, gave licenses to 10 stations on May 2, 1941. Under those licenses, the stations could sell advertising from July 1, 1941. Two years earlier, people at NBC had shown test advertisements for three companies.

Nine dollars for ten seconds. The first commercial under the new licenses ran on WNBT in New York on July 1, 1941, before a Brooklyn Dodgers baseball game against the Philadelphia Phillies. For about ten seconds it showed the face of a Bulova watch over a map of the United States, while a voice said, "America runs on Bulova time." It cost Bulova $9: $4 for the air time and $5 in station charges. There were about 4,000 television sets in the New York area at the time.

Mary Frances Gerety wrote advertisements at N. W. Ayer & Son, the advertising agency. For the diamond company De Beers, she wrote the slogan "A Diamond Is Forever" in the late 1940s. In 1999 the editors of the magazine *Ad Age* named it the most memorable slogan of the 1900s.

Shopping under rationing

Officials of the US government's Office of Price Administration rationed many goods during the Second World War, limiting how much of each one a person could buy. Sugar, meat, cheese, fats, shoes, gasoline and processed foods, foods that were canned, dried or frozen, were among them. At the start, each person could buy 26 pounds of sugar a year, about 8 ounces a week. Every person in the country, babies included, got a ration book full of stamps.

War Ration Book Two came into use on March 1, 1943. Its blue stamps bought processed foods, and its red stamps bought meat, cheese, fats and oils. Each stamp was worth a number of points, such as 8, 5, 2 or 1, and every food had a price in points as well as in money. In a cartoon the US government made to teach the system, a shopper's string beans cost 3 blue points.

Each person got 48 blue points and 64 red points a month, so a family of four had 192 blue points a month for processed food. Every cut of almost every kind of meat had its own point value.

At the store a shopper paid with stamps and with money together. The price could not go above the ceiling price, the highest price government officials allowed. Point values changed often. Newspaper editors printed them, radio announcers read them out and members of local ration boards posted them. By the end of the war, more than 100,000 volunteers were running the program through about 5,600 local boards.

Emilia Ruth Palmquist Lundberg

Who: A widowed mother of six in Jersey City who shopped for her family with ration books during the Second World War.

When and where: Jersey City, New Jersey, about 1942 to 1943.

Six children, $100 a month and a ration book for each.

Emilia Lundberg, who was born in Göteborg, Sweden, in 1894, fed six children on a small, fixed income, and during the war she had to count ration stamps as well. In 1930 her husband was killed in an explosion at the dry-cleaning plant where he was in charge. As her son Donald remembered it, his father left her with six children, no relatives to turn to and no money.

She raised the children on workmen's compensation, money paid to a worker's family after the worker is hurt or killed on the job, of $100 a month. The rent was $35 a month. Her oldest daughter, 16, moved to night school and took a job keeping accounts for $12 a week. Donald packed and delivered groceries at a store after school and on Saturdays for $5 a week.

At the store. Rationing changed little at the family's table. Before the war, they ate a roast on Sunday after church and potatoes and macaroni the rest of the week. Under rationing, they still bought meat only for Sunday and ate macaroni, spaghetti and mashed potatoes the rest of the week.

Everyone in the family had a ration book with stamps for meat and other goods, and they took the books to the store and bought what the stamps allowed. The ration was counted for each person, so a large family got more in all than a small one. Shoes were rationed too. Each child had one good pair for school and one pair of sneakers for play.

Emilia had a 1933 Plymouth car. Donald remembered the family's gasoline ration as about a gallon and a half, but he did not say whether that was for a week or a month. When they told the ration board they

were driving to visit his older brother, a soldier at Camp Kilmer in New Jersey, they got a coupon for about two more gallons. Donald described all of this in an interview for the Rutgers Oral History Archives in 2008, about 65 years later.

BY 1950

If you remember one thing: Between 1900 and 1950, shoppers began picking goods off the shelves themselves in ever-bigger chain stores, and they bought cars and radios on monthly payments.

One number: 15,000. The A&P had nearly 200 stores in 1900 and about 15,000 in 1930, about 75 times as many.

Next: After 1950, shoppers drove to the first enclosed malls and paid with plastic cards.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 10 MINUTES

Americans began shopping at enclosed malls and discount stores after 1950, and paying with plastic cards. The first fully enclosed shopping mall in the United States opened in Minnesota in 1956. Kmart, Target and Wal-Mart all opened their first stores in 1962. In 1974 a cashier in Troy, Ohio, made the first sale with a scanner that read a printed code on a package. By 2000, people could shop at home on television shopping channels, and from 1995 on a computer.

The enclosed mall

Southdale Center opened in Edina, Minnesota, on October 8, 1956. It was the first fully enclosed shopping mall in the United States with its own heating and cooling. It had 72 stores on two levels around a brightly lit central court. Its two biggest stores were the department stores Dayton's and Donaldson's.

The Dayton family owned department stores in Minneapolis. In 1952 they hired the architect Victor Gruen and his firm, Victor Gruen & Associates, to design the mall. Building began in 1954. Southdale cost $20 million.

Victor Gruen

Who: The architect who designed the first enclosed American mall and later rejected what developers built from his idea.

When and where: Vienna, then New York and Minnesota. Southdale opened October 8, 1956.

Movie: *The Gruen Effect: Victor Gruen and the Shopping Mall* (2009), a documentary by Anette Baldauf and Katharina Weingartner, about Gruen and the malls he started.

He arrived in New York with eight dollars and no English.

Victor Gruen designed Southdale as the center of a new neighborhood, and developers copied only the mall. Gruen was a Jewish architect from Vienna, in Austria.

Leaving Vienna. In March 1938 the leaders of Nazi Germany, the Germany ruled by Adolf Hitler's Nazi Party, took over Austria and made it part of Germany, a takeover called the Anschluss. In the weeks after, Austrian Nazis and others beat, attacked and humiliated Jews. In Vienna, Nazis forced Jews to scrub the city's streets while crowds jeered at them. Soon Nazi officials put Austria's Jews under the same laws that German officials already used to take away Jewish rights in Germany.

Gruen fled Vienna that year. He reached New York on the ship *Statendam* with an architect's degree, eight dollars and no English. One of his early jobs was a shop front on Fifth Avenue in New York, for Ludwig Lederer's leather-goods shop. Gruen designed its entrance as an arcade, a covered walkway, meant as a "customer trap" to draw people inside.

For Southdale, the Dayton company bought about 500 acres of land in Edina. Gruen's plan for the land around the mall had apartment buildings, houses, schools, a medical center, a park and a lake. He said he wanted "the Minneapolis downtown you would get if you started over and corrected all the mistakes." The medical center opened in 1965. The Daytons sold the rest of the land for housing.

> In a speech in London in 1978, Gruen rejected the malls that American developers had built. He said he refused to pay alimony, the money a person pays a former husband or wife after a divorce, for those developments, and he used a rude word to describe them. He went back to Vienna and objected to a shopping center built there.

Plastic at the counter

With a credit card, a shopper could take goods home from any store that took the card and pay the bank later. Chapter 17, Money, describes how the cards began: the cardboard Diners Club card of 1950, which holders had to pay off in full every month, and the BankAmericards that officers of Bank of America mailed to people in Fresno, California, in September 1958.

At the counter. The Fresno cards came ready to use, though nobody had asked for them. Each of the 60,000 or so cardholders got $300 to $500 of credit at once, good in any store that took the card, and each store that took it paid the bank 6 percent of every sale. The bank's officers later licensed the card across the country, and in 1976 it was renamed Visa. In 1970 members of Congress banned mailing credit cards to people who had not asked for them.

Women and credit. Before 1974, lenders often turned women down for credit because they were women, or because they were married or single. Mortgage lenders, who lend money to buy houses, often counted only part of a married woman's pay, especially if she was young enough to have children. Lawmakers in Congress passed the Equal Credit Opportunity Act in October 1974. Under it, lenders could no longer treat people differently because of their sex or whether they were married.

In March 1976 the lawmakers added more reasons lenders could not use: race, color, religion, national origin, which means the country a person or their family came from, age, and getting money from government aid programs.

Four discount chains in one year

Four discount chains, selling goods at prices below what other stores charged, began in 1962. The first Kmart store opened in Garden City, Michigan, on March 1, 1962, and reports stated that 4,000 customers waited in line on the first day. Target's first store followed on May 1, in Roseville, Minnesota. On July 2, Sam Walton opened the first Wal-Mart in Rogers, Arkansas. Woolco's first store opened that year too.

Kmart grew out of the S. S. Kresge chain of five-and-dime stores, which sold small goods for 5 and 10 cents, and Woolco out of F. W. Woolworth's company. Target grew out of the Dayton Company's department stores, run by the same Dayton family that had hired Victor Gruen to design Southdale.

Sam Walton

Who: The Arkansas storekeeper who put discount stores in small towns and built the largest retailer in the United States.

When and where: Rogers, Arkansas, from July 2, 1962.

Movie: *Wal-Mart: The High Cost of Low Price* (2005), a documentary by Robert Greenwald. It argues against the company and is not a life story of Walton.

He put discount stores in towns too small for the big chains.

Sam Walton built Walmart, spelled Wal-Mart at first, by opening discount stores in small towns. The heads of the large chains had judged those towns too small to bother with. Before 1962 Walton ran Ben Franklin variety stores in Arkansas, which sold many kinds of small, cheap goods. He bought goods in huge amounts and priced them below the stores nearby. Walmart became the largest retailer in the United States and the largest private employer, which means it had more workers than any other company.

Economists have measured what happened to shoppers and to towns when Walmart stores opened. Two economists, one at MIT and one at the US Department of Agriculture, reported in 2007 that shoppers gained

a great deal from Walmart's low prices, most of all households with lower incomes.

Jobs and sales. Three other economists reported in 2008 that when a Walmart opened, the county around it lost about 150 retail jobs, or 2.7 percent. By their count, each Walmart worker replaced about 1.4 workers at other stores.

Small towns. Kenneth Stone, an economist at Iowa State University, has studied Walmart in Iowa since 1988. In a 2012 study, he and a co-author followed 28 Iowa towns of 3,000 to 20,000 people for 15 years after each got a Walmart. Total retail sales in those towns rose, but most of the gain went to Walmart, and other stores in town that sold the same things lost sales.

None of the study's Walmart towns had fewer than 3,000 people. In Iowa's smallest towns, under 2,500 people, retail sales fell 30 percent, about $1.5 billion, in the years after Walmart came to the state. In those years, shopping in Iowa moved to the bigger cities and to the Walmart towns, where people from nearby towns now came to shop.

The franchise

Roy Allen bought a recipe for root beer in 1919. In 1924, by most accounts, he began selling A&W franchises: the right for other people to run a business under the A&W name, following his rules. Writers on the history of franchising often call A&W the first successful food franchise. J. Willard Marriott was one of its early franchise owners.

The Howard Johnson's restaurant business sold its first franchise to Reginald Sprague in 1935. By the end of 1936 there were 41 Howard Johnson's restaurants. By 1939 there were 107, with about $10.5 million in sales.

The barcode

The Universal Product Code, or UPC, is the barcode printed on packages in stores, read by a scanner at the checkout.

The people who planned the first scan chose a small pack of gum on purpose. They wanted to show that the code could be printed clearly on a package that size. The Smithsonian's National Museum of American History keeps one of the first ten scanners, a Spectra-Physics Model A.

Sharon Buchanan

Who: The supermarket cashier who made the first sale ever scanned with a barcode.

When and where: Marsh Supermarket, Troy, Ohio, 8:01 a.m., June 26, 1974.

A ten-pack of Juicy Fruit gum, 67 cents, at 8:01 in the morning.

Sharon Buchanan was the cashier at the first sale ever made with a barcode scanner. At 8:01 in the morning on June 26, 1974, she was working at the Marsh Supermarket in Troy, Ohio. The customer was Clyde Dawson, who headed research and development, the work of trying out new ideas, at Marsh. He bought a ten-pack of Wrigley's Juicy Fruit gum. Buchanan passed it over the scanner. The price was 67 cents.

Stamps, television selling and the end of the big catalog

Green Stamps. About 80 percent of American households collected S&H Green Stamps in the 1960s and 1970s. These trading stamps were small stamps that shoppers got with purchases at grocery stores, gas stations and other stores. Shoppers pasted them into books and traded full books for goods at a Green Stamps store or from a catalog. In the 1960s more S&H stamps were printed than US postage stamps, and about 35 million S&H catalogs went out each year.

Shopping on television. The Home Shopping Network began with a radio station. In 1977 a company that advertised on Lowell "Bud" Paxson's radio station paid him in electric can openers instead of money. The station's host, Bob Circosta, sold them on the air for $9.95 each. In 1982 Paxson and Roy Speer started the Home Shopping Club on cable television in Pinellas County, Florida, and it went national on July 1, 1985.

Joe Segel founded QVC, another shopping channel, in 1986. It first went on the air that November, and the first thing it sold was a radio made to be used in the shower.

The last Sears catalog. Sears officials announced on January 25, 1993, that they were closing the company's catalog business, cutting 50,000 jobs and closing 113 stores. The last general catalog went out that spring. The catalog had run for about a hundred years.

Buying on a computer begins

Jeff Bezos filed papers to start a company called Cadabra, Inc., on July 5, 1994, working from a rented house with a garage in Bellevue, Washington. The company became Amazon. Amazon.com opened for orders on July 16, 1995. The first book it sold was *Fluid Concepts and Creative Analogies*, by Douglas Hofstadter. In its first week it took in about $12,000 in book orders.

Pierre Omidyar started a website called AuctionWeb, where people sold goods at auction to whoever offered the most money. He started it over Labor Day weekend, on September 3, 1995. It later became eBay. The first thing sold on it went for $14.83. By eBay's account, it was a broken laser pointer.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 12 MINUTES

About one dollar in six of all American retail spending went to online sales from April to June 2026, by the count of the US Census Bureau. Since 2005, members of Amazon Prime have paid a fee for two-day shipping. Drivers carry the orders to people's doors, including on days of summer heat. Sellers now buy the right to show advertisements to one person at a time, chosen from records of what that person has done online.

How much shopping is online?

Online sales were 17.1 percent of all retail sales in the United States from April through June 2026, by the count that workers at the US Census Bureau publish every three months. In all of 2025 they were 16.4 percent. The April-to-June figure came to $340.2 billion, 12.2 percent more than in the same months of 2025. The bureau's staff released those numbers on August 18, 2026. By those numbers, more than four dollars in five were still spent in stores.

Researchers at the Federal Reserve, which acts as a bank for other banks, ask people to keep diaries of how they pay. In 2024, credit cards were the most-used way to pay in the United States, used for 35 percent of all payments. Cash was used for 14 percent.

Jeff Bezos

Who: The founder of Amazon, which began as an online bookstore and grew into a store selling books, music, movies and many other kinds of goods.

When and where: Bellevue and Seattle, Washington, from July 1994.

Movie: *Amazon Empire: The Rise and Reign of Jeff Bezos* (2020), a documentary by James Jacoby and Anya Bourg in the PBS series *Frontline*. It is an investigation that argues a case against Amazon's power.

Web use was growing 2,300 percent a year, so he quit.

Jeff Bezos was a vice president at D. E. Shaw, an investment company in New York, when he read in 1994 that use of the web had been growing by 2,300 percent a year that spring. He quit his job to sell goods online.

He and his wife, MacKenzie Bezos, moved from Manhattan to the Seattle area. They chose it because software engineers lived and worked there, at Microsoft and the University of Washington, and because of its taxes. Bezos studied which product would sell best online, and he chose books. Music and DVDs were the next goods Amazon added.

Prime. When Amazon Prime began on February 2, 2005, members paid $79 a year and got two-day shipping on their orders at no extra charge, according to Amazon's announcement. By 2021, more than 200 million people around the world were members. In 2026 Prime in the United States cost $139 for members who paid once a year, or $14.99 a month for members who paid monthly, about $180 over a year. Those prices had not changed since February 2022, according to the shopping news site dealnews.

The workers. Senate committee staff, drivers and union representatives have complained about how Amazon treats the people who pack and deliver its orders. A Senate committee's staff counted more injuries in Amazon's warehouses than in other warehouses. In 2023 Amazon ended its contract with one delivery company soon after the company's drivers

> joined a union, a group that workers form to bargain together with their employer. Amazon's representatives said the contract ended for other reasons.

Malls empty out

As shoppers moved online or to newer outdoor shopping centers, the anchor department stores of many malls closed. Anchor stores are the big stores that draw shoppers to the smaller shops around them, and the smaller shops that had depended on the department stores' crowds lost customers. Mall owners could not find new stores to fill the empty space. Owners and builders have turned some empty malls into apartments, clinics, colleges and warehouses.

How empty. Nobody keeps an official government count of malls, and the private counts disagree, because people define a mall in different ways. In 2017, Green Street Advisors, a company that grades malls for investors, sorted them by how well they were doing. The more than 300 malls it gave its lowest grades were only about 72 percent full, while the best malls were about 95 percent full. In the weakest malls, more than a quarter of the space stood empty.

Across the whole country, researchers at Coresight Research, a company that studies stores, counted about 3,000 more stores closing than opening in 2025.

Advertising aimed at one person

When a person visits a website, the company that runs the site can save small files and codes on the person's device that record what the person looked at. Companies called data brokers collect records like these and combine them with records from outside the internet, such as store purchases, warranty cards and property records. Then they sell what they have gathered, including the chance to show an advertisement to a chosen group of people.

The staff of the Federal Trade Commission, the government office that protects shoppers, published a report in May 2014 called *Data Brokers: A Call for Transparency and Accountability*. The commission's staff found that data brokers held "billions of data elements," meaning billions of separate facts, about nearly every American shopper. They gathered most of it without people knowing.

The report describes how brokers attached offline records to the files in a person's web browser, so the person could be followed from site to site and shown advertisements chosen for them. The commissioners asked Congress to pass a law under which people could see the information held about them.

Website and app owners use money from this advertising to keep their services free to use, and the advertisements can show a person something they want to buy. But companies the person has never heard of buy and sell records of what the person reads and buys. As of 2026, members of Congress had passed no general federal privacy law. By June 29, 2026, lawmakers in 24 states had passed their own, according to the law firm Husch Blackwell.

Selling to children inside a game

Fortnite is a video game made by Epic Games that came out in 2017. It is free to play. Epic sells V-Bucks, game money that players buy with real money to get costumes and dance moves for their characters. By 2022, the game had more than 400 million players around the world, according to the Federal Trade Commission.

The $520 million. Officials of the Federal Trade Commission announced on December 19, 2022, that Epic had agreed to pay $520 million. Of that, $275 million was a penalty under the Children's Online Privacy Protection Act, a law that requires a company to get a parent's permission before it collects personal information from a child under 13. The officials said Epic had collected personal information from children under 13 who played Fortnite without telling their parents or getting their permission.

The other $245 million went back to customers as refunds. The officials said Epic had used "dark patterns," confusing buttons and screens that led players into charges they did not mean to make. They said children could buy V-Bucks just by pressing buttons, with no parent or card owner agreeing, and that the game could charge a player who was only waking it from sleep mode.

The officials cited "hundreds of millions of dollars in unauthorized charges," meaning charges that players had not agreed to. Lina Khan was the head of the commission at the time.

Payday loans

A payday loan is a small loan from a storefront lender that the borrower is supposed to pay back on the next payday. Researchers at the Consumer Financial Protection Bureau, a government office that watches over lenders, published a study of these loans in April 2013. They found that a borrower who took the typical $350 loan, with a fee of $15 for each $100, had to find more than $400 in 14 days.

Nearly half of payday borrowers took out more than 10 loans in a year, and the typical borrower was in debt 199 days of the year, more than half of it. Chapter 17, Money, describes the rest of the study, including how a fee like that comes to 391 percent a year.

Buying secondhand clothes

The staff of ThredUp, a company that sells used clothes online, publish a yearly report on the market for secondhand clothes. Because ThredUp sells used clothes, its report is a company's estimate, not a government count.

By ThredUp's 2025 report, the market for used clothes in the United States grew 14 percent in 2024, and online sales of used clothes grew 23 percent. In 2024, 58 percent of shoppers bought something secondhand, up from 52 percent in 2023. The firm GlobalData did the research for ThredUp's 2026 report, which states that in 2025 used clothing sales grew almost four times as fast as all clothing sales. GlobalData's researchers forecast that the US secondhand market will reach $78.8 billion by 2030.

The last step: heat in the delivery truck

The drivers who make fast delivery possible keep delivering in summer heat. Injury records kept by OSHA, the government's workplace safety office, list at least 40 UPS drivers taken to the hospital since 2015 for heat illness, which happens when the body gets too hot and cannot cool itself down. Danielle Kaye of NPR gave that count in July 2023.

José Cruz Rodriguez was 23. He died of heat illness during a UPS delivery shift in Waco, Texas, in August 2021, according to OSHA. His family sued UPS for causing his death, and the case was settled.

Esteban Chavez Jr., a UPS driver for four years, died after he was found unconscious in his truck. It was June 25, 2022, the day after his 24th birthday, and he was on his route in Pasadena, California. The temperature that day reached the upper 90s. UPS trucks had no air conditioning then. His family said at least 20 minutes went by before anyone noticed him and called for help.

The medical examiner, the doctor whose job is to find out why a person died, found that his heart stopped working. His family believes the heat caused it.

UPS managers and leaders of the Teamsters union, which represents UPS drivers, agreed in June 2023 that every small delivery truck UPS bought after January 1, 2024, would have air conditioning, heat shields and fans.

Inside the warehouses. Warehouse workers pack the orders before drivers carry them. In December 2024, Senator Bernie Sanders released a report by staff of the Senate committee he led, staff members who work for the party that holds the most seats in the Senate. They found that in 2023 Amazon recorded more than 30 percent more injuries at its warehouses than the average for the warehouse industry. For seven years in a row, Amazon warehouse workers were nearly twice as likely to be hurt as workers at other warehouses.

The report states that Amazon had plans to lower injuries and did not use them, because the plans would slow down work.

Renica Turner

Who: A driver who delivered Amazon packages in the California desert for a small delivery company, and who joined a union to push for protection from the heat.

When and where: Palmdale and Victorville, California, about 2022 to 2023.

110 degrees, a broken air conditioner and 300 packages to go.

Renica Turner delivered Amazon packages for a company called Battle Tested Strategies. It was one of about 3,000 small companies under contract to deliver Amazon's packages. Its vans were leased from Amazon, and its drivers worked out of an Amazon building in Palmdale, California.

The hot day. In a July 2023 story by the NPR reporter Danielle Kaye, Turner described a day in Victorville, California, when the temperature reached 110 degrees. The van's air conditioning and fans were not working, she said. When she rolled the windows down, hot air came in. Her body began to tingle, and she thought she might pass out.

She told the Amazon dispatcher, the worker who sends drivers out and keeps track of them, and the dispatcher gave her a 20-minute break. In her words, "They never sent no one out to help me with the rest of the route." The route was 300 packages, and she was expected to deliver 25 every hour. She finished it herself, feeling woozy and numb.

Amazon's representatives told NPR that its vans had working air conditioning and that any van without it was taken off the road at once. The delivery companies were in charge of fixing the vans, they said, and Amazon had changed some routes the year before so drivers could take more breaks to cool down. The owner of Battle Tested Strategies, Johnathon Ervin, said Amazon regularly failed to fix broken air conditioning, sometimes for weeks or months.

The union. Turner and 83 other drivers at the company joined the Teamsters union in April 2023 and bargained a contract with Battle Tested Strategies. NPR reported that they joined the union in large part

to push for protection from the heat.

Amazon ended its contract with the company in June 2023. Teamsters representatives and the company's owner said Amazon was punishing the drivers for joining a union. Amazon's representatives said Amazon ended the contract over safety violations and missed insurance payments by the company. The drivers went on strike, stopping work as a protest.

What the drivers got. Lawyers for the National Labor Relations Board, the government office that enforces labor law, brought a case against Amazon. They argued that Amazon was the drivers' employer too, even though another company had hired them. In April 2026 they settled the case with Amazon, agreeing on terms that ended it. Turner and the other drivers, about 84 of them, were each to get two weeks of pay, about $250,000 in all.

Under the settlement, Amazon did not admit that it had been the drivers' employer. A judge approved the settlement in May 2026, and the Teamsters asked to appeal. The news stories about the case do not say what Turner did after the strike.

THE THREE QUESTIONS, ANSWERED

1. **How did colonists pay for goods when they had almost no coins?** They took goods home on credit and paid later in crops, other goods, work and wampum, while the shopkeeper wrote each debt in a ledger.
2. **Where were people bought and sold like goods?** At the market New York's aldermen set up on Wall Street in 1711, in newspaper advertisements such as the 277 or more in Franklin's *Pennsylvania Gazette*, and at a racetrack near Savannah, where Pierce Butler sold between 429 and 436 people in 1859.
3. **How much of what Americans buy today is bought online?** About one dollar in six: online sales were 17.1 percent of all retail

sales from April to June 2026, by the US Census Bureau's count.

What changed: Before 1500, goods passed hand to hand at trading places like the one on the Columbia River, and by 2026 one dollar in six of American retail spending went to online orders carried to the door.

FIVE DATES TO KEEP

1653: John Stewart owes John Pynchon 30 pounds for his freedom.

1711: New York's aldermen set up a market for selling enslaved people.

1872: Montgomery Ward mails his first catalog.

1916: The first Piggly Wiggly lets shoppers serve themselves.

1995: Amazon.com opens for orders.

NOT KNOWN: No one counted how many children the morphine in Mrs. Winslow's Soothing Syrup killed.

Where to go: A sign at Wall Street and Water Street, in New York City, marks where the city's market for enslaved people stood from 1711 to 1762.

Next: Chapter 19, Big Business and Its Power. It describes how a handful of companies grew huge, and what Americans did about their power.

Chapter 19: Big Business and Its Power

CHAPTER 19 OF 37 · BIG BUSINESS AND ITS POWER · 10 ERAS · ABOUT 95 MINUTES

From the Virginia Company of 1606 to the trillion-dollar companies of 2026, the biggest businesses here kept getting bigger, and at every step people fought over how much power their owners should have.

Members of a protest group called the Sons of Liberty smashed open 340 chests of tea with axes on December 16, 1773, and dumped the tea into Boston Harbor. The tea belonged to a company, the East India Company of London. British lawmakers had just let the company's agents sell its tea straight to the colonies, more cheaply than colonial merchants could. In February 1774 the company's directors sent a bill for the tea to the British minister in charge of the colonies. It came to 9,659 pounds, 6 shillings and 4 pence.

This chapter describes the biggest companies of each era, from the London investors behind Jamestown to the technology companies in court in 2026. It follows where each company's power came from. At first it came from a government's written permission. Later it came from secret deals with railroads and from buying up rivals until a few owners ran whole industries. People pushed back. Kings and lawmakers took that permission away, workers went on strike, the reporter Ida Tarbell dug through the records, and presidents and judges split companies apart. The owners of some companies made money from shipping enslaved people. Others kept selling leaded gasoline after workers who made its additive died, and cigarettes after studies linked smoking to lung cancer.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. How did a few companies come to control whole industries?
2. What did owners do when their workers went on strike?
3. Did breaking up a giant company ever work?

Five minutes? Read "Homestead, 1892" in 1850 to 1900.

Can skip: "The Hudson's Bay Company, 1670 to 1825", "Who ran the corporations? 1932", "What was a conglomerate?". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 1 MINUTE

No company existed in this land before 1500, no business owned by a group of people who put money into it and shared what it earned. Starting a corporation, a company that goes on after its first owners are gone, took a written grant from a government.

Native nations traded goods over hundreds of miles, and Chapter 18, Marketplace and Consumer Life, tells that trade. The traders belonged to many different nations, and none of them ran the trade as a company whose owners each held a part of it.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 1 MINUTE

Merchants in London started forming joint-stock companies in the 1500s, and later companies of that kind paid for England's first lasting colonies on this coast. Kings and queens paid for the European voyages that reached this coast during that century. No company with a charter, the written grant from a government that creates a company and lists its rights, traded here in those years.

What was a joint-stock company?

A joint-stock company had many owners at once. Each investor bought shares, parts of the ownership, and got a part of the profit that matched the number of shares he owned. The money the investors paid in was called stock.

The explorer Sebastian Cabot and a group of London merchants formed the Muscovy Company in 1555. It held a monopoly on English trade with Russia, the right to be the only English company trading there. Before it, investors had taken their money back after each voyage. The Muscovy Company was the first English joint-stock company that kept its investors' money in the business from one voyage to the next.

Sir Edward Osborne founded the Levant Company on September 11, 1592, by joining two older companies, the Venice Company and the Turkey Company. Its merchants traded in the eastern Mediterranean Sea, not in North America.

A charter from the queen. A nobleman and 218 other men asked Queen Elizabeth I for a charter for a new company. She gave one to the East India Company of London on December 31, 1600.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 10 MINUTES

The first lasting English colonies here were started by companies, and the investors who owned them hoped the colonies would earn them a profit. A king signed each company's charter, investors bought its shares, and the company's officers sent the settlers. The kings who signed the charters gave the companies land where Native nations already lived. Two of those companies lost their charters before the century ended. King James I took the Virginia Company's in 1624, and English judges cancelled the Massachusetts Bay Company's in 1684.

Companies that traded people. The owners of other companies made money from enslaved people. The Dutch West India Company owned the enslaved men who dug the trench for a wall at New Amsterdam. The ships of the Royal African Company, chartered in 1672, carried more enslaved Africans to the Americas than those of any other company or group in the history of the slave trade, the historian William Pettigrew found.

The Virginia Company, a colony run as a business

King James I of England gave the Virginia Company of London a charter in 1606 to start a colony in North America. The company's settlers founded Jamestown on May 13, 1607. They built it inside Tsenacomoco, the land of the Powhatan chiefdom, a group of towns under one leading chief.

The shares. A share in the company cost 12 pounds and 10 shillings, at 20 shillings to the pound, and it lasted seven years. By one estimate, the first sale of shares raised as much as 10,000 pounds. In 1616 the company paid its shareholders in land alone.

Who ran it. Under a second charter, dated May 23, 1609, the king gave up some of his power over the company, and from then on the investors elected a treasurer to run it. A third charter, dated March 12, 1612, added the island of Bermuda to the company's lands and allowed the company to run lotteries.

The lotteries raised 7,000 pounds of the company's 9,831 pounds in cash in the year before May 1620. Members of the House of Commons, one of the two groups of lawmakers in England's Parliament, attacked the lotteries in a debate in February 1621. King James I banned them soon after.

The first Africans in Virginia. The first Africans known to reach English Virginia came in 1619, while the company ran the colony. Earlier that summer the crews of two privateers, ships whose captains had a government's permission to attack and rob enemy ships, had attacked a Portuguese slave ship, the *São João Bautista*, off the coast of Campeche, in what is now Mexico. They seized 50 to 60 Africans from it.

One of the two, the *White Lion*, had sailed from the Netherlands, and its captain, John Colyn Jope, carried Dutch papers giving him that permission. The *White Lion* landed "20. and odd" Africans at Point Comfort in Virginia in late August 1619, in the words of the colonist John Rolfe. Governor George Yeardley and the merchant Abraham Peirsey bought them and paid for them with food.

The other ship, the English *Treasurer*, arrived three or four days later with more of the stolen people. Its owners were Robert Rich, Lord Warwick, a nobleman, and Samuel Argall, Virginia's deputy governor.

The deaths. Of the 4,270 people counted in Virginia from 1619 to 1622, only 1,240 were alive at the end. About 700 settlers lived in the colony in 1619. Over the next three years the company's officers shipped 3,570 more men, women and children there.

English settlers had been taking Powhatan land to grow tobacco. An alliance of Virginia Indians led by Opechancanough, the leading chief of the Powhatan, attacked the English settlements on March 22, 1622, and killed as many as 347 colonists. Besides those 347, 2,683 people were gone. One investor asked what had happened to them. Most of them had died of disease, Encyclopedia Virginia's history of the company states.

The end of the company. King James I's advisers on the Privy Council, his inner council, named a group of officials in May 1623 to look into the company's business. On May 24, 1624, the king took away the company's charter. From then on Virginia was a royal colony, run by officials the king chose.

Sir Edwin Sandys

Who: The man who ran the Virginia Company while its officers shipped thousands of settlers to a colony where most of them died.

When and where: London, 1619 to 1624.

Every person shipped to Virginia earned someone 50 acres.

The investors of the Virginia Company elected Sir Edwin Sandys their treasurer, the man who ran the company, on April 28, 1619. In the next three years most of the people counted in the company's colony died or were killed.

To draw settlers, Sandys and the company's officers used a plan called the headright. They promised 50 acres of land for each person whose trip to Virginia someone paid for. The payer got the land, whether he paid for his own trip or for another person's. The settler then paid the company a quitrent, a small yearly rent on the land, of one shilling a year. The land handed out this way was Powhatan land.

Who could have stopped it. The historian Edmund S. Morgan studied these years in a book published in 1975. He and later scholars have shown that a responsible king would have stopped the company from recklessly shipping his people to their deaths, Encyclopedia Virginia's history of the company states. King James I did not stop the shipments while they went on, from 1619 to 1622. He took the company's charter away in 1624.

The Dutch West India Company

Members of the States General, the lawmaking assembly of the Netherlands, gave the Dutch West India Company a charter on June 3, 1621. For 24 years no one else from the Netherlands could sail to or trade with the Americas. The same rule held for the coast of Africa from the Tropic of Cancer, a line on maps north of the equator, to the Cape of Good Hope, near Africa's southern tip.

Fort Orange and Manhattan. Men working for the company built a trading post called Fort Orange in 1624, where Albany, New York, stands today. It was the first lasting Dutch settlement in New Netherland, the colony along the Hudson River. The upper Hudson was the country of the Mohican people.

The company's settlers then moved onto Manhattan Island, the home of the Lenape people. Company officials said they bought Manhattan in 1626 for trade goods worth 60 guilders in Dutch coins. A guide to Lenape history from the Pratt Institute Libraries says the Dutch likely misunderstood what the Lenape meant by that exchange.

People the company owned. The company owned people as well as ships and forts. Enslaved men owned by the company dug the trench for a wall at New Amsterdam, the town on Manhattan, in 1653. Three of them are known by name: Paulo d'Angola, Simon Congo and Anthony Portuguese.

The company's director and council had given these three men, eight other men and their wives what the officials called "half-freedom" in 1644, after 18 or 19 years of forced work. The men could own land, but their children stayed the company's property. The men still owed the company a yearly payment of grain or beans and a hog, and they had to work for the company whenever its officials called them.

The Massachusetts Bay Company

Investors in the Massachusetts Bay Company started the colony of Massachusetts, and the company's leaders governed it under the company's charter. King Charles I signed that charter in March 1629. In late August 1629 twelve men, among them John Winthrop, signed a paper called the Cambridge Agreement. They promised to sail to New England if the company's charter and its government moved there with them.

Boston. Winthrop arrived at the Shawmut Peninsula in 1630 with about 1,000 Puritan settlers, English Protestants who wanted to "purify" the king's official church, the Church of England. Winthrop renamed the peninsula Boston.

The land around the peninsula belonged to the Massachusett people, whose leading chief was Chickataubut. About 100,000 people had lived in the region, according to the West End Museum in Boston, and an epidemic, a disease that spread quickly through many people, had killed about 75,000 of them from 1616 to 1618. In 1633 Chickataubut agreed to a treaty with Winthrop, a written agreement that gave up his rights to the peninsula. He died of smallpox that same year.

The charter cancelled. English judges cancelled the company's charter on October 23, 1684, for three reasons. Colonists had traded with other countries against English trade laws. The colony's leaders had made their own coins, without the king's picture on them. And the colony's lawmakers had passed laws against members of the Church of England and against Quakers, a Christian group, also called the Society of Friends, that began in England in the 1600s.

The Hudson's Bay Company, 1670 to 1825

King Charles II gave a charter to the Hudson's Bay Company on May 2, 1670. Prince Rupert, the king's cousin, had persuaded the king and a group of merchants and noblemen to back the company. Under the charter, the company alone could trade in all the lands whose rivers flow into Hudson Bay, in what is now Canada. In the charter those lands are called Rupert's Land.

The Hudson's Bay Company was an English company. Much later, in 1821, it took over the trading posts of its rival, the North West Company, in the Pacific Northwest. The company's governor, George Simpson, and the trader Dr. John McLoughlin opened Fort Vancouver on the Columbia River, in what is now Washington state, on March 19, 1825. Chinookan people had lived along that river for thousands of years. They called the place where the fort stood Skatcutxat, which means "Mud Turtles."

The Royal African Company

The Royal African Company's investors made money from shipping enslaved Africans to the Americas. King Charles II gave the company a charter in 1672, and his brother James, who held the title Duke of York, led it. James later became King James II. The company held the only English right to trade with West Africa, a trade in gold, silver and enslaved people.

Ships that the company put money into carried 186,748 enslaved people on 652 voyages to English colonies in the Americas between 1672 and 1731. Of those people, 16,077 died on the way. The count comes from the Trans-Atlantic Slave Trade Database, a record of known slave voyages. From 1680 to 1686 the company's ships carried about 5,000 people a year, most of them to English colonies in the Caribbean and to Virginia.

The brands. Thousands of the people on the company's ships arrived with the company's initials branded on their chests. To brand a person means to press a red-hot metal stamp against the skin. The heat burns the letters into the flesh and leaves a raised scar for life. Many of the brands read DoY, for

Duke of York, the company's leader. Others read RAC, for Royal African Company. The accounts of the branding name the company but not the men who pressed the hot stamps into people's skin.

The historian William Pettigrew wrote in his 2013 book *Freedom's Debt* that the company "shipped more enslaved African women, men and children to the Americas than any other single institution (company or other group) during the entire period of the transatlantic (across the Atlantic) slave trade." He also wrote that its investors knew what the company did and meant to make money from it.

1700 to 1750

ERA 4 OF 10 · 1700 TO 1750 · ABOUT 4 MINUTES

The historian Robert E. Wright counts only 8 business corporations chartered in the colonies before independence, so almost no business in the colonies from 1700 to 1750 was a corporation. He writes that before the Revolution, American business corporations were "few, small, and largely inconsequential," which means mostly unimportant. Under British rules, Wright writes, getting a charter cost a lot, and its owners got little in return. So most colonists in business found other ways to organize.

Partners, and the trade in people

Many colonial businesses were partnerships, in which two or more men put their money together and shared the profits. Under the law of the time, each partner was liable for all of the firm's debts, which meant he could be made to pay them. If the firm failed, the people it owed could make any one partner pay all of it from his own property.

The trade opened. The Royal African Company's monopoly ended in practice in 1689, after King James II lost his throne, and the company's own leaders admitted it that year. Under a law that members of the English Parliament passed in 1698, any English merchant could carry enslaved people from Africa. He had to pay the company a fee of 10 percent on the goods he shipped out of Africa. The Royal African Company itself stopped trading in enslaved people in 1731.

Boston's trade in people. Boston merchants bought and sold people. The *Boston Gazette*, a newspaper, ran about 2,300 advertisements for about 2,000 enslaved people from 1719 to 1781. Charles Apthorp, a Boston merchant born in Britain, ran a firm that brought in enslaved people and sold them along with other goods. By 1746 he was one of the richest men in Boston.

Apthorp placed advertisements in the *Boston Gazette* in the 1730s and 1740s for "a parcel of likely negros just imported," a group of newly arrived Black people he called healthy, good-looking and fit for work. In 1742 he offered a reward of five pounds for the return of "a negro man named Jack about 35 years old," who had escaped from his enslaver, Stephen Eastwick. Apthorp's business partner was Thomas Hancock, one of the richest merchants in New England.

Thomas Hancock

Who: The Boston merchant whose firm rented out the ships that carried the Acadians away from their homeland in 1755.

When and where: Boston, from about 1724 until his death in 1764.

His firm's ships, rebuilt like slave ships, carried away Acadian families.

Thomas Hancock built one of the largest fortunes in New England, and part of his firm's business was carrying people whom British officials had forced from their homes. He started out at 13 or 14 as a bookseller's apprentice in Boston, learning the trade.

What he traded. Hancock's ships took codfish, whale oil, logwood (a wood that gives a dye) and potash (a salt made from wood ashes) to other countries. With different partners he made paper. He sold rum and molasses to the crews of the fishing fleet off Newfoundland, and he controlled a group of fishing boats of his own.

Smuggling. Under English trade laws, colonial merchants could buy and sell only where the laws allowed. Hancock's ships carried tea and paper from Amsterdam to the West Indies anyway, and when his ships brought French molasses into Boston, he hid it.

The Acadians. Hancock's partner Charles Apthorp was a paymaster and agent for the British army and navy, the man who paid out their money, and he supplied goods and money to British forces in Nova Scotia and Boston. In the autumn of 1755 British officials forced the Acadians, French-speaking Catholic farm families, out of Nova Scotia and took their houses and farms. The officials who gave the orders were Governor Charles Lawrence of Nova Scotia and Governor William Shirley of Massachusetts.

Lawrence and Shirley hired about 24 sailing ships from the firm of Apthorp and Hancock to carry the Acadians away. The partners charged 40 to 48 pounds a month for each ship, and the governors also paid a

fixed fee for each person carried. In Boston the ships were rebuilt inside to hold two people for every ton of cargo the ship could carry, and some held 300 to 500 people. The historian Mark Peterson writes that they were "fitted out in the manner of slave ships."

The ships carried the Acadians to British colonies along the Atlantic coast, among them Maryland and South Carolina. The ships were in poor condition. On board, Acadians went without enough food, caught diseases and died. The ships carried no passenger lists, so no record shows which Acadians died at sea or how many.

Hancock made his nephew, John Hancock, his equal partner in 1763. Thomas Hancock died of a stroke on August 1, 1764, as he entered the council chamber in Boston. He left property and money worth about 70,000 pounds.

1750 to 1800

ERA 5 OF 10 · 1750 TO 1800 · ABOUT 6 MINUTES

Colonists in Boston destroyed tea in 1773 that belonged to the East India Company of London. British lawmakers had just given that company the right to sell its tea straight to the colonies. After independence, American lawmakers began chartering companies of their own.

Charters at home. Most of the new charters went to banks and to insurance companies, which took a regular fee from people and paid them back after a loss such as a fire. Others went to companies that piped water to towns or built canals, bridges and toll roads, roads that people paid a fee to use.

Robert E. Wright counts 319 business corporations chartered in the United States before 1801. Only 8 of them came from the colonial years and 21 from 1776 to 1789. The other 290 were chartered from 1790 to 1800.

Whose tea went into Boston Harbor?

The tea belonged to the East India Company of London, the company chartered in 1600. The company held about 17 million pounds of tea, by weight, that it could not sell. Members of the British Parliament passed the Tea Act on May 10, 1773. Under it, the company could ship tea straight to the American colonies, and its own agents could sell the tea there at a lower price.

The Act contained no new tax. The tax on tea that members of Parliament had set in 1767 still had to be paid on the company's tea. But the company's agents could sell tea more cheaply than colonial merchants could, so the merchants who sold tea in the colonies lost business.

The three ships. Ships carrying the company's tea reached Boston in late 1773. Thomas Hutchinson, the royal governor of Massachusetts, refused to let the three ships, the *Beaver*, the *Dartmouth* and the *Eleanor*, leave the harbor until they had unloaded.

On December 16, 1773, members of the Sons of Liberty, a protest group, boarded the ships. Some of them were dressed as Mohawk men. They dumped all of the tea into the harbor, more than 92,000 pounds of it, about 46 tons. The company's directors later asked the British government to pay them back for it.

Americans start chartering companies

Robert Morris planned the first commercial bank in the United States, the Bank of North America, a bank that kept people's money safe and lent money to merchants and businesses. Members of the Continental Congress, the leaders from the 13 states who ran the country during the Revolution, approved his plan on May 26, 1781. They granted the bank its charter on December 31, 1781, and it opened on Chestnut Street in Philadelphia on January 7, 1782.

Morris started the bank with a shipment of French silver worth $450,000 that had been sent to Congress, and the bank's officers then lent the money back to Congress. Ninety-nine Philadelphians and members of Congress bought shares.

A fight over the charter. Pennsylvania's lawmakers gave the bank a second charter of their own in 1782. In March 1785 they received petitions, written requests signed by many people, asking them to cancel it. The bank's critics said its officers favored their friends, charged too much interest on loans and had too much power over trade and politics. They pointed to the 14 percent dividends, shares of the profits, that the bank paid its shareholders.

The lawmaker William Findley called the bank "a monopoly." That September the lawmakers voted to cancel the charter. In 1787 they gave the bank a narrower charter that lasted 14 years. Under it the bank's capital, the money its owners put in, could be no more than $2 million, and the bank could own no property beyond what its business needed.

Toll bridges. Only 7 of the 319 corporations that Wright counts before 1801 were for making goods. Lawmakers in the Northeast chartered 59 private companies to build toll bridges from 1786 to 1798. The first was the Charles River Bridge in Boston, and in its first six years its investors earned an average of 10.5 percent a year on their money.

What a charter cost. Getting a charter cost money. Wright found that people who wanted one paid for signatures and for help getting a bill passed by the lawmakers. Some paid lobbyists, people hired to persuade lawmakers, and

some paid bribes.

How much an owner could lose. In a corporation, each owner risks the money he paid for his shares. Under a rule called limited liability, owners cannot also be made to pay the company's debts from their own property. The historians Oscar and Mary Handlin found only 16 early charters that spelled out that promise. Wright argues that owners' risk was limited anyway, because a company could not charge its shareholders more than the price of their shares.

Robert Morris

Who: The merchant who ran the country's finances near the end of the Revolution, then went to a debtors' prison owing nearly $3 million.
When and where: Philadelphia, 1781 to 1801. Born 1734, died 1806.

When he left prison, he owed $2,948,711.11.

As Superintendent of Finance, the official in charge of the Continental Congress's money, Robert Morris wrote the charter of the Bank of North America. He used the bank to keep the value of the country's money steady and to keep the national government from running out of money.

After the war, Morris bought land with borrowed money. Starting in 1793, he and his partners, among them John Nicholson, bought thousands of building lots in the new District of Columbia. They also bought millions of acres in Pennsylvania, New York, Kentucky, Virginia, Georgia and the Carolinas.

Seneca land. Morris's land in western New York was Seneca land. His son Thomas Morris and his agent Charles Williamson met Seneca leaders at Geneseo, New York, from August 20 to September 16, 1797. Nearly 3,000 people came from the Seneca and the other nations of the Haudenosaunee, the union of six Native nations to which the Seneca belong.

The Seneca leaders at Geneseo included Cornplanter, Red Jacket and Handsome Lake, along with the clan mothers, the women leaders who choose their clan's chiefs and can remove a chief who acts badly. At this meeting the Seneca leaders signed the Treaty of Big Tree. They gave up almost all of their remaining land in New York, nearly 3.5 million acres, and kept 12 small pieces.

Morris paid $100,000. Federal officials held the money and put it into shares of the Bank of the United States, which paid the Seneca up to $6,000 a year. Morris asked that the $100,000 go back to his own heirs, the family members who would inherit from him, if the Seneca nation should "become extinct," meaning if every Seneca died. The heads of the federal Treasury and State departments refused. Most of the land went on to the Holland Land Company.

Prison. Morris and Nicholson together owed their creditors, the people they had borrowed from, about $12 million by 1797. Officers arrested Morris at his home in February 1798 and took him to the Prune Street debtors' apartment, next to the Walnut Street Prison in Philadelphia. He was held there about three and a half years because he could not pay his debts.

Members of Congress passed a bankruptcy law in 1800. Under it, a court could divide what a person owned among the people he owed and free him from the rest of the debt. Accounts differ about whether Morris's time in prison helped get that law passed. He was released under it in 1801. The three officials who handled his case found that he himself owed $2,948,711.11.

1800 to 1850

ERA 6 OF 10 · 1800 TO 1850 · ABOUT 9 MINUTES

State lawmakers chartered thousands of corporations, companies the law treats as one body, in the first half of the 1800s, and the fights over them reached the Supreme Court and the president. At the start of the century the lawmakers had to pass a special law for each charter. The justices of the Supreme Court ruled in 1819 that a state's lawmakers could not change a charter they had already granted. By 1837 a Connecticut law let people start a corporation for any lawful business by following set steps.

The mills and the bank. Merchants in Boston used corporations to build cotton mills, and by 1850 their group controlled a fifth of the country's cotton cloth making. In the 1830s President Andrew Jackson fought the Second Bank of the United States, one of the largest companies in the country, and its federal charter ran out in 1836.

From special charter to general law

A group that wanted a corporation before 1811 had to ask lawmakers to pass a special law just for them. New York's lawmakers changed that on March 22, 1811, when they passed the country's first general incorporation law, a law that let any group form a corporation by following set steps, without a special vote.

Under the New York law, only makers of goods could form such a company: makers of goods of wool, cotton or linen, and of iron, steel, copper, lead and similar metals. Any five or more people could form one. Its charter lasted 20 years, and it could raise no more than $100,000.

An emergency law. The historian Seavoy called the law "essentially an emergency measure" in a 1972 article in the *Business History Review*. Under two federal laws that banned trade, the Embargo of 1807 and the Non-Intercourse Act of 1809, cloth from Europe had stopped coming in. New York's lawmakers wanted thread made at home so that families could weave their own cloth.

Connecticut's lawmakers went further in 1837. Their new law let people incorporate, or form a corporation, for "any other lawful business." It was the first such law that did not list which trades were allowed or set a time limit on the corporation's life. Banks still needed a special act.

Who was shut out. Lawmakers in some Southern states shut particular groups out of their general incorporation laws, most often people who were not white. In those states, the economic historian Eric Hilt found, a Black American could not form a corporation under the general law.

How many. State lawmakers created 22,419 business corporations by special laws, one charter at a time, from 1790 to 1860, by the count of the economic historians Richard Sylla and Robert E. Wright. That is about 70 times the 319 corporations chartered before 1801. Together their charters allowed their owners to raise at least $4.5 billion. Several thousand more corporations formed under general laws.

Could lawmakers take back a charter? The Dartmouth case, 1819

The justices of the Supreme Court ruled in 1819 that a charter is a contract, and that a state's lawmakers cannot change it at will. The case was about a college's charter, but business corporations could rely on the same rule to protect their own.

The case. King George III had granted Dartmouth College its charter in 1769. The college's trustees, the board that ran it, removed its president, John Wheelock, in 1815. Wheelock then persuaded the governor of New Hampshire to change the charter, and in 1816 the state's lawmakers rewrote it. Under the new charter the governor chose trustees and a state board could overrule them. The lawmakers also renamed the college Dartmouth University.

The old trustees sued William Woodward, who served as secretary under the new plan. Daniel Webster argued the trustees' case before the Supreme Court. "It is, sir, as I have said, a small college, and yet there are those who love it!" he said. Chief Justice John Marshall wrote the Court's decision and ruled that the 1769 charter was a contract. The Constitution states that no state may pass a law "impairing," or weakening, "the obligation of contracts," and New Hampshire's lawmakers had broken that rule.

The way around it. After the ruling, state lawmakers could not take back a charter that earlier lawmakers had granted. Justice Joseph Story, in his own written opinion in the case, pointed to a way around this. Lawmakers could write into a charter, at the start, a power "to alter, modify, or repeal" it, which means to change it or cancel it. State lawmakers began writing such lines into new charters.

Dartmouth College's own history of the case describes it as a basis for the Constitution's protection of corporations. Supreme Court justices still cite it, as they did in *Citizens United v. FEC*, a 2010 case about money spent on elections, and in *Burwell v. Hobby Lobby*.

The Boston Associates and the mills

A group of Boston merchants, known today as the Boston Associates, built cotton mills with far more money behind them than their rivals had. By 1850, the National Park Service counts, they controlled a fifth of the country's cotton cloth making.

Francis Cabot Lowell, Patrick Tracy Jackson and Nathan Appleton organized the Boston Manufacturing Company in 1813. It started with $400,000 in capital, the money its owners put in, more than ten times the money behind the average cotton mill in Rhode Island. By 1820 the owners had put in $200,000 more.

Waltham. They built a mill at Waltham, on the Charles River, in 1814. It was the first mill in the world to spin cotton into thread and weave it into cloth under one roof, so every step from raw cotton to finished cloth happened in one building.

Within six years the mill ran 5,376 spindles, the rods that twist cotton fibers into thread, and 175 power looms, weaving machines driven by water power. A typical Rhode Island mill ran fewer than 1,000 spindles. The Waltham mill used 450,000 pounds of cotton a year, and by 1820 it used all the power the Charles River could give.

Lowell. The same investors then built mills at Pawtucket Falls, on the Merrimack River. The falls were a fishing place of the Pennacook people, and in the 1600s two Pennacook towns stood there, under the leaders Passaconaway and his son Wannalancet.

What happened to the Pennacook. Native nations fought the English colonies of New England in 1675 and 1676, and Wannalancet kept peace with the English. In 1676 he led about 400 people from the nations allied with him to make peace with an English captain, Richard Waldron. Waldron took them all prisoner.

Officials in Boston hanged seven or eight of the prisoners, and about 200 were enslaved for life and shipped to Barbados. Wannalancet, whom Waldron let go, moved north to Canada with his people. Chapter 14, Work and Workers, tells this in full.

The mill village became a town named Lowell on March 1, 1826. It had 2,500 people that year and 6,477 in 1830.

Whose cotton. Enslaved people in the South grew the cotton the mills spun. The mills also made a cheap cloth, which people at the time called "negro cloth," that planters bought to clothe the people they enslaved. Senator Charles Sumner of Massachusetts called the tie between the mill owners and the slaveholders an "unholy union" between the lords of the loom and the lords of the lash, or whip.

Nicholas Biddle

Who: The head of the Second Bank of the United States, one of the largest companies in the country, who cut off its loans in his fight with President Andrew Jackson.

When and where: Philadelphia, from 1822 or 1823 to 1839.

He cut off loans, hoping people would blame Jackson.

Nicholas Biddle became president of the Second Bank of the United States in 1822 or 1823. The Federal Reserve's own history of the bank describes it as "one of the largest U.S. corporations." Its charter, which President James Madison signed into law on April 10, 1816, ran for 20 years, and the bank opened in Philadelphia in January 1817.

The bank had $35 million in capital, three and a half times the $10 million of the first national bank. The federal government owned a fifth of its stock, and the president chose 5 of its 25 directors, the board that ran it. By the end of the 1820s the bank had at least 25 branches and did about $70 million of business a year.

The Federal Reserve's history states that Biddle "was not above allowing the Bank to make loans to his friends while denying loans to those less friendly."

The fight with Jackson. Andrew Jackson, president from 1829, called the bank unconstitutional, or against the Constitution, and corrupt. Both houses of Congress voted to renew its charter early, in 1832, 28 to 20 in the Senate and 107 to 85 in the House, and Jackson vetoed the bill, refusing to sign it. Chapter 17 tells that fight in full.

After Jackson won a second term, he ordered the government's money moved out of the bank and into banks chartered by the states, and by late 1833 most of it was gone.

Biddle's answer. Biddle cut the bank's lending and called in loans, telling borrowers to pay back what they owed. He believed that a shortage of credit, money to borrow, might turn people against Jackson. In April

1834 a majority of the House of Representatives voted against renewing the charter.

The federal charter ran out in 1836, and Pennsylvania's lawmakers chartered the bank again as a state bank. In 1839 the bank's officers suspended payment: they stopped handing out coins to people who brought in its paper notes. Biddle resigned that year.

What the stockholders found. The bank's stockholders, the people who owned its shares, chose a committee in 1841 to look into its books. The committee members reported that Biddle had used the bank's money to buy cotton, tobacco and other crops and ship them to Europe. The bank closed for good on April 4, 1841.

Charged with a crime. A grand jury, a group of citizens who decide whether there is enough proof for a trial, charged Biddle and two other bank officers with a crime on December 10, 1841. The charge stated that the three men had cheated the stockholders out of $400,000 in 1836 and had tried to cover it up with false records in 1841. Biddle was arrested. Judges later dropped the charges.

Biddle paid the bank's creditors, the people it owed money, with what was left of his own fortune. He faced lawsuits until he died in 1844. In one of them he was sued for nearly $25 million.

1850 to 1900

ERA 7 OF 10 · 1850 TO 1900 · ABOUT 18 MINUTES

A few companies came to control whole industries between 1850 and 1900. One railroad, the Pennsylvania, had more capital in 1880 than the federal government took in that whole year. John D. Rockefeller's Standard Oil refined 90 to 95 percent of the country's oil by 1880, and by 1895 one company controlled about 98 percent of the country's sugar refining.

Rules and soldiers. Members of Congress wrote the first federal rules for big business in these years, and federal lawyers used one of them against striking railroad workers. When workers struck, owners and officials answered with armed guards, court orders and soldiers.

How big was the biggest railroad?

The largest corporation in the country in 1880 was a railroad, the Pennsylvania. That year it had 30,000 workers and $400 million in capital, and it carried 10 percent of all the freight in the United States and 20 percent of the passengers. Federal officials collected about $334 million in all in the year that ended on June 30, 1880, less than the railroad's capital. By 1882 the Pennsylvania was the largest corporation in the world.

Free land. Federal and state officials also gave the railroads land grants, gifts of land from a government. Federal officials granted about 130 million acres to railroad companies from 1850 to 1871, and state lawmakers granted about 51 million acres more. The Illinois Central got the first federal grant in 1851, under a law passed the year before: nearly 2.6 million of the law's 3.75 million acres.

Whose land. The granted land came from land that federal officials had taken, or were taking, from Native nations. The Pacific Railroad Act of July 1, 1862, states: "The United States shall extinguish as rapidly as may be the

Indian titles to all lands falling under the operation of this act." In that law, members of Congress told federal officials to end the Native nations' rights to the land along the railroad as fast as they could.

John D. Rockefeller

Who: The Cleveland businessman who built Standard Oil and set up the first large trust.

When and where: Cleveland and New York, 1870 to 1911.

Movie: *The Men Who Built America* (2012), a History Channel series about Rockefeller, Carnegie, J. P. Morgan and others. It is a docudrama: actors play the real people in scripted scenes.

"Take Standard Oil Stock, and your family will never know want."

John D. Rockefeller used secret deals with the railroads to take over nearly all of the country's oil refining, the work of cleaning crude oil from the ground and separating it into products that people can use.

Rockefeller formed the Standard Oil Company in Ohio on January 10, 1870, with his brother William Rockefeller, Henry M. Flagler and two other partners. The company had $1,000,000 in capital. Its refineries in Cleveland could handle about 1,500 barrels of crude oil a day, out of about 10,000 to 12,000 barrels a day for all the refineries in Cleveland together.

The secret deal. Thomas A. Scott of the Pennsylvania Railroad set up the South Improvement Company late in 1871, a secret deal between a few refiners and the railroads. Rockefeller and his partners controlled 900 of its 2,000 shares. Under the deal, the railroads would charge $2.56 a barrel to carry crude oil to New York, and members would get back $1.06 on every barrel they shipped. That payment was called a rebate.

Members would also get $1.06 in cash on every barrel that their rivals shipped, a payment called a drawback. A rival refiner would pay the full price, and part of what he paid would go to his own competitors.

Oil producers in western Pennsylvania learned of the plan and fought it. They organized, raided the shipments of the scheme's members and asked Pennsylvania's lawmakers and Congress for help. Pennsylvania officials suspended the South Improvement Company's charter on April 2, 1872, and the company never shipped any oil.

The Cleveland buyout. While the scheme stood, in early 1872, Rockefeller bought out at least 21 of the 26 refiners in Cleveland within three months. One refiner later testified that "our establishment was worth $150,000, and we sold it for about $65,000," about forty or forty-five cents for each dollar his business was worth. Rockefeller told the sellers, "Take Standard Oil Stock, and your family will never know want," meaning they would never be poor.

In those months Standard Oil went from refining about 1,500 barrels a day to 10,000. Ida Tarbell, a reporter who later wrote a history of Standard Oil, found that it then held more than a fifth of the country's refining capacity. Rockefeller kept buying out rivals and making deals with railroads for lower rates. By 1880 Standard Oil refined 90 to 95 percent of all the oil produced in the United States.

What a trust was

A trust was a way to run many companies as one business, with one small group in charge, and the Standard Oil Trust was the first large one. More than 40 people who owned shares in Standard Oil signed the Standard Oil Trust Agreement on January 2, 1882.

They handed over their shares in about 40 companies to nine trustees, people who hold and manage property for others. Rockefeller was one of the nine, and the nine trustees themselves owned most of the stock. The trust was valued at about $70 million. In time the trustees ran some 40 corporations, 14 of them fully owned.

Owners in other industries copied the plan, and laws against such combinations of companies are still called antitrust laws.

The Ohio ruling. The justices of the Ohio Supreme Court ruled in 1892 that the Standard Oil Trust was a monopoly, a business with no real rivals, and that it broke Ohio law. Rockefeller moved the property to companies in other states. Ida Tarbell later wrote of the trust, "You could argue its existence from its effects, but you could not prove it." She meant that people could see what the trust did, but they could not prove it existed.

Tobacco and sugar. James B. Duke had gone into the cigarette business in 1881. He leased new machines that rolled cigarettes, advertised heavily and bought up smaller rivals. On January 31, 1890, Duke and the owners of four other firms joined their businesses into one, the American Tobacco Company, the largest tobacco business in the world. Duke's own firm was W. Duke, Sons and Company of Durham, North Carolina. In sugar, the American Sugar Refining Company controlled about 98 percent of the country's sugar refining by 1895.

Franklin Tarbell

Who: An oil producer who fought Standard Oil from 1872 into the 1890s, and the father of the reporter Ida Tarbell.

When and where: Oil Creek and Titusville, Pennsylvania, from 1859 until his death in 1905.

He and scores of other producers pledged not to sell to Standard Oil.

Franklin Tarbell fought Standard Oil for twenty years, and in 1893 he had to mortgage his family's home to pay a ruined partner's debts. His daughter, the reporter Ida Tarbell, told his story in her memoir, published in 1939.

Tanks. Tarbell was on his way home to Iowa in 1859 when he heard about the oil well at Titusville, Pennsylvania. He guessed that oil men would need tanks to hold their oil, and he believed he could build a wooden one that held 500 barrels or more. He was told, "Show me a model that won't leak, and I'll give you an order." He made the model, got the order and built the first large round wooden tank on Oil Creek. For ten years he built tanks.

He began to produce oil himself in 1867, on farms near Rouseville, and in 1870 he moved his family into a new house he had built in Titusville. Ida was thirteen.

The pledge. The oil producers learned of the South Improvement scheme in 1872. Ida remembered her father coming home one night with a grim look on his face. He told the family that he and scores of other producers had signed a pledge not to sell oil to Standard Oil, the one company that had gained from the scheme. Ida, fifteen that year, later wrote that in 1872 "there was born in me a hatred of privilege, privilege of any sort."

Twenty years. The fight between the independent producers and Standard Oil went on for twenty years. The producers waited for slow decisions from the Interstate Commerce Commission, the federal board

set up in 1887 to watch over the railroads, and some of their businesses failed while they waited.

One of Franklin Tarbell's business partners lost everything in this fight and shot himself between 1891 and 1893, while Ida was living in Paris. Ida's memoir does not state the man's name. The partner left Franklin Tarbell owing money on notes, written promises to repay loans. To pay them, during the money panic of 1893, he mortgaged the family's home: he borrowed money and pledged the house, which the lender could take if the loan was not repaid.

His warning. Ida Tarbell later spent most of five years investigating Standard Oil. Her father warned her that Rockefeller and Standard Oil could crush her, just as, in his view, they had crushed her home town of Titusville, a 2012 account in *Smithsonian* magazine says. Franklin Tarbell died in Titusville on March 1, 1905.

Andrew Carnegie

Who: The Pittsburgh steelmaker whose company owned every step of making steel, and whose manager broke the union at Homestead.
When and where: Pittsburgh, until he sold his company in 1901.
Movie: *Andrew Carnegie: The Richest Man in the World*, an American Experience documentary shown on PBS on January 20, 1997.

One company owned the coke, the ore, the ships and the railroad.

Andrew Carnegie cut his costs and raised his profits by owning every step of making steel. That way of running a business is called vertical integration: one company owns each stage of making a product, from the raw material to the finished goods.

Coke and ore. Carnegie already owned 73.5 percent of Henry Clay Frick's coke company by 1888. The company made coke, a fuel baked from coal that steel makers burn to melt iron ore. Carnegie leased newly

found iron ore deposits in the Mesabi Range of Minnesota in the 1890s. The name Mesabi comes from the Ojibwe name for the range, Misaabe Wajiw, which means Big Man Mountain.

Ojibwe land. The Mesabi Range was Ojibwe country. Ojibwe bands gave up northeastern Minnesota to the United States in a treaty of 1854. Federal officials wanted a vein of copper there, on the north shore of Lake Superior. In a treaty of 1855 Ojibwe bands gave up most of north-central Minnesota, where federal officials wanted land for logging and mining.

Ships and a railroad. Carnegie bought ships on the Great Lakes to carry his ore, and he bought a railroad and extended it to link his steel works to Lake Erie. He no longer had to buy coke, ore or shipping from other companies, and that cut his costs. Carnegie Steel was the largest steel maker in the world by the end of the 1890s, and it made a quarter of all the steel produced in the United States. In 1900 it earned $40 million in profits.

Homestead. Carnegie was in Scotland in the summer of 1892. In the words of the encyclopedia Britannica, he gave his general manager, Henry Clay Frick, "carte blanche," or full freedom, "to break the union" at the Homestead works.

BY 1892: Standard Oil had refined 90 to 95 percent of the country's oil as early as 1880. The American Tobacco Company was the largest tobacco business in the world, and Andrew Carnegie owned most of Henry Clay Frick's coke company.

Homestead, 1892

Henry Clay Frick broke the steelworkers' union at the Homestead works near Pittsburgh in 1892 with a fence, a lockout and about 300 armed Pinkerton men. Frick was the general manager of Carnegie Steel. That year he became its chairman, and he owned 11 percent of it. The union was the Amalgamated Association of Iron and Steel Workers, and its contract ran out on July 1, 1892.

The lockout. Frick cut wages and had a fence built around the plant, topped with barbed wire, which the workers called "Fort Frick." In late June he locked the workers out, closing the plant to them. On July 2 he fired all 3,800 workers.

The Pinkertons. Frick signed a contract with William and Robert Pinkerton, who ran the Pinkerton National Detective Agency, for 300 armed men at five dollars a day for each man. Agency officials gathered 316 men in New York and Chicago. Some were Pinkerton regulars. Others had no jobs, some were criminals on the run, and a few were college students earning money for the summer. Their crates held 250 Winchester rifles and 300 pistols.

Early on July 6, 1892, tugboats towed two barges carrying the men up the Monongahela River to the plant. Dawn was breaking when the barges reached the riverbank, where about 10,000 people were waiting, by the count of the historian Leon Wolff. When the Pinkerton men tried to come ashore, shooting broke out on both sides. No one knows who fired the first shot.

The surrender. The gun battle went on all day. Strikers threw dynamite at the barges and sent a burning raft toward them. By late afternoon the Pinkerton men had agreed to surrender, and the crowd beat them as they walked up to the town.

The dead. Counts of the dead differ. The encyclopedia Britannica lists at least 7 workers and 3 Pinkerton men killed in the battle and the days after it. Wolff counts about 9 strikers and 7 Pinkerton men dead from bullets, beatings, drowning and suicide.

Wolff writes that about 40 strikers and 20 Pinkerton men were shot, and he names some of the dead. A Pinkerton guard named Klein died on the gangplank, shot through the head. Joseph Sotak went to help a wounded worker, Martin Murray, and was shot in the mouth and killed. A worker named Streigle was shot through the throat and died at once. Neither Wolff nor Britannica names the men who fired the shots that killed them.

The soldiers. After the battle, Frick asked Governor Robert Pattison of Pennsylvania for help. Pattison sent about 8,500 soldiers of the state National Guard, and they took over the plant on July 12. By July 15 Carnegie Steel's managers had the plant running again with replacement workers.

Many of the replacement workers were Black men from the South, and the union did not let Black workers join it. In November 1892 about 2,000 white workers attacked Black workers and their families, and gunfire badly wounded several people. The accounts do not say who fired. The union gave up on November 21. By then, Wolff counts, 35 men had died from the battle and the violence that followed.

After the strike. Officials charged scores of union leaders and workers with crimes, and almost all of them were found not guilty. Carnegie Steel's managers cut wages in all of Carnegie's mills by about half. A heater's helper, one of the workers who heated the steel, was paid by the ton of steel: he earned 4.85 cents a ton in February 1892 and 2.22 cents a ton in February 1894. The managers enforced the twelve-hour workday.

Employers blacklisted the members of the union's advisory committee for life, putting them on a list of workers the employers agreed never to hire. Members of Congress investigated the use of private armed guards at Homestead, and Frick testified before them.

John W. Holway

Who: A 23-year-old medical student hired as a Pinkerton guard for the Homestead job.

When and where: Chicago to Homestead, Pennsylvania, July 1892.

Movie: *The River Ran Red* (1993), a documentary about the Homestead lockout, directed by Steffi Domike and Nicole Fauteux. It tells the story from the workers' side.

The agency promised "the element of danger" would be "entirely lacking."

John W. Holway was hired to guard the Homestead works, and a crowd there kicked him and beat him with stones. He was studying to be a doctor and was one of the college students who signed up with the Pinkerton agency for summer work at five dollars a day.

The train. The man in charge of the agency's Chicago office would not tell the men where they were going. "The element of danger which is usually found in such expeditions will be here entirely lacking," he told them.

After dark, agency men put Holway and the other Chicago men on a train at the Lake Shore depot. Pinkerton detectives stood guard to stop anyone from getting off, even at the stops in Toledo and Cleveland. The thought struck Holway, Wolff writes, that he was "a sort of prisoner," and he had a feeling that there would be shooting.

The barges. Holway was on the barges at Homestead on July 6. According to Wolff, he does not seem to have fired a shot all day. On the walk up to the town after the surrender, three strikers knocked Holway down, and one of them said, "You have killed two men this morning. I saw you!" As they pushed him up the hill, a stone hit him in the head.

Holway told the congressional committee under oath what happened next. He ran about half a mile, but he was weak and had had nothing to eat or drink, and his legs gave out. A man grabbed him by the back of his

> coat. Then, in Holway's words, "about 20 or 30 men came up and kicked me and pounded me with stones."
>
> "I thought I was about going," he said, meaning about to die, "and commenced to scream." Two or three strikers with rifles then ran up and kept the crowd off him.

The first federal rules, and how they were used

Members of Congress passed the first federal laws to control big business in 1887 and 1890. In the 1890s the justices of the Supreme Court let the sugar trust stand, and federal officials used the second law to break a railroad strike.

The railroads. The Interstate Commerce Act, which set rules for interstate commerce, or trade between the states, became law on February 4, 1887. Under the Act, the five members of a new board, the Interstate Commerce Commission, watched over the railroads. The railroads became the first industry under federal regulation, rules made and enforced by the national government, and the commission was the first federal board of its kind.

The Sherman Act. The Sherman Antitrust Act, named for Senator John Sherman of Ohio, became law on July 2, 1890. Under it, every contract or combination "in restraint of trade" became illegal, meaning any deal that blocks free buying and selling between the states. Trying to monopolize, or to become the only seller of something, also became a crime.

A person found guilty could be fined $5,000 and sent to jail for a year, and people harmed could sue for three times their losses. The law did not define the words "trust," "combination," "conspiracy" or "monopoly."

The sugar case. The justices of the Supreme Court ruled on the sugar trust in 1895, in *United States v. E. C. Knight Co*. The American Sugar Refining Company controlled about 98 percent of all sugar refining in the United States, and the justices ruled that it had not broken the law. They reasoned that making sugar was manufacturing, and that manufacturing was not trade.

Pullman. The Pullman Palace Car Company ran sleeping cars, railroad cars with beds, on trains across the country. Its managers laid off more than 2,000 workers and cut wages by 25 percent in 1893, during a depression, a long time when many businesses fail and many people lose their jobs. The company owned the town where its workers lived, and its managers did not lower the rents. Company president George M. Pullman refused to meet the workers' representatives.

Railroad workers in 27 states, between 125,000 and 250,000 of them, joined a boycott of Pullman cars in 1894, refusing to handle trains that carried them. That year federal officials used the Sherman Act against the workers. A special lawyer working for the US attorney general claimed in court that the strike broke the Sherman Act.

The court order. On July 2, 1894, two federal judges granted the government's lawyer an injunction, a court order that tells people to stop doing something and lets judges jail anyone who breaks it. President Grover Cleveland used the injunction as his reason to send federal troops. The soldiers arrested boycotters and rioters and sometimes shot them, according to the Federal Judicial Center's history of the case.

About 30 people were killed across the country during the strike, and the histories of it do not say who killed each of them.

BY 1900

If you remember one thing: Between 1850 and 1900 a few owners took control of whole industries, and when workers struck, a governor and a president sent soldiers against them.

- 1882: Standard Oil's owners sign the first large trust agreement.
- 1890: Under the new Sherman Antitrust Act, deals "in restraint of trade" become illegal.
- 1892: Frick's Pinkerton men and the Homestead steelworkers fight a gun battle.

Next: After 1900 bankers joined hundreds of firms into giant corporations, and two presidents had their lawyers sue to break up the biggest.

1900 to 1950

ERA 8 OF 10 · 1900 TO 1950 · ABOUT 16 MINUTES

The biggest companies the country had yet seen took shape in these years, and presidents and judges began to break some of them apart. Between 1895 and 1904 owners and bankers joined more than 1,800 manufacturing firms into 157 large corporations. The largest, US Steel, issued more than a billion dollars in stock, shares sold to investors, in 1901.

Breakups and new rules. Presidents Theodore Roosevelt and William Howard Taft had their lawyers sue the biggest combinations. In 1911 the justices of the Supreme Court ruled that Standard Oil and the American Tobacco Company had broken the law, and under court orders both were split apart. Members of Congress passed two more antitrust laws in 1914. In 1934, after the stock market crash of 1929, they passed a law that required companies selling stock to report their finances to the public.

Soldiers of the Colorado National Guard, whose costs the mine owners paid, burned a strikers' tent camp at Ludlow in 1914, and Chicago police killed 10 people during a steel strike in 1937. During the Second World War, federal

officials gave about two-thirds of the value of their main war contracts to 100 companies.

The great merger movement and US Steel

The 157 large combinations of 1895 to 1904 were mergers, in which two or more companies join into one, and more than 60 of them formed in 1899 alone.

Naomi Lamoreaux names the causes in her book *The Great Merger Movement in American Business*. Factories cost a great deal to build, and industries grew fast after 1887. After the depression of 1893 began, rival owners cut their prices against each other in price wars. The owners had made agreements, called pools, to hold prices up, but the price wars went on anyway.

Lamoreaux writes that "there was nothing natural or inevitable," nothing certain to happen, about these combinations. Most of them used more money and work to make the same goods than the new rivals that soon appeared, and in her words they "quickly lost their positions of market dominance," their lead in their markets. The firms that built barriers against rivals, such as US Steel through its control of iron ore, kept their lead longer.

US Steel. The banker J. P. Morgan put US Steel together as a corporation in New Jersey in February 1901. He bought Carnegie Steel for Andrew Carnegie's asking price of $480 million. Other companies went in with it, among them makers of steel, pipe and bridges and the Lake Superior Consolidated Iron Mines, whose ore came from Ojibwe land in Minnesota. Charles M. Schwab was president from 1901 to 1903, and Elbert H. Gary was chairman from 1901 to 1927.

A billion dollars in stock. US Steel was the first company in the world with more than a billion dollars in stock. It issued stock with a stated value of about $1.4 billion.

Government investigators at the federal Bureau of Corporations put the real value of what the company owned at about $682 million, about half the stock issued. So about half of the stock was watered stock, stock issued for more than the property behind it.

Two-thirds of the steel. US Steel made about two-thirds of all the steel in the United States at the start. In 1902 the company employed 168,000 people. By 1911 its share had fallen to less than half.

J.P. Morgan

Who: The Wall Street banker who joined rival companies into giant ones, among them US Steel in 1901.

When and where: New York, 1901 to 1904.

Carnegie named $480 million. Morgan said yes at once.

J. P. Morgan, a banker on Wall Street in New York City, led a wave of mergers around 1900, joining rival companies into single giant ones.

The steel deal. Charles M. Schwab, then president of Carnegie Steel, gave a speech at the University Club in December 1900, and the speech led Morgan to the steel deal. Carnegie named a price of $480 million for his company, and Morgan accepted it at once. Morgan then formed US Steel in 1901 and sat on its finance committee.

Northern Securities. Morgan and the railroad owner James J. Hill also formed the Northern Securities Company in 1901. It was a holding company, a company that owns controlling shares in other companies and does little else. Through it they controlled three railroads: the Great Northern, the Northern Pacific, and the Chicago, Burlington and Quincy. President Theodore Roosevelt's Justice Department lawyers sued to break it up in 1902.

Ida Tarbell

Who: The reporter whose history of Standard Oil, pieced together from court records and sworn testimony, showed how Rockefeller took over the oil business.

When and where: New York and the Pennsylvania oil region, 1900 to 1904.

Rockefeller called her "That poisonous woman."

Ida Tarbell spent most of five years, by her own count, tracing from public records how John D. Rockefeller built Standard Oil. She began in 1900. Her father was Franklin Tarbell, one of the oil producers who had signed the 1872 pledge not to sell oil to Standard Oil.

The records. Tarbell read hundreds of thousands of documents from across the country, among them court records and depositions, sworn testimony taken outside a courtroom and written down. She interviewed employees and lawyers. The writer Mark Twain arranged for her to meet Henry H. Rogers, an officer of Standard Oil, and she interviewed him too.

Her *History of the Standard Oil Company* came out in 19 parts in *McClure's* magazine from November 1902 to October 1904, and as a book in two volumes in 1904.

The widow's plant. In one part, Tarbell told the story of a Cleveland widow, Mrs. Backus, who sold her late husband's plant for making oil for machines to Rockefeller in 1878. Tarbell wrote that he paid her next to nothing. Rockefeller's biographer Ron Chernow tells it differently: the plant was out of date, the widow asked for as much as $200,000, and Rockefeller paid $79,000, including $10,000 added on top. The two accounts of that sale do not agree.

Chernow does call Rockefeller's buyouts of his Cleveland rivals in 1872 "one of the most shameful episodes in his career." Rockefeller called Tarbell "That poisonous woman." He told his advisers, "Not a word about that misguided woman."

What came of it. Her series made many Americans furious with Standard Oil. Smithsonian magazine writes that this public fury is credited with the company's breakup. The breakup came after the justices of the Supreme Court ruled against Standard Oil in 1911.

Theodore Roosevelt

Who: The president known as the trust-buster, whose lawyers won the Northern Securities case.

When and where: Washington, 1901 to 1909.

Movie: *TR: The Story of Theodore Roosevelt*, an American Experience documentary first shown on PBS in October 1996.

His lawyers brought 44 antitrust suits. Taft's brought more.

Theodore Roosevelt is known as the trust-buster, but the president after him had his lawyers bring more antitrust suits. Roosevelt's Justice Department lawyers sued the Northern Securities Company, J. P. Morgan and James J. Hill's railroad holding company, in 1902 under the Sherman Act, the federal law of 1890 against deals that block trade.

The ruling. The justices of the Supreme Court ruled 5 to 4 for the government on March 14, 1904, and upheld the order to break the company up. Justice John M. Harlan wrote for the majority. Justice Oliver Wendell Holmes disagreed, writing, "Great cases like hard cases make bad law." He meant that a case the whole country is excited about stirs up feelings that can bend the judges' thinking.

Who brought more. Roosevelt's lawyers brought 44 antitrust suits in seven and a half years. William Howard Taft, the next president, had his lawyers bring more in four years, at least 75. Taft's lawyers sued US Steel in 1911, and Roosevelt then accused Taft of being unable to tell the good trusts from the bad ones.

Standard Oil and American Tobacco are broken up, 1911

The justices of the Supreme Court ruled against Standard Oil and the American Tobacco Company in May 1911, and both companies were split apart. On May 15 they ruled that Standard Oil of New Jersey had broken the Sherman Act. Chief Justice Edward D. White wrote the court's decision. He wrote that the Sherman Act banned only "unreasonable" limits on trade, a test called the rule of reason. The justices gave the company's owners six months to break it up, and Standard Oil was split into 34 separate companies.

Richer after the breakup. Rockefeller was worth about $300 million in May 1911 and more than $900 million by the end of 1913, three times as much. According to Chernow, Roosevelt said that Wall Street's prayer was now "Oh Merciful Providence, give us another dissolution," asking God for another breakup. In 1916 newspaper headlines called Rockefeller the world's first billionaire. Companies that grew out of Standard Oil later became Exxon, Mobil and Chevron.

Tobacco. The justices ruled against the American Tobacco Company on May 29, 1911. They found that James B. Duke, Benjamin N. Duke, George W. Watts, R. J. Reynolds and others had broken the Sherman Act "by seeking to monopolize practically all sectors of the tobacco industry." Federal judges in New York divided the company's property in November 1911 among a new American Tobacco Company, Liggett and Myers, P. Lorillard, R. J. Reynolds and others. James B. Duke's tie to American Tobacco ended that year.

Two new laws, 1914

Members of Congress passed two laws in 1914 that added to the Sherman Act. President Woodrow Wilson signed the first, the Federal Trade Commission Act, on September 26, 1914. Under it, "unfair methods of competition" became illegal, and the members of a new Federal Trade Commission had the power to make companies obey that rule. The commission opened on March 16, 1915.

The Clayton Act. The second law named business practices the Sherman Act had left vague. Wilson signed it, the Clayton Antitrust Act, on October 15, 1914. It banned price discrimination, charging different buyers different prices for the same goods. It also banned deals that tied a buyer to one seller, mergers that cut down competition, and the same people sitting on the boards of competing companies.

The Clayton Act also stated "that the labor of a human being is not a commodity or article of commerce," not a thing to be bought and sold. Under that section, federal lawyers and judges could no longer treat unions as illegal combinations, as they had used the Sherman Act against the railroad workers of the Pullman boycott in 1894.

Ludlow, 1914

Soldiers of the Colorado National Guard, the state's part-time army, burned the tent camp of striking coal miners at Ludlow, Colorado, on April 20, 1914. The mine owners were paying the Guard's costs. At least 19 people were killed, 13 of them women and children. Most of the strikers worked for the Colorado Fuel and Iron Company, whose main stockholder, the person who owned the most shares, was John D. Rockefeller Jr.

The strike. The miners struck in September 1913. In October men in a company armored car known as the "Death Special" fired on their tent camp at Forbes and killed one person. Governor Elias M. Ammons sent the Colorado National Guard.

The fire. Fighting broke out at the tent camp at Ludlow on April 20, 1914. Nobody knows who fired the first shot. Guardsmen set the tents on fire. Thirteen women and children had hidden in a pit dug under a tent, and they suffocated there, dying for lack of air. One guardsman and five miners were also killed in the fighting. Guardsmen shot the strike leader Louis Tikas three times in the back.

President Wilson sent the US Army on April 28. The strike ended in December 1914, and the union won none of its goals.

Leaded gasoline, 1924 to 1926

The leaders of three of the largest companies in the country kept selling a lead fuel additive in the 1920s after workers who made it died. The additive was tetraethyl lead, a liquid made with lead. Researchers at General Motors added it to gasoline to stop engine knock, a pinging sound in the engine. General Motors and Standard Oil of New Jersey formed the Ethyl Gasoline Corporation in August 1924 to sell it, and DuPont made it. Chapter 13 tells the whole story of the additive.

The dead. Workers died at plants and a laboratory of all three companies. Seven men died and 33 went to the hospital after working at Standard Oil's Bayway refinery in Elizabeth, New Jersey, in October 1924, by the count of Bill Kovarik, who wrote a history of leaded gasoline in 2005. Other accounts count five dead. Kovarik counts ten more dead at a DuPont plant and at least two dead at General Motors' laboratory in Dayton, Ohio.

Poisoned workers at Bayway were "black and blue from uncontrolled muscle spasms." Some had to be tied into straitjackets, coats that hold a person's arms tight against the body.

"A gift from heaven." The Surgeon General, the head of the federal public health service, called a meeting about the additive on May 20, 1925. Frank Howard of Standard Oil said there that the industry could not give up "what has come to the industry like a gift from heaven." The companies kept selling it. Robert Kehoe, a scientist paid by the Ethyl company, then set out a theory of a "safe level" of lead that the companies' leaders relied on for decades.

Who ran the corporations? 1932

Hired managers, not owners, ran the 200 largest corporations outside banking, two writers showed in 1932, and those 200 held about half of the country's corporate wealth. Adolf Berle and Gardiner Means counted them in their book *The Modern Corporation and Private Property*. By 1930 the 200 held 49.2 percent of the country's corporate wealth. The scholar Gerald F. Davis later worked out that at the same pace they would have held all of it by 1959.

Berle and Means also found that the ownership of these companies was split among many scattered shareholders, so the managers made the decisions.

The Securities and Exchange Commission, 1934

After the stock market crash of 1929, members of Congress passed a law that required companies selling stock to report their finances to the public. President Franklin D. Roosevelt signed it, the Securities Exchange Act, on June 6, 1934. Under it, the members of a new Securities and Exchange Commission, or SEC, watched over the stock markets. The yearly and quarterly reports that such companies still file with the SEC began with this law.

The fox and the hen house. Roosevelt made Joseph P. Kennedy the first chairman of the SEC in the summer of 1934. Kennedy had made money in the stock market using the same practices the new law banned, and he had given, lent and raised money for Roosevelt's 1932 campaign.

Newspaper writers said the choice was "like putting the fox in the hen house." In private, Roosevelt answered, "set a thief to catch a thief." Both sayings meant the same thing: Roosevelt had put a man who had used those practices in charge of stopping them. Kennedy resigned in September 1935.

Spies, guns and company police, 1936 to 1940

Senators on a committee led by Senator Robert M. La Follette Jr. of Wisconsin held hearings from 1936 to 1940 on how employers fought unions. Witnesses told the senators that company managers had planted spies inside unions and hired their own police forces. The managers had also stored up weapons, among them submachine guns, rifles and tear gas.

Memorial Day, 1937. Several hundred men, women and children marched toward the Republic Steel plant in Chicago on Memorial Day, May 30, 1937, to support striking steelworkers. Republic Steel's chairman was Tom M. Girdler.

At the plant, 264 Chicago police threw tear gas at the marchers, fired their guns and beat them with clubs. The police killed 10 people and shot 40, and more than 90 people were hurt in all. The senators on the La Follette committee found that the police had used "excessive force," far more force than was needed.

Hawaii's Big Five

Five companies in Hawaii, known as the Big Five, controlled about 94 percent of the islands' sugar crop by 1920, by the count of the historian Carol MacLennan. Two of them were Castle and Cooke and Alexander and Baldwin.

The same people sat on the boards of several of the firms, and together they controlled shipping, banking and stores in the islands. Four of the firms together owned nearly three-quarters of the Matson shipping line, which carried 80 percent of the cargo between the mainland and Hawaii.

The overthrow. Hawaii was a kingdom with its own rulers until 1893. On January 17 of that year, a group of mostly American businessmen calling themselves the Committee of Safety moved against Queen Lili‘uokalani. John L. Stevens, the United States minister to Hawaii, was the American government's representative there. He had 162 US sailors and Marines brought ashore from a warship.

The queen's soldiers and police did not fight. She gave up her power under protest, to the United States rather than to the committee. Chapter 23, America and the World, tells the overthrow in full.

Some children of Big Five partners were members of the Committee of Safety, which then pressed for the United States to annex the islands, or take them over. The Big Five's plantations stood on the land of Native Hawaiians, the Kanaka Maoli. From 1893 into the 1950s, the owners of the Big Five dominated Hawaii's economy and government.

War contracts, 1940 to 1944

A small number of large companies received most of the government's war business during the Second World War. Robert Higgs, writing for the Independent Institute in 1995, gives the figures for prime contracts, contracts made directly between the government and a company, from 1940 to 1944. The 100 companies with the most contract money received about two-thirds of the value of those contracts, the top 10 received about 30 percent, and General Motors alone received nearly 8 percent.

Federal officials also paid for new factories and rented them to private companies. Just 26 companies had the use of half the value of all those government-paid factories as of June 30, 1944.

BY 1950

If you remember one thing: Judges split up Standard Oil and American Tobacco in 1911, but the biggest corporations kept growing through the next forty years.

One number: 49.2 percent. By 1930 the 200 largest corporations outside banking held that share of the country's corporate wealth, and at the same pace, Gerald F. Davis worked out, they would have held all of it by 1959.

Next: After 1950 the largest companies had hundreds of thousands of workers each, and their leaders organized to win influence in Washington.

1950 to 2000

ERA 9 OF 10 · 1950 TO 2000 · ABOUT 16 MINUTES

Companies grew so large in these years that General Motors had 618,365 workers in the United States in 1979, and the Bell telephone system had about a million in the early 1980s. From the 1970s, business leaders organized to win influence in Washington. By 1982 more than 2,400 firms paid lobbyists registered there to persuade lawmakers.

Products and disease. The leaders of some companies kept selling products that studies linked to disease and death. Tobacco companies paid for advertisements in 1954 in which their leaders disputed studies linking smoking to lung cancer, and in 1994 heads of tobacco companies told a House hearing that they did not believe nicotine is addictive.

Breakups. AT&T's leaders agreed with federal lawyers to split up the Bell System, and the split took effect in 1984. Federal lawyers won a ruling in 1999 that Microsoft held a monopoly, and in 2001 an appeals court agreed that Microsoft had broken the law to keep it.

General Motors

General Motors was the country's largest car maker in the 1950s, and in 1953 it sold more to the armed forces than any other company. In 1954 it sold about half of all new cars in the country, 54 percent by the Associated Press's count.

A billion dollars. In 1955 GM became the first company to earn more than a billion dollars in profit in one year. In the first three quarters of that year alone it made $912,887,537 in profit. *TIME* magazine wrote, "Never before in history has one corporation made so much in so short a time." GM's workforce in the United States peaked at 618,365 in 1979, which made it the largest private employer in the country, according to an Associated Press timeline.

"Good for General Motors." President Dwight D. Eisenhower chose GM's president, Charles E. Wilson, as Secretary of Defense in January 1953. Wilson gave up a salary of $600,000 a year for one of $22,000. He owned 40,000 shares of GM stock, and GM sold more to the armed forces than any other company. As Secretary of Defense he could make decisions that helped or hurt GM, so at his hearing senators pressed him on that conflict.

Senator Robert C. Hendrickson asked whether Wilson could make a decision that went strongly against GM's interest. Wilson answered, "Yes, sir, I could." But he said he could not imagine one, "because, for years, I thought what was good for our country was good for General Motors, and vice versa," meaning the other way around. People soon repeated his words as "What is good for General Motors is good for the country."

Ralph Nader. Ralph Nader criticized the safety of GM's Corvair car in a 1965 book called *Unsafe at Any Speed*. GM managers hired private detectives to look into Nader's private life, and in 1966 GM's president, James M. Roche, apologized to a Senate committee. That same year members of Congress passed the National Traffic and Motor Vehicle Safety Act, the first federal rules for how cars must be built.

Nader sued GM for invading his privacy and settled for $425,000, which he used to start groups that work for consumers. GM stopped making the Corvair in 1969.

Eisenhower's warning, 1961

President Dwight D. Eisenhower warned the country about the power of the arms makers and the armed forces together in his farewell speech, on January 17, 1961. "In the councils of government," he said, "we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex."

By the military-industrial complex he meant the ties between the armed forces and the companies that made their weapons. He meant that the people making the government's decisions had to keep the arms makers and the armed forces from gaining power they had no good reason to have, whether they went looking for it or not. The weapons makers were the same kinds of large companies that had received most of the war contracts of 1940 to 1944.

What was a conglomerate?

A conglomerate was one company that owned many businesses that had nothing to do with each other. Harold Geneen ran the company ITT from 1959 to 1977, and in those years ITT bought more than 250 companies in more than 80 countries. They included the Sheraton hotel chain, Avis car rental, the Hartford insurance company and Continental Baking, the maker of Wonder Bread.

ITT's yearly sales grew from about $700 million to $17 billion, and it became the eleventh-largest corporation in the country. Geneen believed that good managers could make a success of any business.

ABC and Chile. ITT's leaders tried to buy the ABC television network for $700 million in 1966, and federal antitrust officials stopped the deal. In Chile, officials under President Salvador Allende took over ITT's company there. ITT's leaders later admitted that the company had given the CIA, the American spy agency, $350,000 for "political" purposes in Chile.

Business organizes in Washington

Heads of large companies built up their own political power in Washington in the 1970s.

The Powell memo. The lawyer Lewis F. Powell Jr. sent a private memo to Eugene B. Sydnor Jr. of the US Chamber of Commerce, a national group of businesses, on August 23, 1971. Its title was "Attack On American Free Enterprise System." Powell wrote that critics of business now came from "the college campus, the pulpit (preachers in churches), the media" and from politicians. He urged business leaders to keep "constant surveillance," or a close watch, on textbooks and television programs.

President Richard Nixon nominated Powell to the Supreme Court on October 21, 1971, less than two months later. The newspaper columnist Jack Anderson made the memo public in September 1972. That year the Chamber's leaders set up a 40-person working group on the memo, and in late 1973 they approved plans for business to act in education, in communications, in politics and in the courts.

The Business Roundtable. Three groups of company heads joined to form the Business Roundtable on October 13, 1972. Its founders included John D. Harper of Alcoa and Roger Blough, the retired head of US Steel. They set out to fight the growing power of unions, especially construction unions.

Offices and lobbyists. Company heads opened offices in Washington, and by 1978 more than 500 corporations had one. They also hired lobbyists to persuade lawmakers. Firms with registered lobbyists went from 175 in 1971 to 2,445 in 1982, about 14 times as many.

Money for candidates. Companies also set up political action committees, or PACs, groups that collect money and give it to candidates. Officials of the Federal Election Commission counted 89 company PACs at the end of 1974 and 1,206 at the end of 1980, more than 13 times as many.

Rules removed. In the same years, members of Congress voted to take federal rules off three industries, and President Jimmy Carter signed each law. The airline law of 1978 began ending federal officials' control over which

routes airlines flew and what they charged, and the federal board that had set them closed in 1984.

The banking law of 1980 ended, over six years, the limits on the interest banks could pay savers. The trucking law of 1980 let trucking companies set many of their own prices and made it easier for new companies to start. Each law took power over prices from federal officials and gave it to the companies.

What did the companies say when their products hurt people?

Heads of tobacco companies publicly disputed the evidence that smoking causes disease and that nicotine is addictive for forty years, from 1954 to 1994. The major American tobacco companies ran an advertisement called "A Frank Statement to Cigarette Smokers" in more than 400 newspapers on January 4, 1954, and it reached about 43 million people.

In it, the companies' leaders disputed new scientific studies that linked smoking cigarettes to lung cancer. The public relations firm Hill and Knowlton, a company paid to shape what the public thinks of its clients, designed it.

The 1963 memo. Addison Yeaman, the chief lawyer of the Brown and Williamson tobacco company, wrote a memo on July 17, 1963. To protect its earnings, he wrote, the industry must "either a) disprove the theory of causal relationship or b) discover the carcinogen or carcinogens...and demonstrate our ability to remove or neutralize them." He meant that the companies had to either show that smoking does not cause cancer, or find the substances in smoke that do cause it and show they could take them out or make them harmless.

The 1994 hearing. Representative Ron Wyden asked seven tobacco company heads whether nicotine is addictive at a hearing in the House of Representatives on April 14, 1994. William Campbell of Philip Morris answered, "I believe nicotine is not addictive, yes." James Johnston of R. J. Reynolds said cigarettes "clearly do not meet the classic definition of addiction." Joseph Taddeo of US Tobacco said, "I don't believe that nicotine or our products are addictive."

The settlement. Four cigarette makers, Philip Morris, R. J. Reynolds, Brown and Williamson and Lorillard, signed an agreement on November 23, 1998, with the attorneys general, the chief lawyers, of 46 states. The attorneys general had sued to get back what their states spent treating sick smokers. The companies' leaders agreed to pay at least $206 billion over the first 25 years and to limit their advertising.

Asbestos. Asbestos is a mineral that separates into thin, strong fibers, and builders used it to fireproof and insulate buildings. When people breathe asbestos fibers in, the fibers can stay in the lungs for years. They scar the lungs and can cause asbestosis, a lung disease that brings shortness of breath, coughing and lasting lung damage. They can also cause mesothelioma, a cancer of the thin linings of the chest and belly. The illness can take 10 to 40 years or more to show.

Johns-Manville was once the largest maker of asbestos products in the country. Andrew Hansen began working at a shipyard in 1940, tearing old insulation out of ships and putting new insulation in. Most of it was made by Johns-Manville and contained asbestos. In 1978, at 65, he was found to have asbestosis and mesothelioma, and he died 13 months later. His widow sued the company.

What the company knew. Dr. Kenneth Smith, Johns-Manville's medical director until 1966, gave sworn testimony in the case. He said that in the 1940s he had told the company's leaders about the danger asbestos posed to insulation workers and had urged warnings on its insulation products, and that they did not act on his advice.

Johns-Manville's lawyers answered that the company began putting warnings on its products in 1964, as soon as science proved a link between its products and asbestosis. The jury found for Hansen's widow, and in 1984 a federal appeals court upheld that finding against the company.

By 1981, while her case was still in the courts, Johns-Manville faced 9,300 lawsuits brought by 12,800 people who sued over illness from asbestos. Its leaders filed for bankruptcy, a court process for a company that cannot pay its debts, in August 1982. Under the filing, all the injury lawsuits against the

company were put on hold. By the end of 1988, more than 12,600 claims, almost $500 million in all, had been paid from a fund set up in the bankruptcy to pay for injuries.

Bhopal. More than 40 tons of a poison gas called methyl isocyanate leaked from a pesticide plant in Bhopal, India, a factory that made poisons to kill insects, on December 3, 1984. Union Carbide India Limited, part of the American company Union Carbide, ran the plant.

How it happened. Union Carbide's leaders had planned to close the plant, which was losing money. Instead they cut many jobs to run it for less, among them maintenance engineers. In June 1984 the unit that kept the gas cold was shut down, to cut the plant's use of electricity by 18 percent. Weeks before the leak, the machine meant to clean escaping gas was turned off too: on October 23 by the date in a report by France's environment ministry, or three weeks before by a 2005 medical review.

On December 2, 1984, the plant's senior managers ordered some pipes cleaned with water. A broken valve let about a ton of that water into a tank holding 40 tons of the gas, and on December 3 the gas escaped into the air. Neither report names the people who turned off the gas-cleaning machine or shut down the cooling unit.

What the gas did. The gas damaged people's eyes, causing redness and sores, and it filled their lungs with fluid. It killed about 2,000 people in the first hours, according to Britain's Health and Safety Executive, a government safety agency. The 2005 medical review, by Edward Broughton, gives about 3,800 dead at once, and 15,000 to 20,000 early deaths reported over the next twenty years.

At first Union Carbide's leaders tried to keep the company free of legal blame. Later they said the company accepted "moral responsibility," and the company paid $470 million to the government of India.

The Bell System is split, 1984

AT&T's Bell System held about $150 billion in property and employed about a million people in the early 1980s. Justice Department lawyers had sued AT&T in 1974. In January 1982 AT&T's leaders and the Justice Department's lawyers agreed that AT&T would give up its local telephone companies.

In return, a 1956 court order that had kept AT&T out of the computer business was lifted, and most newspapers reported the deal as a win for AT&T. Judge Harold H. Greene approved the deal with changes, and the case was closed on August 24, 1982.

The Baby Bells. The local companies became seven regional companies, called the Baby Bells, on January 1, 1984. AT&T kept its long-distance service, its research center, Bell Labs, and its equipment maker, Western Electric. It kept $34 billion of the $149.5 billion in property it had held the day before, less than a quarter, and it had 636,000 fewer workers.

Bill Gates

Who: The head of Microsoft when federal and state lawyers sued it for keeping an illegal monopoly on the software that runs personal computers.

When and where: Redmond, Washington, and Washington, D.C., 1998 to 2001.

Movie: *Inside Bill's Brain: Decoding Bill Gates* (2019), a Netflix series directed by Davis Guggenheim.

A judge ordered his company split in two.

Bill Gates founded Microsoft and ran it as its chief executive until January 2000, so he was in charge when a federal judge found that it held an illegal monopoly. Microsoft made Windows, the operating system, or main program, that ran most personal computers and the other programs on them.

The case. Lawyers for the Justice Department, the attorneys general of twenty states and the District of Columbia sued Microsoft on May 18, 1998. The main question was whether Microsoft could bundle its web browser, Internet Explorer, the program people use to look at websites, with Windows. To bundle it meant to build it into Windows, which made it harder for rival browsers such as Netscape Navigator to win users.

On tape. Gates answered the government lawyers' questions in a deposition that was filmed on videotape. A person who was there called him "evasive and nonresponsive," dodging the questions. According to *Businessweek* magazine, the government lawyers used snippets of emails to show that many of his denials were false.

The rulings. Judge Thomas Penfield Jackson found on November 5, 1999, that Microsoft held a monopoly. On June 7, 2000, he ordered the company split into two, one for Windows and one for its other software. On June 28, 2001, seven judges of the federal appeals court agreed that Microsoft had illegally kept its monopoly, but they threw out the breakup order, partly because Jackson had talked about the case to reporters while it was still going on.

No breakup. Attorney General John Ashcroft announced on September 6, 2001, that Justice Department lawyers would no longer seek a breakup. The government's lawyers settled with Microsoft on November 1, 2001. Microsoft's leaders agreed to share some of the company's technical information with other companies and accepted a panel of three investigators with full access to its systems.

Steve Young

Who: A Vlasic pickle executive who described what it was like to sell to Walmart.

When and where: The late 1990s to January 2001. His account was published in December 2003.

Movie: *Is Wal-Mart Good for America?* (FRONTLINE, PBS, 2004), a documentary about Walmart.

Walmart sold a gallon of Vlasic pickles for $2.97.

Steve Young watched Walmart's buyers push his company's pickles to a price that left almost no profit. He was vice president of grocery marketing for pickles at Vlasic. The reporter Charles Fishman told his story in *Fast Company* magazine in December 2003.

The jar. A Walmart buyer saw Vlasic's gallon jar of pickles in the late 1990s and began talking about it with Pat Hunn, the head of Vlasic's Walmart sales team. The jar went into every Walmart, about 3,000 stores, at $2.97. At that price Vlasic and Walmart each made a penny or two a jar, if that. Young said each store sold about 80 jars a week, which came to 240,000 gallons of pickles a week.

Walmart was 30 percent of Vlasic's business. Young says shoppers who used to buy Vlasic's pickle spears and chips at supermarkets bought the cheap gallon jar instead, and Vlasic's profits from pickles fell by 25 percent or more.

The threat. Young says Vlasic's managers asked to raise the price. He remembers the Walmart buyers' answer: "If you do that, all the other products of yours we buy, we'll stop buying." He called it "a clear threat." Hunn remembers the buyers saying, "We want the $2.97 gallon of pickles. If you don't do it, we'll see if someone else might."

Later, Walmart's buyers let Vlasic shrink the jar to just over half a gallon, at $2.79. Vlasic filed for bankruptcy in January 2001, though everyone involved agrees that the gallon jar was not a main cause.

Why this story is here: A buyer as large as Walmart could name its price, even a price that left the seller almost nothing.

BY 2000

If you remember one thing: Between 1950 and 2000 the biggest companies had hundreds of thousands of workers, and from the 1970s their leaders built up their own power in Washington.

One question this era leaves open: The Bell System was split up in 1984 under a deal a judge approved, but in 2001 appeals judges threw out the order to split Microsoft in two. Would judges order a giant company split up again? The next era answers it.

Next: After 2000 three American companies came to be worth more than $4 trillion each, and government lawyers took four of the largest technology companies to court.

2000 to Today

ERA 10 OF 10 · 2000 TO TODAY · ABOUT 13 MINUTES

Three American companies, Nvidia, Apple and Alphabet, the company that owns Google, were each worth more than $4 trillion in September 2026. In the same years government lawyers took four of the largest technology companies to court over monopoly power. Walmart employed about 1.6 million people in the United States in 2026, by its own count, about 2.6 times General Motors' American workforce at its peak in 1979.

Fraud and a rescue. A federal jury convicted Enron's former chief executives of fraud in 2006. Purdue Pharma, the maker of the pain pill OxyContin, pleaded guilty to federal crimes in 2007 and again in 2020. Lehman Brothers failed in 2008, and members of Congress set aside $700 billion that year to rescue banks and other companies.

The four cases. The four technology companies taken to court were Google, Meta, Amazon and Apple. By September 2026 judges had ruled twice that Google broke the law and once for Meta, and the Amazon and Apple cases had not come to trial.

How big are the biggest companies?

Nvidia became the first company worth $5 trillion on October 29, 2025, according to the business news network CNBC. A company's worth, its market value, is the price of one share times the number of shares, and it changes every day the stock market is open. The investment website The Motley Fool listed the three most valuable companies in the world on September 7, 2026: Nvidia at about $5.6 trillion, Apple at about $4.7 trillion and Alphabet at about $4.1 trillion.

Workers. Walmart reported $713.2 billion in revenue, the money it took in, for the year that ended on January 31, 2026. Its 2026 annual report records about 2.1 million workers around the world, about 1.6 million of them in the United States, and about 92 percent of its American workers were paid by the hour. At that time it had more than 10,900 stores in 19 countries.

Amazon's yearly report to the government for 2025 states that it employed about 1,576,000 people at the end of that year. It also used independent contractors, workers paid for each job who are not employees, and temporary workers, and neither group is counted in that number.

Fraud and harm at the top

Judges and juries found that leaders of several large companies of these years had deceived the public, and Purdue Pharma's leaders admitted it in guilty pleas.

Enron. Enron, an energy company in Houston, Texas, filed for bankruptcy on December 2, 2001. Its workers had much of their retirement savings in Enron stock. At the end of 2000, 62 percent of the money in the company's retirement plan was in its own shares, according to the Congressional Research Service, which does research for Congress.

The shares fell from more than $80 each in January 2001 to less than 70 cents in January 2002, less than a hundredth of their old price. A lawsuit claimed that Enron had blocked its workers from moving their retirement money out of Enron stock while the price fell.

A federal jury in Houston convicted Enron's former chief executives, Kenneth L. Lay and Jeffrey K. Skilling, on May 25, 2006. The jury found them guilty of conspiracy, planning a crime together with others, and of fraud, lying or cheating to get money. According to the Justice Department, the two men had lied to investors and others to make Enron look healthy, as if it were growing steadily and had no large debts or losses. Their lies pushed up the price of Enron's stock.

Tobacco in court. Federal Judge Gladys Kessler ruled on August 17, 2006, that the major tobacco companies had broken the federal racketeering law, the law against running a business through a pattern of fraud. She found that the companies had "defrauded the American people by lying for decades about the health risks of smoking and their marketing to children."

She wrote that they had "marketed and sold their lethal products with zeal, with deception," meaning with great eagerness and with lies, and that they had cared only about their profits, "without regard for the human tragedy or social costs that success exacted," the price other people paid for it. She ordered them to publish statements about the harm of smoking and about how addictive nicotine is.

Purdue Pharma. Purdue Pharma made OxyContin, a pain pill and an opioid, a drug from the same family of chemicals as heroin. The first wave of opioid overdose deaths, from 1999, came from prescription opioids, after doctors wrote more opioid prescriptions in the 1990s, according to the federal Centers for Disease Control and Prevention. CDC researchers count about 806,000 Americans who died of opioid overdoses from 1999 to 2023, from all kinds of opioids.

Guilty pleas. Purdue pleaded guilty in May 2007 to misleading the public about the risk of becoming addicted to OxyContin, and it agreed to pay $600 million. Its president, Michael Friedman, its top lawyer, Howard R. Udell, and its former chief medical officer, Paul D. Goldenheim, also pleaded guilty. They admitted to misbranding, selling a drug with false or misleading claims about it, and together they paid $34.5 million.

Purdue pleaded guilty again on November 24, 2020, to three federal felonies, which are serious crimes. No member of the Sackler family, which owned Purdue, was charged with a crime.

Attorneys general of 55 states and territories joined a $7.4 billion settlement with Purdue and the Sacklers on June 16, 2025, according to the New York attorney general's office. Federal Judge Madeline Cox Arleo sentenced Purdue to pay $5.5 billion on April 28, 2026, as CNBC and Reuters reported. She said she could not send Purdue's executives or owners to prison, because Justice Department lawyers had charged only the company.

More than 40 people spoke at the sentencing. Judge Arleo said, "Your government failed you." New York's attorney general announced on May 1, 2026, that Purdue had shut down. A new company, Knoa Pharma, took over, with no role for the Sacklers.

The 2008 rescue

The investment bank Lehman Brothers failed in 2008, and members of Congress voted public money to rescue banks and other companies.

Lehman Brothers. Lehman Brothers filed the largest bankruptcy in the country's history on September 15, 2008. It had about $639 billion in property and $619 billion in debts, according to the reference publisher EBSCO. Its chief executive was Richard S. Fuld Jr.

Investigators later looked into whether Lehman's executives, Fuld among them, had moved money and raised their own pay just before the bankruptcy. EBSCO's entry states that Fuld "walked away with $480 million" but does not say over what years he received it.

Repo 105. Anton R. Valukas, an investigator named by the bankruptcy court, reported in March 2010 on deals that Lehman's managers called Repo 105. They had used the deals to make the firm's books look stronger at the end of each quarter, the three-month periods for which companies report their results. Officials of the Securities and Exchange Commission reported in 2011 that it would be hard to prove that Lehman had broken the law. No Lehman executive was charged with a crime.

The rescue. Members of Congress passed the Emergency Economic Stabilization Act on October 3, 2008. It allowed up to $700 billion to rescue banks and other companies. Federal officials paid out $443.5 billion in all, and most of it was paid back. Auditors at the Government Accountability Office, which checks federal spending for Congress, put the final cost at $31.1 billion in December 2023.

Some parts of the rescue made money, and others lost it. The money put into banks under the Capital Purchase Program earned a profit of $16.3 billion. The rescue of the insurance company AIG, the loans to car makers and the housing programs all cost money, and the housing programs cost the most. The car loans began with $13.4 billion that President George W. Bush announced in December 2008.

Antitrust returns

Government lawyers brought monopoly cases against four of the largest technology companies in the 2020s. By September 2026 they had won two cases against Google and lost one against Meta, and two more were waiting for trial. Neither judge in the Google cases ordered Google to sell off part of its business.

Google search. Federal Judge Amit P. Mehta ruled on August 5, 2024, that Google had illegally kept monopolies in general internet search and in search advertising. On September 2, 2025, he refused to make Google sell its Chrome browser or its Android phone software. Then, on December 5, 2025, he ordered Google to share its search index, the huge list of web pages a search engine keeps, and some user data with rival companies. A committee of five technical experts was to oversee it.

Google's lawyers appealed. In late July 2026 Justice Department lawyers filed a brief, a written argument, with the appeals court, according to the news service Courthouse News. They asked the court to keep the ruling and to ban Google's large payments to companies such as Apple. Under those deals, Google is the search engine that the companies' products use unless the user changes it.

Google advertising. In a second case, federal Judge Leonie Brinkema ruled in April 2025 that Google had illegally monopolized the tools that websites use to sell advertising space. Her opinion on what Google must do was made public on September 16, 2026. She refused to make Google sell its advertising exchange, the online market where websites sell ad space to advertisers, and ordered new rules for how the tools work.

The National Law Review reported the opinion in an article by a writer for Chamber of Progress, a group funded by the technology industry.

Meta. The Federal Trade Commission's case against Meta was about its purchases of Instagram in 2012 and WhatsApp in 2014. The trial began on April 14, 2025, and Judge James Boasberg ruled for Meta on November 18,

2025. He found that Meta did not hold a monopoly, because TikTok and YouTube competed with it. FTC lawyers appealed on January 20, 2026, and in August 2026 the appeals judges had not yet set a date to hear the case.

Amazon and Apple. FTC lawyers and 17 state attorneys general sued Amazon on September 26, 2023, for keeping an illegal monopoly. Judge John H. Chun set the trial for March 29, 2027, and he will decide the case himself, without a jury. Justice Department lawyers and 16 state attorneys general sued Apple on March 21, 2024, for monopolizing the market for smartphones. On June 30, 2025, Judge Julien Neals refused Apple's request to throw the case out.

Lina Khan

Who: A law student whose 2017 article argued that the people who enforce antitrust law were missing Amazon's kind of power, and who later led the Federal Trade Commission.

When and where: New Haven, Connecticut, and Washington, D.C., 2017 to 2025.

At 32 she became the youngest head of the FTC.

Lina Khan argued that the judges and officials who enforce antitrust law had stopped looking at the kind of power Amazon held, and she later ran the agency that sued Amazon. She published her argument in the *Yale Law Journal* in 2017, while she was a student at Yale Law School, under the title "Amazon's Antitrust Paradox," a paradox being something that seems to contradict itself.

Her argument. She wrote that those judges and officials had come to judge competition mainly by whether prices went up. In her view, that test missed the power Amazon's leaders built by accepting losses while the company spread into selling, delivery, publishing and cloud computing, renting out computer storage and computing power over the internet. They could use the company's place in one business to gain in another.

The diapers. Her article gave an example. In 2009 Amazon's leaders wanted to buy Quidsi, the company that ran the website Diapers.com, and Quidsi's owners said no. Amazon then cut its prices for diapers and other baby goods by up to 30 percent. Quidsi's executives worked out that Amazon was on track to lose $100 million in three months on diapers alone. Amazon bought Quidsi the next year, and by February 2012 it had cut the discounts it gave parents from 30 percent to 20 percent, she wrote.

At the FTC. Members of the Senate confirmed her to the Federal Trade Commission by a vote of 69 to 28 on June 15, 2021. President Joe Biden chose her as the commission's chair, and she was sworn in the same day. At 32 she was the youngest chair in the agency's history, according to CNBC. Under her, FTC lawyers sued Amazon in 2023 and carried on the case against Meta.

Her critics. Robert D. Atkinson and Michael R. Ward of the Information Technology and Innovation Foundation, a research group funded partly by technology companies, argued in a 2023 report that her 2017 article misread how online markets work. Khan served as chair until January 20, 2025.

Corporate money in politics

Corporations and unions have been able to spend without limit on elections since 2010, as long as they do not work directly with a candidate. The justices of the Supreme Court ruled 5 to 4 on January 21, 2010, in *Citizens United v. Federal Election Commission*, that "the Government may not suppress political speech based on the speaker's corporate identity." That meant the government could not silence speech about politics just because a corporation was doing the speaking.

The case. The case began with a film that a non-profit corporation had made to attack Hillary Clinton. Federal law had barred the group from advertising it close to the election.

Super PACs. After the ruling, committees called super PACs could raise and spend unlimited sums. Researchers at the Brennan Center for Justice, a law and policy institute, count about $6.4 billion that super PACs spent on federal elections from 2010 to 2022. In the 2024 election they spent at least $2.7 billion. That year, spending by groups that do not have to name their donors passed $1 billion, spending people call dark money.

Lobbying. Companies and other groups also pay lobbyists. Organizations spent $5.08 billion on lobbying the federal government in 2025, the first year above $5 billion, according to OpenSecrets, a group that tracks money in politics. That year 15,768 organizations reported lobbying, and the US Chamber of Commerce spent the most, $72.1 million.

Working for a company without being employed by it

Some companies now pay people for work without hiring them as employees. Ride and delivery companies call their drivers independent contractors. The federal law on the minimum wage and overtime pay is the Fair Labor Standards Act, and its rules apply to employees but not to independent contractors, according to the Department of Labor.

How many. The count of Americans who do this kind of work depends on the question asked. Researchers at the Bureau of Labor Statistics, the federal agency that counts jobs, found 1.6 million people in May 2017 who found work through an app or a website, 1.0 percent of all workers. Researchers at the Pew Research Center found in 2021 that 16 percent of American adults had ever earned money through an online job app, and 9 percent had done so in the past year.

THE THREE QUESTIONS, ANSWERED

1. **How did a few companies come to control whole industries?** Their owners made secret deals with railroads, bought out rivals and joined companies into trusts and mergers. By 1880 Standard Oil refined 90 to 95 percent of the country's oil.
2. **What did owners do when their workers went on strike?** They locked workers out and hired armed guards, and officials sent soldiers and court orders. At Homestead in 1892 Frick's Pinkerton men fought the steelworkers, and at Ludlow in 1914 soldiers paid by the mine owners burned the strikers' tent camp.
3. **Did breaking up a giant company ever work?** Not clearly. Judges split Standard Oil into 34 companies in 1911, yet Rockefeller was three times as rich by 1913. AT&T gave up its local telephone companies in 1984 in a deal most newspapers called a win for AT&T, the order to split Microsoft was thrown out in 2001, and judges in 2025 and 2026 would not make Google sell off parts of its business.

What changed: In 1500 no company existed in this land, and by 2026 three American companies were each worth more than $4 trillion.

FIVE DATES TO KEEP

May 13, 1607: The Virginia Company's settlers found Jamestown.

December 16, 1773: Colonists dump the East India Company's tea into Boston Harbor.

July 2, 1890: The Sherman Antitrust Act becomes law.

May 15, 1911: The justices of the Supreme Court rule against Standard Oil.

January 21, 2010: The justices decide *Citizens United*, on corporate spending in elections.

NOT KNOWN: No record shows which Acadians died at sea on the ships Thomas Hancock's firm rented out in 1755, or how many.

Where to go: Lowell National Historical Park stands in Lowell, Massachusetts, the mill town the Boston Associates built.

Next: Chapter 20, Government, Law, and Politics. It asks who wrote the rules of American government, and who got to vote.

PART 5

Power, Law, and War

Chapter 20: Government, Law, and Politics

CHAPTER 20 OF 37 · GOVERNMENT, LAW, AND POLITICS · 10 ERAS · ABOUT 140 MINUTES

The rules of American government were written by people, and in every era people with power rewrote them, most often to decide who could vote and who could not.

One copy of a report survives in the National Archives of the United Kingdom. John Pory wrote it in 1619. It records six days, July 30 to August 4, when twenty-two elected men sat in the church at Jamestown, Virginia, the only building on the island big enough to hold them all. They were the first elected lawmakers in English North America. They made rules about tobacco, gambling and land. No record says who voted for them.

This chapter follows the rules from that church to the Capitol on January 6, 2021. Watch three things as you read. Who may vote: the answer changes in nearly every era, and the people who changed it usually wrote down why. What judges may do: in 1803 the justices of the Supreme Court first cancelled a law, and they have been cancelling and allowing laws ever since. What happens to people in power who break the law: a governor in 1614, a cabinet secretary in 1929, a president in 1974.

The chapter also follows the laws about schools, which say where children must go and what they may be taught. From 1790 on, it tracks the laws on who may come to live in the country and who may become a citizen.

THREE QUESTIONS THIS CHAPTER ANSWERS

1. Who decided who could vote, and how did the answer change?

2. When did judges first cancel a law, and what have they done with that power since?
3. What happens when people in power break the law?

Five minutes? Read "The Zenger trial, 1735" in 1700 to 1750, then the John Peter Zenger and Andrew Hamilton stories after it.

Can skip: "Land for colleges, 1862", "The food laws of 1906", "New kinds of schools, 1991 to 1996", "Immigration law after 2001". The chapter still makes sense without them.

Before 1500

ERA 1 OF 10 · BEFORE 1500 · ABOUT 6 MINUTES

Long before Europeans arrived, the Native nations here governed themselves, and they did it in different ways. Most of this era is about the Haudenosaunee, five nations in the Northeast that joined in a league and lived under one law, because their own full telling of that law survives. Two short spans at the end cover the Pueblo towns along the Rio Grande, where each town ran its own affairs, and Cahokia, a city of thousands on the Mississippi River led by chiefs.

How five nations at war made one law

The Haudenosaunee are a league of Native nations whose homelands lie mainly in what is now New York State and the Great Lakes region. Their name means "people who build a house." Five nations joined first: the Mohawk, the Oneida, the Onondaga, the Cayuga and the Seneca. The Tuscarora joined in 1722, which made six. Each nation stayed a separate nation inside the league.

The law that joined them is called the Great Law of Peace. In the Haudenosaunee account, the five nations were once at war with each other. A man called the Peacemaker wanted to spread peace among them. He came to the house of an Onondaga leader named Hayo'wetha, often written Hiawatha. When the nations made peace, they pulled up a white pine tree and threw their weapons into the hole. Then they planted the tree again on top of the weapons and named it the Tree of Peace.

The Haudenosaunee kept the Great Law in memory and passed it on by speaking it. A full telling takes several days. They also wove belts of purple and white shell beads, called wampum. The patterns in the belts recorded the laws of the league, the stories told at ceremonies, and important dealings with other nations. The belts were presented at meetings of the Grand Council, the league's lawmaking body. The Haudenosaunee used wampum to keep these records, and never as money.

KNOWN:	The league was in place before Europeans arrived.
DISPUTED:	When it began. The dates people give run from about 1142 to the 1400s or 1500s.

The Grand Council and the clan mothers

The league's lawmaking body is the Grand Council, and it has fifty seats. Each seat belongs to a leader called a *hoyaneh*. The Onondaga hold fourteen seats, the Cayuga ten, the Mohawk nine, the Oneida nine and the Seneca eight. Council members are not paid, and they serve for life.

The Haudenosaunee count the Onondaga Nation as the league's capital. They say the council fire burns there, as the Peacemaker promised, and they call the Onondaga the "Keepers of the Central Fire." The Mohawk, in the east, are the "Keepers of the Eastern Door," and the Seneca, in the west, are the "Keepers of the Western Door."

How a law passes. Before the council members pass a law, every member must agree to it. This way of deciding is called consensus. Under it, no law passes while even one member is against it.

Women hold power in this government through the clan mothers. A clan is a large group of related families. The members of a clan choose a clan mother together, and she serves for life. The clan mothers choose the council members. A clan mother can also remove any *hoyaneh* who does not serve the good of his nation.

Did the Constitution borrow from this law? In 1988 members of both houses of Congress voted for a resolution, a written statement that lawmakers vote on, which said yes. Representative Morris Udall put it forward. Its title states that it was meant "to acknowledge the contribution of the Iroquois Confederacy of Nations to the development of the U.S. Constitution." Iroquois is the more common English name for the Haudenosaunee, and a confederacy is a league of nations or states. The Constitution is the written plan for how the national government of the United States works.

Scholars disagree about how much the men who wrote the Constitution took from the Great Law. Bruce Johansen and Donald Grinde argue that the founders admired Native governments and borrowed ideas from them. Elisabeth Tooker, an anthropologist, a scientist who studies how peoples

live, argued the other side. She wrote that the founders took their models from European ideas and that the evidence of borrowing from the league is very thin.

The Pueblo towns

Groups of Spanish explorers began coming up the Rio Grande in 1540. They found farming peoples living in settled towns, which the Spanish called pueblos, the Spanish word for towns. The people of each town governed themselves. Each town had its own leaders, customs and language. No one leader or council ruled all the pueblos.

At Zuni, a council of priests held power over the town. One group of them, the bow priests, handled dealings with outsiders.

Cahokia, a city led by chiefs

Cahokia stood near the Mississippi River, east of where St. Louis is now. The city covered more than 4,000 acres, and its largest years came between about 1050 and 1150. Archaeologists, the scientists who dig up what people left behind, disagree widely about how many people lived there then. Their estimates run from 10,000 to 20,000, and some go higher.

Cahokia was a chiefdom, a society led by chiefs and by officials of high rank. The people built large mounds of earth with flat tops. Buildings for religious leaders and for other officials stood on top of the mounds. Other mounds held the graves of people of high rank.

The 1500s

ERA 2 OF 10 · THE 1500S · ABOUT 2 MINUTES

The first governors of Florida and of New Mexico served the king of Spain. Pedro Menéndez de Avilés held his office in Florida by a contract with the king, who lived across the ocean in Spain. Juan de Oñate held his office in New Mexico by a contract with the viceroy, the official who ruled in the king's name from Mexico City. Menéndez used a Timucua council house as his first fort. Oñate made a Tewa town his first capital.

A governor for Florida, 1565

Pedro Menéndez de Avilés founded St. Augustine, in Florida, on September 8, 1565. King Philip II of Spain had ordered the voyage. Menéndez held the title of *adelantado*, a Spanish office that a man received by signing a contract with the king. He soon became Florida's first governor. St. Augustine is the oldest European settlement in the mainland United States where people have lived without a break since its founding.

Menéndez made his first settlement in the town led by Seloy, a chief of the Timucua people. About 800 colonists came with him, among them 26 women and an unknown number of Africans whom the Spanish held as slaves. Timucua council houses were usually round, built of thatch, and big enough to hold up to a thousand people. Seloy offered Menéndez his council house to use as a fort, and the Spanish used it as their first fort in Florida.

Officials of the king of Spain set rules in 1573 for laying out new towns. The rules belong to a body of royal orders known as the Laws of the Indies. They required a town's streets to form a grid around a central square, or plaza. The main government buildings and the church were to face the plaza. St. Augustine's grid of streets was laid out in 1603, thirty-eight years after the town was founded.

A governor for New Mexico, 1598

Juan de Oñate made a contract with the viceroy in Mexico City. He promised to settle New Mexico and govern it. In return he got loans, supplies and soldiers. He left the town of Santa Bárbara early in 1598 with 600 Spanish settlers and Native allies from Tlaxcala, in Mexico.

On the Rio Grande he set up his first capital at Ohkay Owingeh, a town of Tewa-speaking people. The Spanish named the town San Juan de los Caballeros in 1598. A year later Oñate moved his capital across the river to a place called San Gabriel. The people of Ohkay Owingeh still live in their town.

Oñate went to the pueblos one by one in the autumn of 1598. Through translators, he made the people of each pueblo swear loyalty to the king of Spain. He also placed a missionary, a priest sent to bring people into his religion, in each one. Oñate governed New Mexico until 1608. The next era tells what the king's judges later found he had done there.

The 1600s

ERA 3 OF 10 · THE 1600S · ABOUT 10 MINUTES

Spanish judges in Mexico City put a former governor of New Mexico on trial in 1614. The English built Jamestown, in Virginia, in 1607, and twelve years later twenty-two elected men met there as the first elected assembly in English North America. The next year, forty-one men aboard the *Mayflower* signed an agreement to make laws for themselves and obey them.

The colonists' own lawmakers decided who could vote, and they changed the rules many times. In 1662 Virginia's lawmakers passed a law that made every child born to an enslaved woman a slave as well. In Massachusetts, lawmakers made towns keep a school.

What the judges found Oñate guilty of, 1614

Royal judges in Mexico City tried Juan de Oñate, the former governor of New Mexico, in 1614. Officials of the king of Spain had brought 30 charges against him. The judges found him guilty of 12 and not guilty of 18. They ordered him out of New Mexico for life and barred him from Mexico City for four years, or five, since accounts differ. They also fined him 6,000 ducats in the money of Castile, in Spain.

The charges. One of the twelve was using too much force against Acoma Pueblo. He was found guilty of it because of the sentences he gave the Acoma people after the fighting there in 1599. He was also found guilty of hanging two Native men without just cause, of the murders of two of his own captains, of ordering his captains to kill two soldiers who had run away from the army, and of lying to the viceroys and the king about how rich the land was.

What happened at Acoma. Oñate's nephew Juan de Zaldívar came to Acoma in December 1598 with about thirty soldiers. He took some of them up the mesa, the flat-topped hill where the town stands, to demand food. In the Acoma people's own account, the soldiers raped an Acoma woman. Rape means forcing a person into sex. The Acoma killed Zaldívar and eleven to fourteen of his men. Accounts differ on the number.

Oñate sent Juan's brother, Vicente de Zaldívar, to Acoma in January 1599 with about seventy soldiers. Over two or three days of fighting, those soldiers killed Acoma men, women and children, and they burned much of the town. No one counted the dead at the time.

KNOWN:	The soldiers killed hundreds of people. The Pueblo nations' own leaders use the figure of about 800.
DISPUTED:	The count. Estimates run from about 300 to about 1,500, and PBS reports that about 200 people of Acoma survived out of nearly 2,000. Those figures come from different sources and do not fit together.

The sentences. Afterward Oñate sentenced the Acoma men over twenty-five to have one foot cut off, and to be forced to work as slaves of the Spanish for twenty years. Younger men and boys from twelve up, and women and girls over twelve, got the same twenty years of forced work. He handed the old people to the Plains Apache as slaves.

The children. He took the children under twelve from their families and gave them to the friars, the Catholic religious brothers with his colony. On Oñate's order, about 70 of the girls were sent to convents in Mexico, houses where nuns live. The National Park Service's account states that almost certainly none of the girls ever came home.

The Hopi men. Oñate also sentenced two Hopi men captured in the fighting to have their right hands cut off. Then he had them released to carry word of the punishment to their own people.

The feet. The sentences are in the written record. Whether the feet were cut off is disputed. In the Acoma people's own account, Oñate had the right feet of 24 captive men cut off. The historians Marc Simmons and John Kessell doubt that it was done, and Kessell points out that no record describes a one-footed Acoma man.

The first General Assembly, 1619

The leaders of the Virginia Company of London, the business that ran the colony, put out a paper called the Great Charter in 1618. A charter is a written grant of rights and powers. Sir Thomas Smythe and Sir Edwin Sandys wrote it. It allowed the governor to "summon a General Assembly to legislate as appropriate." That meant the governor could call a meeting of men to make laws.

In the summer of 1619 Governor George Yeardley used that power. The colony had eleven settlements, and two elected men came from each one to speak and vote for it. They were called burgesses. A burgess was an elected member of the assembly. The twenty-two burgesses met in the Jamestown church with Yeardley and his council, the six men who advised him, from July 30 to August 4, 1619.

In six days the members set rules for how they would do business and protected colonists' claims to their land. They also made the Church of England the colony's official church. They passed laws about tobacco, gambling, behavior and dealings with Native nations.

Whose land it was. Jamestown stood on land that belonged to the Paspahegh. They were one of twenty-eight to thirty-two groups, each with its own chief, that paid tribute, goods given to a more powerful ruler, to Powhatan. He was the chief over all the other chiefs of Tsenacomoco. The anthropologist Helen C. Rountree estimates that about 15,000 people lived in Tsenacomoco, across about 6,000 square miles. The English built Jamestown on Paspahegh land in 1607 and stayed there without asking the Paspahegh's permission.

The assembly outlives the company. The king's officials took away the Virginia Company's charter in 1624. Virginia became a royal colony in 1625, with a governor and council chosen by the king. No one in England had given the assembly permission to go on meeting, but the burgesses kept meeting.

Whether the assembly had any legal right to meet stayed unclear until 1627. That year the king asked the General Assembly to help make rules for the tobacco trade. By asking, he treated the assembly as a lawful body, though no written order said it could meet.

John Pory

Who: The colony's secretary, who served as Speaker of the first elected assembly in English North America and wrote the record of what it did.
When and where: Jamestown, Virginia, July 30 to August 4, 1619.

Pory, the colony's secretary, ran the 1619 assembly and wrote its record.

John Pory wrote the record of the first meeting of Virginia's General Assembly. He called his report "The Proceedings of the First General Assembly, July 30, 1619." One copy of it survives, in the National Archives of the United Kingdom. Any copies kept in Virginia, Brent Tarter wrote on the Library of Virginia's blog in 2019, would have been destroyed in one of the British raids on Richmond during the American Revolution, along with most of the colony's records.

Pory knew how a lawmaking body ran its business. He had sat in the English Parliament, the group of lawmakers who made England's laws. The leaders of the Virginia Company made him secretary of the colony on December 2, 1618. He sailed from England in January 1619 with the governor, George Yeardley, and reached Jamestown on April 18.

That summer Yeardley made him Speaker of the assembly, the officer who runs its meetings. Pory was not one of the elected burgesses. He ran the meetings because the governor appointed him. He left Virginia in the early summer of 1622, after Christopher Davidson was made secretary in his place.

Why forty-one men signed a paper off Cape Cod, 1620

The *Mayflower* anchored off Cape Cod, in what is now Massachusetts, in November 1620. The passengers had permission, called a patent, to settle near the Hudson River. That land lay inside the Virginia Company's territory. Off Cape Cod they were outside it, so no one had given them the right to govern themselves there.

Forty-one men signed an agreement on November 11, 1620, to keep order until a new patent came. It is known as the Mayflower Compact. The signers agreed to "covenant & combine our selves together into a Civill body politick." That meant they promised to form a government together. They also promised to make and obey "just & equall lawes." The women and children did not sign. Most of the servants did not sign either. The original paper has been lost.

The passengers founded Plymouth Colony. They settled at Patuxet, where a Wampanoag community had lived until "a sickness had killed most of them." Plymouth remained a separate colony from Massachusetts Bay until 1691.

Who could vote

The colonies' lawmakers decided who could vote. In Virginia they went back and forth for more than fifty years over one question: whether every free man could vote, or only a man who owned land or headed a household. The rules came from an old English idea that only people who owned property should have a say in running a place. No record says who voted for the first burgesses in 1619.

The members of the General Assembly let all freemen vote in 1646. A freeman was a man who was neither enslaved nor bound as a servant. They allowed only heads of households to vote in 1655, and they opened the vote to all freemen again in 1656. In 1670 they limited the vote to men who owned land or headed a household.

That limit lasted, except for one year. In 1676, during a revolt called Bacon's Rebellion, all freemen could vote again. The Assembly's members put the limit back in 1677, after the revolt fell apart. In 1684 men who rented land for their whole lives could vote as well.

The members passed a law in 1699 that barred women and anyone under twenty-one from voting. Women voting went against English custom, and no one knows whether any Virginia woman had tried to vote before then.

Candidates in Virginia gave voters food and drink before and after an election. People called it treating. Virginia's lawmakers limited treating during the week of an election, so candidates had other people do the treating for them.
